When calling the `UpdateEndpoint` API, set `RetainDeploymentConfig` to `True` to keep the `DeploymentConfig` options from your original endpoint configuration.

```python
response = client.update_endpoint(
    EndpointName="<your-endpoint-name>",
    EndpointConfigName="<your-config-name>",
    RetainDeploymentConfig=True
)
```

**How to update an endpoint (CLI)**

If you are using the AWS CLI, the following example shows how to start a blue/green linear deployment using the `update-endpoint` command.

```bash
update-endpoint
```
To configure the linear traffic shifting option, do the following:

- For `endpoint-name`, use the name of the endpoint you want to update.
- For `endpoint-config-name`, use the name of the endpoint configuration you want to use.
- For `deployment-config`, use a `BlueGreenUpdatePolicy` JSON object.

**Note**
If you would rather save your JSON object in a file, see Generating AWS CLI skeleton and input parameters in the AWS CLI User Guide.

---

### Exclusions

You can only use deployment guardrails with newly created endpoints. There are also feature-based exclusions that make your endpoint incompatible with deployment guardrails at this time. If your endpoint uses any of the following features, you cannot use deployment guardrails on your endpoint, and your endpoint will fall back to using a blue/green deployment with all at once traffic shifting and no final baking period.

- Marketplace containers
- Multi-container endpoints
- Multi-model endpoints
- Multi-variant endpoints
- Endpoints that use Inf1 (Inferentia-based) instances
- Endpoints that use Amazon SageMaker Model Monitor (with data capture enabled)
- Amazon Elastic Inference endpoints

---

### Inference cost optimization best practices

The following content provides techniques and considerations for optimizing the cost of endpoints. You can use these recommendations to optimize the cost for both new and existing endpoints.

#### Best practices

To optimize your SageMaker Inference costs, follow these best practices.

**Pick the best inference option for the job.**

SageMaker offers 4 different inference options to provide the best inference option for the job. You may be able to save on costs by picking the inference option that best matches your workload.

- Use **real-time inference** for low latency workloads with predictable traffic patterns that need to have consistent latency characteristics and are always available. You pay for using the instance.
• Use serverless inference for synchronous workloads that have a spiky traffic pattern and can accept variations in the p99 latency. Serverless inference automatically scales to meet your workload traffic so you don't pay for any idle resources. You only pay for the duration of the inference request. The same model and containers can be used with both real-time and serverless inference so you can switch between these two modes if your needs change.

• Use asynchronous inference for asynchronous workloads that process up to 1 GB of data (such as text corpus, image, video, and audio) that are latency insensitive and cost sensitive. With asynchronous inference, you can control costs by specifying a fixed number of instances for the optimal processing rate instead of provisioning for the peak. You can also scale down to zero to save additional costs.

• Use batch inference for workloads for which you need inference for a large set of data for processes that happen offline (that is, you don’t need a persistent endpoint). You pay for the instance for the duration of the batch inference job.

Opt in to a SageMaker Savings Plan.

• If you have a consistent usage level across all SageMaker services, you can opt in to a SageMaker Savings Plan to help reduce your costs by up to 64%.

• Amazon SageMaker Savings Plans provide a flexible pricing model for Amazon SageMaker, in exchange for a commitment to a consistent amount of usage (measured in $/hour) for a one-year or three-year term. These plans automatically apply to eligible SageMaker ML instance usages including SageMaker Studio Notebook, SageMaker On-Demand Notebook, SageMaker Processing, SageMaker Data Wrangler, SageMaker Training, SageMaker Real-Time Inference, and SageMaker Batch Transform regardless of instance family, size, or Region. For example, you can change usage from a CPU ml.c5.xlarge instance running in US East (Ohio) to a ml.Inf1 instance in US West (Oregon) for inference workloads at any time and automatically continue to pay the Savings Plans price.

Optimize your model to run better.

• Unoptimized models can lead to longer run times and use more resources. You may choose to use more or bigger instances to improve performance; however, this leads to higher costs.

• By optimizing your models to be more performant, you may be able to lower costs by using fewer or smaller instances while keeping the same or better performance characteristics. You can use SageMaker Neo with SageMaker Inference to automatically optimize models. For more details and samples, see Optimize model performance using Neo (p. 3063).

Use the most optimal instance type and size for real-time inference.

• SageMaker Inference has over 70 instance types and sizes that can be used to deploy ML models including AWS Inferentia and Graviton chipsets that are optimized for ML. Choosing the right instance for your model helps ensure you have the most performant instance at the lowest cost for your models.

• By using Inference Recommender, you can quickly compare different instances to understand the performance of the model and the costs. With these results, you can choose the instance to deploy with the best return on investment.

Improve efficiency and costs by combining multiple endpoints into a single endpoint for real-time inference.

• Costs can quickly add up when you deploy multiple endpoints, especially if the endpoints don’t fully utilize the underlying instances. To understand if the instance is under-utilized, check the utilization metrics (CPU, GPU, etc) in Amazon CloudWatch for your instances. If you have more than one of
these endpoints, you can combine the models or containers on these multiple endpoints into a single endpoint.

- Using **Multi-model endpoints** (MME) or **Multi-container endpoints** (MCE), you can deploy multiple ML models or containers in a single endpoint to share the instance across multiple models or containers and improve your return on investment. To learn more, see this [Save on inference costs by using Amazon SageMaker multi-model endpoints](https://aws.amazon.com/blogs/machine-learning/save-on-inference-costs-by-using-amazon-sagemaker-multi-model-endpoints/) or [Deploy multiple serving containers on a single instance using Amazon SageMaker multi-container endpoints](https://aws.amazon.com/blogs/machine-learning/deploy-multiple-serving-containers-on-a-single-instance-using-amazon-sagemaker-multi-container-endpoints/) on the AWS Machine Learning blog.

**Set up autoscaling to match your workload requirements for real-time and asynchronous inference.**

- Without autoscaling, you need to provision for peak traffic or risk model unavailability. Unless the traffic to your model is steady throughout the day, there will be excess unused capacity. This leads to low utilization and wasted resources.
- **Autoscaling** is an out-of-the-box feature that monitors your workloads and dynamically adjusts the capacity to maintain steady and predictable performance at the possible lowest cost. When the workload increases, autoscaling brings more instances online. When the workload decreases, autoscaling removes unnecessary instances, helping you reduce your compute cost. To learn more, see [Configuring autoscaling inference endpoints in Amazon SageMaker](https://aws.amazon.com/blogs/machine-learning/configuring-autoscaling-inference-endpoints-in-amazon-sagemaker/) on the AWS Machine Learning blog.

**Register and Deploy Models with Model Registry**

With the SageMaker model registry you can do the following:

- Catalog models for production.
- Manage model versions.
- Associate metadata, such as training metrics, with a model.
- Manage the approval status of a model.
- Deploy models to production.
- Automate model deployment with CI/CD.

Catalog models by creating model package groups that contain different versions of a model. You can create a model group that tracks all of the models that you train to solve a particular problem. You can then register each model you train and the model registry adds it to the model group as a new model version. A typical workflow might look like the following:

- Create a model group.
- Create an ML pipeline that trains a model. For information about SageMaker pipelines, see [Create and Manage SageMaker Pipelines](https://docs.aws.amazon.com/sagemaker/latest/dg/pipelines.html). (p. 3250).
- For each run of the ML pipeline, create a model version that you register in the model group you created in the first step.

**Model Registry Structure**

The SageMaker Model Registry is structured as several model groups with model packages in each group. Each model package in a model group corresponds to a trained model. The version of each model package is a numerical value that starts at 1 and is incremented with each new model package added to a model group. For example, if 5 model packages are added to a model group, the model package versions will be 1, 2, 3, 4, and 5. The example Model Registry shown in the following image contains 3 model groups, where each group contains the model packages related to a particular ML problem.
There are two types of model packages in SageMaker. One type is used in the AWS Marketplace, and the other is used in the Model Registry. Model packages used in the AWS Marketplace are not versionable entities and are not associated with model groups in the Model Registry. For more information about model packages used in the AWS Marketplace, see Buy and Sell Amazon SageMaker Algorithms and Models in AWS Marketplace (p. 3475).

The model packages used in the Model Registry are versioned, and must be associated with a model group. The ARN of this model package type has the structure: `arn:aws:sagemaker:region:account:model-group/version`

The following topics show you how to use the Model Registry.

**Topics**
- Create a Model Group (p. 2983)
- Delete a Model Group (p. 2987)
- Register a Model Version (p. 2988)
- View Model Groups and Versions (p. 2995)
- View the Details of a Model Version (p. 2997)
- Delete a Model Version (p. 2999)
- Update the Approval Status of a Model (p. 3001)
- Deploy a Model from the Registry (p. 3005)
- View the Deployment History of a Model (p. 3008)
- Amazon SageMaker Model Registry FAQ (p. 3011)

## Create a Model Group

A model group contains a group of versioned models. Create a model group by using either the AWS SDK for Python (Boto3) or Amazon SageMaker Studio.

### Create a Model Package Group (Boto3)

To create a model group by using Boto3, call the `create_model_package_group` method and specify a name and description as parameters. The following example shows how to create a model group.

```python
model_package_group_name = 'my-model-package-group'
model_package_group_description = 'This is a model package group for my experiment.'
create_model_package_group(ModelGroupName=model_package_group_name, ModelGroupDescription=model_package_group_description)
```
response from the `create_model_package_group` call is the Amazon Resource Name (ARN) of the new model package group.

First, import the required packages and set up the SageMaker Boto3 client.

```python
import time
import os
from sagemaker import get_execution_role, session
import boto3

region = boto3.Session().region_name
role = get_execution_role()
sm_client = boto3.client('sagemaker', region_name=region)

Now create the model group.

```python
model_package_group_name = "scikit-iris-detector-" + str(round(time.time()))
model_package_group_input_dict = {
    "ModelPackageGroupName" : model_package_group_name,
    "ModelPackageGroupDescription" : "Sample model package group"
}

create_model_package_group_response = sm_client.create_model_package_group(**model_package_group_input_dict)
print('ModelPackageGroup Arn : {}'.format(create_model_package_group_response["ModelPackageGroupArn"]))
```

Create a Model Package Group (Amazon SageMaker Studio)

To create a model group in Amazon SageMaker Studio, complete the following steps.

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. In the left navigation pane, choose the SageMaker Resources icon (🔍).
3. Choose Model registry.
4. Choose Create model group.
5. In the **Create new model group** dialog box, enter the following information:

   - Enter the name of the new model group in the **Name** field.
   - (Optional) Enter a description for the model group in the **Description** field.
   - (Optional) Enter any key-value pairs you want to associate with the model group in the **Tags** field. For information about using tags, see *Tagging AWS resources* in the *AWS General Reference*.
   - (Optional) Choose a project with which to associate the model group in the **Project** field. For information about projects, see *Automate MLOps with SageMaker Projects* (p. 3281).

6. Choose **Create model group**.
Delete a Model Group

This procedure demonstrates how to delete a model group in Amazon SageMaker Studio.

Delete a Model Package Group (Amazon SageMaker Studio)

To delete a model group in Amazon SageMaker Studio, complete the following steps.

1. Sign in to Amazon SageMaker Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. In the left navigation pane, choose the SageMaker Resources icon (🔗).
3. Choose Model registry in the dropdown menu at the top of the SageMaker resources panel.
   A list of your model groups appears.
4. From the model groups list, double-click the model group you want to delete.
   The model details tab opens to the right.
5. In the Actions dropdown menu in the top right corner of the model details tab, choose Delete.
6. In the confirmation dialog box, choose Delete.

**Register a Model Version**

You can register an Amazon SageMaker model by creating a model version that specifies the model group to which it belongs. A model version must include both the model artifacts (the trained weights of a model) and the inference code for the model.

An *inference pipeline* is a SageMaker model composed of a linear sequence of two to fifteen containers that process inference requests. You register an inference pipeline by specifying the containers and the associated environment variables. For more information on inference pipelines, see Host models along with pre-processing logic as serial inference pipeline behind one endpoint (p. 2789).

You can register a model with an inference pipeline, by specifying the containers and the associated environment variables. To create a model version with an inference pipeline by using either the AWS SDK for Python (Boto3) or by creating a step in a SageMaker model building pipeline, use the following steps.

**Topics**
- Register a Model Version (SageMaker Pipelines) (p. 2989)
Register a Model Version (SageMaker Pipelines)

To register a model version by using a SageMaker model building pipeline, create a RegisterModel step in your pipeline. For information about creating a RegisterModel step as part of a pipeline, see Step 8: Define a RegisterModel Step to Create a Model Package (p. 3261).

Register a Model Version (Boto3)

To register a model version by using Boto3, call the create_model_package method.

First, you set up the parameter dictionary to pass to the create_model_package method.

```python
# Specify the model source
model_url = "s3://your-bucket-name/model.tar.gz"

modelpackage_inference_specification = {
    "InferenceSpecification": {
        "Containers": [
            {
                "Image": '257758044811.dkr.ecr.us-east-2.amazonaws.com/sagemaker-xgboost:1.2-1',
                "ModelDataUrl": model_url
            }
        ],
        "SupportedContentTypes": [ "text/csv" ],
        "SupportedResponseMIMETypes": [ "text/csv" ],
    }
}

create_model_package_input_dict = {
    "ModelPackageGroupName": model_package_group_name,
    "ModelPackageDescription": "Model to detect 3 different types of irises (Setosa, Versicolour, and Virginica)",
    "ModelApprovalStatus": "PendingManualApproval"

create_model_package_input_dict.update(modelpackage_inference_specification)

create_model_package_response = sm_client.create_model_package(**create_model_package_input_dict)
model_package_arn = create_model_package_response["ModelPackageArn"]
print('ModelPackage Version ARN : {}'.format(model_package_arn))
```

Register a Model Version from a Different Account

To register model versions with a model package group created by a different AWS account, you must add a cross-account AWS Identity and Access Management resource policy to enable that account. For example, one AWS account in your organization is responsible for training models, and a different
account is responsible for managing, deploying, and updating models. You create IAM resource policies and apply the policies to the specific account resource to which you want to grant access for this case. For more information about cross-account resource policies in AWS, see Cross-account policy evaluation logic in the AWS Identity and Access Management User Guide.

Note
You must also use a KMS key to encrypt the output data config action during training for cross-account model deployment.

To enable cross-account model registry in SageMaker, you have to provide a cross-account resource policy for the model group that contains the model versions. The following is an example that creates cross-account policies for the model package group and applies these policies to that specific resource.

The following configuration must be set in the source account which registers models cross-account in a model package group. In this example, the source account is the model training account which will train and then register the model cross-account into the Model Registry of the model registry account.

The example assumes that you previously defined the following variables:

- **sm_client** - A SageMaker Boto3 client.
- **model_package_group_name** - The model group to which you want to grant access.
- **model_package_group_arn** - The model group arn to which you want to grant cross-account access.
- **bucket** - The S3 bucket where the model training artifacts are stored.

To be able to deploy a model created in a different account, the user must have a role that has access to SageMaker actions, such as a role with the AmazonSageMakerFullAccess managed policy. For information about SageMaker managed policies, see AWS Managed Policies for Amazon SageMaker (p. 3571).

**Required IAM resource policies**

The following diagram captures the policies required to allow cross-account model registration. As shown, these policies need to be active during model training to properly register the model into the model registry account.
Amazon ECR, Amazon S3, and AWS KMS policies are demonstrated in the following code samples.

**Sample Amazon ECR policy**

```json
{
  'Version': '2012-10-17',
  'Statement': [
    {
      'Sid': 'AddPerm',
      'Effect': 'Allow',
```
Sample Amazon S3 policy

```json
{
  'Version': '2012-10-17',
  'Statement': [
    {
      'Sid': 'AddPerm',
      'Effect': 'Allow',
      'Principal': {
        'AWS': 'arn:aws:iam::{model_registry_account}:root'
      },
      'Action': ['s3:GetObject', 's3:GetBucketAcl', 's3:GetObjectAcl'],
      'Resource': 'arn:aws:s3:::{bucket}/*'
    }
  ]
}
```

Sample AWS KMS policy

```json
{
  'Version': '2012-10-17',
  'Statement': [
    {
      'Sid': 'AddPerm',
      'Effect': 'Allow',
      'Principal': {
        'AWS': 'arn:aws:iam::{model_registry_account}:root'
      },
      'Action': ['kms:Decrypt', 'kms:GenerateDataKey*'],
      'Resource': '*'
    }
  ]
}
```

Apply resource policies to accounts

The following policy configuration applies the policies discussed in the previous section and must be put in the model training account.

```python
import json

# The model registry account id of the model package group
model_registry_account = '111111111111'
```
# The model training account id where training happens
model_training_account = '222222222222'

# 1. Create a policy for access to the ECR repository
# in the model training account for the model registry account model package group
ecr_repo_policy = {'Version': '2012-10-17',
                   'Statement': [{'Sid': 'AddPerm',
                                  'Effect': 'Allow',
                                  'Principal': {'AWS': f'arn:aws:iam::{model_registry_account}:root'},
                                  'Action': ['ecr:BatchGetImage',
                                             'ecr:Describe*']
                     ]}

# Convert the ECR policy from JSON dict to string
ecr_repo_policy = json.dumps(ecr_repo_policy)

# Set the new ECR policy
ecr = boto3.client('ecr')
response = ecr.set_repository_policy(registryId=model_training_account,
                                        repositoryName='decision-trees-sample',
                                        policyText=ecr_repo_policy)

# 2. Create a policy in the model training account for access to the S3 bucket
# where the model is present in the model registry account model package group
bucket_policy = {'Version': '2012-10-17',
                 'Statement': [{'Sid': 'AddPerm',
                                'Effect': 'Allow',
                                'Principal': {'AWS': f'arn:aws:iam::{model_registry_account}:root'},
                                'Action': ['s3:GetObject',
                                           's3:GetBucketAcl',
                                           's3:GetObjectAcl']
                   },
                   'Resource': f'arn:aws:s3::{bucket}/**'
                 ]}

# Convert the S3 policy from JSON dict to string
bucket_policy = json.dumps(bucket_policy)

# Set the new bucket policy
s3 = boto3.client('s3')
response = s3.put_bucket_policy(Bucket=bucket,
                                Policy=bucket_policy)

# 3. Create the KMS grant for the key used during training for encryption
# in the model training account to the model registry account model package group
client = boto3.client('kms')
response = client.create_grant(GranteePrincipal=model_registry_account,
                               KeyId=kms_key_id,
                               Operations=[
                                             'Decrypt',
                                             'GenerateDataKey'
                                             ],
                               CiphertextBlob=ciphertext_blob)
The following configuration needs to be put in the model registry account where the model package group exists.

```python
# The model registry account id of the model package group
model_registry_account = '111111111111'

# 1. Create policy to allow the model training account to access the ModelPackageGroup
model_package_group_policy = {'Version': '2012-10-17',
   'Statement': [
      {
         'Sid': 'AddPermModelPackageVersion',
         'Effect': 'Allow',
         'Principal': {'AWS': f'arn:aws:iam::{model_training_account}:root'},
         'Action': ['sagemaker:CreateModelPackage'],
         'Resource': f'arn:aws:sagemaker:{region}:{model_registry_account}:model-package/{model_package_group_name}/*'
      }
   ]
}

# Convert the policy from JSON dict to string
model_package_group_policy = json.dumps(model_package_group_policy)

# Set the new policy
response = sm_client.put_model_package_group_policy(
    ModelPackageGroupName = model_package_group_name,
    ResourcePolicy = model_package_group_policy)

Finally, use the create_model_package action from the model training account to register the model package in the cross-account.

```python
# Specify the model source
model_url = "s3://(bucket)/model.tar.gz"

# Set up the parameter dictionary to pass to the create_model_package method
modelpackage_inference_specification = {
   "InferenceSpecification": {
      "Containers": [
         {
            "Image": f'${model_training_account}.dkr.ecr.us-east-2.amazonaws.com/decision-trees-sample:latest',
            "ModelDataUrl": model_url
         }
      ],
      "SupportedContentTypes": [ "text/csv" ],
      "SupportedResponseMIMETypes": [ "text/csv" ],
   }
}

# Alternatively, you can specify the model source like this:
# modelpackage_inference_specification["InferenceSpecification"]["Containers"][0]["ModelDataUrl"] = model_url

create_model_package_input_dict = {
   "ModelPackageGroupName" : model_package_group_arn,
   "ModelPackageDescription" : "Model to detect 3 different types of irises (Setosa, Versicolour, and Virginica)",
   "ModelApprovalStatus" : "PendingManualApproval"
}
} create_model_package_input_dict.update(modelpackage_inference_specification)

# Create the model package in the model registry account
create_model_package_response =
    sm_client.create_model_package(**create_model_package_input_dict)
model_package_arn = create_model_package_response['ModelPackageArn']
print('ModelPackage Version ARN : {}'.format(model_package_arn))

View Model Groups and Versions

Model groups and versions help you organize your models. You can view a list of the model versions in a model group.

View a List of Model Versions in a Group

You can view all of the model versions that are associated with a model group. If a model group represents all models that you train to address a specific ML problem, you can view all of those related models.

View a List of Model Versions in a Group (Boto3)

To view model versions associated with a model group by using Boto3, call the list_model_packages method, and pass the name of the model group as the value of the ModelPackageGroupName parameter. The following code lists the model versions associated with the model group you created in Create a Model Package Group (Boto3) (p. 2983).

```
sm_client.list_model_packages(ModelPackageGroupName=model_package_group_name)
```

View a List of Model Versions in a Group (Amazon SageMaker Studio)

To view a list of the model versions in a model group, complete the following steps.

1. Sign in to Amazon SageMaker Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. In the left navigation pane, choose the SageMaker Resources icon (🔍).
3. Choose Model registry.
4. From the model groups list, choose the model group you want to view.
5. A new tab appears with a list of the model versions in the model group, as shown in the following image.
View the Details of a Model Version

You can view details of a specific model version by using either the AWS SDK for Python (Boto3) or by using Amazon SageMaker Studio.

View the Details of a Model Version (Boto3)

To view the details of a model version by using Boto3, complete the following steps.

1. Call the `list_model_packages` method to view the model versions in a model group.

   ```python
   sm_client.list_model_packages(ModelPackageGroupName="ModelGroup1")
   ```

   The response is a list of model package summaries. You can get the Amazon Resource Name (ARN) of the model versions from this list.

   ```json
   {'ModelPackageSummaryList': 

   2. Call `describe_model_package` to see the details of the model version. You pass in the ARN of a model version that you got in the output of the call to `list_model_packages`.

   ```python
   sm_client.describe_model_package(ModelPackageName="arn:aws:sagemaker:us-east-2:123456789012:model-package/ModelGroup1/1")
   ```

   The output of this call is a JSON object with the model version details.

   ```json
   {'ModelPackageName': 'ModelGroup1', 'ModelPackageVersion': 1, 'ModelPackageArn': 'arn:aws:sagemaker:us-east-2:123456789012:model-package/ModelGroup1/1', 'ModelPackageDescription': 'Test Model', 'CreationTime': datetime.datetime(2020, 10, 29, 1, 27, 46, 46000, tzinfo=tzlocal()), 'InferenceSpecification': {'Containers': [{'Image': '257758044811.dkr.ecr.us-east-2.amazonaws.com/sagemaker-xgboost:1.0-1-cpu-py3', 'ImageDigest': 'sha256:99fa682cfff19ae33297a5926f8497ca7bcd2a391b7d600300204efb03bca66', 'ModelDataUrl': 's3://sagemaker-us-east-2-123456789012/ModelGroup1/pipelines-0gdoncek7o9-AbaloneTrain-stmlyht1R/output/model.tar.gz'}], 'SupportedTransformInstanceTypes': ['ml.m5.xlarge'], 'SupportedRealtimeInferenceInstanceTypes': ['ml.t2.medium', 'ml.m5.xlarge'], 'SupportedContentTypes': ['text/csv'], 'SupportedResponseMIMETypes': ['text/csv'], 'ModelPackageStatus': 'Completed', 'ModelPackageStatusDetails': {'ValidationStatuses': [], 'ImageScanStatuses': []}}

2997
View the Details of a Model Version (Amazon SageMaker Studio)

To view the details of a model version in Amazon SageMaker Studio, complete the following steps.

1. Sign in to Amazon SageMaker Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. In the left navigation pane, choose the SageMaker Resources icon (licas).
3. Choose Model registry.
4. From the model groups list, double-click the model group you want to view.
5. A new tab appears with a list of the model versions in the model group, as shown in the following image.

6. In the list of model versions, double-click the model version for which you want to view details.

7. On the model version tab that opens, choose one of the following to see details about the model version:

   - **Activity**: Shows events for the model version, such as approval status updates.
   - **Metrics**: Shows quality metrics for the model. For metrics to appear, you must enable data capture for your model by using SageMaker Model Monitor. For information about capturing data, see [Capture data](p. 2855).
   - **Settings**: Shows information such as the project with which the model version is associated, the pipeline that generated the model, the model group, and the model's location in Amazon S3.

---

**Delete a Model Version**

This procedure demonstrates how to delete a model version in Amazon SageMaker Studio.
Delete a Model Version (Amazon SageMaker Studio)

To delete a model version in Amazon SageMaker Studio, complete the following steps.

1. Sign in to Amazon SageMaker Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. In the left navigation pane, choose the SageMaker Resources icon ().
3. Choose Model registry in the dropdown menu at the top of the SageMaker resources panel.

A list of your model groups appears.
4. From the model groups list, double-click the model group of the model version you want to delete.

The model details tab opens to the right.
5. From the list of model versions in the model details tab, double-click the model version you want to delete.

6. Choose the Settings tab.
7. Choose Delete Version in the Settings tab.
8. In the confirmation dialog box, choose **Delete**.

## Update the Approval Status of a Model

After you create a model version, you typically want to evaluate its performance before you deploy it to a production endpoint. If it performs to your requirements, you can update the approval status of the model version to **Approved**. Setting the status to **Approved** can initiate CI/CD deployment for the model. If the model version does not perform to your requirements, you can update the approval status to **Rejected**.

You can manually update the approval status of a model version after you register it, or you can create a condition step to evaluate the model when you create a SageMaker pipeline. For information about creating a condition step in a SageMaker pipeline, see **Pipeline Steps** (p. 3211).

When you use one of the SageMaker provided project templates and the approval status of a model version changes, the following action occurs. Only valid transitions are shown.

- **PendingManualApproval** to **Approved** – initiates CI/CD deployment for the approved model version
- **PendingManualApproval** to **Rejected** – No action
• Rejected to Approved – initiates CI/CD deployment for the approved model version
• Approved to Rejected – initiates CI/CD to deploy the latest model version with an Approved status

You can update the approval status of a model version by using the AWS SDK for Python (Boto3) or by using Amazon SageMaker Studio. You can also update the approval status of a model version as part of a condition step in a SageMaker pipeline. For information about using a model approval step in a SageMaker pipeline, see SageMaker Pipelines Overview (p. 3204).

Update the Approval Status of a Model (Boto3)

When you created the model version in Register a Model Version (p. 2988), you set the ModelApprovalStatus to PendingManualApproval. You update the approval status for the model by calling update_model_package. Note that you can automate this process by writing code that, for example, sets the approval status of a model depending on the result of an evaluation of some measure of the model's performance. You can also create a step in a pipeline that automatically deploys a new model version when it is approved. The following code snippet shows how to manually change the approval status to Approved.

```python
model_package_update_input_dict = {
    "ModelPackageArn" : model_package_arn,
    "ModelApprovalStatus" : "Approved"
}
model_package_update_response = sm_client.update_model_package(**model_package_update_input_dict)
```

Update the Approval Status of a Model (Amazon SageMaker Studio)

The following procedure shows how to manually change the approval status from Approved to Rejected.

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. In the left navigation pane, choose the SageMaker Resources icon (🔍).
3. Choose Model registry.
4. From the model groups list, choose the model group you want to view. A new tab opens with a list of the model versions in the group.

5. In the list of model versions, right-click the model version you want to update and choose **Update model version status**.
6. In the **Update model version status** dialog box, for **Status** choose **Rejected**, and then choose **Update status**.

![Update model version status dialog box](image)
Deploy a Model from the Registry

After you register a model version and approve it for deployment, deploy it to a SageMaker endpoint for real-time inference.

When you create an MLOps project and choose an MLOps project template that includes model deployment, approved model versions in the model registry are automatically deployed to production. For information about using SageMaker MLOps projects, see Automate MLOps with SageMaker Projects (p. 3281).

You can also enable an AWS account to deploy model versions that were created in a different account by adding a cross-account resource policy. For example, one team in your organization might be responsible for training models, and a different team is responsible for deploying and updating models.

Topics

- Deploy a Model from the Registry (SageMaker SDK) (p. 3005)
- Deploy a Model from the Registry (Boto3) (p. 3005)
- Deploy a Model Version from a Different Account (p. 3006)

Deploy a Model from the Registry (SageMaker SDK)

To deploy a model version using the Amazon SageMaker Python SDK use the following code snippet:

```python
from sagemaker import ModelPackage
from time import gmtime, strftime

model_package_arn = 'arn:aws:sagemaker:us-east-2:12345678901:model-package/modeltest/1'
model = ModelPackage(role=role,
                     model_package_arn=model_package_arn,
                     sagemaker_session=sagemaker_session)
model.deploy(initial_instance_count=1, instance_type='ml.m5.xlarge')
```

Deploy a Model from the Registry (Boto3)

To deploy a model version using the AWS SDK for Python (Boto3), complete the following steps:

1. Create a model object from the model version by calling the create_model method. Pass the Amazon Resource Name (ARN) of the model version as part of the Containers for the model object.

   The following code snippet assumes you have already created the SageMaker Boto3 client `sm_client`, and that you have already created a model version with an ARN that you have stored in a variable named `model_version_arn`.

   ```python
   model_name = 'DEMO-modelregistry-model-' + strftime("%Y-%m-%d-%H-%M-%S", gmtime())
   print("Model name : {}".format(model_name))
   container_list = ["ModelPackageName": model_version_arn]

   create_model_response = sm_client.create_model(
       ModelName = model_name,
       ExecutionRoleArn = role,
       Containers = container_list
   )
   print("Model arn : {}".format(create_model_response["ModelArn"]))
   ```

2. Create an endpoint configuration by calling create_endpoint_config. The endpoint configuration specifies the number and type of Amazon EC2 instances to use for the endpoint.
endpoint_config_name = 'DEMO-modelregistry-EndpointConfig-' + strftime("%Y-%m-%d-%H-%M-%S", gmtime())
p
print(endpoint_config_name)
create_endpoint_config_response = sm_client.create_endpoint_config(
    EndpointConfigName = endpoint_config_name,
    ProductionVariants=[{
        'InstanceType':'ml.m4.xlarge',
        'InitialVariantWeight':1,
        'InitialInstanceCount':1,
        'ModelName':model_name,
        'VariantName':'AllTraffic'}])

3. Create the endpoint by calling create_endpoint.

endpoint_name = 'DEMO-modelregistry-endpoint-' + strftime("%Y-%m-%d-%H-%M-%S", gmtime())
p
print("EndpointName=", endpoint_name)
create_endpoint_response = sm_client.create_endpoint(
    EndpointName=endpoint_name,
    EndpointConfigName=endpoint_config_name)
p

Deploy a Model Version from a Different Account

You can permit an AWS account to deploy model versions that were created in a different account by adding a cross-account resource policy. For example, one team in your organization might be responsible for training models, and a different team is responsible for deploying and updating models. When you create these resource policies, you apply the policy to the specific resource to which you want to grant access. For more information about cross-account resource policies in AWS, see Cross-account policy evaluation logic in the AWS Identity and Access Management User Guide.

Note
You must use a KMS key to encrypt the output data config action during training for cross-account model deployment.

To enable cross-account model deployment in SageMaker, you have to provide a cross-account resource policy for the model group that contains the model versions you want to deploy, the Amazon ECR repository where the inference image for the model group resides, and the Amazon S3 bucket where the model versions are stored.

To be able to deploy a model that was created in a different account, you must have a role that has access to SageMaker actions, such as a role with the AmazonSageMakerFullAccess managed policy. For information about SageMaker managed policies, see AWS Managed Policies for Amazon SageMaker (p. 3571).

The following example creates cross-account policies for all three of these resources, and applies the policies to the resources.

The example assumes that you previously defined the following variables:

- bucket - The Amazon S3 bucket where the model versions are stored.
- kms_key_id - The KMS key used to encrypt the training output.
- model_package_group_name - The model group to which you want to grant cross-account access.
- model_package_group_arn - The model group arn to which you want to grant cross-account access.
import json

# The cross-account id to grant access to
cross_account_id = "123456789012"

# Create the policy for access to the ECR repository
ecr_repository_policy = {
    'Version': '2012-10-17',
    'Statement': [{
        'Sid': 'AddPerm',
        'Effect': 'Allow',
        'Principal': {
            'AWS': f'arn:aws:iam::{cross_account_id}:root'
        },
        'Action': ['ecr:*']
    }]
}

# Convert the ECR policy from JSON dict to string
ecr_repository_policy = json.dumps(ecr_repository_policy)

# Set the new ECR policy
ecr = boto3.client('ecr')
response = ecr.set_repository_policy(
    registryId = account,
    repositoryName = 'decision-trees-sample',
    policyText = ecr_repository_policy
)

# Create a policy for accessing the S3 bucket
bucket_policy = {
    'Version': '2012-10-17',
    'Statement': [{
        'Sid': 'AddPerm',
        'Effect': 'Allow',
        'Principal': {
            'AWS': f'arn:aws:iam::{cross_account_id}:root'
        },
        'Action': 's3:*',
        'Resource': f'arn:aws:s3:::{bucket}/*'
    }]
}

# Convert the policy from JSON dict to string
bucket_policy = json.dumps(bucket_policy)

# Set the new policy
s3 = boto3.client('s3')
response = s3.put_bucket_policy(
    Bucket = bucket,
    Policy = bucket_policy
)

# Create the KMS grant for encryption in the source account to the
# model registry account model package group
client = boto3.client('kms')
response = client.create_grant(
    GranteePrincipal=cross_account_id,
    KeyId=kms_key_id
    Operations=[
        'Decrypt',
        'GenerateDataKey',
    ],
)
# 3. Create a policy for access to the model package group.

```python
model_package_group_policy = {
    'Version': '2012-10-17',
    'Statement': [
        {'Sid': 'AddPermModelPackageGroup',
         'Effect': 'Allow',
         'Principal': {
             'AWS': f'arn:aws:iam::{cross_account_id}:root' },
         'Action': ['sagemaker:DescribeModelPackageGroup'],
         'Resource': f'arn:aws:sagemaker:{region}:{account}:model-package-group/
{model_package_group_name}'
    ],
    {'Sid': 'AddPermModelPackageVersion',
     'Effect': 'Allow',
     'Principal': {
         'AWS': f'arn:aws:iam::{cross_account_id}:root'
     },
     'Action': ['sagemaker:DescribeModelPackage',
                'sagemaker:ListModelPackages',
                'sagemaker:UpdateModelPackage',
                'sagemaker:CreateModel'],
     'Resource': f'arn:aws:sagemaker:{region}:{account}:model-package/
{model_package_group_name}/*' ]
}
```

# Convert the policy from JSON dict to string

```python
model_package_group_policy = json.dumps(model_package_group_policy)
```

# Set the policy to the model package group

```python
response = sm_client.put_model_package_group_policy(
    ModelPackageGroupName = model_package_group_name,
    ResourcePolicy = model_package_group_policy)
```

print('ModelPackageGroupArn : ' + create_model_package_group_response['ModelPackageGroupArn'])
print("First Versioned ModelPackageArn: " + model_package_arn)
print("Second Versioned ModelPackageArn: " + model_package_arn2)

print("Success! You are all set to proceed for cross-account deployment.")
```

### View the Deployment History of a Model

View the deployments for a model version Amazon SageMaker Studio by opening the tab for that model version.

**View the deployment history for a model version**

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. In the left navigation pane, choose the **SageMaker Resources** icon (🔗).
3. Choose **Model registry**.
4. From the model groups list, choose the model group you want to view.
5. A new tab appears with a list of the model versions in the model group.
6. In the list of model versions, double-click the model version for which you want to view details.
7. On the model version tab that opens, choose Activity. Deployments for the model version appear as events in the activity list with an Event type of ModelDeployment.
Amazon SageMaker Model Registry FAQ

Use the following FAQ items to find answers to commonly asked questions about SageMaker Model Registry.

Q. How should I organize my models into model groups and model packages in the SageMaker Model Registry?

A model package is the actual model that is registered into the model registry as a versioned entity. Please note there are two ways you can use model packages in SageMaker. One is with SageMaker Marketplace — these model packages are not versioned. The other is with the SageMaker Model Registry, in which the model package must be versioned. The model registry receives every new model that you retrain, gives it a version, and assigns it to a model group inside the model registry. The following image shows an example of a model group with 25 consecutively-versioned models.

Q. How does a model registry differ from Amazon Elastic Container Registry (Amazon ECR)?

SageMaker’s Model Registry is a metadata store for your machine learning models. Amazon Elastic Container Registry is a repository that stores all of your containers. Within the model registry, models are versioned and registered as model packages within model groups. Each model package contains an Amazon S3 URI to the model files associated with the trained model and an Amazon ECR URI that points to the container used while serving the model.

Deploy models at the edge with SageMaker Edge Manager

Amazon SageMaker Edge Manager provides model management for edge devices so you can optimize, secure, monitor, and maintain machine learning models on fleets of edge devices such as smart cameras, robots, personal computers, and mobile devices.

Why Use Edge Manager?

Many machine learning (ML) use cases require running ML models on a fleet of edge devices, which allows you to get predictions in real-time, preserves the privacy of the end users, and lowers the cost of network connectivity. With the increasing availability of low-power edge hardware designed for ML, it is now possible to run multiple complex neural network models on edge devices.

However, operating ML models on edge devices is challenging, because devices, unlike cloud instances, have limited compute, memory, and connectivity. After the model is deployed, you need to continuously monitor the models, because model drift can cause the quality of model to decay overtime. Monitoring models across your device fleets is difficult because you need to write custom code to collect data samples from your device and recognize skew in predictions. In addition, models are often hard-coded into the application. To update the model, you must rebuild and update the entire application or device firmware, which can disrupt your operations.

With SageMaker Edge Manager, you can optimize, run, monitor, and update machine learning models across fleets of devices at the edge.

How Does it Work?

At a high level, there are five main components in the SageMaker Edge Manager workflow: compiling models with SageMaker Neo, packaging Neo-compiled models, deploying models to your devices, running models on the SageMaker inference engine (Edge Manager agent), and maintaining models on the devices.
SageMaker Edge Manager uses SageMaker Neo to optimize your models for the target hardware in one click, then to cryptographically sign your models before deployment. Using SageMaker Edge Manager, you can sample model input and output data from edge devices and send it to the cloud for monitoring and analysis, and view a dashboard that tracks and visually reports on the operation of the deployed models within the SageMaker console.

SageMaker Edge Manager extends capabilities that were previously only available in the cloud to the edge, so developers can continuously improve model quality by using Amazon SageMaker Model Monitor for drift detection, then relabel the data with SageMaker Ground Truth and retrain the models in SageMaker.

**How Do I Use SageMaker Edge Manager?**

If you are a first time user of SageMaker Edge Manager, we recommend that you do the following:

1. **Read the Getting Started section** - This section walks you through setting up your first edge packaging job and creating your first fleet.
2. **Explore Edge Manager Jupyter notebook examples** - Example notebooks are stored in the [amazon-sagemaker-examples](https://github.com/aws-samples/sagemaker-examples) GitHub repository in the `sagemaker_edge_manager` folder.

**Getting Started**

This guide demonstrates how to complete the necessary steps to register, deploy, and manage a fleet of devices, and how to satisfy Amazon SageMaker Edge Manager prerequisites.

**Topics**

- Setting Up (p. 3015)
- Train, Compile, and Package Your Model (p. 3017)
- Create and Register Fleets and Authenticate Devices (p. 3020)
- Download and Set Up Edge Manager (p. 3023)
- Run Agent (p. 3026)
Setting Up

Before you begin using SageMaker Edge Manager to manage models on your device fleets, you must first create IAM Roles for both SageMaker and AWS IoT. You will also want to create at least one Amazon S3 bucket where you will store your pre-trained model, the output of your SageMaker Neo compilation job, as well as input data from your edge devices.

1. **Set up an AWS account.**

   Create an AWS account and an IAM administrator user. For instructions on how to set up your AWS account, see [How do I create and activate a new AWS account?](#) For instructions on how to create an administrator user in your AWS account, see [Creating your first IAM admin user and group](#).

2. **Create an IAM role for Amazon SageMaker.**

   SageMaker Edge Manager needs access to your Amazon S3 bucket URI. To facilitate this, create an IAM role that can run SageMaker and has permission to access Amazon S3. Using this role, SageMaker can run under your account and access to your Amazon S3 bucket.

   You can create an IAM role by using the IAM console, AWS SDK for Python (Boto3), or AWS CLI. The following is an example of how to create an IAM role and attach the necessary policies with the IAM console.

   a. Sign in to the AWS Management Console and open the IAM console at [https://console.aws.amazon.com/iam/](https://console.aws.amazon.com/iam/).
   b. In the navigation pane of the IAM console, choose **Roles**, and then choose **Create role**.
   c. For **Select type of trusted entity**, choose **AWS service**.
   d. Choose the service that you want to allow to assume this role. In this case, choose **SageMaker**. Then choose **Next: Permissions**.
      - This automatically creates an IAM policy that grants access to related services such as Amazon S3, Amazon ECR, and CloudWatch Logs.
   e. Choose **Next: Tags**.
   f. (Optional) Add metadata to the role by attaching tags as key–value pairs. For more information about using tags in IAM, see [Tagging IAM resources](#).
   g. Choose **Next: Review**.
   h. Type in a **Role name**.
   i. If possible, type a role name or role name suffix. Role names must be unique within your AWS account. They are not distinguished by case. For example, you cannot create roles named both PR0DROLE and prodrole. Because other AWS resources might reference the role, you cannot edit the name of the role after it has been created.
   j. (Optional) For **Role description**, type a description for the new role.
   k. Review the role and then choose **Create role**.

   Note the SageMaker Role ARN, which you use to create a compilation job with SageMaker Neo and a packaging job with Edge Manager. To find out the role ARN using the console, do the following:

   i. Go to the IAM console: [https://console.aws.amazon.com/iam/](https://console.aws.amazon.com/iam/)
   ii. Select **Roles**.
   iii. Search for the role you just created by typing in the name of the role in the search field.
   iv. Select the role.
   v. The role ARN is at the top of the **Summary** page.

3. **Create an IAM role for AWS IoT.**
The AWS IoT IAM role you create is used to authorize your thing objects. You also use the IAM role ARN to create and register device fleets with a SageMaker client object.

Configure an IAM role in your AWS account for the credentials provider to assume on behalf of the devices in your device fleet. Then, attach a policy to authorize your devices to interact with AWS IoT services.

Create a role for AWS IoT either programmatically or with the IAM console, similar to what you did when you created a role for SageMaker.

a. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
b. In the navigation pane of the IAM console, choose Roles, and then choose Create role.
c. For Select type of trusted entity, choose AWS service.
d. Choose the service that you want to allow to assume this role. In this case, choose IoT. Select IoT as the Use Case.
e. Choose Next: Permissions.
f. Choose Next: Tags.
g. (Optional) Add metadata to the role by attaching tags as key–value pairs. For more information about using tags in IAM, see Tagging IAM resources.
h. Choose Next: Review.
i. Type in a Role name. The role name must start with SageMaker.
j. (Optional) For Role description, type a description for the new role.
k. Review the role and then choose Create role.
l. Once the role is created, choose Roles in the IAM console. Search for the role you created by typing in role name in the Search field.
m. Choose your role.
n. Next, choose Attach Policies.
o. Search for AmazonSageMakerEdgeDeviceFleetPolicy in the Search field. Select AmazonSageMakerEdgeDeviceFleetPolicy.
p. Choose Attach policy.
q. Add the following policy statement to the trust relationship:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {"Service": "credentials.iot.amazonaws.com"},
            "Action": "sts:AssumeRole"
        },
        {
            "Effect": "Allow",
            "Principal": {"Service": "sagemaker.amazonaws.com"},
            "Action": "sts:AssumeRole"
        }
    ]
}
```

A trust policy is a JSON policy document in which you define the principals that you trust to assume the role. For more information about trust policies, see Roles terms and concepts.

r. Note the AWS IoT role ARN. You use the AWS IoT Role ARN to create and register the device fleet. To find the IAM role ARN with the console:
i. Go to the IAM console: https://console.aws.amazon.com/iam/
ii. Choose Roles.
iii. Search for the role you created by typing in the name of the role in the Search field.
iv. Select the role.
v. The role ARN is on the Summary page.

4. Create an Amazon S3 bucket.

SageMaker Neo and Edge Manager access your pre-compiled model and compiled model from an Amazon S3 bucket. Edge Manager also stores sample data from your device fleet in Amazon S3.

a. Open the Amazon S3 console at https://console.aws.amazon.com/s3/.
b. Choose Create bucket.
c. In Bucket name, enter a name for your bucket.
d. In Region, choose the AWS Region where you want the bucket to reside.
e. In Bucket settings for Block Public Access, choose the settings that you want to apply to the bucket.
f. Choose Create bucket.

For more information about creating Amazon S3 buckets, see Getting started with Amazon S3.

Train, Compile, and Package Your Model

In this section you will create SageMaker and AWS IoT client objects, download a pre-trained machine learning model, upload your model to your Amazon S3 bucket, compile your model for your target device with SageMaker Neo, and package your model so that it can be deployed with the Edge Manager agent.

1. Import libraries and create client objects.

This tutorial uses the AWS SDK for Python (Boto3) to create clients to interact with SageMaker, Amazon S3, and AWS IoT.

Import Boto3, specify your Region, and initialize the client objects you need as shown in the following example:

```python
import boto3
import json
import time

AWS_REGION = 'us-west-2'  # Specify your Region
bucket = 'bucket-name'
sagemaker_client = boto3.client('sagemaker', region_name=AWS_REGION)
iot_client = boto3.client('iot', region_name=AWS_REGION)
```

Define variables and assign them the role ARN you created for SageMaker and AWS IoT as strings:

```python
# Replace with the role ARN you created for SageMaker
sagemaker_role_arn = "arn:aws:iam::<account>:role/*"

# Replace with the role ARN you created for AWS IoT.
# Note: The name must start with 'SageMaker'
iot_role_arn = "arn:aws:iam::<account>:role/SageMaker*
```
2. **Train a machine learning model.**

   See [*Train a Model with Amazon SageMaker*](#) for more information on how to train a machine learning model using SageMaker. You can optionally upload your locally trained model directly into an Amazon S3 URI bucket.

   If you do not have a model yet, you can use a pre-trained model for the next steps in this tutorial. For example, you can save the MobileNet V2 models from the TensorFlow framework. MobileNet V2 is an image classification model optimized for mobile applications. For more information about MobileNet V2, see the [*MobileNet GitHub README*](#).

   Type the following into your Jupyter Notebook to save the pre-trained MobileNet V2 model:

   ```python
   # Save the MobileNet V2 model to local storage
   import tensorflow as tf
   model = tf.keras.applications.MobileNetV2()
   model.save("mobilenet_v2.h5")
   ```

   **Note**
   - If you do not have TensorFlow installed, you can do so by running `pip install tensorflow=2.4`
   - Use TensorFlow version 2.4 or lower for this tutorial.

   The model will be saved into the `mobilenet_v2.h5` file. Before packaging the model, you will need to first compile your model using SageMaker Neo. See [*Supported Frameworks, Devices, Systems, and Architectures*](#) to check if your version of TensorFlow (or other framework of choice) is currently supported by SageMaker Neo.

   SageMaker Neo requires models to be stored as a compressed TAR file. Repackage it as a compressed TAR file (*.tar.gz):

   ```python
   # Package MobileNet V2 model into a TAR file
   import tarfile
   tarfile_name='mobilenet-v2.tar.gz'
   with tarfile.open(tarfile_name, mode='w:gz') as archive:
       archive.add('mobilenet-v2.h5')
   ```

3. **Upload your model to Amazon S3.**

   Once you have a machine learning model, store it in an Amazon S3 bucket. The following example uses an AWS CLI command to upload the model to the Amazon S3 bucket you created earlier in a directory called `models`. Type in the following into your Jupyter Notebook:

   ```bash
   !aws s3 cp mobilenet-v2.tar.gz s3://{bucket}/models/
   ```

4. **Compile your model with SageMaker Neo.**

   Compile your machine learning model with SageMaker Neo for an edge device. You need to know your Amazon S3 bucket URI where you stored the trained model, the machine learning framework you used to train your model, the shape of your model's input, and your target device.

   For the MobileNet V2 model, use the following:

   ```python
   framework = 'tensorflow'
   target_device = 'jetson_nano'
   ```
SageMaker Neo requires a specific model input shape and model format based on the deep learning framework you use. For more information about how to save your model, see What input data shapes does SageMaker Neo expect? (p. 3065). For more information about devices and frameworks supported by Neo, see Supported Frameworks, Devices, Systems, and Architectures (p. 3105).

Use the CreateCompilationJob API to create a compilation job with SageMaker Neo. Provide a name to the compilation job, the SageMaker Role ARN, the Amazon S3 URI where your model is stored, the input shape of the model, the name of the framework, the Amazon S3 URI where you want SageMaker to store your compiled model, and your edge device target.

```python
# Specify the path where your model is stored
model_directory = 'models'
s3_model_uri = 's3://{}/models.tar'.format(bucket, model_directory, tarfile_name)

# Store compiled model in S3 within the 'compiled-models' directory
compilation_output_dir = 'compiled-models'
s3_output_location = 's3://{}/{}'.format(bucket, compilation_output_dir)

# Give your compilation job a name
compilation_job_name = 'getting-started-demo'
sagemaker_client.create_compilation_job(CompilationJobName=compilation_job_name,
    RoleArn=sagemaker_role_arn,
    InputConfig={'S3Uri': s3_model_uri,
                 'DataInputConfig': data_shape,
                 'Framework': framework.upper()},
    OutputConfig={'S3OutputLocation': s3_output_location,
                  'TargetDevice': target_device},
    StoppingCondition={'MaxRuntimeInSeconds': 900})
```

5. **Package your compiled model.**

Packaging jobs take SageMaker Neo–compiled models and make any changes necessary to deploy the model with the inference engine, Edge Manager agent. To package your model, create an edge packaging job with the create_edge_packaging API or the SageMaker console.

You need to provide the name that you used for your Neo compilation job, a name for the packaging job, a role ARN (see Setting Up (p. 3015) section), a name for the model, a model version, and the Amazon S3 bucket URI for the output of the packaging job. Note that Edge Manager packaging job names are case-sensitive. The following is an example of how to create a packaging job using the API.

```python
edge_packaging_name='edge-packaging-demo'
model_name='sample-model'
model_version='1.1'

define the Amazon S3 URI where you want to store the packaged model.

# Output directory where you want to store the output of the packaging job
packaging_output_dir = 'packaged_models'
packaging_s3_output = 's3://{}/'.format(bucket, packaging_output_dir)

Use CreateEdgePackagingJob to package your Neo-compiled model. Provide a name for your edge packaging job and the name you provided for your compilation job (in this example, it was
stored in the variable compilation_job_name). Also provide a name for your model, a version for your model (this is used to help you keep track of what model version you are using), and the S3 URI where you want SageMaker to store the packaged model.

```python
sagemaker_client.create_edge_packaging_job(
    EdgePackagingJobName=edge_packaging_name,
    CompilationJobName=compilation_job_name,
    RoleArn=sagemaker_role_arn,
    ModelName=model_name,
    ModelVersion=model_version,
    OutputConfig={
        "S3OutputLocation": packaging_s3_output
    }
)
```

Create and Register Fleets and Authenticate Devices

In this section you will create your AWS IoT thing object, create a device fleet, register your device fleet so it can interact with the cloud, create X.509 certificates to authenticate your devices to AWS IoT Core, associate the role alias with AWS IoT that was generated when you created your fleet, get your AWS account-specific endpoint for the credentials provider, get an official Amazon Root CA file, and upload the Amazon CA file to Amazon S3.

1. **Create AWS IoT things.**

   SageMaker Edge Manager takes advantage of the AWS IoT Core services to facilitate the connection between the edge devices and endpoints in the AWS cloud. You can take advantage of existing AWS IoT functionality after you set up your devices to work with Edge Manager.

   To connect your device to AWS IoT, you need to create AWS IoT thing objects, create and register a client certificate with AWS IoT, and create and configure the IAM role for your devices.

   First, create AWS IoT thing objects with the AWS IoT client (iot_client) you created earlier with Boto3. The following example shows how to create two thing objects:

   ```python
   iot_thing_name = 'sample-device'
   iot_thing_type = 'getting-started-demo'

   iot_client.create_thing_type(
       thingTypeName=iot_thing_type
   )

   # Create an AWS IoT thing objects
   iot_client.create_thing(
       thingName=iot_thing_name,
       thingTypeName=iot_thing_type
   )
   ```

2. **Create your device fleet.**

   Create a device fleet with the SageMaker client object defined in a previous step. You can also use the SageMaker console to create a device fleet.

   ```python
   import time
   device_fleet_name="demo-device-fleet" + str(time.time()).split('.')[0]
device_name="sagemaker-edge-demo-device" + str(time.time()).split('.')[0]
   ```

   Specify your IoT role ARN. This lets AWS IoT grant temporary credentials to devices.
device_model_directory='device_output'
s3_device_fleet_output = 's3://{}'.format(bucket, device_model_directory)

sagemaker_client.create_device_fleet(
    DeviceFleetName=device_fleet_name,
    RoleArn=iot_role_arn, # IoT Role ARN specified in previous step
    OutputConfig={'S3OutputLocation': s3_device_fleet_output}
)

An AWS IoT role alias is created when you create a device fleet. This role alias is associated with AWS IoT using the `iot_client` object in a later step.

3. **Register your device fleet.**

To interact with the cloud, you need to register your device with SageMaker Edge Manager. In this example, you register a single device with the fleet you created. To register the device, you need to provide a device name and the AWS IoT thing name as shown in the following example:

```python
# Device name should be 36 characters
device_name = "sagemaker-edge-demo-device" + str(time.time()).split('.')[0]

sagemaker_client.register_devices(
    DeviceFleetName=device_fleet_name,
    Devices=[
        {
            "DeviceName": device_name,
            "IotThingName": iot_thing_name
        }
    ]
)
```

4. **Create X.509 certificates.**

After creating the AWS IoT thing object, you must create a X.509 device certificate for your thing object. This certificate authenticates your device to AWS IoT Core.

Use the following to create a private key, public key, and a X.509 certificate file using the AWS IoT client defined (`iot_client`) earlier.

```python
# Creates a 2048-bit RSA key pair and issues an X.509 # certificate # using the issued public key.
create_cert = iot_client.create_keys_and_certificate(setAsActive=True)

# Get certificate from dictionary object and save in its own
with open('./device.pem.crt', 'w') as f:
    for line in create_cert['certificatePem'].split('
'):
        f.write(line)
        f.write('
')

# Get private key from dictionary object and save in its own
with open('./private.pem.key', 'w') as f:
    for line in create_cert['keyPair']['PrivateKey'].split('
'):
        f.write(line)
        f.write('
')

# Get a private key from dictionary object and save in its own
with open('./public.pem.key', 'w') as f:
    for line in create_cert['keyPair']['PublicKey'].split('
'):
        f.write(line)
```
5. **Associate the role alias with AWS IoT.**

When you create a device fleet with SageMaker (sagemaker_client.create_device_fleet()), a role alias is generated for you. An AWS IoT role alias provides a mechanism for connected devices to authenticate to AWS IoT using X.509 certificates, and then obtain short-lived AWS credentials from an IAM role that is associated with an AWS IoT role alias. The role alias allows you to change the role of the device without having to update the device. Use DescribeDeviceFleet to get the role alias name and ARN.

```python
# Print Amazon Resource Name (ARN) and alias that has access
# to AWS Internet of Things (IoT).
sagemaker_client.describe_device_fleet(DeviceFleetName=device_fleet_name)

# Store iot role alias string in a variable
# Grabs role ARN
full_role_alias_name =
sagemaker_client.describe_device_fleet(DeviceFleetName=device_fleet_name)['IotRoleAlias']
start_index = full_role_alias_name.find('SageMaker')  # Find beginning of role name
role_alias_name = full_role_alias_name[start_index:]
```

Use the iot_client to facilitate associating the role alias generated from creating the device fleet with AWS IoT:

```python
role_alias = iot_client.describe_role_alias(
    roleAlias=role_alias_name)
```

For more information about IAM role alias, see [Role alias allows access to unused services](#).

You created and registered a certificate with AWS IoT earlier for successful authentication of your device. Now, you need to create and attach a policy to the certificate to authorize the request for the security token.

```python
alias_policy = {
    "Version": "2012-10-17",
    "Statement": {
        "Effect": "Allow",
        "Action": "iot:AssumeRoleWithCertificate",
        "Resource": role_alias['roleAliasDescription']['roleAliasArn']
    }
}

policy_name = 'aliaspolicy-\' + str(time.time()).split('.')[0]
aliaspolicy = iot_client.create_policy(policyName=policy_name,
    policyDocument=json.dumps(alias_policy))

# Attach policy
iot_client.attach_policy(policyName=policy_name,
    target=create_cert['certificateArn'])
```

6. **Get your AWS account-specific endpoint for the credentials provider.**

Edge devices need an endpoint in order to assume credentials. Obtain your AWS account-specific endpoint for the credentials provider.

```python
# Get the unique endpoint specific to your AWS account that is making the call.
s3_endpoint = s3_client.describe_endpoint(    endpointType='s3:CredentialProvider'
```
7. **Get the official Amazon root CA file and upload it to the Amazon S3 bucket.**

Use the following in your Jupyter Notebook or AWS CLI (if you use your terminal, remove the `!` magic function):

```bash
!wget https://www.amazontrust.com/repository/AmazonRootCA1.pem
```

Use the endpoint to make an HTTPS request to the credentials provider to return a security token. The following example command uses `curl`, but you can use any HTTP client.

```bash
!curl --cert device.pem.crt --key private.pem.key --cacert AmazonRootCA1.pem $endpoint
```

If the certificate is verified, upload the keys and certificate to your Amazon S3 bucket URI:

```bash
!aws s3 cp private.pem.key s3://{bucket}/authorization-files/
!aws s3 cp device.pem.crt s3://{bucket}/authorization-files/
!aws s3 cp AmazonRootCA1.pem s3://{bucket}/authorization-files/
```

Clean your working directory by moving your keys and certificate to a different directory:

```bash
# Optional - Clean up working directory
!mkdir authorization-files
!mv private.pem.key device.pem.crt AmazonRootCA1.pem authorization-files/
```

---

**Download and Set Up Edge Manager**

The Edge Manager agent is an inference engine for your edge devices. Use the agent to make predictions with models loaded onto your edge devices. The agent also collects model metrics and captures data at specific intervals.

In this section you will set up your device with the agent. To do so, first copy a release artifact and signing root certificate from the release bucket locally to your machine. After you unzip the release artifact, upload it to Amazon S3. Next, define and save a configuration file for the agent. A template is provided for you to copy and paste. Finally, copy the release artifacts, configuration file, and credentials to your device.

1. **Download the SageMaker Edge Manager agent.**

   The agent is released in binary format for supported operating systems. This example runs inference on a Jetson Nano which uses a Linux operating system and has an ARM64 architecture. For more information about what operating system and architecture supported devices use, see [Supported Devices, Chip Architectures, and Systems](p. 3107).

   Fetch the latest version of binaries from the SageMaker Edge Manager release bucket from the us-west-2 Region.

   ```bash
   !aws s3 ls s3://sagemaker-edge-release-store-us-west-2-linux-armv8/Releases/ | sort -r
   ```

   This returns release artifacts sorted by their version.
The version has the following format: `<MAJOR_VERSION>.<YYYY-MM-DD>.<SHA-7>`. It consists of three components:

- `<MAJOR_VERSION>`: The release version. The release version is currently set to 1.
- `<YYYY-MM-DD>`: The time stamp of the artifact release.
- `<SHA-7>`: The repository commit ID from which the release is built.

Copy the zipped TAR file locally or to your device directly. The following example shows how to copy the latest release artifact at the time this document was released.

```bash
!aws s3 cp s3://sagemaker-edge-release-store-us-west-2-linux-x64/Releases/1.20201218.81f481f/1.20201218.81f481f.tgz ./
```

Once you have the artifact, unzip the zipped TAR file. The following unzips the TAR file and stores it in a directory called `agent_demo`:

```bash
!mkdir agent_demo
!tar -xvzf 1.20201218.81f481f.tgz -C ./agent_demo
```

Upload the agent release artifacts to your Amazon S3 bucket. The following code example copies the content within `agent_demo` and uploads it to a directory within your Amazon S3 bucket called `agent_demo`:

```bash
!aws s3 cp --recursive ./agent_demo s3://{bucket}/agent_demo
```

You also need the signing root certificates from the release bucket:

```bash
!aws s3 cp s3://sagemaker-edge-release-store-us-west-2-linux-x64/Certificates/us-west-2/us-west-2.pem ./
```

Upload the signing root certificate to your Amazon S3 bucket:

```bash
!aws s3 cp us-west-2.pem s3://{bucket}/authorization-files/
```

2. **Define a SageMaker Edge Manager agent configuration file.**

First, define the agent configuration file as follows:

```python
sagemaker_edge_config = {
    "sagemaker_edge_core_device_name": "device_name",
    "sagemaker_edge_core_device_fleet_name": "device_fleet_name",
    "sagemaker_edge_core_capture_data_buffer_size": 30,
    "sagemaker_edge_core_capture_data_push_period_seconds": 4,
    "sagemaker_edge_core_folder_prefix": "demo_capture",
    "sagemaker_edge_core_region": "us-west-2",
    "sagemaker_edge_core_root_certs_path": "/agent_demo/certificates",
    "sagemaker_edge_provider_aws_ca_cert_file": "/agent_demo/iot-credentials/AmazonRootCA1.pem",
}
```
Replace the following:

- "device_name" with the name of your device (this string was stored in an earlier step in a variable named device_name).
- "device_fleet_name" with the name of your device fleet (this string was stored in an earlier step in a variable named device_fleet_name)
- "endpoint" with your AWS account-specific endpoint for the credentials provider (this string was stored in an earlier step in a variable named endpoint).

Next, save it as a JSON file:

```python
edge_config_file = open("sagemaker_edge_config.json", "w")
json.dump(sagemaker_edge_config, edge_config_file, indent = 6)
edge_config_file.close()
```

Upload the configuration file to your Amazon S3 bucket:

```
!aws s3 cp sagemaker_edge_config.json s3://{bucket}/
```

3. **Copy the release artifacts, configuration file, and credentials to your device.**

The following instructions are performed on the edge device itself.

**Note**

You must first install Python, the AWS SDK for Python (Boto3), and the AWS CLI on your edge device.

Open a terminal on your device. Create a folder to store the release artifacts, your credentials, and the configuration file.

```bash
mkdir agent_demo
cd agent_demo
```

Copy the contents of the release artifacts that you stored in your Amazon S3 bucket to your device:

```bash
# Copy release artifacts
aws s3 cp s3://<bucket-name>/agent_demo/ ./ --recursive
```

(The contents of the release artifact was stored in a directory called agent_demo in a previous step. Replace <bucket-name> and agent_demo with the name of your Amazon S3 bucket and the file path to your release artifacts, respectively.

Go the /bin directory and make the binary files executable:

```bash
cd bin
```
chmod +x sagemaker_edge_agent_binary
chmod +x sagemaker_edge_agent_client_example

cd agent_demo

Make a directory to store your AWS IoT credentials and copy your credentials from your Amazon S3 bucket to your edge device (use the same on you define in the variable bucket):

```bash
mkdir iot-credentials
cd iot-credentials
aws s3 cp s3://<bucket-name>/authorization-files/AmazonRootCA1.pem ./
aws s3 cp s3://<bucket-name>/authorization-files/device.pem.crt ./
aws s3 cp s3://<bucket-name>/authorization-files/private.pem.key ./
cd ../
```

Make a directory to store your model signing root certificates:

```bash
mkdir certificates
cd certificates
aws s3 cp s3://<bucket-name>/authorization-files/us-west-2.pem ./
cd agent_demo
```

Copy your configuration file to your device:

```bash
#Download config file from S3
aws s3 cp s3://<bucket-name>/sagemaker_edge_config.json ./
cd agent_demo
```

Your `agent_demo` directory on your edge device should look similar to the following:

```
###agent_demo
 |    ### bin
 |        ### sagemaker_edge_agent_binary
 |        ### sagemaker_edge_agent_client_example
 |    ### sagemaker_edge_config.json
 |    ### certificates
 |        ###us-west-2.pem
 |    ### iot-credentials
 |        ###AmazonRootCA1.pem
 |        ### device.pem.crt
 |        ### private.pem.key
 |    ### docs
 |        ### api
 |        ### examples
 |        ### ATTRIBUTIONS.txt
 |        ### LICENSE.txt
 |    ### RELEASE_NOTES.md
```

**Run Agent**

In this section you will run the agent as a binary using gRPC, and check that both your device and fleet are working and collecting sample data.
1. **Launch the agent.**

The SageMaker Edge Manager agent can be run as a standalone process in the form of an Executable and Linkable Format (ELF) executable binary or can be linked against as a Dynamic Shared Object (.dll). Running as a standalone executable binary is the preferred mode and is supported on Linux.

This example uses gRPC to run the agent. gRPC is an open source high-performance Remote Procedure Call (RPC) framework that can run in any environment. For more information about gRPC, see the [gRPC documentation](#).

To use gRPC, perform the following steps:

- b. Generate server and client code using the protocol buffer compiler.
- c. Use the Python (or other languages supported by gRPC) gRPC API to write the server for your service.
- d. Use the Python (or other languages supported by gRPC) gRPC API to write a client for your service.

The release artifact you downloaded contains a gRPC application ready for you to run the agent. The example is located within the /bin directory of your release artifact. The `sagemaker_edge_agent_binary` binary executable is in this directory.

To run the agent with this example, provide the path to your socket file (.sock) and JSON .config file:

```bash
./bin/sagemaker_edge_agent_binary -a /tmp/sagemaker_edge_agent_example.sock -c sagemaker_edge_config.json
```

2. **Check your device.**

Check that your device is connected and sampling data. Making periodic checks, manually or automatically, allows you to check that your device or fleet is working properly.

Provide the name of the fleet to which the device belongs and the unique device identifier. From your local machine, run the following:

```python
sagemaker_client.describe_device(
    DeviceName=device_name,
    DeviceFleetName=device_fleet_name
)
```

For the given model, you can see the name, model version, latest sample time, and when the last inference was made.

```json
{
    "DeviceName": "sample-device",
    "DeviceFleetName": "demo-device-fleet",
    "IoTThingName": "sample-thing-name-1",
    "RegistrationTime": 1600977370,
    "LatestHeartbeat": 1600977370,
    "Models": [
        {
            "ModelName": "mobilenet_v2.tar.gz",
            "ModelVersion": "1.1",
            "LatestSampleTime": 1600977370,
            "LatestInference": 1600977370
        }
    ]
}
```
The timestamp provided by LastetHeartbeat indicates the last signal that was received from the device. LatestSampleTime and LatestInference describe the time stamp of the last data sample and inference, respectively.

3. **Check your fleet.**

Check that your fleet is working with `GetDeviceFleetReport`. Provide the name of the fleet the device belongs to.

```python
sagemaker_client.get_device_fleet_report(
    DeviceFleetName=device_fleet_name
)
```

For a given model, you can see the name, model version, latest sample time, and when the last inference was made, along with the Amazon S3 bucket URI where the data samples are stored.

```python
# Sample output
{
    "DeviceFleetName": "sample-device-fleet",
    "OutputConfig": {
        "S3OutputLocation": "s3://fleet-bucket/package_output",
    },
    "AgentVersions": [{"Version": "1.1", "AgentCount": 2}]
    "DeviceStats": {"Connected": 2, "Registered": 2},
    "Models": [{
        "ModelName": "sample-model",
        "ModelVersion": "1.1",
        "OfflineDeviceCount": 0,
        "ConnectedDeviceCount": 2,
        "ActiveDeviceCount": 2,
        "SamplingDeviceCount": 100
    }]
}
```

## Set Up Devices and Fleets

Fleets are collections of logically grouped devices you can use to collect and analyze data. You can use SageMaker Edge Manager to operate machine learning models on a fleet of smart cameras, smart speakers, robots, and other edge devices.

Create a fleet and register your devices either programmatically with the AWS SDK for Python (Boto3) or through the SageMaker console.

**Topics**
- Create a Fleet (p. 3028)
- Register a Device (p. 3032)
- Check Status (p. 3034)

### Create a Fleet

You can create a fleet programmatically with the AWS SDK for Python (Boto3) or through the SageMaker console [https://console.aws.amazon.com/sagemaker].
Create a Fleet (Boto3)

Use the CreateDeviceFleet API to create a fleet. Specify a name for the fleet, your AWS IoT Role ARN for the RoleArn field, as well as an Amazon S3 URI where you want the device to store sampled data.

You can optionally include a description of the fleet, tags, and an AWS KMS Key ID.

```python
import boto3

# Create SageMaker client so you can interact and manage SageMaker resources
sagemaker_client = boto3.client("sagemaker", region_name="aws-region")

sagemaker_client.create_device_fleet(
    DeviceFleetName="sample-fleet-name",
    RoleArn="arn:aws:iam::999999999:role/rolename", # IoT Role ARN
    Description="fleet description",
    OutputConfig={
        S3OutputLocation="s3://bucket/",
        KMSKeyId: "1234abcd-12ab-34cd-56ef-1234567890ab",
    },
    Tags=[
        {"Key": "string",
         "Value": "string"
        }
    ],
)

An AWS IoT Role Alias is created for you when you create a device fleet. The AWS IoT role alias provides a mechanism for connected devices to authenticate to AWS IoT using X.509 certificates and then obtain short-lived AWS credentials from an IAM role that is associated with the AWS IoT role alias.

Use DescribeDeviceFleet to get the role alias name and ARN.

```python
# Print Amazon Resource Name (ARN) and alias that has access
# to AWS Internet of Things (IoT).
sagemaker_client.describe_device_fleet(DeviceFleetName=device_fleet_name)['IotRoleAlias']
```

Use DescribeDeviceFleet API to get a description of fleets you created.

```python
sagemaker_client.describe_device_fleet(
    DeviceFleetName="sample-fleet-name"
)
```

By default, it returns the name of the fleet, the device fleet ARN, the Amazon S3 bucket URI, the IAM role, the role alias created in AWS IoT, a timestamp of when the fleet was created, and a timestamp of when the fleet was last modified.

```
{
    "DeviceFleetName": "sample-fleet-name",
    "IAMRole": "arn:aws:iam::999999999:role/rolename",
    "Description": "this is a sample fleet",
    "OutputConfig": {
        "S3OutputLocation": "s3://bucket/folder",
        "KMSKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
    },
```
Create a Fleet (Console)

You can create a Edge Manager packaging job using the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker.

1. In the SageMaker console, choose Edge Manager and then choose Edge device fleets.
2. Choose Create device fleet.
3. Enter a name for the device fleet in the Device fleet name field. Choose Next.
4. On the **Output configuration** page, specify the Amazon S3 bucket URI where you want to store sample data from your device fleet. You can optionally add an encryption key as well by electing an existing AWS KMS key from the dropdown list or by entering a key’s ARN. Choose **Submit**.
5. Choose the name of your device fleet to be redirected to the device fleet details. This page displays the name of the device fleet, ARN, description (if you provided one), date the fleet was created, last time the fleet was modified, Amazon S3 bucket URI, AWS KMS key ID (if provided), AWS IoT alias (if provided), and IAM role. If you added tags, they appear in the **Device fleet tags** section.

## Register a Device

**Important**
Device registration is required to use any part of SageMaker Edge Manager.

You can create a fleet programmatically with the AWS SDK for Python (Boto3) or through the SageMaker console at [https://console.aws.amazon.com/sagemaker](https://console.aws.amazon.com/sagemaker).

### Register a Device (Boto3)

To register your device, first create and register an AWS IoT thing object and configure an IAM role. SageMaker Edge Manager takes advantage of the AWS IoT Core services to facilitate the connection between the edge devices and the cloud. You can take advantage of existing AWS IoT functionality after you set up your devices to work with Edge Manager.

To connect your device to AWS IoT you need to create AWS IoT thing objects, create and register a client certificate with AWS IoT, and create and configure IAM role for your devices.

See the [Getting Started Guide](https://console.aws.amazon.com/sagemaker) for an in-depth example or the [Explore AWS IoT Core services in hands-on tutorial](https://console.aws.amazon.com/sagemaker).

Use the `register_devices` API to register your device. Provide the name of the fleet of which you want the devices to be a part, as well as a name for the device. You can optionally add a description to the device, tags, and AWS IoT thing name associated with the device.

```python
sagemaker_client.register_devices(
    DeviceFleetName="sample-fleet-name",
    # Other parameters...
)```

---

**Output configuration**

Use the fields below to specify the S3 bucket URI where you want devices to store sample data. You can also (optional) specify a KMS key.

- **S3 bucket URI**
  Enter your S3 bucket URI where you want devices to store sample data.

  ```
  s3://bucket-example/sagmaker-edge/device-output
  ```

  To find a path, [go to Amazon S3](https://console.aws.amazon.com/s3).

- **Encryption key - optional**
  Encrypt your data. Choose an existing KMS key or enter a key’s ARN.

  ```
  No Custom Encryption
  ```
Register a Device (Console)

You can register your device using the SageMaker console at https://console.aws.amazon.com/sagemaker.

1. In the SageMaker console, choose Edge Inference and then choose Edge devices.
2. Choose Register devices.
3. In the Device properties section, enter the name of the fleet the device belongs to under the Device fleet name field. Choose Next.
4. In the Device source section, add your devices one by one. You must include a Device Name for each device in your fleet. You can optionally provide a description (in the Description field) and an
Internet of Things (IoT) object name (in the IoT name field). Choose Submit once you have added all your devices.

### Device source

#### Add devices one by one

<table>
<thead>
<tr>
<th>Device Name</th>
<th>Description - optional</th>
<th>IoT name - optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter device name</td>
<td>Enter description</td>
<td>Enter IoT name</td>
</tr>
</tbody>
</table>

Add another device

You can add up to 50 devices

The Devices page displays the name of the device you have added, the fleet to which it belongs, when it was registered, the last heartbeat, and the description and AWS IoT name, if you provided one.

Choose a device to view the device's details, including the device name, fleet, ARN, description, IoT Thing name, when the device was registered, and the last heartbeat.

### Check Status

Check that your device or fleet is connected and sampling data. Making periodic checks, manually or automatically, allows you to check that your device or fleet is working properly.

Use the Amazon S3 console at https://console.aws.amazon.com/s3/ to interactively choose a fleet for a status check. You can also use the AWS SDK for Python (Boto3). The following describes different APIs from Boto3 you can use to check the status of your device or fleet. Use the API that best fits your use case.

- **Check an individual device.**

  To check the status of an individual device, use DescribeDevice API. A list containing one or more models is provided if a models have been deployed to the device.

  ```python
  sagemaker_client.describe_device(
      DeviceName="sample-device-1",
      DeviceFleetName="sample-fleet-name"
  )
  ```

  Running DescribeDevice returns:

  ```json
  { "DeviceName": "sample-device",
    "Description": "this is a sample device",
    "DeviceFleetName": "sample-device-fleet",
    "IoTThingName": "SampleThing",
  ```
"RegistrationTime": 1600977370,
"LatestHeartbeat": 1600977370,
"Models": [
  {
    "ModelName": "sample-model",
    "ModelVersion": "1.1",
    "LatestSampleTime": 1600977370,
    "LatestInference": 1600977370
  }
]

• **Check a fleet of devices.**

To check the status of the fleet, use the `GetDeviceFleetReport` API. Provide the name of the device fleet to get a summary of the fleet.

```python
sagemaker_client.get_device_fleet_report(
    DeviceFleetName="sample-fleet-name"
)
```

• **Check for a heartbeat.**

Each device within a fleet periodically generates a signal, or "heartbeat". The heartbeat can be used to check that the device is communicating with Edge Manager. If the timestamp of the last heartbeat is not being updated, the device may be failing.

Check the last heartbeat with made by a device with the `DescribeDevice` API. Specify the name of the device and the fleet to which the edge device belongs.

```python
sagemaker_client.describe_device(
    DeviceName="sample-device-1",
    DeviceFleetName="sample-fleet-name"
)
```

---

**Package Model**

SageMaker Edge Manager packaging jobs take Amazon SageMaker Neo–compiled models and make any changes necessary to deploy the model with the inference engine, Edge Manager agent.

**Topics**

- Prerequisites (p. 3035)
- Package a Model (Amazon SageMaker Console) (p. 3037)
- Package a Model (Boto3) (p. 3040)

**Prerequisites**

To package a model, you must do the following:

1. **Compile your machine learning model with SageMaker Neo.**

   If you have not already done so, compile your model with SageMaker Neo. For more information on how to compile your model, see Compile and Deploy Models with Neo. If you are first-time user of SageMaker Neo, go through Getting Started with Neo Edge Devices.

2. **Get the name of your compilation job.**
Provide the name of the compilation job name you used when you compiled your model with SageMaker Neo. Open the SageMaker console at https://console.aws.amazon.com/sagemaker/ and choose Compilation jobs to find a list of compilations that have been submitted to your AWS account. The names of submitted compilation jobs are in the Name column.

3. **Get your IAM ARN.**

You need an Amazon Resource Name (ARN) of an IAM role that you can use to download and upload the model and contact SageMaker Neo.

Use one of the following methods to get your IAM ARN:

- **Programmatically with the SageMaker Python SDK**

  ```python
  import sagemaker
  # Initialize SageMaker Session object so you can interact with AWS resources
  sess = sagemaker.Session()
  # Get the role ARN
  role = sagemaker.get_execution_role()
  print(role)
  >> arn:aws:iam::<your-aws-account-id>:role/<your-role-name>
  
  For more information about using the SageMaker Python SDK, see the SageMaker Python SDK API.

- **Using the AWS Identity and Access Management (IAM) console**

  Navigate to the IAM console at https://console.aws.amazon.com/iam/. In the IAM Resources section, choose Roles to view a list of roles in your AWS account. Select or create a role that has AmazonSageMakerFullAccess, AWSSoTFullAccess, and AmazonS3FullAccess.

  For more information on IAM, see What is IAM?

4. **Have an S3 bucket URI.**

You need to have at least one Amazon Simple Storage Service (Amazon S3) bucket URI to store your Neo-compiled model, the output of the Edge Manager packaging job, and sample data from your device fleet.

Use one of the following methods to create an Amazon S3 bucket:

- **Programmatically with the SageMaker Python SDK**

  You can use the default Amazon S3 bucket during a session. A default bucket is created based on the following format: sagemaker-{region}-{aws-account-id}. To create a default bucket with the SageMaker Python SDK, use the following:

  ```python
  import sagemaker
  session=sagemaker.create_session()
  bucket=session.default_bucket()
  
  On AWS Identity and Access Management (IAM) console
  
  Navigate to the IAM console at https://console.aws.amazon.com/iam/ and choose Roles to view a list of roles in your AWS account. Select or create a role that has AmazonSageMakerFullAccess, AWSSoTFullAccess, and AmazonS3FullAccess.

  For more information on IAM, see What is IAM?

4. **Have an S3 bucket URI.**

You need to have at least one Amazon Simple Storage Service (Amazon S3) bucket URI to store your Neo-compiled model, the output of the Edge Manager packaging job, and sample data from your device fleet.

Use one of the following methods to create an Amazon S3 bucket:

- **Programmatically with the SageMaker Python SDK**

  You can use the default Amazon S3 bucket during a session. A default bucket is created based on the following format: sagemaker-{region}-{aws-account-id}. To create a default bucket with the SageMaker Python SDK, use the following:

  ```python
  import sagemaker
  session=sagemaker.create_session()
  bucket=session.default_bucket()
  
  On AWS Identity and Access Management (IAM) console
  
  Navigate to the IAM console at https://console.aws.amazon.com/iam/ and choose Roles to view a list of roles in your AWS account. Select or create a role that has AmazonSageMakerFullAccess, AWSSoTFullAccess, and AmazonS3FullAccess.

  For more information on IAM, see What is IAM?

4. **Have an S3 bucket URI.**

You need to have at least one Amazon Simple Storage Service (Amazon S3) bucket URI to store your Neo-compiled model, the output of the Edge Manager packaging job, and sample data from your device fleet.

Use one of the following methods to create an Amazon S3 bucket:

- **Programmatically with the SageMaker Python SDK**

  You can use the default Amazon S3 bucket during a session. A default bucket is created based on the following format: sagemaker-{region}-{aws-account-id}. To create a default bucket with the SageMaker Python SDK, use the following:

  ```python
  import sagemaker
  session=sagemaker.create_session()
  bucket=session.default_bucket()
  
  On AWS Identity and Access Management (IAM) console
  
  Navigate to the IAM console at https://console.aws.amazon.com/iam/ and choose Roles to view a list of roles in your AWS account. Select or create a role that has AmazonSageMakerFullAccess, AWSSoTFullAccess, and AmazonS3FullAccess.

  For more information on IAM, see What is IAM?

4. **Have an S3 bucket URI.**

You need to have at least one Amazon Simple Storage Service (Amazon S3) bucket URI to store your Neo-compiled model, the output of the Edge Manager packaging job, and sample data from your device fleet.

Use one of the following methods to create an Amazon S3 bucket:

- **Programmatically with the SageMaker Python SDK**

  You can use the default Amazon S3 bucket during a session. A default bucket is created based on the following format: sagemaker-{region}-{aws-account-id}. To create a default bucket with the SageMaker Python SDK, use the following:

  ```python
  import sagemaker
  session=sagemaker.create_session()
  bucket=session.default_bucket()
  
  On AWS Identity and Access Management (IAM) console
  
  Navigate to the IAM console at https://console.aws.amazon.com/iam/ and choose Roles to view a list of roles in your AWS account. Select or create a role that has AmazonSageMakerFullAccess, AWSSoTFullAccess, and AmazonS3FullAccess.

  For more information on IAM, see What is IAM?
Package a Model (Amazon SageMaker Console)

You can create a SageMaker Edge Manager packaging job using the SageMaker console at https://console.aws.amazon.com/sagemaker/. Before continuing, make sure you have satisfied the Prerequisites (p. 3035).

1. In the SageMaker console, choose **Edge Inference** and then choose **Edge packaging jobs**, as shown in the following image.

![Image of SageMaker console showing Edge packaging jobs](https://console.aws.amazon.com/sagemaker/

2. On the **Job properties** page, enter a name for your packaging job under **Edge packaging job name**. Note that Edge Manager packaging job names are case-sensitive. Name your model and give it a version: enter this under **Model name** and **Model version**, respectively.

3. Next, select an **IAM role**. You can chose a role or let AWS create a role for you. You can optionally specify a **resource key ARN** and **job tags**.

4. Choose **Next**.
5. Specify the name of the compilation job you used when compiling your model with SageMaker Neo in the **Compilation job name** field. Choose **Next**.
On the **Output configuration** page, enter the Amazon S3 bucket URI in which you want to store the output of the packaging job.

The **Status** column on the **Edge packaging** jobs page should read **IN PROGRESS**. Once the packaging job is complete, the status updates to **COMPLETED**.

Selecting a packaging job directs you to that job's settings. The **Job settings** section displays the job name, ARN, status, creation time, last modified time, duration of the packaging job, and role ARN.

The **Input configuration** section displays the location of the model artifacts, the data input configuration, and the machine learning framework of the model.
The **Output configuration** section displays the output location of the packaging job, the target device for which the model was compiled, and any tags you created.

7. Choose the name of your device fleet to be redirected to the device fleet details. This page displays the name of the device fleet, ARN, description (if you provided one), date the fleet was created, last time the fleet was modified, Amazon S3 bucket URI, AWS KMS key ID (if provided), AWS IoT alias (if provided), and IAM role. If you added tags, they appear in the **Device fleet tags** section.

---

## Package a Model (Boto3)

You can create a SageMaker Edge Manager packaging job with the AWS SDK for Python (Boto3). Before continuing, make sure you have satisfied the [Prerequisites](p. 3035).

To request an edge packaging job, use `CreateEdgePackagingJob`. You need to provide a name to your edge packaging job, the name of your SageMaker Neo compilation job, your role Amazon resource name (ARN), a name for your model, a version for your model, and the Amazon S3 bucket URI where you want to store the output of your packaging job. Note that Edge Manager packaging job names and SageMaker Neo compilation job names are case-sensitive.

```python
# Import AWS SDK for Python (Boto3)
import boto3

# Create Edge client so you can submit a packaging job
sagemaker_client = boto3.client("sagemaker", region_name='aws-region')

sagemaker_client.create_edge_packaging_job(
    EdgePackagingJobName="edge-packaging-name",
    CompilationJobName="neo-compilation-name",
    RoleArn="arn:aws:iam::99999999999:role/rolename",
    ModelName="sample-model-name",
    ModelVersion="model-version",
    OutputConfig={
        "S3OutputLocation": "s3://your-bucket/",
    }
)
```

You can check the status of an edge packaging job using `DescribeEdgePackagingJob` and providing the case-sensitive edge packaging job name:

```python
response = sagemaker_client.describe_edge_packaging_job(
    EdgePackagingJobName="edge-packaging-name")
```

This returns a dictionary that can be used to poll the status of the packaging job:

```python
# Optional - Poll every 30 sec to check completion status
import time

while True:
    response = sagemaker_client.describe_edge_packaging_job(
        EdgePackagingJobName="edge-packaging-name")

    if response['EdgePackagingJobStatus'] == 'Completed':
        break
    elif response['EdgePackagingJobStatus'] == 'Failed':
        raise RuntimeError('Packaging job failed')
    print('Packaging model...')
    time.sleep(30)
print('Done!')
```
For a list of packaging jobs, use ListEdgePackagingJobs. You can use this API to search for a specific packaging job. Provide a partial name to filter packaging job names for NameContains, a partial name for ModelNameContains to filter for jobs in which the model name contains the name you provide. Also specify with which column to sort with SortBy, and by which direction to sort for SortOrder (either Ascending or Descending).

```python
sagemaker_client.list_edge_packaging_jobs(
    "NameContains": "sample",
    "ModelNameContains": "sample",
    "SortBy": "column-name",
    "SortOrder": "Descending"
)
```

To stop a packaging job, use StopEdgePackagingJob and provide the name of your edge packaging job.

```python
sagemaker_client.stop_edge_packaging_job(
    EdgePackagingJobName="edge-packaging-name"
)
```

For a full list of Edge Manager APIs, see the Boto3 documentation.

### The Edge Manager Agent

The Edge Manager agent is an inference engine for your edge devices. Use the agent to make predictions with models loaded onto your edge devices. The agent also collects model metrics and captures data at specific intervals. Sample data is stored in your Amazon S3 bucket.

There are two methods of installing and deploying the Edge Manager agent onto your edge devices:

1. Download the agent as a binary from the Amazon S3 release bucket. For more information, see Download and Set Up the Edge Manager Agent Manually (p. 3041).
2. Use the AWS IoT Greengrass V2 console or the AWS CLI to deploy `aws.greengrass.SageMakerEdgeManager`. See Create the AWS IoT Greengrass V2 Components (p. 3047).

### Download and Set Up the Edge Manager Agent Manually

Download the Edge Manager agent based on your operating system, architecture, and AWS Region. The agent is periodically updated, so you have the option to choose your agent based on release dates and versions. Once you have the agent, create a JSON configuration file. Specify the device IoT thing name, fleet name, device credentials, and other key-value pairs. See Running the Edge Manager agent (p. 3043) for full a list of keys you must specify in the configuration file. You can run the agent as an executable binary or link against it as a dynamic shared object (DSO).

**How the agent works**

The agent runs on the CPU of your devices. The agent runs inference on the framework and hardware of the target device you specified during the compilation job. For example, if you compiled your model for the Jetson Nano, the agent supports the GPU in the provided Deep Learning Runtime (DLR).

The agent is released in binary format for supported operating systems. Check that your operating system is supported and meets the minimum OS requirement in the following table:

**Linux**

Version: Ubuntu 18.04
**Supported Binary Formats:** x86-64 bit (ELF binary) and ARMv8 64 bit (ELF binary)

Windows

**Version:** Windows 10 version 1909

**Supported Binary Formats:** x86-32 bit (DLL) and x86-64 bit (DLL)

### Installing the Edge Manager agent

To use the Edge Manager agent, you first must obtain the release artifacts and a root certificate. The release artifacts are stored in an Amazon S3 bucket in the us-west-2 Region. To download the artifacts, specify your operating system (<OS>) and the <VERSION>.

Based on your operating system, replace <OS> with one of the following:

<table>
<thead>
<tr>
<th>Windows 32-bit</th>
<th>Windows 64-bit</th>
<th>Linux x86-64</th>
<th>Linux ARMv8</th>
</tr>
</thead>
<tbody>
<tr>
<td>windows-x86</td>
<td>windows-x64</td>
<td>linux-x64</td>
<td>linux-armv8</td>
</tr>
</tbody>
</table>

The VERSION is broken into three components: `<MAJOR_VERSION>-.<YYYY-MM-DD>-<SHA-7>`, where:

- `<MAJOR_VERSION>`: The release version. The release version is currently set to 1.
- `<YYYY-MM-DD>`: The time stamp of the artifacts release.
- `<SHA-7>`: The repository commit ID from which the release is built.

You must provide the `<MAJOR_VERSION>` and the time stamp in YYYY-MM-DD format. We suggest you use the latest artifact release time stamp.

Run the following in your command line to get the latest time stamp. Replace <OS> with your operating system:

```bash
aws s3 ls s3://sagemaker-edge-release-store-us-west-2-<OS>/Releases/ | sort -r
```

For example, if you have a Windows 32-bit OS, run:

```bash
aws s3 ls s3://sagemaker-edge-release-store-us-west-2-windows-x86/Releases/ | sort -r
```

This returns:

```
2020-12-01 23:33:36 0
  PRE 1.20201218.81f481f/
  PRE 1.20201207.02d0e97/
```

The return output in this example shows two release artifacts. The first release artifact file notes that the release version has a major release version of 1, a time stamp of 20201218 (in YYYY-MM-DD format), and a 81f481f SHA-7 commit ID.

**Note**

The preceding command assumes you have configured the AWS Command Line Interface. For more information, about how to configure the settings that the AWS CLI uses to interact with AWS, see [Configuring the AWS CLI](#).
Based on your operating system, use the following commands to install the artifacts:

Windows 32-bit

aws s3 cp s3://sagemaker-edge-release-store-us-west-2-windows-x86/Releases/<VERSION>/sha256_hex.shasum .

Windows 64-bit

aws s3 cp s3://sagemaker-edge-release-store-us-west-2-windows-x64/Releases/<VERSION>/.<VERSION>.zip .
aws s3 cp s3://sagemaker-edge-release-store-us-west-2-windows-x64/Releases/<VERSION>/sha256_hex.shasum .

Linux x86-64

aws s3 cp s3://sagemaker-edge-release-store-us-west-2-linux-x64/Releases/<VERSION>/.<VERSION>.tgz .
aws s3 cp s3://sagemaker-edge-release-store-us-west-2-linux-x64/Releases/<VERSION>/sha256_hex.shasum .

Linux ARMv8

You also must download a root certificate. This certificate validates model artifacts signed by AWS before loading them onto your edge devices.

Replace <OS> corresponding to your platform from the list of supported operation systems and replace <REGION> with your AWS Region.

aws s3 cp s3://sagemaker-edge-release-store-us-west-2-<OS>/Certificates/<REGION>/<REGION>.pem .

**Running the Edge Manager agent**

You can run the SageMaker Edge Manager agent as a standalone process in the form of an Executable and Linkable Format (ELF) executable binary or you can link against it as a dynamic shared object (.dll). Linux supports running it as a standalone executable binary and is the preferred mode. Windows supports running it as a shared object (.dll).

On Linux, we recommend that you run the binary via a service that’s a part of your initialization (init) system. If you want to run the binary directly, you can do so in a terminal as shown in the following example. If you have a modern OS, there are no other installations necessary prior to running the agent, since all the requirements are statically built into the executable. This gives you flexibility to run the agent on the terminal, as a service, or within a container.

To run the agent, first create a JSON configuration file. Specify the following key-value pairs:

- sagemaker_edge_core_device_name: The name of the device. This device name needs to be registered along with the device fleet in the SageMaker Edge Manager console.
• `sagemaker_edge_core_device_fleet_name`: The name of the fleet to which the device belongs.

• `sagemaker_edge_core_region`: The AWS Region associated with the device, the fleet and the Amazon S3 buckets. This corresponds to the Region where the device is registered and where the Amazon S3 bucket is created (they are expected to be the same). The models themselves can be compiled with SageMaker Neo in a different Region, this configuration is not related to model compilation Region.

• `sagemaker_edge_core_root_certs_path`: The absolute folder path to root certificates. This is used to validate the device with the relevant AWS account.

• `sagemaker_edge_provider_aws_ca_cert_file`: The absolute path to Amazon Root CA certificate (AmazonRootCA1.pem). This is used to validate the device with the relevant AWS account. AmazonCA is a certificate owned by AWS.

• `sagemaker_edge_provider_aws_cert_file`: The absolute path to AWS IoT signing root certificate (*.pem.crt).

• `sagemaker_edge_provider_aws_cert_pk_file`: The absolute path to AWS IoT private key. (*.pem.key).

• `sagemaker_edge_provider_aws_iot_cred_endpoint`: The AWS IoT credentials endpoint (identifier.iot.region.amazonaws.com). This endpoint is used for credential validation. See Connecting devices to AWS IoT for more information.

• `sagemaker_edge_provider_provider`: This indicates the implementation of the provider interface being used. The provider interface communicates with the end network services for uploads, heartbeats and registration validation. By default this is set to "Aws". We allow custom implementations of the provider interface. It can be set to None for no provider or Custom for custom implementation with the relevant shared object path provided.

• `sagemaker_edge_provider_provider_path`: Provides the absolute path to the provider implementation shared object (.so or .dll file). The "Aws" provider .dll or .so file is provided with the agent release. This field is mandatory.

• `sagemaker_edge_provider_s3_bucket_name`: The name of your Amazon S3 bucket (not the Amazon S3 bucket URI). The bucket must have a sagemaker string within its name.

• `sagemaker_edge_log_verbose` (Boolean): Optional. This sets the debug log. Select either True or False.

• `sagemaker_edge_telemetry_libsystemd_path`: For Linux only, systemd implements the agent crash counter metric. Set the absolute path of libsystemd to turn on the crash counter metric. You can find the default libsystemd path can be found by running `whereis libsystemd` in the device terminal.

• `sagemaker_edge_core_capture_data_destination`: The destination for uploading capture data. Choose either "Cloud" or "Disk". The default is set to "Disk". Setting it to "Disk" writes the input and output tensor(s) and auxiliary data to the local file system at your preferred location of. When writing to "Cloud" use the Amazon S3 bucket name provided in the `sagemaker_edge_provider_s3_bucket_name` configuration.

• `sagemaker_edge_core_capture_data_disk_path`: Set the absolute path in the local file system, into which capture data files are written when "Disk" is the destination. This field is not used when "Cloud" is specified as the destination.

• `sagemaker_edge_core_folder_prefix`: The parent prefix in Amazon S3 where captured data is stored when you specify "Cloud" as the capture data destination (sagemaker_edge_core_capture_data_disk_path). Captured data is stored in a sub-folder under sagemaker_edge_core_capture_data_disk_path if "Disk" is set as the data destination.

• `sagemaker_edge_core_capture_data_buffer_size` (Integer value): The capture data circular buffer size. It indicates the maximum number of requests stored in the buffer.

• `sagemaker_edge_core_capture_data_batch_size` (Integer value): The capture data batch size. It indicates the size of a batch of requests that are handled from the buffer. This value must to be less than sagemaker_edge_core_capture_data_buffer_size. A maximum of half the size of the buffer is recommended for batch size.
• `sagemaker_edge_core_capture_data_push_period_seconds` (Integer value): The capture data push period in seconds. A batch of requests in the buffer is handled when there are batch size requests in the buffer, or when this time period has completed (whichever comes first). This configuration sets that time period.

• `sagemaker_edge_core_capture_data_base64_embed_limit`: The limit for uploading capture data in bytes. Integer value.

Your configuration file should look similar to the following example (with your specific values specified). This example uses the default AWS provider ("Aws") and does not specify a periodic upload.

```json
{
    "sagemaker_edge_core_device_name": "device-name",
    "sagemaker_edge_core_device_fleet_name": "fleet-name",
    "sagemaker_edge_core_region": "region",
    "sagemaker_edge_core_root_certs_path": "<Absolute path to root certificates>",
    "sagemaker_edge_provider_provider": "Aws",
    "sagemaker_edge_provider_provider_path": "/path/to/libprovider-aws.so",
    "sagemaker_edge_core_capture_data_destination": "Cloud",
    "sagemaker_edge_provider_s3_bucket_name": "sagemaker-bucket-name",
    "sagemaker_edge_core_capture_data_buffer_size": 30,
    "sagemaker_edge_core_capture_data_batch_size": 10,
    "sagemaker_edge_core_capture_data_push_period_seconds": 4000,
    "sagemaker_edge_core_capture_data_base64_embed_limit": 2,
    "sagemaker_edge_log_verbose": false
}
```

The release artifact includes a binary executable called `sagemaker_edge_agent_binary` in the `/bin` directory. To run the binary, use the `-a` flag to create a socket file descriptor (.sock) in a directory of your choosing and specify the path of the agent JSON config file you created with the `-c` flag.

```bash
./sagemaker_edge_agent_binary -a <ADDRESS_TO_SOCKET> -c <PATH_TO_CONFIG_FILE>
```

The following example shows the code snippet with a directory and file path specified:

```bash
./sagemaker_edge_agent_binary -a /tmp/sagemaker_edge_agent_example.sock -c sagemaker_edge_config.json
```

In this example, a socket file descriptor named `sagemaker_edge_agent_example.sock` is created in the `/tmp` directory and points to a configuration file that is in the same working directory as the agent called `sagemaker_edge_config.json`.

**Deploy the Model Package and Edge Manager Agent with AWS IoT Greengrass**

SageMaker Edge Manager integrates AWS IoT Greengrass version 2 to simplify accessing, maintaining, and deploying the Edge Manager agent and model to your devices. Without AWS IoT Greengrass V2, setting up your devices and fleets to use SageMaker Edge Manager requires you to manually copy the Edge Manager agent from an Amazon S3 release bucket. You use the agent to make predictions with models loaded onto your edge devices. With AWS IoT Greengrass V2 and SageMaker Edge Manager
integration, you can use AWS IoT Greengrass V2 components. Components are pre-built software modules that can connect your edge devices to AWS services or third-party service via AWS IoT Greengrass.

You must install the AWS IoT Greengrass Core software onto your device(s) if you want to use AWS IoT Greengrass V2 to deploy the Edge Manager agent and your model. For more information about device requirements and how to set up your devices, see Setting up AWS IoT Greengrass core devices in the AWS IoT Greengrass documentation.

You use the following three components to deploy the Edge Manager agent:

- **A pre-built public component**: SageMaker maintains the public Edge Manager component.
- **A autogenerated private component**: The private component is autogenerated when you package your machine learning model with the CreateEdgePackagingJob API and specify GreengrassV2Component for the Edge Manager API field PresetDeploymentType.
- **A custom component**: This is the inference application that is responsible for preprocessing and making inferences on your device. You must create this component. See either ??? (p. 3049) in the SageMaker Edge Manager documentation or Create custom AWS IoT Greengrass components in the AWS IoT Greengrass documentation for more information on how to create custom components.

**Prerequisites**

SageMaker Edge Manager uses AWS IoT Greengrass V2 to simplify the deployment of the Edge Manager agent, your machine learning models, and your inference application to your devices with the use of components. To make it easier to maintain your AWS IAM roles, Edge Manager allows you to reuse your existing AWS IoT role alias. If you do not have one yet, Edge Manager generates a role alias as part of the Edge Manager packaging job. You no longer need to associate a role alias generated from the SageMaker Edge Manager packaging job with your AWS IoT role.

Before you start, you must complete the following prerequisites:

1. Install the AWS IoT Greengrass Core software. For detailed information, see Install the AWS IoT Greengrass Core software.
2. Set up AWS IoT Greengrass V2. For more information, see Install AWS IoT Greengrass Core software with manual resource provisioning. **Note**
   - Make sure the AWS IoT thing name is all lowercase and does not contain characters except (optionally) dashes (-).
   - The IAM Role must start with SageMaker*
3. Attach the following permission and inline policy to the IAM role created during AWS IoT Greengrass V2 setup.
   - Navigate to the IAM console https://console.aws.amazon.com/iam/.
   - Search for the role you created by typing in the role name in the Search field.
   - Choose your role.
   - Next, choose Attach policies.
   - Search for AmazonSageMakerEdgeDeviceFleetPolicy.
   - Select AmazonSageMakerFullAccess (This is an optional step that makes it easier for you to reuse this IAM role in model compilation and packaging).
   - Choose Add inline policy.

```json
{
   "Version":"2012-10-17",
   "Statement":[
   {
```
Choose **Attach policy**.
Choose **Trust relationship**.
Choose **Edit trust relationship**.
Replace the content with the following.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Principal": {
            "Service": "credentials.iot.amazonaws.com"
         },
         "Action": "sts:AssumeRole"
      },
      {
         "Effect": "Allow",
         "Principal": {
            "Service": "sagemaker.amazonaws.com"
         },
         "Action": "sts:AssumeRole"
      }
   ]
}
```

4. Create an Edge Manager device fleet. For information on how to create a fleet, see Set Up Devices and Fleets (p. 3028).
5. Register your device with the same name as your AWS IoT thing name created during the AWS IoT Greengrass V2 setup.
6. Create at least one custom private AWS IoT Greengrass component. This component is the application that runs inference on the device. For more information, see Create a Hello World custom component (p. 3049)

**Note**

- The SageMaker Edge Manager and AWS IoT Greengrass integration only works for AWS IoT Greengrass v2.
- Both your AWS IoT thing name and Edge Manager device name must be the same.
- SageMaker Edge Manager does not load local AWS IoT certificates and call the AWS IoT credential provider endpoint directly. Instead, SageMaker Edge Manager uses the AWS IoT Greengrass v2 TokenExchangeService and it fetches a temporary credential from a TES endpoint.

**Create the AWS IoT Greengrass V2 Components**

AWS IoT Greengrass uses components, a software module that is deployed to and runs on a AWS IoT Greengrass core device. You need (at a minimum) three components:
1. A public Edge Manager Agent AWS IoT Greengrass component which deploys the Edge Manager agent binary.

2. A model component that is autogenerated when you package your machine learning model with either the AWS SDK for Python (Boto3) API or with the SageMaker console. For information, see Create an autogenerated component (p. 3048).

3. A private, custom component to implement the Edge Manager agent client application, and do any preprocessing and post-processing of the inference results. For more information about how to create a custom component, see Create an autogenerated component (p. 3048) or Create custom AWS IoT Greengrass components.

Create an autogenerated component

Generate the model component with the CreateEdgePackagingJob API and specify GreengrassV2Component for the SageMaker Edge Manager packaging job API field PresetDeploymentType. When you call the CreateEdgePackagingJob API, Edge Manager takes your SageMaker Neo-compiled model in Amazon S3 and creates a model component. The model component is automatically stored in your account. You can view any of your components by navigating to the AWS IoT console https://console.aws.amazon.com/iot/. Select Greengrass and then select Core devices. The page has a list of AWS IoT Greengrass core devices associated with your account. If a model component name is not specified in PresetDeploymentConfig, the default name generated consists of "SagemakerEdgeManager" and the name of your Edge Manager agent packaging job. The following example demonstrates how to specify to Edge Manager to create a AWS IoT Greengrass V2 component with the CreateEdgePackagingJob API.

```python
import sagemaker
import boto3

# Create a SageMaker client object to make it easier to interact with other AWS services.
sagemaker_client = boto3.client('sagemaker', region='YOUR_REGION')

# Replace with your IAM Role ARN
sagemaker_role_arn = "arn:aws:iam::<account>:role/*"

# Replace string with the name of your already created S3 bucket.
bucket = 'edge-manager-demo-bucket'

# Specify a name for your edge packaging job.
edge_packaging_name = "edge_packag_job_demo"

# Replace the following string with the name you used for the SageMaker Neo compilation job.
compilation_job_name = "getting-started-demo"

# The name of the model and the model version.
model_name = "sample-model"
model_version = "1.1"

# Output directory in S3 where you want to store the packaged model.
packaging_output_dir = 'packaged_models'
packaging_s3_output = 's3://{}/{}'.format(bucket, packaging_output_dir)

# The name you want your Greengrass component to have.
component_name = "SagemakerEdgeManager" + edge_packaging_name

sagemaker_client.create_edge_packaging_job(
    EdgePackagingJobName=edge_packaging_name,
    CompilationJobName=compilation_job_name,
    RoleArn=sagemaker_role_arn,
    ModelName=model_name,
    ModelVersion=model_version,
    OutputConfig={
```
You can also create the autogenerated component with the SageMaker console. Follow steps 1-6 in Package a Model (Amazon SageMaker Console) (p. 3037)

Enter the Amazon S3 bucket URI where you want to store the output of the packaging job and optional encryption key.

Complete the following to create the model component:

1. Choose **Preset deployment**.
2. Specify the name of the component for the **Component name** field.
3. Optionally, provide a description of the component, a component version, the platform OS, or the platform architecture for the **Component description**, **Component version**, **Platform OS**, and **Platform architecture**, respectively.
4. Choose **Submit**.

Create a Hello World custom component

The custom application component is used to perform inference on the edge device. The component is responsible for loading models to SageMaker Edge Manager, invoking the Edge Manager agent for inference, and unloading the model when the component is shut down. Before you create your component, ensure the agent and application can communicate with Edge Manager. To do this, configure gRPC. The Edge Manager agent uses methods defined in Protobuf Buffers and the gRPC server to establish communication with the client application on the edge device and the cloud.

To use gRPC, you must:

1. Create a gRPC stub using the .proto file provided when you download the Edge Manager agent from Amazon S3 release bucket.
2. Write client code with the language you prefer.

You do not need to define the service in a .proto file. The service .proto files are included in the compressed TAR file when you download the Edge Manager agent release binary from the Amazon S3 release bucket.

Install gRPC and other necessary tools on your host machine and create the gRPC stubs agent_pb2_grpc.py and agent_pb2.py in Python. Make sure you have agent.proto in your local directory.

```bash
pip install grpcio
pip install grpcio-tools
python3 -m grpc_tools.protoc --proto_path=. --python_out=. --grpc_python_out=. agent.proto
```

The preceding code generates the gRPC client and server interfaces from your .proto service definition. In other words, it creates the gRPC model in Python. The API directory contains the Protobuf specification for communicating with the agent.

Next, use the gRPC API to write a client and server for your service (2). The following example script, edge_manager_python_example.py, uses Python to load, list, and unload a yolov3 model to the edge device.
import grpc
from PIL import Image
import agent_pb2
import agent_pb2_grpc
import os

model_path = '<PATH-TO-SagemakerEdgeManager-COMPONENT>'
ageant_socket = 'unix:///tmp/aws.greengrass.SageMakerEdgeManager.sock'
ageant_channel = grpc.insecure_channel(agent_socket, options=((grpc.enable_http_proxy', 0),))
ageant_client = agent_pb2_grpc.AgentStub(agent_channel)

def list_models():
    return agent_client.ListModels(agent_pb2.ListModelsRequest())

def list_model_tensors(models):
    return {
        model.name: {
            'inputs': model.input_tensor_metadatas,
            'outputs': model.output_tensor_metadatas
        }
    for model in list_models().models
}

def load_model(model_name, model_path):
    load_request = agent_pb2.LoadModelRequest()
    load_request.url = model_path
    load_request.name = model_name
    return agent_client.LoadModel(load_request)

def unload_model(name):
    unload_request = agent_pb2.UnLoadModelRequest()
    unload_request.name = name
    return agent_client.UnLoadModel(unload_request)

def predict_image(model_name, image_path):
    image_tensor = agent_pb2.Tensor()
    image_tensor.byte_data = Image.open(image_path).tobytes()
    image_tensor_metadata = list_model_tensors(list_models())[model_name]['inputs'][0]
    image_tensor.tensor_metadata.name = image_tensor_metadata.name
    image_tensor.tensor_metadata.data_type = image_tensor_metadata.data_type
    for shape in image_tensor_metadata.shape:
        image_tensor.tensor_metadata.shape.append(shape)
    predict_request = agent_pb2.PredictRequest()
    predict_request.name = model_name
    predict_request.tensors.append(image_tensor)
    predict_response = agent_client.Predict(predict_request)
    return predict_response

def main():
    try:
        unload_model('your-model')
    except:
        pass
    print('LoadModel...', end='')
try:
    load_model('your-model', model_path)
    print('done.')
except Exception as e:
    print()
    print(e)
    print('Model already loaded!')

print('ListModels...', end='')
try:
    print(list_models())
    print('done.')
except Exception as e:
    print()
    print(e)
    print('List model failed!')

print('Unload model...', end='')
try:
    unload_model('your-model')
    print('done.')
except Exception as e:
    print()
    print(e)
    print('unload model failed!')

if __name__ == '__main__':
    main()

Ensure model_path points to the name of the AWS IoT Greengrass component containing the model if you use the same client code example.

You can create your AWS IoT Greengrass V2 Hello World component once you have generated your gRPC stubs and you have your Hello World code ready. To do so:

- Upload your edge_manager_python_example.py, agent_pb2_grpc.py, and agent_pb2.py to your Amazon S3 bucket and note down their Amazon S3 path.
- Create a private component in the AWS IoT Greengrass V2 console and define the recipe for your component. Specify the Amazon S3 URI to your Hello World application and gRPC stub in the following recipe.

```yaml
---
RecipeFormatVersion: 2020-01-25
ComponentName: com.sagemaker.edgePythonExample
ComponentVersion: 1.0.0
ComponentDescription: Sagemaker Edge Manager Python example
ComponentPublisher: Amazon Web Services, Inc.
ComponentDependencies:
  aws.greengrass.SageMakerEdgeManager:
    VersionRequirement: '>=1.0.0'
    DependencyType: HARD
Manifests:
- Platform:
  os: linux
    architecture: "/amd64|x86/"
Lifecycle:
  install: |-  
    apt-get install python3-pip
    pip3 install grpcio
    pip3 install grpcio-tools
    pip3 install protobuf
    pip3 install Pillow
```
run:
  script: |- 
    python3 {{[artifacts:path]}}/edge_manager_python_example.py
```
Artifacts:
  - URI: <code-s3-path>
  - URI: <pb2-s3-path>
  - URI: <pb2-grpc-s3-path>
```

For detailed information about creating a Hello World recipe, see Create your first component in the AWS IoT Greengrass documentation.

**Deploy the components to your device**

Deploy your components with the AWS IoT console or with the AWS CLI.

**To deploy your components (console)**

Deploy your AWS IoT Greengrass components with the AWS IoT console.

1. In the AWS IoT Greengrass console at https://console.aws.amazon.com/iot/ navigation menu, choose **Deployments**.
2. On the **Components** page, on the **Public components** tab, choose `aws.greengrass.SageMakerEdgeManager`
3. On the `aws.greengrass.SageMakerEdgeManager` page, choose **Deploy**
4. From **Add to deployment**, choose one of the following:
   a. To merge this component to an existing deployment on your target device, choose **Add to existing deployment**, and then select the deployment that you want to revise.
   b. To create a new deployment on your target device, choose **Create new deployment**. If you have an existing deployment on your device, choosing this step replaces the existing deployment.
5. On the **Specify target** page, do the following:
   a. Under **Deployment information**, enter or modify the friendly name for your deployment.
   b. Under **Deployment targets**, select a target for your deployment, and choose **Next**. You cannot change the deployment target if you are revising an existing deployment.
6. On the **Select components** page, under **My components**, choose:
   - `com.<CUSTOM-COMPONENT-NAME>`
   - `aws.greengrass.SageMakerEdgeManager`
   - `SagemakerEdgeManager.<YOUR-PACKAGING-JOB>`
7. On the **Configure components** page, choose `com.greengrass.SageMakerEdgeManager`, and do the following.
   a. Choose **Configure component**
   b. Under **Configuration update**, in **Configuration to merge**, enter the following configuration.

    ```
    {
      "DeviceFleetName": "device-fleet-name",
      "BucketName": "DOC-EXAMPLE-BUCKET"
    }
    ```

    Replace **device-fleet-name** with the name of the edge device fleet that you created, and replace **DOC-EXAMPLE-BUCKET** with the name of the Amazon S3 bucket that is associated with your device fleet.
   c. Choose **Confirm**, and then choose **Next**.
8. On the **Configure advanced settings** page, keep the default configuration settings, and choose **Next**.
9. On the **Review** page, choose **Deploy**.
To deploy your components (AWS CLI)

1. Create a deployment.json file to define the deployment configuration for your SageMaker Edge Manager components. This file should look like the following example.

```json
{
    "targetArn": "targetArn",
    "components": {
        "aws.greengrass.SageMakerEdgeManager": {
            "componentVersion": 1.0.0,
            "configurationUpdate": {
                "merge": {
                    "DeviceFleetName": "device-fleet-name",
                    "BucketName": "DOC-EXAMPLE-BUCKET"
                }
            }
        },
        "com.greengrass.SageMakerEdgeManager.ImageClassification": {
            "componentVersion": 1.0.0,
            "configurationUpdate": {
            }
        },
        "com.greengrass.SageMakerEdgeManager.ImageClassification.Model": {
            "componentVersion": 1.0.0,
            "configurationUpdate": {
            }
        } ...
    }
}
```

- In the targetArn field, replace `targetArn` with the Amazon Resource Name (ARN) of the thing or thing group to target for the deployment, in the following format:
  - Thing: `arn:aws:iot:region:account-id:thing/thingName`
  - Thing group: `arn:aws:iot:region:account-id:thinggroup/thingGroupName`
- In the merge field, replace `device-fleet-name` with the name of the edge device fleet that you created, and replace `DOC-EXAMPLE-BUCKET` with the name of the Amazon S3 bucket that is associated with your device fleet.
- Replace the component versions for each component with the latest available version.

2. Run the following command to deploy the components on the device:

```bash
aws greengrassv2 create-deployment \
    --cli-input-json file://path/to/deployment.json
```

The deployment can take several minutes to complete. In the next step, check the component log to verify that the deployment completed successfully and to view the inference results.

For more information about deploying components to individual devices or groups of devices, see Deploy AWS IoT Greengrass components to devices.

**Deploy the Model Package Directly with SageMaker Edge Manager Deployment API**

SageMaker Edge Manager provides a deployment API that you can use to deploy models to device targets without AWS IoT Greengrass. It is useful in situations where you want to update models independently of firmware updates or application deployment mechanisms. You can use the API to integrate your edge deployments into a CI/CD workflow to automatically deploy models once you have
validated your model for accuracy. The API also has convenient rollback and staged rollout options for you to ensure models work well in a particular environment before wider rollout.

To use the Edge Manager deployment API first compile and package your model. For information on how to compile and package your model, see Train, Compile, and Package Your Model (p. 3017). The following sections of this guide show how you can create edge deployments using SageMaker API, after you have compiled and packaged your models.

Topics
- Create an edge deployment plan (p. 3054)
- Start the edge deployment (p. 3055)
- Check the status of the deployment (p. 3055)

Create an edge deployment plan

You can create an edge deployment plan with the CreateEdgeDeploymentPlan API. The deployment plan can have multiple stages. You can configure each stage to rollout the deployment to a subset of edge devices (by percentage, or by device name). You can also configure how rollout failures are handled at each stage.

The following code snippet shows how you can create an edge deployment plan with 1 stage to deploy a compiled and package model to 2 specific edge devices:

```python
import boto3
client = boto3.client("sagemaker")

client.create_edge_deployment_plan(
    EdgeDeploymentPlanName="edge-deployment-plan-name",
    DeviceFleetName="device-fleet-name",
    ModelConfigs=[
        {
            "EdgePackagingJobName": "edge-packaging-job-name",
            "ModelHandle": "model-handle"
        }
    ],
    Stages=[
        {
            "StageName": "stage-name",
            "DeviceSelectionConfig": {
                "DeviceSubsetType": "SELECTION",
                "DeviceNames": ["device-name-1", "device-name-2"]
            },
            "DeploymentConfig": {
                "FailureHandlingPolicy": "ROLLBACK_ON_FAILURE"
            }
        }
    ]
)
```

Instead of specific devices, if you want to deploy to the model to a percentage of devices in your fleet, then set the value of DeviceSubsetType to "PERCENTAGE" and replace "DeviceNames": ["device-name-1", "device-name-2"] with "Percentage": desired-percentage in the above example.

Stages can be added after the deployment plan has been created with the CreateEdgeDeploymentStage API, in case you want to start rolling out new stages after validating your test rollout success. For more information about deployment stages see DeploymentStage.
Start the edge deployment

After creating the deployment plan and the deployment stages, you can start the deployment with the `StartEdgeDeploymentStage` API.

```
client.start_edge_deployment_stage(
    EdgeDeploymentPlanName="edge-deployment-plan-name",
    StageName="stage-name"
)
```

Check the status of the deployment

You can check the status of the edge deployment with the `DescribeEdgeDeploymentPlan` API.

```
client.describe_edge_deployment_plan(
    EdgeDeploymentPlanName="edge-deployment-plan-name"
)
```

Manage Model

The Edge Manager agent can load multiple models at a time and make inference with loaded models on edge devices. The number of models the agent can load is determined by the available memory on the device. The agent validates the model signature and loads into memory all the artifacts produced by the edge packaging job. This step requires all the required certificates described in previous steps to be installed along with rest of the binary installation. If the model’s signature cannot be validated, then loading of the model fails with appropriate return code and reason.

SageMaker Edge Manager agent provides a list of Model Management APIs that implement control plane and data plane APIs on edge devices. Along with this documentation, we recommend going through the sample client implementation which shows canonical usage of the below described APIs.

The proto file is available as a part of the release artifacts (inside the release tarball). In this doc, we list and describe the usage of APIs listed in this proto file.

**Note**

There is one-to-one mapping for these APIs on Windows release and a sample code for an application implementation in C# shared with the release artifacts for Windows. Below instructions are for running the Agent as a standalone process, applicable for the release artifacts for Linux.

Extract the archive based on your OS. Where VERSION is broken into three components: `<MAJOR_VERSION>.-<YYYY-MM-DD>-<SHA-7>`. See Installing the Edge Manager agent (p. 3042) for information on how to obtain the release version `<MAJOR_VERSION>`, time stamp of the release artifact `<YYYY-MM-DD>`, and the repository commit ID (SHA-7)

**Linux**

The zip archive can be extracted with the command:

```
tar -xvfz <VERSION>.tgz
```

**Windows**

The zip archive can be extracted with the UI or command:
unzip <VERSION>.tgz

The release artifact hierarchy (after extracting the tar/zip archive) is shown below. The agent proto file is available under api/.

```

- Predict (p. 3061)

Load Model

The Edge Manager agent supports loading multiple models. This API validates the model signature and loads into memory all the artifacts produced by the EdgePackagingJob operation. This step requires all the required certificates to be installed along with rest of the agent binary installation. If the model's signature cannot be validated then this step fails with appropriate return code and error messages in the log.

```c
// perform load for a model
// Note:
// 1. currently only local filesystem paths are supported for loading models.
// 2. multiple models can be loaded at the same time, as limited by available device memory
// 3. users are required to unload any loaded model to load another model.
// Status Codes:
// 1. OK - load is successful
// 2. UNKNOWN - unknown error has occurred
// 3. INTERNAL - an internal error has occurred
// 4. NOT_FOUND - model doesn't exist at the url
// 5. ALREADY_EXISTS - model with the same name is already loaded
// 6. RESOURCE_EXHAUSTED - memory is not available to load the model
```
// 7. FAILED_PRECONDITION - model is not compiled for the machine.
//
rpc LoadModel(LoadModelRequest) returns (LoadModelResponse);

Input

//
// request for LoadModel rpc call
//
message LoadModelRequest {
  string url = 1;
  string name = 2;  // Model name needs to match regex "^[a-zA-Z0-9\-]*[a-zA-Z0-9]+"$
}

Output

//
// response for LoadModel rpc call
//
message LoadModelResponse {
  Model model = 1;
}

//
// Model represents the metadata of a model
// url - url representing the path of the model
// name - name of model
// input_tensor_metadatas - TensorMetadata array for the input tensors
// output_tensor_metadatas - TensorMetadata array for the output tensors
//
// Note:
// 1. input and output tensor metadata could empty for dynamic models.
//
message Model {
  string url = 1;
  string name = 2;
  repeated TensorMetadata input_tensor_metadatas = 3;
  repeated TensorMetadata output_tensor_metadatas = 4;
}

Unload Model

Unloads a previously loaded model. It is identified via the model alias which was provided during LoadModel. If the alias is not found or model is not loaded then returns error.

//
// perform unload for a model
// Status Codes:
// 1. OK - unload is successful
// 2. UNKNOWN - unknown error has occurred
// 3. INTERNAL - an internal error has occurred
// 4. NOT_FOUND - model doesn’t exist
//
rpc UnLoadModel(UnLoadModelRequest) returns (UnLoadModelResponse);

Input

//

3057
Manage Model

// request for UnLoadModel rpc call
//
message UnLoadModelRequest {
  string name = 1; // Model name needs to match regex "^[a-zA-Z0-9](-*[a-zA-Z0-9])*$"
}

Output

// // response for UnLoadModel rpc call
//
message UnLoadModelResponse {}

List Models

Lists all the loaded models and their aliases.

// // lists the loaded models
// Status Codes:
// 1. OK - unload is successful
// 2. UNKNOWN - unknown error has occurred
// 3. INTERNAL - an internal error has occurred
// rpc ListModels(ListModelsRequest) returns (ListModelsResponse);

Input

// // request for ListModels rpc call
//
message ListModelsRequest {}

Output

// // response for ListModels rpc call
//
message ListModelsResponse {
  repeated Model models = 1;
}

Describe Model

Describes a model that is loaded on the agent.

// // Status Codes:
// 1. OK - load is successful
// 2. UNKNOWN - unknown error has occurred
// 3. INTERNAL - an internal error has occurred
// 4. NOT_FOUND - model doesn’t exist at the url
// rpc DescribeModel(DescribeModelRequest) returns (DescribeModelResponse);
Input

```protobuf
// request for DescribeModel rpc call
message DescribeModelRequest {
  string name = 1;
}
```

Output

```protobuf
// response for DescribeModel rpc call
message DescribeModelResponse {
  Model model = 1;
}
```

Capture Data

Allows the client application to capture input and output tensors in Amazon S3 bucket, and optionally the auxiliary. The client application is expected to pass a unique capture ID along with each call to this API. This can be later used to query status of the capture.

```protobuf
// allows users to capture input and output tensors along with auxiliary data.
// Status Codes:
// 1. OK - data capture successfully initiated
// 2. UNKNOWN - unknown error has occurred
// 3. INTERNAL - an internal error has occurred
// 5. ALREADY_EXISTS - capture initiated for the given capture_id
// 6. RESOURCE_EXHAUSTED - buffer is full cannot accept any more requests.
// 7. OUT_OF_RANGE - timestamp is in the future.
// 8. INVALID_ARGUMENT - capture_id is not of expected format.
// rpc CaptureData(CaptureDataRequest) returns (CaptureDataResponse);
```

Input

```protobuf
enum Encoding {
  CSV = 0;
  JSON = 1;
  NONE = 2;
  BASE64 = 3;
}
```

```protobuf
// AuxiliaryData represents a payload of extra data to be capture along with inputs and outputs of inference
// encoding - supports the encoding of the data
// data - represents the data of shared memory, this could be passed in two ways:
// a. send across the raw bytes of the multi-dimensional tensor array
// b. send a SharedMemoryHandle which contains the posix shared memory segment id and offset in bytes to location of multi-dimensional tensor array.
message AuxiliaryData {
  string name = 1;
  Encoding encoding = 2;
  oneof data {
```
// Tensor represents a tensor, encoded as contiguous multi-dimensional array.
// tensor_metadata - represents metadata of the shared memory segment
// data_or_handle - represents the data of shared memory, this could be passed in two ways:
// a. send across the raw bytes of the multi-dimensional tensor array
// b. send a SharedMemoryHandle which contains the posix shared memory segment id and offset in bytes to location of multi-dimensional tensor array.

message Tensor {
  TensorMetadata tensor_metadata = 1;  //optional in the predict request
  oneof data {
    bytes byte_data = 4;
    // will only be used for input tensors
    SharedMemoryHandle shared_memory_handle = 5;
  }
}

// request for CaptureData rpc call
// message CaptureDataRequest {
  string model_name = 1;  //uid
  string capture_id = 2;  //uuid string
  Timestamp inference_timestamp = 3;
  repeated Tensor input_tensors = 4;
  repeated Tensor output_tensors = 5;
  repeated AuxilaryData inputs = 6;
  repeated AuxilaryData outputs = 7;
}

Output

// response for CaptureData rpc call
// message CaptureDataResponse {}

Get Capture Status

Depending on the models loaded the input and output tensors can be large (for many edge devices). Capture to the cloud can be time consuming. So the CaptureData() is implemented as an asynchronous operation. A capture ID is a unique identifier that the client provides during capture data call, this ID can be used to query the status of the asynchronous call.

 rpc GetCaptureDataStatus(GetCaptureDataStatusRequest) returns (GetCaptureDataStatusResponse);
Input

```protobuf
// request for GetCaptureDataStatus rpc call
message GetCaptureDataStatusRequest {
  string capture_id = 1;
}
```

Output

```protobuf
enum CaptureDataStatus {
  FAILURE = 0;
  SUCCESS = 1;
  IN_PROGRESS = 2;
  NOT_FOUND = 3;
}

// response for GetCaptureDataStatus rpc call
message GetCaptureDataStatusResponse {
  CaptureDataStatus status = 1;
}
```

**Predict**

The `predict` API performs inference on a previously loaded model. It accepts a request in the form of a tensor that is directly fed into the neural network. The output is the output tensor (or scalar) from the model. This is a blocking call.

```protobuf
// perform inference on a model.
// Note:
// 1. users can chose to send the tensor data in the protobuf message or
// through a shared memory segment on a per tensor basis, the Predict
// method with handle the decode transparently.
// 2. serializing large tensors into the protobuf message can be quite expensive,
// based on our measurements it is recommended to use shared memory of
// tenors larger than 256KB.
// 3. SMEdge IPC server will not use shared memory for returning output tensors,
// i.e., the output tensor data will always send in byte form encoded
// in the tensors of PredictResponse.
// 4. currently SMEdge IPC server cannot handle concurrent predict calls, all
// these call will be serialized under the hood. this shall be addressed
// in a later release.
// Status Codes:
// 1. OK - prediction is successful
// 2. UNKNOWN - unknown error has occurred
// 3. INTERNAL - an internal error has occurred
// 4. NOT_FOUND - when model not found
// 5. INVALID_ARGUMENT - when tenors types mismatch
// rpc Predict(PredictRequest) returns (PredictResponse);
```

Input

```protobuf
// request for Predict rpc call
```
/ message PredictRequest {
  string name = 1;
  repeated Tensor tensors = 2;
}

// Tensor represents a tensor, encoded as contiguous multi-dimensional array.
// tensor_metadata - represents metadata of the shared memory segment
// data_or_handle - represents the data of shared memory, this could be passed in
// two ways:
// a. send across the raw bytes of the multi-dimensional tensor
// array
// b. send a SharedMemoryHandle which contains the posix shared
// memory segment
// id and offset in bytes to location of multi-dimensional
// tensor array.
// message Tensor {
  TensorMetadata tensor_metadata = 1; //optional in the predict request
  oneof data {
    bytes byte_data = 4;
      // will only be used for input tensors
    SharedMemoryHandle shared_memory_handle = 5;
  }
}

// TensorMetadata represents the metadata for a tensor
// name - name of the tensor
// data_type - data type of the tensor
// shape - array of dimensions of the tensor
// message TensorMetadata {
  string name = 1;
  DataType data_type = 2;
  repeated int32 shape = 3;
}

// SharedMemoryHandle represents a posix shared memory segment
// offset - offset in bytes from the start of the shared memory segment.
// segment_id - shared memory segment id corresponding to the posix shared memory
// segment.
// size - size in bytes of shared memory segment to use from the offset position.
Optimize model performance using Neo

Neo is a capability of Amazon SageMaker that enables machine learning models to train once and run anywhere in the cloud and at the edge.

If you are a first time user of SageMaker Neo, we recommend you check out the Getting Started with Edge Devices section to get step-by-step instructions on how to compile and deploy to an edge device.

What is SageMaker Neo?

Generally, optimizing machine learning models for inference on multiple platforms is difficult because you need to hand-tune models for the specific hardware and software configuration of each platform. If you want to get optimal performance for a given workload, you need to know the hardware architecture, instruction set, memory access patterns, and input data shapes, among other factors. For traditional software development, tools such as compilers and profilers simplify the process. For machine learning, most tools are specific to the framework or to the hardware. This forces you into a manual trial-and-error process that is unreliable and unproductive.

Neo automatically optimizes Gluon, Keras, MXNet, PyTorch, TensorFlow, TensorFlow-Lite, and ONNX models for inference on Android, Linux, and Windows machines based on processors from Ambarella, ARM, Intel, Nvidia, NXP, Qualcomm, Texas Instruments, and Xilinx. Neo is tested with computer vision models available in the model zoos across the frameworks. SageMaker Neo supports compilation and deployment for two main platforms: cloud instances (including Inferentia) and edge devices.

For more information about supported frameworks and cloud instance types you can deploy to, see Supported Instance Types and Frameworks (p. 3078) for cloud instances.

For more information about supported frameworks, edge devices, operating systems, chip architectures, and common machine learning models tested by SageMaker Neo for edge devices, see Supported Frameworks, Devices, Systems, and Architectures (p. 3105) for edge devices.

How it Works

Neo consists of a compiler and a runtime. First, the Neo compilation API reads models exported from various frameworks. It converts the framework-specific functions and operations into a framework-agnostic intermediate representation. Next, it performs a series of optimizations. Then it generates
binary code for the optimized operations, writes them to a shared object library, and saves the model definition and parameters into separate files. Neo also provides a runtime for each target platform that loads and executes the compiled model.

You can create a Neo compilation job from either the SageMaker console, the AWS Command Line Interface (AWS CLI), a Python notebook, or the SageMaker SDK. For information on how to compile a model, see Use Neo to Compile a Model (p. 3065). With a few CLI commands, an API invocation, or a few clicks, you can convert a model for your chosen platform. You can deploy the model to a SageMaker endpoint or on an AWS IoT Greengrass device quickly.

Neo can optimize models with parameters either in FP32 or quantized to INT8 or FP16 bit-width.

**Neo Sample Notebooks**

For sample notebooks that use SageMaker Neo to train, compile, optimize, and deploy machine learning models to make inferences, see:

- MNIST Training, Compilation and Deployment with MXNet Module
- MNIST Training, Compilation and Deployment with Tensorflow Module
- Deploying pre-trained PyTorch vision models with SageMaker Neo
- Model Optimization with an Image Classification Example
- Model Optimization with XGBoost Example

For instructions on how to run these example notebooks in SageMaker, see Example Notebooks (p. 306). If you need instructions on how to create a notebook instance to run these examples, see Use Amazon SageMaker Notebook Instances (p. 291). To navigate to the relevant example in your notebook instance,
choose the Amazon SageMaker Examples tab to see a list of all of the SageMaker samples. To open a notebook, choose its Use tab, then choose Create copy.

**Use Neo to Compile a Model**

This section shows how to create, describe, stop, and list compilation jobs. The following options are available in Amazon SageMaker Neo for managing the compilation jobs for machine learning models: the Neo CLI, the Amazon SageMaker console, or the Amazon SageMaker SDK.

**Topics**
- Prepare Model for Compilation (p. 3065)
- Compile a Model (AWS Command Line Interface) (p. 3071)
- Compile a Model (Amazon SageMaker Console) (p. 3073)
- Compile a Model (Amazon SageMaker SDK) (p. 3078)

**Prepare Model for Compilation**

SageMaker Neo requires machine learning models satisfy specific input data shape. The input shape required for compilation depends on the deep learning framework you use. Once your model input shape is correctly formatted, save your model according to the requirements below. Once you have a saved model, compress the model artifacts.

**Topics**
- What input data shapes does SageMaker Neo expect? (p. 3065)
- Saving Models for SageMaker Neo (p. 3066)

**What input data shapes does SageMaker Neo expect?**

Before you compile your model, make sure your model is formatted correctly. Neo expects the name and shape of the expected data inputs for your trained model with JSON format or list format. The expected inputs are framework specific.

Below are the input shapes SageMaker Neo expects:

**Keras**

Specify the name and shape (NCHW format) of the expected data inputs using a dictionary format for your trained model. Note that while Keras model artifacts should be uploaded in NHWC (channel-last) format, DataInputConfig should be specified in NCHW (channel-first) format. The dictionary formats required are as follows:

- For one input: `{'input_1':[1,3,224,224]}`
- For two inputs: `{'input_1': [1,3,224,224], 'input_2':[1,3,224,224]}`

**MXNet/ONNX**

Specify the name and shape (NCHW format) of the expected data inputs using a dictionary format for your trained model. The dictionary formats required are as follows:

- For one input: `{'data':[1,3,1024,1024]}`
- For two inputs: `{'var1': [1,1,28,28], 'var2':[1,1,28,28]}`
PyTorch

Specify the name and shape (NCHW format) of the expected data inputs using a dictionary format for your trained model. Alternatively, you can specify the shape only using a list format. The dictionary formats required are as follows:

- For one input in dictionary format: {'input0':[1,3,224,224]}
- For one input in list format: [[1,3,224,224]]
- For two inputs in dictionary format: {'input0':[1,3,224,224], 'input1':[1,3,224,224]}
- For two inputs in list format: [[1,3,224,224], [1,3,224,224]]

TensorFlow

Specify the name and shape (NHWC format) of the expected data inputs using a dictionary format for your trained model. The dictionary formats required are as follows:

- For one input: {'input':[1,1024,1024,3]}
- For two inputs: {'data1': [1,28,28,1], 'data2':[1,28,28,1]}

TFLite

Specify the name and shape (NHWC format) of the expected data inputs using a dictionary format for your trained model. The dictionary formats required are as follows:

- For one input: {'input':[1,224,224,3]}

Note

SageMaker Neo only supports TensorFlow Lite for edge device targets. For a list of supported SageMaker Neo edge device targets, see the SageMaker Neo Devices (p. 3107) page. For a list of supported SageMaker Neo cloud instance targets, see the SageMaker Neo Supported Instance Types and Frameworks (p. 3078) page.

XGBoost

An input data name and shape are not needed.

Saving Models for SageMaker Neo

The following code examples show how to save your model to make it compatible with Neo. Models must be packaged as compressed tar files (*.tar.gz).

Keras

Keras models require one model definition file (.h5).

There are two options for saving your Keras model in order to make it compatible for SageMaker Neo:

1. Export to .h5 format with model.save("<model-name>", save_format="h5").
2. Freeze the SavedModel after exporting.

Below is an example of how to export a tf.keras model as a frozen graph (option two):

```python
import os
import tensorflow as tf
from tensorflow.keras.applications.resnet50 import ResNet50
from tensorflow.keras import backend
```
tf.keras.backend.set_learning_phase(0)
model = tf.keras.applications.ResNet50(weights='imagenet', include_top=False,
    input_shape=(224, 224, 3), pooling='avg')
model.summary()

# Save as a SavedModel
export_dir = 'saved_model/
model.save(export_dir, save_format='tf')

# Freeze saved model
input_node_names = [inp.name.split(':')[0] for inp in model.inputs]
output_node_names = [output.name.split(':')[0] for output in model.outputs]
print("Input names: ", input_node_names)
with tf.Session() as sess:
    loaded = tf.saved_model.load(sess, export_dir=export_dir, tags=["serve"])
    frozen_graph = tf.graph_util.convert_variables_to_constants(sess,
        sess.graph.as_graph_def(),
        output_node_names)
    tf.io.write_graph(graph_or_graph_def=frozen_graph, logdir=".", name="frozen_graph.pb",
        as_text=False)

import tarfile
tar = tarfile.open("frozen_graph.tar.gz", "w:gz")
tar.add("frozen_graph.pb")
tar.close()

Warning
Do not export your model with the SavedModel class using model.save(<path>,
    save_format='tf'). This format is suitable for training, but it is not suitable for inference.

MXNet

MXNet models must be saved as a single symbol file *-symbol.json and a single parameter *.params
files.

Gluon Models

Define the neural network using the HybridSequential Class. This will run the code in the style of
symbolic programming (as opposed to imperative programming).

def get_net():
    net = nn.HybridSequential()  # Here we use the class HybridSequential.
    net.add(nn.Dense(256, activation='relu'),
        nn.Dense(128, activation='relu'),
        nn.Dense(2))
    net.initialize()
    return net

# Define an input to compute a forward calculation.
x = nd.random.normal(shape=(1, 512))
net = get_net()

# During the forward calculation, the neural network will automatically infer
# the shape of the weight parameters of all the layers based on the shape of
# the input.
net(x)

# hybridize model
net.hybridize()
net(x)
Amazon SageMaker Developer Guide
Compile Models

# export model
net.export('<model_name>') # this will create model-symbol.json and model-0000.params
files
import tarfile
tar = tarfile.open("<model_name>.tar.gz", "w:gz")
for name in ["<model_name>-0000.params", "<model_name>-symbol.json"]:
tar.add(name)
tar.close()

For more information about hybridizing models, see the MXNet hybridize documentation.
Gluon Model Zoo (GluonCV)
GluonCV model zoo models come pre-hybridized. So you can just export them.
import numpy as np
import mxnet as mx
import gluoncv as gcv
from gluoncv.utils import export_block
import tarfile
net = gcv.model_zoo.get_model('<model_name>', pretrained=True) # For example, choose
<model_name> as resnet18_v1
export_block('<model_name>', net, preprocess=True, layout='HWC')
tar = tarfile.open("<model_name>.tar.gz", "w:gz")
for name in ["<model_name>-0000.params", "<model_name>-symbol.json"]:
tar.add(name)
tar.close()

Non Gluon Models
All non-Gluon models when saved to disk use *-symbol and *.params ﬁles. They are therefore
already in the correct format for Neo.
# Pass the following 3 parameters: sym, args, aux
mx.model.save_checkpoint('<model_name>',0,sym,args,aux) # this will create
<model_name>-symbol.json and <model_name>-0000.params files
import tarfile
tar = tarfile.open("<model_name>.tar.gz", "w:gz")
for name in ["<model_name>-0000.params", "<model_name>-symbol.json"]:
tar.add(name)
tar.close()

PyTorch
PyTorch models must be saved as a deﬁnition ﬁle (.pt or .pth) with input datatype of float32.
To save your model, use torch.jit.trace followed by torch.save. This will save an object to a
disk ﬁle and by default uses python pickle (pickle_module=pickle) to save the objects and some
metadata. Next, convert the saved model to a compressed tar ﬁle.
import torchvision
import torch
model = torchvision.models.resnet18(pretrained=True)

3068


model.eval()
inp = torch.rand(1, 3, 224, 224)
model_trace = torch.jit.trace(model, inp)

# Save your model. The following code saves it with the .pth file extension
model_trace.save('model.pth')

# Save as a compressed tar file
import tarfile
with tarfile.open('model.tar.gz', 'w:gz') as f:
    f.add('model.pth')
    f.close()

**TensorFlow**

TensorFlow requires one .pb or one .pbtxt file and a variables directory that contains variables. For frozen models, only one .pb or .pbtxt file is required.

**Pre-Trained Model**

The following code example shows how to use the tar Linux command to compress your model. Run the following in your terminal or in a Jupyter notebook (if you use a Jupyter notebook, insert the ! magic command at the beginning of the statement):

```bash
# Download SSD_Mobilenet trained model
!wget http://download.tensorflow.org/models/object_detection/ssd_mobilenet_v2_coco_2018_03_29.tar.gz

# unzip the compressed tar file
!tar xvf ssd_mobilenet_v2_coco_2018_03_29.tar.gz

# Compress the tar file and save it in a directory called 'model.tar.gz'
!tar czvf model.tar.gz ssd_mobilenet_v2_coco_2018_03_29/frozen_inference_graph.pb
```

The command flags used in this example accomplish the following:

- c: Create an archive
- z: Compress the archive with gzip
- v: Display archive progress
- f: Specify the filename of the archive

**Built-In Estimators**

Built-in estimators are either made by framework-specific containers or algorithm-specific containers. Estimator objects for both the built-in algorithm and framework-specific estimator saves the model in the correct format for you when you train the model using the built-in `.fit` method.

For example, you can use a `sagemaker.TensorFlow` to define a TensorFlow estimator:

```python
from sagemaker.tensorflow import TensorFlow
estimator = TensorFlow(entry_point='mnist.py',
    role=role,  # param role can be arn of a sagemaker execution role
    framework_version='1.15.3',
    py_version='py3',
    training_steps=1000,
    evaluation_steps=100,
    instance_count=2,
    instance_type='ml.c4.xlarge')
```
Then train the model with `.fit` built-in method:

```python
estimator.fit(inputs)
```

Before finally compiling model with the build in `compile_model` method:

```python
# Specify output path of the compiled model
output_path = '/'.join(estimator.output_path.split('/')[:-1])

# Compile model
optimized_estimator = estimator.compile_model(target_instance_family='ml_c5',
                                           input_shape={'data':[1, 784]},  # Batch size 1, 3 channels,
                                           output_path=output_path,
                                           framework='tensorflow', framework_version='1.15.3')
```

You can also use the `sagemaker.estimator.Estimator` Class to initialize an estimator object for training and compiling a built-in algorithm with the `compile_model` method from the SageMaker Python SDK:

```python
import sagemaker
from sagemaker.image_uris import retrieve

sagemaker_session = sagemaker.Session()
aws_region = sagemaker_session.boto_region_name

# Specify built-in algorithm training image
training_image = retrieve(framework='image-classification',
                          region=aws_region, image_scope='training')

# Create estimator object for training
estimator = sagemaker.estimator.Estimator(image_uri=training_image,
                                          role=role,  #param role can be arn of a sagemaker
                                          execution role
                                          instance_count=1,
                                          instance_type='ml.p3.8xlarge',
                                          volume_size = 50,
                                          max_run = 360000,
                                          input_mode= 'File',
                                          output_path=s3_training_output_location,
                                          base_job_name='image-classification-training')

# Setup the input data_channels to be used later for training.
train_data = sagemaker.inputs.TrainingInput(s3_training_data_location,
                                            content_type='application/x-recordio',
                                            s3_data_type='S3Prefix')
validation_data = sagemaker.inputs.TrainingInput(s3_validation_data_location,
                                                content_type='application/x-recordio',
                                                s3_data_type='S3Prefix')
data_channels = {'train': train_data, 'validation': validation_data}

# Train model
estimator.fit(inputs=data_channels, logs=True)

# Compile model with Neo
optimized_estimator = estimator.compile_model(target_instance_family='ml_c5',
                                             ...)
Compile Models

input_shape={'data':[1, 3, 224, 224],
            'softmax_label':[1],
            output_path=s3_compilation_output_location,
            framework='mxnet',
            framework_version='1.7')

For more information about compiling models with the SageMaker Python SDK, see Compile a Model (Amazon SageMaker SDK) (p. 3078).

Compile a Model (AWS Command Line Interface)

This section shows how to manage Amazon SageMaker Neo compilation jobs for machine learning models using AWS Command Line Interface (CLI). You can create, describe, stop, and list the compilation jobs.

1. Create a Compilation Job

   With the CreateCompilationJob API operation, you can specify the data input format, the S3 bucket in which to store your model, the S3 bucket to which to write the compiled model, and the target hardware device or platform.

   The following table demonstrates how to configure CreateCompilationJob API based on whether your target is a device or a platform.

   **Device Example**

   ```json
   {
   "CompilationJobName": "neo-compilation-job-demo",
   "RoleArn": "arn:aws:iam::<your-account>:role/service-role/AmazonSageMaker-ExecutionRole-yyyyymmdTHHMMSS",
   "InputConfig": {
      "S3Uri": "s3://<your-bucket>/sagemaker/neo-compilation-job-demo-data/train",
      "DataInputConfig": "{'data': [1,3,1024,1024]}",
      "Framework": "MXNET"
   },
   "OutputConfig": {
      "S3OutputLocation": "s3://<your-bucket>/sagemaker/neo-compilation-job-demo-data/compile",
      "TargetDevice": "ml_c5"
   },
   "StoppingCondition": {
      "MaxRuntimeInSeconds": 300
   }
   }
   ```

   You can optionally specify the framework version you used with the FrameworkVersion field if you used the PyTorch framework to train your model and your target device is a ml_* target.

   ```json
   {
   "CompilationJobName": "neo-compilation-job-demo",
   "RoleArn": "arn:aws:iam::<your-account>:role/service-role/AmazonSageMaker-ExecutionRole-yyyyymmdTHHMMSS",
   "InputConfig": {
      "S3Uri": "s3://<your-bucket>/sagemaker/neo-compilation-job-demo-data/train",
      "DataInputConfig": "{'data': [1,3,1024,1024]}",
      "Framework": "PYTORCH"
   },
   "OutputConfig": {
      "S3OutputLocation": "s3://<your-bucket>/sagemaker/neo-compilation-job-demo-data/compile",
      "TargetDevice": "ml_c5"
   },
   "StoppingCondition": {
      "MaxRuntimeInSeconds": 300
   }
   }
   ```

3071
# excluding ml_inf. Supported values are 1.4 or 1.5 or 1.6. Default is 1.6
"FrameworkVersion": "1.6"
},
"OutputConfig": {
  "S3OutputLocation": "s3://your-bucket/sagemaker/neo-compilation-job-demo-data/compile",
  # A target device specification example for a ml_c5 instance family
  "TargetDevice": "ml_c5",
  # When compiling for ml_* instances using PyTorch framework, use the
  "CompilerOptions" field in
  # OutputConfig to provide the correct data type ("dtype") of the model’s
  input. Default assumed is "float32"
  "CompilerOptions": {
    "dtype": 'long'}
},
"StoppingCondition": {
  "MaxRuntimeInSeconds": 300
}
}

Note
This API field is only supported for PyTorch.

Platform Example

```
{
  "CompilationJobName": "neo-test-compilation-job",
  "RoleArn": "arn:aws:iam::your-account:role/service-role/AmazonSageMaker-ExecutionRole-yyyyymmddThhmmss",
  "InputConfig": {
    "S3Uri": "s3://your-bucket/sagemaker/neo-compilation-job-demo-data/train",
    "DataInputConfig": {
      "data": [1,3,1024,1024]
    },
    "Framework": "MXNET"
  },
  "OutputConfig": {
    "S3OutputLocation": "s3://your-bucket/sagemaker/neo-compilation-job-demo-data/compile",
    # A target platform configuration example for a p3.2xlarge instance
    "TargetPlatform": {
      "Os": "LINUX",
      "Arch": "X86_64",
      "Accelerator": "NVIDIA"
    },
    "CompilerOptions": {
      "cuda-ver": '10.0', 'trt-ver': '6.0.1', 'gpu-code': 'sm_70'
    },
    "StoppingCondition": {
      "MaxRuntimeInSeconds": 300
    }
  }
}
```

Note
For the OutputConfig API operation, the TargetDevice and TargetPlatform API operations are mutually exclusive. You have to choose one of the two options.

To find the JSON string examples of DataInputConfig depending on frameworks, see What input data shapes Neo expects.

For more information about setting up the configurations, see the InputConfig, OutputConfig, and TargetPlatform API operations in the SageMaker API reference.

2. After you configure the JSON file, run the following command to create the compilation job:
aws sagemaker create-compilation-job
--cli-input-json file://job.json
--region us-west-2

# You should get CompilationJobArn

3. Describe the compilation job by running the following command:

```bash
da sagemaker describe-compilation-job
--compilation-job-name $JOB_NM
--region us-west-2
```

4. Stop the compilation job by running the following command:

```bash
da sagemaker stop-compilation-job
--compilation-job-name $JOB_NM
--region us-west-2
```

# There is no output for compilation-job operation

5. List the compilation job by running the following command:

```bash
da sagemaker list-compilation-jobs
--region us-west-2
```

**Compile a Model (Amazon SageMaker Console)**

You can create an Amazon SageMaker Neo compilation job in the Amazon SageMaker console.

1. In the Amazon SageMaker console, choose **Compilation jobs**, and then choose **Create compilation job**.

2. On the **Create compilation job** page, under **Job name**, enter a name. Then select an **IAM role**.
3. If you don’t have an IAM role, choose **Create a new role**.

4. On the **Create an IAM role** page, choose **Any S3 bucket**, and choose **Create role**.
5. Non PyTorch Frameworks

Within the **Input configuration** section, enter the full path of the Amazon S3 bucket URI that contains your model artifacts in the **Location of model artifacts** input field. Your model artifacts must be in a compressed tarball file format (.tar.gz).

For the **Data input configuration** field, enter the JSON string that specifies the shape of the input data. For **Machine learning framework**, choose the framework of your choice.

To find the JSON string examples of input data shapes depending on frameworks, see [What input data shapes Neo expects](#).

**PyTorch Framework**

Similar instructions apply for compiling PyTorch models. However, if you trained with PyTorch and are trying to compile the model for ml_* (except ml_inf) target, you can optionally specify the version of PyTorch you used.

To find the JSON string examples of input data shapes depending on frameworks, see [What input data shapes Neo expects](#).
Note
When compiling for ml_* instances using PyTorch framework, use Compiler options field in Output Configuration to provide the correct data type (dtype) of the model’s input. The default is set to “float32”.

Output configuration
Amazon SageMaker needs to know where to store the modules compiled with this job. Learn more

- Target device
  Choose the target device or the machine learning instance that you want to run your model on after the compilation has completed.
- Target platform
  Control the target platform that you want your model to run on, such as OS, architecture, and accelerators.

Target device
Amazon SageMaker needs to know where you intend to deploy your model to an Amazon SageMaker ML instance or to an AWS IoT Greengrass device.

Compiler options - optional
Specify additional parameters for compiler options in JSON format.

S3 Output location
Amazon SageMaker needs the path to the S3 bucket or folder where you want to store the compiled module.

Encryption key – optional
Encrypt your data. Choose an existing KMS key or enter a key's ARN.

Warning
If you specify an Amazon S3 bucket URI path that leads to .pth file, you will receive the following error after starting compilation: ClientError: InputConfiguration: Unable to untar input model. Please confirm the model is a tar.gz file

6. Go to the Output configuration section. Choose where you want to deploy your model. You can deploy your model to a Target device or a Target platform. Target devices include cloud and edge devices. Target platforms refer to specific OS, architecture, and accelerators you want your model to run on.

For S3 Output location, enter the path to the S3 bucket where you want to store the model. You can optionally add compiler options in JSON format under the Compiler options section.
7. Check the status of the compilation job when started. This status of the job can be found at the top of the Compilation Job page, as shown in the following screenshot. You can also check the status of it in the Status column.

8. Check the status of the compilation job when completed. You can check the status in the Status column as shown in the following screenshot.
Compile a Model (Amazon SageMaker SDK)

You can use the `compile_model` API in the Amazon SageMaker SDK for Python to compile a trained model and optimize it for specific target hardware. The API should be invoked on the estimator object used during model training.

**Note**

You must set `MMS_DEFAULT_RESPONSE_TIMEOUT` environment variable to 500 when compiling the model with MXNet or PyTorch. The environment variable is not needed for TensorFlow.

The following is an example of how you can compile a model using the `trained_model_estimator` object:

```python
# Replace the value of expected_trained_model_input below and
# specify the name & shape of the expected inputs for your trained model
expected_trained_model_input = {'data':[1, 784]}

# Replace the example target_instance_family below to your preferred target_instance_family
compiled_model = trained_model_estimator.compile_model(target_instance_family='ml_c5',
                                                      input_shape=expected_trained_model_input,
                                                      output_path='insert s3 output path',
                                                      env={'MMS_DEFAULT_RESPONSE_TIMEOUT': '500'})
```

The code compiles the model, saves the optimized model at `output_path`, and creates a SageMaker model that can be deployed to an endpoint. Sample notebooks of using the SDK for Python are provided in the Neo Model Compilation Sample Notebooks section.

Cloud Instances

Amazon SageMaker Neo provides compilation support for popular machine learning frameworks such as TensorFlow, PyTorch, MXNet, and more. You can deploy your compiled model to cloud instances and AWS Inferentia instances. For a full list of supported frameworks and instances types, see Supported Instances Types and Frameworks.

You can compile your model in one of three ways: through the AWS CLI, the SageMaker Console, or the SageMaker SDK for Python. See, Use Neo to Compile a Model for more information. Once compiled, your model artifacts are stored in the Amazon S3 bucket URI you specified during the compilation job. You can deploy your compiled model to cloud instances and AWS Inferentia instances using the SageMaker SDK for Python, AWS SDK for Python (Boto3), AWS CLI, or the AWS console.

If you deploy your model using AWS CLI, the console, or Boto3, you must select a Docker image Amazon ECR URI for your primary container. See Neo Inference Container Images for a list of Amazon ECR URIs.

**Topics**

- Supported Instance Types and Frameworks (p. 3078)
- Deploy a Model (p. 3082)
- Request Inferences from a Deployed Service (p. 3099)
- Inference Container Images (p. 3102)

**Supported Instance Types and Frameworks**

Amazon SageMaker Neo supports popular deep learning frameworks for both compilation and deployment. You can deploy your model to cloud instances, AWS Inferentia instance types, or Amazon Elastic Inference accelerators.
The following describes frameworks SageMaker Neo supports and the target cloud instances you can compile and deploy to. For information on how to deploy your compiled model to a cloud or Inferentia instance, see Deploy a Model with Cloud Instances. For information on how to deploy your compiled model with Elastic Inference accelerators, see Use EI on Amazon SageMaker Hosted Endpoints (p. 3137).

Cloud Instances

SageMaker Neo supports the following deep learning frameworks for CPU and GPU cloud instances:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>MXNet</td>
<td>1.8.0</td>
<td>Supports 1.8.0 or earlier</td>
<td>Image Classification, Object Detection, Semantic Segmentation, Pose Estimation, Activity Recognition</td>
<td>One symbol file (.json) and one parameter file (.params)</td>
<td>GluonCV v0.8.0</td>
</tr>
<tr>
<td>ONNX</td>
<td>1.7.0</td>
<td>Supports 1.7.0 or earlier</td>
<td>Image Classification, SVM</td>
<td>One model file (.onnx)</td>
<td></td>
</tr>
<tr>
<td>Keras</td>
<td>2.2.4</td>
<td>Supports 2.2.4 or earlier</td>
<td>Image Classification</td>
<td>One model definition file (.h5)</td>
<td></td>
</tr>
<tr>
<td>PyTorch</td>
<td>1.4, 1.5, 1.6, 1.7 or 1.8</td>
<td>Supports 1.4, 1.5, 1.6, 1.7 and 1.8</td>
<td>Image Classification</td>
<td>One model definition file (.pt or .pth) with input dtype of float32</td>
<td></td>
</tr>
<tr>
<td>TensorFlow</td>
<td>1.15.3 or 2.9</td>
<td>Supports 1.15.3 and 2.9</td>
<td>Image Classification</td>
<td>For saved models, one .pb or one .pbtxt file and a variables directory that contains variables For frozen models, only one .pb or .pbtxt file</td>
<td></td>
</tr>
<tr>
<td>XGBoost</td>
<td>1.3.3</td>
<td>Supports 1.3.3 or earlier</td>
<td>Decision Trees</td>
<td>One XGBoost model file (.model) where the number of</td>

<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>nodes in a tree is less than 2^31</td>
</tr>
</tbody>
</table>

**Note**

"Model Version" is the version of the framework used to train and export the model.

**Instance Types**

You can deploy your SageMaker compiled model to one of the cloud instances listed below:

<table>
<thead>
<tr>
<th>Instance</th>
<th>Compute Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ml_c4</td>
<td>Standard</td>
</tr>
<tr>
<td>ml_c5</td>
<td>Standard</td>
</tr>
<tr>
<td>ml_m4</td>
<td>Standard</td>
</tr>
<tr>
<td>ml_m5</td>
<td>Standard</td>
</tr>
<tr>
<td>ml_p2</td>
<td>Accelerated computing</td>
</tr>
<tr>
<td>ml_p3</td>
<td>Accelerated computing</td>
</tr>
<tr>
<td>ml_g4dn</td>
<td>Accelerated computing</td>
</tr>
</tbody>
</table>

For information on the available vCPU, memory, and price per hour for each instance type, see Amazon SageMaker Pricing.

**Note**

When compiling for ml_* instances using PyTorch framework, use Compiler options field in Output Configuration to provide the correct data type (dtype) of the model's input. The default is set to "float32".

**AWS Inferentia**

SageMaker Neo supports the following deep learning frameworks for Inferentia:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>MXNet</td>
<td>1.5 or 1.8</td>
<td>Supports 1.8, 1.5 and earlier</td>
<td>Image Classification, Object Detection, Semantic</td>
<td>One symbol file (.json) and one parameter file (.params)</td>
<td>GluonCV v0.8.0</td>
</tr>
<tr>
<td>-----------</td>
<td>------------------</td>
<td>---------------</td>
<td>--------</td>
<td>--------------------------------------</td>
<td>---------</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Segmentation, Pose Estimation, Activity Recognition</td>
<td></td>
</tr>
<tr>
<td>PyTorch</td>
<td>1.7, 1.8 or 1.9</td>
<td>Supports 1.9 and earlier</td>
<td>Image Classification</td>
<td>One model definition file (.pt or .pth) with input dtype of float32</td>
<td></td>
</tr>
<tr>
<td>TensorFlow</td>
<td>1.15 or 2.5</td>
<td>Supports 2.5, 1.15 and earlier</td>
<td>Image Classification</td>
<td>For saved models, one .pb or one .pbtxt file and a variables directory that contains variables. For frozen models, only one .pb or .pbtxt file.</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

"Model Version" is the version of the framework used to train and export the model.

You can deploy your SageMaker Neo-compiled model to AWS Inferentia-based Amazon EC2 Inf1 instances. AWS Inferentia is Amazon's first custom silicon chip designed to accelerate deep learning. Currently, you can use the ml_inf1 instance to deploy your compiled models.

**Amazon Elastic Inference**

SageMaker Neo supports the following deep learning frameworks for Elastic Inference:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>TensorFlow</td>
<td>2.3.2</td>
<td>Supports 2.3</td>
<td>Image Classification, Object Detection, Semantic Segmentation, Pose Estimation, Activity Recognition</td>
<td>For saved models, one .pb or one .pbtxt file and a variables directory that contains variables. For frozen models, only one .pb or .pbtxt file.</td>
</tr>
</tbody>
</table>
You can deploy your SageMaker Neo-compiled model to an Elastic Inference Accelerator. For more information, see Use EI on Amazon SageMaker Hosted Endpoints (p. 3137).

**Deploy a Model**

To deploy an Amazon SageMaker Neo-compiled model to an HTTPS endpoint, you must configure and create the endpoint for the model using Amazon SageMaker hosting services. Currently, developers can use Amazon SageMaker APIs to deploy modules on to ml.c5, ml.c4, ml.m5, ml.m4, ml.p3, ml.p2, and ml.inf1 instances.

For **Inf1 instances**, models need to be compiled specifically for ml.inf1 instances. Models compiled for other instance types are not guaranteed to work with ml.inf1 instances.

For **Elastic Inference accelerators**, models need to be compiled specifically for ml_eia2 devices. For information on how to deploy your compiled model to an Elastic Inference accelerator, see Use EI on Amazon SageMaker Hosted Endpoints (p. 3137).

When you deploy a compiled model, you need to use the same instance for the target that you used for compilation. This creates a SageMaker endpoint that you can use to perform inferences. You can deploy a Neo-compiled model using any of the following: Amazon SageMaker SDK for Python, SDK for Python (Boto3), AWS Command Line Interface, and the SageMaker console [https://console.aws.amazon.com/SageMaker].

**Note**
For deploying a model using AWS CLI, the console, or Boto3, see Neo Inference Container Images to select the inference image URI for your primary container.

**Topics**

- Prerequisites (p. 3082)
- Deploy a Compiled Model Using SageMaker SDK (p. 3088)
- Deploy a Compiled Model Using Boto3 (p. 3091)
- Deploy a Compiled Model Using the AWS CLI (p. 3092)
- Deploy a Compiled Model Using the Console (p. 3094)

**Prerequisites**

**Note**
Follow the instructions in this section if you compiled your model using AWS SDK for Python (Boto3), AWS CLI, or the SageMaker console.

To create a SageMaker Neo-compiled model, you need the following:

1. A Docker image Amazon ECR URI. You can select one that meets your needs from this list.
2. An entry point script file:
   a. **For PyTorch and MXNet models:**

   *If you trained your model using SageMaker*, the training script must implement the functions described below. The training script serves as the entry point script during inference. In the example detailed in MNIST Training, Compilation and Deployment with MXNet Module and SageMaker Neo, the training script (mnist.py) implements the required functions.

   *If you did not train your model using SageMaker*, you need to provide an entry point script (inference.py) file that can be used at the time of inference. Based on the framework—MXNet or PyTorch—the inference script location must conform to the SageMaker Python SDK Model Directory Structure for MxNet or Model Directory Structure for PyTorch.
When using Neo Inference Optimized Container images with **PyTorch** and **MXNet** on CPU and GPU instance types, the inference script must implement the following functions:

- **model_fn**: Loads the model. (Optional)
- **input_fn**: Converts the incoming request payload into a numpy array.
- **predict_fn**: Performs the prediction.
- **output_fn**: Converts the prediction output into the response payload.
- Alternatively, you can define **transform_fn** to combine **input_fn**, **predict_fn**, and **output_fn**.

The following are examples of inference.py script within a directory named code (code/inference.py) for **PyTorch** and **MXNet (Gluon and Module)**. The examples first load the model and then serve it on image data on a GPU:

**MXNet Module**

```python
import numpy as np
import json
import mxnet as mx
import neomx  # noqa: F401
from collections import namedtuple

Batch = namedtuple('Batch', ['data'])

# Change the context to mx.cpu() if deploying to a CPU endpoint
ctx = mx.gpu()

def model_fn(model_dir):
    # The compiled model artifacts are saved with the prefix 'compiled'
    sym, arg_params, aux_params = mx.model.load_checkpoint('compiled', 0)
    mod = mx.mod.Module(symbol=sym, context=ctx, label_names=None)
    exe = mod.bind(for_training=False,
                   data_shapes=[('data', (1,3,224,224))],
                   label_shapes=mod._label_shapes)
    mod.set_params(arg_params, aux_params, allow_missing=True)
    # Run warm-up inference on empty data during model load (required for GPU)
    data = mx.nd.empty((1,3,224,224), ctx=ctx)
    mod.forward(Batch([data]))
    return mod

def transform_fn(mod, image, input_content_type, output_content_type):
    # pre-processing
    decoded = mx.image.imdecode(image)
    resized = mx.image.resize_short(decoded, 224)
    cropped, crop_info = mx.image.center_crop(resized, (224, 224))
    normalized = mx.image.color_normalize(cropped.astype(np.float32) / 255,
                                           mean=mx.nd.array([0.485, 0.456, 0.406]),
                                           std=mx.nd.array([0.229, 0.224, 0.225]))
    transposed = normalized.transpose((2, 0, 1))
    batchified = transposed.expand_dims(axis=0)
    casted = batchified.astype(dtype='float32')
    processed_input = casted.as_in_context(ctx)

    # prediction/inference
    mod.forward(Batch([processed_input]))

    # post-processing
    prob = mod.get_outputs()[0].asnumpy().tolist()
```

prob_json = json.dumps(prob)
return prob_json, output_content_type

**MXNet Gluon**

```python
import numpy as np
import json
import mxnet as mx
import neomx  # noqa: F401

# Change the context to mx.cpu() if deploying to a CPU endpoint
ctx = mx.gpu()

def model_fn(model_dir):
    # The compiled model artifacts are saved with the prefix 'compiled'
    block = mx.gluon.nn.SymbolBlock.imports('compiled-symbol.json',
                                           ['data'],
                                           'compiled-0000.params',
                                           ctx=ctx)

    # Hybridize the model & pass required options for Neo: static_alloc=True &
    # static_shape=True
    block.hybridize(static_alloc=True, static_shape=True)

    # Run warm-up inference on empty data during model load (required for GPU)
    data = mx.nd.empty((1,3,224,224), ctx=ctx)
    warm_up = block(data)
    return block

def input_fn(image, input_content_type):
    # pre-processing
    decoded = mx.image.imdecode(image)
    resized = mx.image.resize_short(decoded, 224)
    cropped, crop_info = mx.image.center_crop(resized, (224, 224))
    normalized = mx.image.color_normalize(cropped.astype(np.float32) / 255,
                                           mean=mx.nd.array([0.485, 0.456, 0.406]),
                                           std=mx.nd.array([0.229, 0.224, 0.225]))
    transposed = normalized.transpose((2, 0, 1))
    batchified = transposed.expand_dims(axis=0)
    casted = batchified.astype(dtype='float32')
    processed_input = casted.as_in_context(ctx)
    return processed_input

def predict_fn(processed_input_data, block):
    # prediction/inference
    prediction = block(processed_input_data)
    return prediction

def output_fn(prediction, output_content_type):
    # post-processing
    prob = prediction.asnumpy().tolist()
    prob_json = json.dumps(prob)
    return prob_json, output_content_type

**PyTorch 1.4 and Older**

```python
import os
import torch
import torch.nn.parallel
import torch.optim
import torch.utils.data
import torch.utils.data.distributed
import torchvision.transforms as transforms
```
```
from PIL import Image
import io
import json
import pickle

def model_fn(model_dir):
    """Load the model and return it.
    Providing this function is optional.
    There is a default model_fn available which will load the model
    compiled using SageMaker Neo. You can override it here.
    
    Keyword arguments:
    model_dir -- the directory path where the model artifacts are present
    """

    # The compiled model is saved as "compiled.pt"
    model_path = os.path.join(model_dir, 'compiled.pt')
    with torch.neo.config(model_dir=model_dir, neo_runtime=True):
        model = torch.jit.load(model_path)
        device = torch.device("cuda" if torch.cuda.is_available() else "cpu")
        model = model.to(device)
        # We recommend that you run warm-up inference during model load
        sample_input_path = os.path.join(model_dir, 'sample_input.pkl')
        with open(sample_input_path, 'rb') as input_file:
            model_input = pickle.load(input_file)
        if torch.is_tensor(model_input):
            model_input = model_input.to(device)
        elif isinstance(model_input, tuple):
            model_input = (inp.to(device) for inp in model_input if
            torch.is_tensor(inp))
        else:
            print("Only supports a torch tensor or a tuple of torch tensors")
        return model

def transform_fn(model, request_body, request_content_type,
                 response_content_type):
    """Run prediction and return the output.
    The function
    1. Pre-processes the input request
    2. Runs prediction
    3. Post-processes the prediction output.

import json
import pickle

def model_fn(model_dir):
    """Load the model and return it."
    # The compiled model is saved as "model.pt"
    model_path = os.path.join(model_dir, 'model.pt')
    device = torch.device("cuda" if torch.cuda.is_available() else "cpu")
    model = torch.jit.load(model_path, map_location=device)
    model = model.to(device)
    return model

def transform_fn(model, request_body, request_content_type, response_content_type):
    """Run prediction and return the output."
    # preprocess
    decoded = Image.open(io.BytesIO(request_body))
    preprocess = transforms.Compose([
        transforms.Resize(256),
        transforms.CenterCrop(224),
        transforms.ToTensor(),
        transforms.Normalize(mean=[
            0.485, 0.456, 0.406], std=[
            0.229, 0.224, 0.225]),
    ])
    normalized = preprocess(decoded)
    batchified = normalized.unsqueeze(0)

    # predict
    device = torch.device("cuda" if torch.cuda.is_available() else "cpu")
    batchified = batchified.to(device)
    output = model.forward(batchified)
    return json.dumps(output.cpu().numpy().tolist()), response_content_type
b. For inf1 instances or onnx, xgboost, keras container images

For all other Neo Inference-optimized container images, or inferentia instance types, the entry point script must implement the following functions for Neo Deep Learning Runtime:

- neo_preprocess: Converts the incoming request payload into a numpy array.
- neo_postprocess: Converts the prediction output from Neo Deep Learning Runtime into the response body.

**Note**
The preceding two functions do not use any of the functionalities of MXNet, PyTorch, or TensorFlow.

For examples of how to use these functions, see Neo Model Compilation Sample Notebooks.

c. For TensorFlow models

If your model requires custom pre- and post-processing logic before data is sent to the model, then you must specify an entry point script inference.py file that can be used at the time of inference. The script should implement either a either a pair of input_handler and output_handler functions or a single handler function.

**Note**
Note that if handler function is implemented, input_handler and output_handler are ignored.

The following is a code example of inference.py script that you can put together with the compile model to perform custom pre- and post-processing on an image classification model. The SageMaker client sends the image file as an application/x-image content type to the input_handler function, where it is converted to JSON. The converted image file is then sent to the TensorFlow Model Server (TFX) using the REST API.

```python
import json
import numpy as np
import json
import io
from PIL import Image
from tensorflow_serving.apis import predict_pb2
from tensorflow_serving.apis import prediction_service_pb2

def input_handler(data, context):
    """ Pre-process request input before it is sent to TensorFlow Serving REST API ""

    Args:
    data (obj): the request data, in format of dict or string
    context (Context): an object containing request and configuration details

    Returns:
    (dict): a JSON-serializable dict that contains request body and headers
    """
    f = data.read()
    f = io.BytesIO(f)
    image = Image.open(f).convert('RGB')
    batch_size = 1
    image = np.asarray(image.resize((512, 512)))
    image = np.concatenate([image[np.newaxis, :, :] * batch_size]
    image = json.dumps(
        "signature_name": "serving_default",
        "instances":
            image.tolist()"
    return body
```
def output_handler(data, context):
    """Post-process TensorFlow Serving output before it is returned to the client.
    Args:
    data (obj): the TensorFlow serving response
    context (Context): an object containing request and configuration details
    Returns:
    (bytes, string): data to return to client, response content type
    """
    if data.status_code != 200:
        raise ValueError(data.content.decode('utf-8'))
    response_content_type = context.accept_header
    prediction = data.content
    return prediction, response_content_type

If there is no custom pre- or post-processing, the SageMaker client converts the file image to JSON in a similar way before sending it over to the SageMaker endpoint.

For more information, see the Deploying to TensorFlow Serving Endpoints in the SageMaker Python SDK.

3. The Amazon S3 bucket URI that contains the compiled model artifacts.

Deploy a Compiled Model Using SageMaker SDK

You must satisfy the prerequisites section if the model was compiled using AWS SDK for Python (Boto3), AWS CLI, or the Amazon SageMaker console. Follow one of the following use cases to deploy a model compiled with SageMaker Neo based on how you compiled your model.

Topics
- If you compiled your model using the SageMaker SDK (p. 3088)
- If you compiled your model using MXNet or PyTorch (p. 3088)
- If you compiled your model using Boto3, SageMaker console, or the CLI for TensorFlow (p. 3090)

If you compiled your model using the SageMaker SDK

The sagemaker.Model object handle for the compiled model supplies the deploy() function, which enables you to create an endpoint to serve inference requests. The function lets you set the number and type of instances that are used for the endpoint. You must choose an instance for which you have compiled your model. For example, in the job compiled in Compile a Model (Amazon SageMaker SDK) section, this is ml_c5.

predictor = compiled_model.deploy(initial_instance_count = 1, instance_type = 'ml.c5.4xlarge')

# Print the name of newly created endpoint
print(predictor.endpoint_name)

If you compiled your model using MXNet or PyTorch

Create the SageMaker model and deploy it using the deploy() API under the framework-specific Model APIs. For MXNet, it is MXNetModel and for PyTorch, it is PyTorchModel. When you are creating and deploying an SageMaker model, you must set MMS_DEFAULT_RESPONSE_TIMEOUT environment variable to 500 and specify the entry_point parameter as the inference script (inference.py) and the source_dir parameter as the directory location (code) of the inference script. To prepare the inference script (inference.py) follow the Prerequisites step.
The following example shows how to use these functions to deploy a compiled model using the SageMaker SDK for Python:

**MXNet**

```python
from sagemaker.mxnet import MXNetModel

# Create SageMaker model and deploy an endpoint
sm_mxnet_compiled_model = MXNetModel(
    model_data='insert S3 path of compiled MXNet model archive',
    role='AmazonSageMaker-ExecutionRole',
    entry_point='inference.py',
    source_dir='code',
    framework_version='1.8.0',
    py_version='py3',
    image_uri='insert appropriate ECR Image URI for MXNet',
    env={'MMS_DEFAULT_RESPONSE_TIMEOUT': '500'},
)

# Replace the example instance_type below to your preferred instance_type
predictor = sm_mxnet_compiled_model.deploy(initial_instance_count = 1, instance_type = 'ml.p3.2xlarge')

# Print the name of newly created endpoint
print(predictor.endpoint_name)
```

**PyTorch 1.4 and Older**

```python
from sagemaker.pytorch import PyTorchModel

# Create SageMaker model and deploy an endpoint
sm_pytorch_compiled_model = PyTorchModel(
    model_data='insert S3 path of compiled PyTorch model archive',
    role='AmazonSageMaker-ExecutionRole',
    entry_point='inference.py',
    source_dir='code',
    framework_version='1.4.0',
    py_version='py3',
    image_uri='insert appropriate ECR Image URI for PyTorch',
    env={'MMS_DEFAULT_RESPONSE_TIMEOUT': '500'},
)

# Replace the example instance_type below to your preferred instance_type
predictor = sm_pytorch_compiled_model.deploy(initial_instance_count = 1, instance_type = 'ml.p3.2xlarge')

# Print the name of newly created endpoint
print(predictor.endpoint_name)
```

**PyTorch 1.5 and Newer**

```python
from sagemaker.pytorch import PyTorchModel

# Create SageMaker model and deploy an endpoint
sm_pytorch_compiled_model = PyTorchModel(
    model_data='insert S3 path of compiled PyTorch model archive',
    role='AmazonSageMaker-ExecutionRole',
    entry_point='inference.py',
    source_dir='code',
    framework_version='1.5',
    py_version='py3',
    image_uri='insert appropriate ECR Image URI for PyTorch',
)
```
# Replace the example instance_type below to your preferred instance_type
predictor = sm_pytorch_compiled_model.deploy(initial_instance_count = 1, instance_type = 'ml.p3.2xlarge')

# Print the name of newly created endpoint
print(predictor.endpoint_name)

**Note**
The AmazonSageMakerFullAccess and AmazonS3ReadOnlyAccess policies must be attached to the AmazonSageMaker-ExecutionRole IAM role.

If you compiled your model using Boto3, SageMaker console, or the CLI for TensorFlow

Construct a TensorFlowModel object, then call deploy:

```python
role='AmazonSageMaker-ExecutionRole'
model_path='S3 path for model file'
framework_image='inference container arn'
tf_model = TensorFlowModel(model_data=model_path,
                           framework_version='1.15.3',
                           role=role,
                           image_uri=framework_image)
instance_type='ml.c5.xlarge'
predictor = tf_model.deploy(instance_type=instance_type,
                            initial_instance_count=1)
```

See Deploying directly from model artifacts for more information.

You can select a Docker image Amazon ECR URI that meets your needs from this list.

For more information on how to construct a TensorFlowModel object, see the SageMaker SDK.

**Note**
Your first inference request might have high latency if you deploy your model on a GPU. This is because an optimized compute kernel is made on the first inference request. We recommend that you make a warm-up file of inference requests and store that alongside your model file before sending it off to a TFX. This is known as “warming up” the model.

The following code snippet demonstrates how to produce the warm-up file for image classification example in the prerequisites section:

```python
import tensorflow as tf
from tensorflow_serving.apis import classification_pb2
from tensorflow_serving.apis import inference_pb2
from tensorflow_serving.apis import model_pb2
from tensorflow_serving.apis import predict_pb2
from tensorflow_serving.apis import prediction_log_pb2
import numpy as np

with tf.python_io.TFRecordWriter("tf_serving_warmup_requests") as writer:
    img = np.random.uniform(0, 1, size=[224, 224, 3]).astype(np.float32)
    img = np.expand_dims(img, axis=0)
    test_data = np.repeat(img, 1, axis=0)
    request = predict_pb2.PredictRequest()
    request.model_spec.name = 'compiled_models'
    request.model_spec.signature_name = 'serving_default'
    request.inputs["Placeholder:0'].CopyFrom(tf.compat.v1.make_tensor_proto(test_data, shape=test_data.shape, dtype=tf.float32))
```

---

3090
log = prediction_log_pb2.PredictionLog(
predict_log=prediction_log_pb2.PredictLog(request=request))
writer.write(log.SerializeToString())

For more information on how to “warm up” your model, see the TensorFlow TFX page.

Deploy a Compiled Model Using Boto3

You must satisfy the prerequisites section if the model was compiled using AWS SDK for Python (Boto3), AWS CLI, or the Amazon SageMaker console. Follow the steps below to create and deploy a SageMaker Neo-compiled model using Amazon Web Services SDK for Python (Boto3).

Topics
• Deploy the Model (p. 3091)

Deploy the Model

After you have satisfied the prerequisites, use the create_model, create_endpoint_config, and create_endpoint APIs.

The following example shows how to use these APIs to deploy a model compiled with Neo:

```python
import boto3
client = boto3.client('sagemaker')

# create sagemaker model
create_model_api_response = client.create_model(
    ModelName='my-sagemaker-model',
    PrimaryContainer={
        'Image': '<insert the ECR Image URI>',
        'ModelDataUrl': 's3://path/to/model/artifact/model.tar.gz',
        'Environment': {}
    },
    ExecutionRoleArn='ARN for AmazonSageMaker-
    ExecutionRole'
)

print ('create_model API response', create_model_api_response)

# create sagemaker endpoint config
create_endpoint_config_api_response = client.create_endpoint_config(
    EndpointConfigName='sagemaker-neomxnet-endpoint-configuration',
    ProductionVariants=[
        {'VariantName': '<provide your variant name>',
         'ModelName': 'my-sagemaker-model',
         'InitialInstanceCount': 1,
         'InstanceType': '<provide your instance type here>'
        },
    ],
)

print ('create_endpoint_config API response', create_endpoint_config_api_response)

# create sagemaker endpoint
create_endpoint_api_response = client.create_endpoint(
    EndpointName='<provide your endpoint name>',
    EndpointConfigName='<insert your endpoint config name>',
)```
Note
The AmazonSageMakerFullAccess and AmazonS3ReadOnlyAccess policies must be
attached to the AmazonSageMaker-ExecutionRole IAM role.

For full syntax of create_model, create_endpoint_config, and create_endpoint APIs, see
create_model, create_endpoint_config, and create_endpoint, respectively.

If you did not train your model using SageMaker, specify the following environment variables:

MXNet and PyTorch

"Environment": {
    "SAGEMAKER_PROGRAM": "inference.py",
    "SAGEMAKER_SUBMIT_DIRECTORY": "/opt/ml/model/code",
    "SAGEMAKER_CONTAINER_LOG_LEVEL": "20",
    "SAGEMAKER_REGION": "insert your region",
    "MMS_DEFAULT_RESPONSE_TIMEOUT": "500"
}

TensorFlow

"Environment": {
    "SAGEMAKER_PROGRAM": "inference.py",
    "SAGEMAKER_SUBMIT_DIRECTORY": "/opt/ml/model/code",
    "SAGEMAKER_CONTAINER_LOG_LEVEL": "20",
    "SAGEMAKER_REGION": "insert your region"
}

If you trained your model using SageMaker, specify the environment variable
SAGEMAKER_SUBMIT_DIRECTORY as the full Amazon S3 bucket URI that contains the training script.

Deploy a Compiled Model Using the AWS CLI

You must satisfy the prerequisites section if the model was compiled using AWS SDK for Python (Boto3),
AWS CLI, or the Amazon SageMaker console. Follow the steps below to create and deploy a SageMaker
Neo-compiled model using the AWS CLI.

Topics
• Deploy the Model (p. 3092)

Deploy the Model

After you have satisfied the prerequisites, use the create-model, create-endpoint-config, and
create-endpoint AWS CLI commands. The following steps explain how to use these commands to
deploy a model compiled with Neo:

Create a Model

From Neo Inference Container Images, select the inference image URI and then use create-model API
to create a SageMaker model. You can do this with two steps:

1. Create a create_model.json file. Within the file, specify the name of the model, the image URI, the
   path to the model.tar.gz file in your Amazon S3 bucket, and your SageMaker execution role:
Cloud Instances

```
{
    "ModelName": "insert model name",
    "PrimaryContainer": {
        "Image": "insert the ECR Image URI",
        "ModelDataUrl": "insert S3 archive URL",
        "Environment": {"See details below"}
    },
    "ExecutionRoleArn": "ARN for AmazonSageMaker-ExecutionRole"
}
```

If you trained your model using SageMaker, specify the following environment variable:

```
"Environment": {
    "SAGEMAKER_SUBMIT_DIRECTORY": "[Full S3 path for *.tar.gz file containing the training script]"
}
```

If you did not train your model using SageMaker, specify the following environment variables:

**MXNet and PyTorch**

```
"Environment": {
    "SAGEMAKER_PROGRAM": "inference.py",
    "SAGEMAKER_SUBMIT_DIRECTORY": "/opt/ml/model/code",
    "SAGEMAKER_CONTAINER_LOG_LEVEL": "20",
    "SAGEMAKER_REGION": "insert your region",
    "MMS_DEFAULT_RESPONSE_TIMEOUT": "500"
}
```

**TensorFlow**

```
"Environment": {
    "SAGEMAKER_PROGRAM": "inference.py",
    "SAGEMAKER_SUBMIT_DIRECTORY": "/opt/ml/model/code",
    "SAGEMAKER_CONTAINER_LOG_LEVEL": "20",
    "SAGEMAKER_REGION": "insert your region"
}
```

**Note**
The AmazonSageMakerFullAccess and AmazonS3ReadOnlyAccess policies must be attached to the AmazonSageMaker-ExecutionRole IAM role.

2. Run the following command:

```
aws sagemaker create-model --cli-input-json file://create_model.json
```

For the full syntax of the create-model API, see [create-model](https://docs.aws.amazon.com/sagemaker/latest/dg/API_CreateModel.html).

**Create an Endpoint Configuration**

After creating a SageMaker model, create the endpoint configuration using the create-endpoint-config API. To do this, create a JSON file with your endpoint configuration specifications. For example, you can use the following code template and save it as create_config.json:

```
{
    "EndpointConfigName": "<provide your endpoint config name>",
    "ProductionVariants": [
```
Now run the following AWS CLI command to create your endpoint configuration:

```bash
aws sagemaker create-endpoint-config --cli-input-json file://create_config.json
```

For the full syntax of the `create-endpoint-config` API, see `create-endpoint-config`.

Create an Endpoint

After you have created your endpoint configuration, create an endpoint using the `create-endpoint` API:

```bash
aws sagemaker create-endpoint --endpoint-name '<provide your endpoint name>' --endpoint-config-name '<insert your endpoint config name>'
```

For the full syntax of the `create-endpoint` API, see `create-endpoint`.

Deploy a Compiled Model Using the Console

You must satisfy the prerequisites section if the model was compiled using AWS SDK for Python (Boto3), the AWS CLI, or the Amazon SageMaker console. Follow the steps below to create and deploy a SageMaker Neo-compiled model using the SageMaker console [https://console.aws.amazon.com/SageMaker](https://console.aws.amazon.com/SageMaker).

Topics

- Deploy the Model (p. 3094)

Deploy the Model

After you have satisfied the prerequisites, use the following steps to deploy a model compiled with Neo:

1. Choose Models, and then choose Create models from the Inference group. On the Create model page, complete the Model name, IAM role, and VPC fields (optional), if needed.
2. To add information about the container used to deploy your model, choose Add container container, then choose Next. Complete the Container input options, Location of inference code image, and Location of model artifacts, and optionally, Container host name, and Environmental variables fields.
3. To deploy Neo-compiled models, choose the following:

- **Container input options**: Choose *Provide model artifacts and inference image*.
- **Location of inference code image**: Choose the inference image URI from *Neo Inference Container Images*, depending on the AWS Region and kind of application.
- **Location of model artifact**: Enter the Amazon S3 bucket URI of the compiled model artifact generated by the Neo compilation API.
- **Environment variables**:
  - Leave this field blank for *SageMaker XGBoost*.
  - If you trained your model using SageMaker, specify the environment variable `SAGEMAKER_SUBMIT_DIRECTORY` as the Amazon S3 bucket URI that contains the training script.
  - If you did not train your model using SageMaker, specify the following environment variables:

<table>
<thead>
<tr>
<th>Key</th>
<th>Values for MXNet and PyTorch</th>
<th>Values TensorFlow</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAGEMAKER_PROGRAM</td>
<td>inference.py</td>
<td>inference.py</td>
</tr>
<tr>
<td>SAGEMAKER_SUBMIT_DIRECTORY</td>
<td>/opt/ml/model/code</td>
<td>/opt/ml/model/code</td>
</tr>
<tr>
<td>SAGEMAKER_CONTAINER_LOG_LEVEL</td>
<td>20</td>
<td>20</td>
</tr>
<tr>
<td>Key</td>
<td>Values for MXNet and PyTorch</td>
<td>Values TensorFlow</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td>SAGEMAKER_REGION</td>
<td>&lt;your region&gt;</td>
<td>&lt;your region&gt;</td>
</tr>
<tr>
<td>MMS_DEFAULT_RESPONSE_TIMEOUT</td>
<td>500</td>
<td>Leave this field blank for TF</td>
</tr>
</tbody>
</table>

4. Confirm that the information for the containers is accurate, and then choose Create model. On the Create model landing page, choose Create endpoint.

5. In Create and configure endpoint diagram, specify the Endpoint name. For Attach endpoint configuration, choose Create a new endpoint configuration.

6. In New endpoint configuration page, specify the Endpoint configuration name.
7. Choose **Edit** next to the name of the model and specify the correct **Instance type** on the **Edit Production Variant** page. It is imperative that the **Instance type** value match the one specified in your compilation job.
8. Choose **Save**.

9. On the **New endpoint configuration** page, choose **Create endpoint configuration**, and then choose **Create endpoint**.

### Request Inferences from a Deployed Service

If you have followed instructions in Deploy a Model (p. 3082), you should have a SageMaker endpoint set up and running. Regardless of how you deployed your Neo-compiled model, there are three ways you can submit inference requests:

**Topics**
- Request Inferences from a Deployed Service (Amazon SageMaker SDK) (p. 3099)
- Request Inferences from a Deployed Service (Boto3) (p. 3101)
- Request Inferences from a Deployed Service (AWS CLI) (p. 3102)

**Request Inferences from a Deployed Service (Amazon SageMaker SDK)**

Use the following the code examples to request inferences from your deployed service based on the framework you used to train your model. The code examples for the different frameworks are similar. The main difference is that TensorFlow requires `application/json` as the content type.
PyTorch and MXNet

If you are using PyTorch v1.4 or later or MXNet 1.7.0 or later and you have an Amazon SageMaker endpoint InService, you can make inference requests using the predictor package of the SageMaker SDK for Python.

Note
The API varies based on the SageMaker SDK for Python version:

- For version 1.x, use the RealTimePredictor and Predict API.
- For version 2.x, use the Predictor and the Predict API.

The following code example shows how to use these APIs to send an image for inference:

SageMaker Python SDK v1.x

```python
from sagemaker.predictor import RealTimePredictor

endpoint = 'insert name of your endpoint here'

# Read image into memory
payload = None
with open("image.jpg", 'rb') as f:
    payload = f.read()

predictor = RealTimePredictor(endpoint=endpoint, content_type='application/x-image')
inference_response = predictor.predict(data=payload)
print (inference_response)
```

SageMaker Python SDK v2.x

```python
from sagemaker.predictor import Predictor

endpoint = 'insert name of your endpoint here'

# Read image into memory
payload = None
with open("image.jpg", 'rb') as f:
    payload = f.read()

predictor = Predictor(endpoint)
inference_response = predictor.predict(data=payload)
print (inference_response)
```

TensorFlow

The following code example shows how to use the SageMaker Python SDK API to send an image for inference:

```python
from sagemaker.predictor import Predictor
from PIL import Image
import numpy as np
import json

endpoint = 'insert the name of your endpoint here'

# Read image into memory
image = Image.open(input_file)
batch_size = 1
image = np.asarray(image.resize((224, 224)))
```
Request Inferences from a Deployed Service (Boto3)

You can submit inference requests using SageMaker SDK for Python (Boto3) client and `invoke_endpoint()` API once you have an SageMaker endpoint InService. The following code example shows how to send an image for inference:

**PyTorch and MXNet**

```python
import boto3
import json

endpoint = 'insert name of your endpoint here'

runtime = boto3.Session().client('sagemaker-runtime')

# Read image into memory
with open(image, 'rb') as f:
    payload = f.read()

# Send image via InvokeEndpoint API
response = runtime.invoke_endpoint(EndpointName=endpoint, ContentType='application/x-image', Body=payload)

# Unpack response
result = json.loads(response['Body'].read().decode())
```

**TensorFlow**

For TensorFlow submit an input with `application/json` for the content type.

```python
from PIL import Image
import numpy as np
import json
import boto3

client = boto3.client('sagemaker-runtime')

input_file = 'path/to/image'
image = Image.open(input_file)
batch_size = 1
image = np.array(image.resize((224, 224)))/128.0 - 1

body = json.dumps({"instances": image.tolist()})
ioc_predictor_endpoint_name = 'insert name of your endpoint here'
content_type = 'application/json'
ioc_response = client.invoke_endpoint(EndpointName=ioc_predictor_endpoint_name, Body=body, ContentType=content_type)
```

**XGBoost**

For an XGBoost application, you should submit a CSV text instead:

```python
image = image / 128 - 1
image = np.concatenate([image[np.newaxis, :, :]] * batch_size)
body = json.dumps({"instances": image.tolist()})
predictor = Predictor(endpoint)
inference_response = predictor.predict(data=body)
print(inference_response)
```
import boto3
import json

endpoint = 'insert your endpoint name here'
runtime = boto3.Session().client('sagemaker-runtime')

csv_text = '1,-1.0,1.0,1.5,2.6'
# Send CSV text via InvokeEndpoint API
response = runtime.invoke_endpoint(EndpointName=endpoint, ContentType='text/csv',
Body=csv_text)
# Unpack response
result = json.loads(response['Body'].read().decode())

Note that BYOM allows for a custom content type. For more information, see runtime_InvokeEndpoint.

Request Inferences from a Deployed Service (AWS CLI)

Inference requests can be made with the sagemaker-runtime invoke-endpoint once you have an Amazon SageMaker endpoint InService. You can make inference requests with the AWS Command Line Interface (AWS CLI). The following example shows how to send an image for inference:

```
aws sagemaker-runtime invoke-endpoint --endpoint-name 'insert name of your endpoint here'
--body fileb://image.jpg --content-type=application/x-image output_file.txt
```

An output_file.txt with information about your inference requests is made if the inference was successful.

For TensorFlow submit an input with application/json as the content type.

```
aws sagemaker-runtime invoke-endpoint --endpoint-name 'insert name of your endpoint here'
--body fileb://input.json --content-type=application/json output_file.txt
```

Inference Container Images

Based on your use case, replace the highlighted portion in the inference image URI template provided below with appropriate values.

**Amazon SageMaker XGBoost**

```
aws_account_id.dkr.ecr.aws_region.amazonaws.com/xgboost-neo:latest
```

Replace `aws_account_id` from the table at the end of this page based on the `aws_region` you used.

**Keras**

```
aws_account_id.dkr.ecr.aws_region.amazonaws.com/sagemaker-neo-keras:fx_version-instance_type-py3
```

Replace `aws_account_id` from the table at the end of this page based on the `aws_region` you used.

Replace `fx_version` with 2.2.4.

Replace `instance_type` with either cpu or gpu.
MXNet

CPU or GPU instance types

\[
\text{aws_account_id}.dkr.ecr.\text{aws_region}.amazonaws.com/sagemaker-inference-mxnet:\text{fx_version}-\text{instance_type}-py3
\]

Replace \text{aws_account_id} from the table at the end of this page based on the \text{aws_region} you used.

Replace \text{fx_version} with 1.8.0.

Replace \text{instance_type} with either cpu or gpu.

Inferentia instance types

\[
\text{aws_account_id}.dkr.ecr.\text{aws_region}.amazonaws.com/sagemaker-neo-mxnet:\text{fx_version}-\text{instance_type}-py3
\]

Replace \text{aws_region} with either us-east-1 or us-west-2.

Replace \text{aws_account_id} from the table at the end of this page based on the \text{aws_region} you used.

Replace \text{fx_version} with 1.5.1.

Replace \text{instance_type} with inf.

ONNX

\[
\text{aws_account_id}.dkr.ecr.\text{aws_region}.amazonaws.com/sagemaker-neo-onnx:\text{fx_version}-\text{instance_type}-py3
\]

Replace \text{aws_account_id} from the table at the end of this page based on the \text{aws_region} you used.

Replace \text{fx_version} with 1.5.0.

Replace \text{instance_type} with either cpu or gpu.

PyTorch

CPU or GPU instance types

\[
\text{aws_account_id}.dkr.ecr.\text{aws_region}.amazonaws.com/sagemaker-inference-pytorch:\text{fx_version}-\text{instance_type}-py3
\]

Replace \text{aws_account_id} from the table at the end of this page based on the \text{aws_region} you used.

Replace \text{fx_version} with 1.4, 1.5, 1.6, 1.7 or 1.8.

Replace \text{instance_type} with either cpu or gpu.

Inferentia instance types

\[
\text{aws_account_id}.dkr.ecr.\text{aws_region}.amazonaws.com/sagemaker-neo-pytorch:\text{fx_version}-\text{instance_type}-py3
\]
Replace `aws_region` with either `us-east-1` or `us-west-2`.

Replace `aws_account_id` from the table at the end of this page based on the `aws_region` you used.

Replace `fx_version` with `1.5.1`.

Replace `instance_type` with `inf`.

**TensorFlow**

CPU or GPU instance types

```
aws_account_id.dkr.ecr.aws_region.amazonaws.com/sagemaker-inference-tensorflow:fix_version-instance_type-py3
```

Replace `aws_account_id` from the table at the end of this page based on the `aws_region` you used.

Replace `fx_version` with `1.15.3` or `2.9`.

Replace `instance_type` with either `cpu` or `gpu`.

Inferentia instance types

```
aws_account_id.dkr.ecr.aws_region.amazonaws.com/sagemaker-neo-tensorflow:fx_version-instance_type-py3
```

Replace `aws_account_id` from the table at the end of this page based on the `aws_region` you used. Note that for instance type `inf` only `us-east-1` and `us-west-2` are supported.

Replace `fx_version` with `1.15.0`.

Replace `instance_type` with `inf`.

The following table maps `aws_account_id` with `aws_region`. Use this table to find the correct inference image URI you need for your application.

<table>
<thead>
<tr>
<th>aws_account_id</th>

</table>
Edge Devices

Amazon SageMaker Neo provides compilation support for popular machine learning frameworks. You can deploy your Neo-compiled edge devices such as the Raspberry Pi 3, Texas Instruments' Sitara, Jetson TX1, and more. For a full list of supported frameworks and edge devices, see Supported Frameworks, Devices, Systems, and Architectures.

You must configure your edge device so that it can use AWS services. One way to do this is to install DLR and Boto3 to your device. To do this, you must set up the authentication credentials. See Boto3 AWS Configuration for more information. Once your model is compiled and your edge device is configured, you can download the model from Amazon S3 to your edge device. From there, you can use the Deep Learning Runtime (DLR) to read the compiled model and make inferences.

For first-time users, we recommend you check out the Getting Started guide. This guide walks you through how to set up your credentials, compile a model, deploy your model to a Raspberry Pi 3, and make inferences on images.

Topics
- Supported Frameworks, Devices, Systems, and Architectures (p. 3105)
- Deploy Models (p. 3115)
- Getting Started with Neo on Edge Devices (p. 3116)

Supported Frameworks, Devices, Systems, and Architectures

Amazon SageMaker Neo supports common machine learning frameworks, edge devices, operating systems, and chip architectures. Find out if Neo supports your framework, edge device, OS, and chip architecture by selecting one of the topics below.

You can find a list of models that have been tested by the Amazon SageMaker Neo Team in the Tested Models (p. 3109) section.
Note

- Ambarella devices require additional files to be included within the compressed TAR file before it is sent for compilation. For more information, see Troubleshoot Ambarella Errors (p. 3127).
- TIM-VX (libtim-vx.so) is required for i.MX 8M Plus. For information on how to build TIM-VX, see the TIM-VX GitHub repository.

Topics

- Supported Frameworks (p. 3106)
- Supported Devices, Chip Architectures, and Systems (p. 3107)
- Tested Models (p. 3109)

Supported Frameworks

Amazon SageMaker Neo supports the following frameworks.

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>MXNet</td>
<td>1.8</td>
<td>Supports 1.8 or earlier</td>
<td>Image Classification, Object Detection, Semantic Segmentation, Pose Estimation, Activity Recognition</td>
<td>One symbol file (.json) and one parameter file (.params)</td>
<td>GluonCV v0.8.0</td>
</tr>
<tr>
<td>ONNX</td>
<td>1.7</td>
<td>Supports 1.7 or earlier</td>
<td>Image Classification, SVM</td>
<td>One model file (.onnx)</td>
<td></td>
</tr>
<tr>
<td>Keras</td>
<td>2.2</td>
<td>Supports 2.2 or earlier</td>

Supported Devices, Chip Architectures, and Systems

Amazon SageMaker Neo supports the following devices, chip architectures, and operating systems.

**Devices**

You can select a device using the dropdown list in the Amazon SageMaker console or by specifying the TargetDevice in the output configuration of the CreateCompilationJob API.

You can choose from one of the following edge devices:

<table>
<thead>
<tr>

**Tested Models**

The following collapsible sections provide information about machine learning models that were tested by the Amazon SageMaker Neo team. Expand the collapsible section based on your framework to check if a model was tested.
Note
This is not a comprehensive list of models that can be compiled with Neo.

See Supported Frameworks (p. 3106) and SageMaker Neo Supported Operators to find out if you can compile your model with SageMaker Neo.

Deploy Models

You can deploy the compute module to resource-constrained edge devices by: downloading the compiled model from Amazon S3 to your device and using DLR, or you can use AWS IoT Greengrass.

Before moving on, make sure your edge device must be supported by SageMaker Neo. See, Supported Frameworks, Devices, Systems, and Architectures to find out what edge devices are supported. Make sure that you specified your target edge device when you submitted the compilation job, see Use Neo to Compile a Model.

Deploy a Compiled Model (DLR)

DLR is a compact, common runtime for deep learning models and decision tree models. DLR uses the TVM runtime, Treelite runtime, NVIDIA TensorRT™, and can include other hardware-specific runtimes. DLR provides unified Python/C++ APIs for loading and running compiled models on various devices.

You can install latest release of DLR package using the following pip command:

```
pip install dlr
```

For installation of DLR on GPU targets or non-x86 edge devices, please refer to Releases for prebuilt binaries, or Installing DLR for building DLR from source. For example, to install DLR for Raspberry Pi 3, you can use:
**Deploy a Model (AWS IoT Greengrass)**

AWS IoT Greengrass extends cloud capabilities to local devices. It enables devices to collect and analyze data closer to the source of information, react autonomously to local events, and communicate securely with each other on local networks. With AWS IoT Greengrass, you can perform machine learning inference at the edge on locally generated data using cloud-trained models. Currently, you can deploy models on to all AWS IoT Greengrass devices based on ARM Cortex-A, Intel Atom, and Nvidia Jetson series processors. For more information on deploying a Lambda inference application to perform machine learning inferences with AWS IoT Greengrass, see [How to configure optimized machine learning inference using the AWS Management Console](#).

**Getting Started with Neo on Edge Devices**

This guide to getting started with Amazon SageMaker Neo shows you how to compile a model, set up your device, and make inferences on your device. Most of the code examples use Boto3. We provide commands using AWS CLI where applicable, as well as instructions on how to satisfy prerequisites for Neo.

**Note**
You can run the following code snippets on your local machine, within a SageMaker notebook, within SageMaker Studio, or (depending on your edge device) on your edge device. The setup is similar; however, there are two main exceptions if you run this guide within a SageMaker notebook instance or SageMaker Studio session:

- You do not need to install Boto3.
- You do not need to add the ‘AmazonSageMakerFullAccess’ IAM policy

This guide assumes you are running the following instructions on your edge device.

**Prerequisites**

1. **Install Boto3**

   If you are running these commands on your edge device, you must install the AWS SDK for Python (Boto3). Within a Python environment (preferably a virtual environment), run the following locally on your edge device's terminal or within a Jupyter notebook instance:

   **Terminal**

   ```bash
   pip install boto3
   ```

   **Jupyter Notebook**

   ```bash
   !pip install boto3
   ```

2. **Set Up AWS Credentials**

   You need to set up Amazon Web Services credentials on your device in order to run SDK for Python (Boto3). By default, the AWS credentials should be stored in the file `~/.aws/credentials` on your edge device. Within the credentials file, you should see two environment variables: `aws_access_key_id` and `aws_secret_access_key`.

   In your terminal, run:
$ more ~/.aws/credentials

[default]
aws_access_key_id = YOUR_ACCESS_KEY
aws_secret_access_key = YOUR_SECRET_KEY

The AWS General Reference Guide has instructions on how to get the necessary aws_access_key_id and aws_secret_access_key. For more information on how to set up credentials on your device, see the Boto3 documentation.

3. **Set up an IAM Role and attach policies.**

Neo needs access to your S3 bucket URI. Create an IAM role that can run SageMaker and has permission to access the S3 URI. You can create an IAM role either by using SDK for Python (Boto3), the console, or the AWS CLI. The following example illustrates how to create an IAM role using SDK for Python (Boto3):

```python
import boto3
AWS_REGION = 'aws-region'
# Create an IAM client to interact with IAM
iam_client = boto3.client('iam', region_name=AWS_REGION)
role_name = 'role-name'

For more information on how to create an IAM role with the console, AWS CLI, or through the AWS API, see Creating an IAM user in your AWS account.

Create a dictionary describing the IAM policy you are attaching. This policy is used to create a new IAM role.

```python
policy = {
    'Statement': [
        {
            'Action': 'sts:AssumeRole',
            'Effect': 'Allow',
            'Principal': {'Service': 'sagemaker.amazonaws.com'},
        },
    ],
    'Version': '2012-10-17'
}
``` Create a new IAM role using the policy you defined above:

```python
import json

new_role = iam_client.create_role(
    AssumeRolePolicyDocument=json.dumps(policy),
    Path='/',
    RoleName=role_name
)
```

You need to know what your Amazon Resource Name (ARN) is when you create a compilation job in a later step, so store it in a variable as well.

```python
role_arn = new_role['Role']['Arn']
```
Now that you have created a new role, attach the permissions it needs to interact with Amazon SageMaker and Amazon S3:

```python
iam_client.attach_role_policy(
    RoleName=role_name,
    PolicyArn='arn:aws:iam::aws:policy/AmazonSageMakerFullAccess'
)

iam_client.attach_role_policy(
    RoleName=role_name,
    PolicyArn='arn:aws:iam::aws:policy/AmazonS3FullAccess'
);
```

4. **Create an Amazon S3 bucket to store your model artifacts**

SageMaker Neo will access your model artifacts from Amazon S3

Boto3

```python
# Create an S3 client
s3_client = boto3.client('s3', region_name=AWS_REGION)

# Name buckets
bucket='name-of-your-bucket'

# Check if bucket exists
if boto3.resource('s3').Bucket(bucket) not in boto3.resource('s3').buckets.all():
    s3_client.create_bucket(
        Bucket=bucket,
        CreateBucketConfiguration={
            'LocationConstraint': AWS_REGION
        }
    )
else:
    print(f'Bucket {bucket} already exists. No action needed.')
```

CLI

```
aws s3 mb s3://'name-of-your-bucket' --region specify-your-region

# Check your bucket exists
aws s3 ls s3://'name-of-your-bucket'/
```

5. **Train a machine learning model**

See [Train a Model with Amazon SageMaker](https://docs.aws.amazon.com/sagemaker/latest/dg/model-creation.html) for more information on how to train a machine learning model using Amazon SageMaker. You can optionally upload your locally trained model directly into an Amazon S3 URI bucket.

**Note**

Make sure the model is correctly formatted depending on the framework you used. See [What input data shapes does SageMaker Neo expect?](https://docs.aws.amazon.com/sagemaker/latest/dg/model-creation.html)

If you do not have a model yet, use the `curl` command to get a local copy of the `coco_ssd_mobilenet` model from TensorFlow's website. The model you just copied is an object detection model trained from the [COCO dataset](https://cocodataset.org/). Type the following into your Jupyter notebook:

```
model_zip_filename = './coco_ssd_mobilenet_v1_1.0.zip'
!curl http://storage.googleapis.com/download.tensorflow.org/models/tflite/coco_ssd_mobilenet_v1_1.0_quant_2018_06_29.zip \
```
Note that this particular example was packaged in a .zip file. Unzip this file and repackage it as a compressed tarfile (.tar.gz) before using it in later steps. Type the following into your Jupyter notebook:

```python
# Extract model from zip file
!unzip -u {model_zip_filename}

model_filename = 'detect.tflite'
model_name = model_filename.split('.')[0]

# Compress model into .tar.gz so SageMaker Neo can use it
!tar -czf {model_tar} {model_filename}
```

6. **Upload trained model to an S3 bucket**

Once you have trained your machine learning mode, store it in an S3 bucket.

**Boto3**

```python
# Upload model
s3_client.upload_file(Filename=model_filename, Bucket=bucket, Key=model_filename)
```

**CLI**

Replace `your-model-filename` and `your-S3-bucket` with the name of your S3 bucket.

```bash
aws s3 cp your-model-filename s3://your-S3-bucket
```

**Step 1: Compile the Model**

Once you have satisfied the Prerequisites, you can compile your model with Amazon SageMaker Neo. You can compile your model using the AWS CLI, the console or the Amazon Web Services SDK for Python (Boto3), see Use Neo to Compile a Model. In this example, you will compile your model with Boto3.

To compile a model, SageMaker Neo requires the following information:

1. **The Amazon S3 bucket URI where you stored the trained model.**

   If you followed the prerequisites, the name of your bucket is stored in a variable named `bucket`. The following code snippet shows how to list all of your buckets using the AWS CLI:

   ```bash
   aws s3 ls
   ```

   For example:

   ```bash
   $ aws s3 ls
   2020-11-02 17:08:50 bucket
   ```

2. **The Amazon S3 bucket URI where you want to save the compiled model.**

   The code snippet below concatenates your Amazon S3 bucket URI with the name of an output directory called output:
s3_output_location = f's3://{bucket}/output'

3. **The machine learning framework you used to train your model.**

Define the framework you used to train your model.

```
framework = 'framework-name'
```

For example, if you wanted to compile a model that was trained using TensorFlow, you could either use `tflite` or `tensorflow`. Use `tflite` if you want to use a lighter version of TensorFlow that uses less storage memory.

```
framework = 'tflite'
```

For a complete list of Neo-supported frameworks, see [Supported Frameworks, Devices, Systems, and Architectures](#).

4. **The shape of your model's input.**

Neo requires the name and shape of your input tensor. The name and shape are passed in as key-value pairs. value is a list of the integer dimensions of an input tensor and key is the exact name of an input tensor in the model.

```
data_shape = '{"name": [tensor-shape]}'
```

For example:

```
data_shape = '{"normalized_input_image_tensor": [1, 300, 300, 3]}'
```

**Note**

Make sure the model is correctly formatted depending on the framework you used. See [What input data shapes does SageMaker Neo expect?](#) The key in this dictionary must be changed to the new input tensor's name.

5. **Either the name of the target device to compile for or the general details of the hardware platform**

```
target_device = 'target-device-name'
```

For example, if you want to deploy to a Raspberry Pi 3, use:

```
target_device = 'rasp3b'
```

You can find the entire list of supported edge devices in [Supported Frameworks, Devices, Systems, and Architectures](#).

Now that you have completed the previous steps, you can submit a compilation job to Neo.

```
# Create a SageMaker client so you can submit a compilation job
sagemaker_client = boto3.client('sagemaker', region_name=AWS_REGION)

# Give your compilation job a name
compilation_job_name = 'getting-started-demo'
print(f'Compilation job for {compilation_job_name} started')
```
response = sagemaker_client.create_compilation_job(
    CompilationJobName=compilation_job_name,
    RoleArn=role_arn,
    InputConfig={
        'S3Uri': s3_input_location,
        'DataInputConfig': data_shape,
        'Framework': framework.upper()
    },
    OutputConfig={
        'S3OutputLocation': s3_output_location,
        'TargetDevice': target_device
    },
    StoppingCondition={
        'MaxRuntimeInSeconds': 900
    }
)

# Optional - Poll every 30 sec to check completion status
import time
while True:
    response = sagemaker_client.describe_compilation_job(CompilationJobName=compilation_job_name)
    if response['CompilationJobStatus'] == 'COMPLETED':
        break
    elif response['CompilationJobStatus'] == 'FAILED':
        raise RuntimeError('Compilation failed')
        print('Compiling ...')
        time.sleep(30)
    print('Done!')

If you want additional information for debugging, include the following print statement:

print(response)

If the compilation job is successful, your compiled model is stored in the output Amazon S3 bucket you specified earlier (s3_output_location). Download your compiled model locally:

object_path = f'output/{model}-{target_device}.tar.gz'
neo_compiled_model = f'compiled-{model}.tar.gz'
s3_client.download_file(bucket, object_path, neo_compiled_model)

**Step 2: Set Up Your Device**

You will need to install packages on your edge device so that your device can make inferences. You will also need to either install AWS IoT Greengrass core or Deep Learning Runtime (DLR). In this example, you will install packages required to make inferences for the coco_ssd_mobilenet object detection algorithm and you will use DLR.

1. **Install additional packages**

   In addition to Boto3, you must install certain libraries on your edge device. What libraries you install depends on your use case.

   For example, for the coco_ssd_mobilenet object detection algorithm you downloaded earlier, you need to install **NumPy** for data manipulation and statistics, **PIL** to load images, and **Matplotlib** to generate plots. You also need a copy of TensorFlow if you want to gauge the impact of compiling with Neo versus a baseline.
2. **Install inference engine on your device**

To run your Neo-compiled model, install the Deep Learning Runtime (DLR) on your device. DLR is a compact, common runtime for deep learning models and decision tree models. On x86_64 CPU targets running Linux, you can install the latest release of the DLR package using the following `pip` command:

```
!pip install dlr
```

For installation of DLR on GPU targets or non-x86 edge devices, refer to Releases for prebuilt binaries, or Installing DLR for building DLR from source. For example, to install DLR for Raspberry Pi 3, you can use:

```
```

### Step 3: Make Inferences on Your Device

In this example, you will use Boto3 to download the output of your compilation job onto your edge device. You will then import DLR, download an example images from the dataset, resize this image to match the model's original input, and then you will make a prediction.

1. **Download your compiled model from Amazon S3 to your device and extract it from the compressed tarfile.**

   ```python
   # Download compiled model locally to edge device
   object_path = f'output/{model_name}-{target_device}.tar.gz'
   neo_compiled_model = f'compiled-{model_name}.tar.gz'
   s3_client.download_file(bucket_name, object_path, neo_compiled_model)

   # Extract model from .tar.gz so DLR can use it
   !mkdir ./dlr_model # make a directory to store your model (optional)
   !tar -xzvf ./compiled-detect.tar.gz --directory ./dlr_model
   ```

2. **Import DLR and an initialized DLRModel object.**

   ```python
   import dlr
   device = 'cpu'
   model = dlr.DLRModel('./dlr_model', device)
   ```

3. **Download an image for inferencing and format it based on how your model was trained.**

   For the coco_ssd_mobilenet example, you can download an image from the COCO dataset and then reform the image to 300x300:

   ```python
   from PIL import Image

   # Download an image for model to make a prediction
   input_image_filename = './input_image.jpg'
   !curl https://farm9.staticflickr.com/8325/8077197378_79efb4805e_z.jpg --output {input_image_filename}

   # Format image so model can make predictions
   resized_image = image.resize((300, 300))
   ```
# Troubleshoot Errors

This section contains information about how to understand and prevent common errors, the error messages they generate, and guidance on how to resolve these errors. Before moving on, ask yourself the following questions:

Did you encounter an error before you deployed your model? If yes, see Troubleshoot Neo Compilation Errors.

Did you encounter an error after you compiled your model? If yes, see Troubleshoot Neo Inference Errors.

Did you encounter an error trying to compile your model for Ambarella devices? If yes, see Troubleshoot Ambarella Errors (p. 3127).

## Error Classification Types

This list classifies the user errors you can receive from Neo. These include access and permission errors and load errors for each of the supported frameworks. All other errors are system errors.

### Client permission error

Neo passes the errors for these straight through from the dependent service.

- **Access Denied** when calling sts:AssumeRole
- **Any 400** error when calling Amazon S3 to download or upload a client model
- **PassRole** error

### Load error

Assuming that the Neo compiler successfully loaded .tar.gz from Amazon S3, check whether the tarball contains the necessary files for compilation. The checking criteria is framework-specific:

- **TensorFlow**: Expects only protobuf file (*.pb or *.pbtxt). For saved models, expects one variables folder.
- **Pytorch**: Expect only one pytorch file (*.pth).
- **MXNET**: Expect only one symbol file (*.json) and one parameter file (*.params).
- **XGBoost**: Expect only one XGBoost model file (*.model). The input model has size limitation.

### Compilation error

Assuming that the Neo compiler successfully loaded .tar.gz from Amazon S3, and that the tarball contains necessary files for compilation. The checking criteria is:

```python
# Model is quantized, so convert the image to uint8
x = np.array(resized_image).astype('uint8')

4. **Use DLR to make inferences.**

Finally, you can use DLR to make a prediction on the image you just downloaded:

```python
out = model.run(x)
```

For more examples using DLR to make inferences from a Neo-compiled model on an edge device, see the neo-ai-dlr Github repository.
• **OperatorNotImplemented**: An operator has not been implemented.
• **OperatorAttributeNotImplemented**: The attribute in the specified operator has not been implemented.
• **OperatorAttributeRequired**: An attribute is required for an internal symbol graph, but it is not listed in the user input model graph.
• **OperatorAttributeValueNotValid**: The value of the attribute in the specific operator is not valid.

- Troubleshoot Ambarella Errors (p. 3127)

**Troubleshoot Neo Compilation Errors**

This section contains information about how to understand and prevent common compilation errors, the error messages they generate, and guidance on how to resolve these errors.

**Topics**

- How to Use This Page (p. 3124)
- Framework-Related Errors (p. 3124)
- Infrastructure-Related Errors (p. 3125)
- Check your compilation log (p. 3126)

**How to Use This Page**

Attempt to resolve your error by the going through these sections in the following order:

1. Check that the input of your compilation job satisfies the input requirements. See What input data shapes does SageMaker Neo expect? (p. 3065)
2. Check common framework-specific errors.
3. Check if your error is an infrastructure error.
4. Check your compilation log.

**Framework-Related Errors**

**TensorFlow**

</table>
Check your compilation log

2. Select the region you created the compilation job from the Region dropdown list in the top right.
3. In the navigation pane of the Amazon CloudWatch, choose Logs. Select Log groups.
4. Search for the log group called /aws/sagemaker/CompilationJobs. Select the log group.
5. Search for the logstream named after the compilation job name. Select the log stream.

Troubleshoot Neo Inference Errors

This section contains information about how to prevent and resolve some of the common errors you might encounter upon deploying and/or invoking the endpoint. This section applies to PyTorch 1.4.0 or later and MXNet v1.7.0 or later.

- Make sure the first inference (warm-up inference) on a valid input data is done in model_fn(), if you defined a model_fn in your inference script, otherwise the following error message may be seen on the terminal when predict API is called:

  An error occurred (ModelError) when calling the InvokeEndpoint operation: Received server error (0) from <users-sagemaker-endpoint> with message "Your invocation timed out while waiting for a response from container model. Review the latency metrics for each container in Amazon CloudWatch, resolve the issue, and try again."

- Make sure that the environment variables in the following table are set. If they are not set, the following error message might show up:

  On the terminal:

  An error occurred (ModelError) when calling the InvokeEndpoint operation: Received server error (503) from <users-sagemaker-endpoint> with message "{ "code": 503, "type": "InternalServerErrorException", "message": "Prediction failed" } ".

  In CloudWatch:

  W-9001-model-stdout com.amazonaws.ml.mms.wlm.WorkerLifeCycle - AttributeError: 'NoneType' object has no attribute 'transform'

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAGEMAKER_PROGRAM</td>
<td>inference.py</td>
</tr>
<tr>
<td>SAGEMAKER_SUBMIT_DIRECTORY</td>
<td>/opt/ml/model/code</td>
</tr>
<tr>
<td>SAGEMAKER_CONTAINER_LOG_LEVEL</td>
<td>20</td>
</tr>
<tr>
<td>SAGEMAKER_REGION</td>
<td>&lt;your region&gt;</td>
</tr>
</tbody>
</table>

- Make sure that the MMS_DEFAULT_RESPONSE_TIMEOUT environment variable is set to 500 or a higher value while creating the Amazon SageMaker model; otherwise, the following error message may be seen on the terminal:

  An error occurred (ModelError) when calling the InvokeEndpoint operation: Received server error (0) from <users-sagemaker-endpoint> with message "Your invocation timed out while waiting for a response from container model. Review the latency metrics for each container in Amazon CloudWatch, resolve the issue, and try again."
Troubleshoot Ambarella Errors

SageMaker Neo requires models to be packaged in a compressed TAR file (*.tar.gz). Ambarella devices require additional files to be included within the compressed TAR file before it is sent for compilation. Include the following files within your compressed TAR file if you want to compile a model for Ambarella targets with SageMaker Neo:

- A trained model using a framework supported by SageMaker Neo
- A JSON configuration file
- Calibration images

For example, the contents of your compressed TAR file should look similar to the following example:

```plaintext
###amba_config.json
###calib_data
|    ### data1
|    ### data2
|    ### .
|    ### .
|    ### data500
###mobilenet_v1_1.0_0224_frozen.pb
```

The directory is configured as follows:

- `amba_config.json`: Configuration file
- `calib_data`: Folder containing calibration images
- `mobilenet_v1_1.0_0224_frozen.pb`: TensorFlow model saved as a frozen graph

For information about frameworks supported by SageMaker Neo, see Supported Frameworks (p. 3106).

Setting up the Configuration File

The configuration file provides information required by the Ambarella toolchain to compile the model. The configuration file must be saved as a JSON file and the name of the file must end with *config.json. The following chart shows the contents of the configuration file.

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputs</td>
<td>Dictionary mapping input layers to attribute.</td>
<td><code>{inputs:{&quot;data&quot;: {...}, &quot;data1&quot;:{...}}}</code></td>
</tr>
<tr>
<td>&quot;data&quot;</td>
<td>Input layer name. Note: &quot;data&quot; is an example of the name you can use to label the input layer.</td>
<td>&quot;data&quot;</td>
</tr>
<tr>
<td>shape</td>
<td>Describes the shape of the input to the model. This follows the same conventions that SageMaker Neo uses.</td>
<td>&quot;shape&quot;: &quot;1,3,224,224&quot;</td>
</tr>
<tr>
<td>filepath</td>
<td>Relative path to the directory containing calibration images. These can be binary or image files like JPEG or PNG.</td>
<td>&quot;filepath&quot;: &quot;calib_data/&quot;</td>
</tr>
<tr>
<td>Key</td>
<td>Description</td>
<td>Example</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------------------</td>
</tr>
<tr>
<td>colorformat</td>
<td>Color format that model expects. This will be used while converting images to binary. Supported values: [RGB, BGR]. Default is RGB.</td>
<td>&quot;colorformat&quot;:&quot;RGB&quot;</td>
</tr>
<tr>
<td>mean</td>
<td>Mean value to be subtracted from the input. Can be a single value or a list of values. When the mean is given as a list the number of entries must match the channel dimension of the input.</td>
<td>&quot;mean&quot;:128.0</td>
</tr>
<tr>
<td>scale</td>
<td>Scale value to be used for normalizing the input. Can be a single value or a list of values. When the scale is given as a list, the number of entries must match the channel dimension of the input.</td>
<td>&quot;scale&quot;: 255.0</td>
</tr>
</tbody>
</table>

The following is a sample configuration file:

```json
{
   "inputs": {
      "data": {
         "shape": "1, 3, 224, 224",
         "filepath": "calib_data/",
         "colorformat": "RGB",
         "mean": [128, 128, 128],
         "scale": [128.0, 128.0, 128.0]
      }
   }
}
```

**Calibration Images**

Quantize your trained model by providing calibration images. Quantizing your model improves the performance of the CVFlow engine on an Ambarella System on a Chip (SoC). The Ambarella toolchain uses the calibration images to determine how each layer in the model should be quantized to achieve optimal performance and accuracy. Each layer is quantized independently to INT8 or INT16 formats. The final model has a mix of INT8 and INT16 layers after quantization.

**How many images should you use?**

It is recommended that you include between 100–200 images that are representative of the types of scenes the model is expected to handle. The model compilation time increases linearly to the number of calibration images in the input file.

**What are the recommended image formats?**

Calibration images can be in a raw binary format or image formats such as JPG and PNG.

Your calibration folder can contain a mixture of images and binary files. If the calibration folder contains both images and binary files, the toolchain first converts the images to binary files. Once the conversion
is complete, it uses the newly generated binary files along with the binary files that were originally in the folder.

**Can I convert the images into binary format first?**

Yes. You can convert the images to the binary format with open-source packages such as OpenCV or PIL. Crop and resize the images so they satisfy the input layer of your trained model.

**Mean and Scale**

You can specify mean and scaling pre-processing options to the Amberalla toolchain. These operations are embedded into the network and are applied during inference on each input. Do not provide processed data if you specify the mean or scale. More specifically, do not provide data you have subtracted the mean from or have applied scaling to.

**Check your compilation log**

For information on checking compilation log for Ambarella devices, see [Check your compilation log](p. 3126).

## Use Amazon SageMaker Elastic Inference (EI)

By using Amazon Elastic Inference (EI), you can speed up the throughput and decrease the latency of getting real-time inferences from your deep learning models that are deployed as Amazon SageMaker hosted models, but at a fraction of the cost of using a GPU instance for your endpoint. EI allows you to add inference acceleration to a hosted endpoint for a fraction of the cost of using a full GPU instance. Add an EI accelerator in one of the available sizes to a deployable model in addition to a CPU instance type, and then add that model as a production variant to an endpoint configuration that you use to deploy a hosted endpoint. You can also add an EI accelerator to a SageMaker notebook instance so that you can test and evaluate inference performance when you are building your models.

Elastic Inference is supported in EI-enabled versions of TensorFlow, Apache MXNet, and PyTorch. To use any other deep learning framework, export your model by using ONNX, and then import your model into MXNet. You can then use your model with EI as an MXNet model. For information about importing an ONNX model into MXNet, see [Importing an ONNX model into MXNet](p. 3130).

**Topics**

- How EI Works (p. 3129)
- Choose an EI Accelerator Type (p. 3130)
- Use EI in a SageMaker Notebook Instance (p. 3130)
- Use EI on a Hosted Endpoint (p. 3131)
- Frameworks that Support EI (p. 3131)
- Use EI with SageMaker Built-in Algorithms (p. 3131)
- EI Sample Notebooks (p. 3131)
- Set Up to Use EI (p. 3132)
- Attach EI to a Notebook Instance (p. 3135)
- Use EI on Amazon SageMaker Hosted Endpoints (p. 3137)

**How EI Works**

Amazon Elastic Inference accelerators are network attached devices that work along with SageMaker instances in your endpoint to accelerate your inference calls. Elastic Inference accelerates inference by allowing you to attach fractional GPUs to any SageMaker instance. You can select the client instance
Choose an EI Accelerator Type

Choose an EI Accelerator Type

Consider the following factors when choosing an accelerator type for a hosted model:

- Models, input tensors and batch sizes influence the amount of accelerator memory you need. Start with an accelerator type that provides at least as much memory as the file size of your trained model. Factor in that a model might use significantly more memory than the file size at runtime.
- Demands on CPU compute resources, main system memory, and GPU-based acceleration and accelerator memory vary significantly between different kinds of deep learning models. The latency and throughput requirements of the application also determine the amount of compute and acceleration you need. Thoroughly test different configurations of instance types and EI accelerator sizes to make sure you choose the configuration that best fits the performance needs of your application.

For more information on selecting an EI accelerator, see:

- Amazon Elastic Inference Overview
- Choosing an Instance and Accelerator Type for Your Model
- Optimizing costs in Amazon Elastic Inference with TensorFlow

Use EI in a SageMaker Notebook Instance

Typically, you build and test machine learning models in a SageMaker notebook before you deploy them for production. You can attach EI to your notebook instance when you create the notebook instance. You can set up an endpoint that is hosted locally on the notebook instance by using the local mode supported by TensorFlow, MXNet, and PyTorch estimators and models in the Amazon SageMaker Python SDK to test inference performance. Elastic Inference enabled PyTorch is not currently supported on notebook instances. For instructions on how to attach EI to a notebook instance and set up a local

Use EI on a Hosted Endpoint

When you are ready to deploy your model for production to provide inferences, you create a SageMaker hosted endpoint. You can attach EI to the instance where your endpoint is hosted to increase its performance at providing inferences. For instructions on how to attach EI to a hosted endpoint instance, see Use EI on Amazon SageMaker Hosted Endpoints.

Frameworks that Support EI

Amazon Elastic Inference is designed to be used with AWS enhanced versions of TensorFlow, Apache MXNet, or PyTorch machine learning frameworks. These enhanced versions of the frameworks are automatically built into containers when you use the Amazon SageMaker Python SDK, or you can download them as binary files and import them in your own Docker containers.

You can download the EI-enabled TensorFlow binary files from the public amazonei-tensorflow Amazon S3 bucket to the TensorFlow serving containers. For more information about building a container that uses the EI-enabled version of TensorFlow, see Amazon Elastic Inference with TensorFlow in SageMaker.

You can download the EI-enabled MXNet binary files from the public amazonei-apachemxnet Amazon S3 bucket to the MXNet serving containers. For more information about building a container that uses the EI-enabled version of MXNet, see Amazon Elastic Inference with MXNet in SageMaker.

You can download the EI-enabled PyTorch binary files from the public amazonei-pytorch Amazon S3 bucket to the PyTorch serving containers. For more information about building a container that uses the EI-enabled version of PyTorch, see Amazon Elastic Inference with PyTorch in SageMaker.

To use Elastic Inference in a hosted endpoint, you can choose any of the following frameworks depending on your needs.

- SageMaker Python SDK - Deploy TensorFlow models
- SageMaker Python SDK - Deploy MXNet models
- SageMaker Python SDK - Deploy PyTorch models

If you need to create a custom container for deploying your model that is complex and requires extensions to a framework that the SageMaker pre-built containers do not support, use the low-level AWS SDK for Python (Boto 3).

Use EI with SageMaker Built-in Algorithms

Currently, the Image Classification - MXNet (p. 2172) and Object Detection - MXNet (p. 2196) built-in algorithms support EI. For an example that uses the Image Classification algorithm with EI, see End-to-End Multiclass Image Classification Example.

EI Sample Notebooks

The following Sample notebooks provide examples of using EI in SageMaker:

- Using Amazon Elastic Inference with MXNet on Amazon SageMaker
- Using Amazon Elastic Inference with MXNet on an Amazon SageMaker Notebook Instance
- Using Amazon Elastic Inference with Neo-compiled TensorFlow model on SageMaker
• Using Amazon Elastic Inference with a pre-trained TensorFlow Serving model on SageMaker

Set Up to Use EI

Use the instructions in this topic only if one of the following applies to you:

• You want to use a customized role or permission policy.
• You want to use a VPC for your hosted model or notebook instance.

Note
If you already have an execution role that has the AmazonSageMakerFullAccess managed policy attached (this is true for any IAM role that you create when you create a notebook instance, training job, or model in the console) and you are not connecting to an EI model or notebook instance in a VPC, you do not need to make any of these changes to use EI in Amazon SageMaker.

Topics
• Set Up Required Permissions (p. 3132)
• Use a Custom VPC to Connect to EI (p. 3134)

Set Up Required Permissions

To use EI in SageMaker, the role that you use to open a notebook instance or create a deployable model must have a policy with the required permissions attached. You can attach the AmazonSageMakerFullAccess managed policy, which contains the required permissions, to the role, or you can add a custom policy that has the required permissions. For information about creating an IAM role, see Creating a Role for an AWS Service (Console) in the AWS Identity and Access Management User Guide. For information about attaching a policy to a role, see Adding and Removing IAM Policies.

Add these permissions specifically for connecting EI in an IAM policy.

```json
{
  "Effect": "Allow",
  "Action": [
    "elastic-inference:Connect",
    "ec2:DescribeVpcEndpoints"
  ],
  "Resource": "*"
}
```

The following IAM policy is the complete list of required permissions to use EI in SageMaker.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [

Use a Custom VPC to Connect to EI

To use EI with SageMaker in a VPC, you need to create and configure two security groups, and set up a PrivateLink VPC interface endpoint. EI uses VPC interface endpoint to communicate with SageMaker endpoints in your VPC. The security groups you create are used to connect to the VPC interface endpoint.

Set up Security Groups to Connect to EI

To use EI within a VPC, you need to create two security groups:

- A security group to control access to the VPC interface endpoint that you will set up for EI.
- A security group that allows SageMaker to call into the first security group.

To configure the two security groups

1. Create a security group with no outbound connections. You will attach this to the VPC endpoint interface you create in the next section.
2. Create a second security group with no inbound connections, but with an outbound connection to the first security group.
3. Edit the first security group to allow inbound connections only to the second security group and all outbound connections.
For more information about VPC security groups, see Security Groups for Your VPC in the Amazon Virtual Private Cloud User Guide.

Set up a VPC Interface Endpoint to Connect to EI

To use EI with SageMaker in a custom VPC, you need to set up a VPC interface endpoint (PrivateLink) for the EI service.

- Set up a VPC interface endpoint (PrivateLink) for the EI. Follow the instructions at Creating an Interface Endpoint. In the list of services, choose com.amazonaws.<region>.elastic-inference.runtime. For Security group, make sure you select the first security group you created in the previous section to the endpoint.
- When you set up the interface endpoint, choose all of the Availability Zones where EI is available. EI fails if you do not set up at least two Availability Zones. For information about VPC subnets, see VPCs and Subnets.

Attach EI to a Notebook Instance

To test and evaluate inference performance using EI, you can attach EI to a notebook instance when you create or update a notebook instance. You can then use EI in local mode to host a model at an endpoint hosted on the notebook instance. You should test various sizes of notebook instances and EI accelerators to evaluate the configuration that works best for your use case.

Set Up to Use EI

To use EI locally in a notebook instance, create a notebook instance with an EI instance.

To create a notebook instance with an EI instance

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the navigation pane, choose Notebook instances.
3. Choose Create notebook instance.
4. For Notebook instance name, provide a unique name for your notebook instance.
5. For notebook instance type, choose a CPU instance such as ml.t2.medium.
6. For Elastic Inference (EI), choose an instance from the list, such as ml.eia2.medium.
7. For IAM role, choose an IAM role that has the required permissions to use SageMaker and EI.
8. (Optional) For VPC - Optional, if you want the notebook instance to use a VPC, choose one from the available list. Otherwise, leave it as No VPC. If you use a VPC follow the instructions at Use a Custom VPC to Connect to EI (p. 3134).
9. (Optional) For Lifecycle configuration - optional, either leave it as No configuration or choose a lifecycle configuration. For more information, see Customize a Notebook Instance Using a Lifecycle Configuration Script (p. 299).
10. (Optional) For Encryption key - optional, Optional) If you want SageMaker to use an AWS Key Management Service (AWS KMS) key to encrypt data in the ML storage volume attached to the notebook instance, specify the key.
11. (Optional) For Volume Size In GB - optional, leave the default value of 5.
12. (Optional) For Tags, add tags to the notebook instance. A tag is a label you assign to help manage your notebook instances. A tag consists of a key and a value, both of which you define.
13. Choose Create Notebook Instance.

After you create your notebook instance with EI attached, you can create a Jupyter notebook and set up an EI endpoint that is hosted locally on the notebook instance.
Use EI in Local Mode in SageMaker

To use EI locally in an endpoint hosted on a notebook instance, use local mode with the Amazon SageMaker Python SDK versions of either the TensorFlow, MXNet, or PyTorch estimators or models. For more information about local mode support in the SageMaker Python SDK, see https://github.com/aws/sagemaker-python-sdk#sagemaker-python-sdk-overview.

Use EI in Local Mode with SageMaker TensorFlow Estimators and Models

To use EI with TensorFlow in local mode, specify `local` for `instance_type` and `local_sagemaker_notebook` for `accelerator_type` when you call the `deploy` method of an estimator or a model object. For more information about Amazon SageMaker Python SDK TensorFlow estimators and models, see https://sagemaker.readthedocs.io/en/stable/frameworks/tensorflow/index.html.

The following code shows how to use local mode with an estimator object. To call the `deploy` method, you must have previously either:

- Trained the model by calling the `fit` method of an estimator.
- Pass a model artifact when you initialize the model object.

```python
# Deploys the model to a local endpoint
tf_predictor = tf_model.deploy(initial_instance_count=1,
                                instance_type='local',
                                accelerator_type='local_sagemaker_notebook')
```

Use EI in Local Mode with SageMaker Apache MXNet Estimators and Models

To use EI with MXNet in local mode, specify `local` for `instance_type` and `local_sagemaker_notebook` for `accelerator_type` when you call the `deploy` method of an estimator or a model object. For more information about Amazon SageMaker Python SDK MXNet estimators and models, see https://sagemaker.readthedocs.io/en/stable/frameworks/mxnet/index.html.

The following code shows how to use local mode with an estimator object. You must have previously called the `fit` method of the estimator to train the model.

```python
# Deploys the model to a local endpoint
mxnet_predictor = mxnet_estimator.deploy(initial_instance_count=1,
                                          instance_type='local',
                                          accelerator_type='local_sagemaker_notebook')
```

For a complete example of using EI in local mode with MXNet, see the sample notebook at https://sagemaker-examples.readthedocs.io/en/latest/sagemaker-python-sdk/mxnet_mnist/mxnet_mnist_elastic_inference_local.html.
Use EI in Local Mode with SageMaker PyTorch Estimators and Models

To use EI with PyTorch in local mode, when you call the deploy method of an estimator or a model object, specify local for instance_type and local_sagemaker_notebook for accelerator_type. For more information about Amazon SageMaker Python SDK PyTorch estimators and models, see SageMaker PyTorch Estimators and Models.

The following code shows how to use local mode with an estimator object. You must have previously called the fit method of the estimator to train the model.

```python
# Deploys the model to a local endpoint
pytorch_predictor = pytorch_estimator.deploy(initial_instance_count=1,
                                          instance_type='local',
                                          accelerator_type='local_sagemaker_notebook')
```

Use EI on Amazon SageMaker Hosted Endpoints

To use Elastic Inference (EI) in Amazon SageMaker with a hosted endpoint for real-time inference, specify an EI accelerator when you create the deployable model to be hosted at that endpoint. You can do this in one of the following ways:

- Use the Amazon SageMaker Python SDK versions of either the TensorFlow, MXNet, or PyTorch and the SageMaker pre-built containers for TensorFlow, MXNet, and PyTorch
- Build your own container, and use the low-level SageMaker API (Boto 3). You will need to import the EI-enabled version of either TensorFlow, MXNet, or PyTorch from the provided Amazon S3 locations into your container, and use one of those versions to write your training script.
- Use either the Image Classification - MXNet (p. 2172) or Object Detection - MXNet (p. 2196) built-in algorithms, and use the AWS SDK for Python (Boto3) to run your training job and create your deployable model and hosted endpoint.

Topics

- Use EI with a SageMaker TensorFlow Container (p. 3137)
- Use EI with a SageMaker MXNet Container (p. 3138)
- Use EI with a SageMaker PyTorch Container (p. 3138)
- Use EI with Your Own Container (p. 3139)

Use EI with a SageMaker TensorFlow Container

SageMaker provides default model training and inference code for your convenience. For custom file formats, you might need to implement custom model training and inference code.

Use an Estimator Object

To use an estimator object with EI, when you use the deploy method, include the accelerator_type input argument. The estimator returns a predictor object, which we call its deploy method, as shown in the example code.

```python
# Deploy an estimator using EI (using the accelerator_type input argument)
```
predictor = estimator.deploy(initial_instance_count=1,
    instance_type='ml.m4.xlarge',
    accelerator_type='ml.eia2.medium')

Use a Model Object

To use a model object with EI, when you use the deploy method, include the `accelerator_type` input argument. The estimator returns a predictor object, which we call its deploy method, as shown in the example code.

```python
# Deploy a model using EI (using the accelerator_type input argument)
predictor = model.deploy(initial_instance_count=1,
    instance_type='ml.m4.xlarge',
    accelerator_type='ml.eia2.medium')
```
For information about using PyTorch in the Amazon SageMaker Python SDK, see SageMaker PyTorch Estimators and Models.

For your convenience, SageMaker provides default model training and inference code. For custom file formats, you might need to write custom model training and inference code.

Use an Estimator Object

To use an estimator object with EI, when you use the deploy method, include the `accelerator_type` input argument. The estimator returns a predictor object, which we call its deploy method, as shown in this example code.

```
# Deploy an estimator using EI (using the accelerator_type input argument)
predictor = estimator.deploy(initial_instance_count=1,
                              instance_type='ml.m4.xlarge',
                              accelerator_type='ml.eia2.medium')
```

Use a Model Object

To use a model object with EI, when you use the deploy method, include the `accelerator_type` input argument. The model returns a predictor object, which we call its deploy method, as shown in this example code.

```
# Deploy a model using EI (using the accelerator_type input argument)
predictor = model.deploy(initial_instance_count=1,
                          instance_type='ml.m4.xlarge',
                          accelerator_type='ml.eia2.medium')
```

Use EI with Your Own Container

To use EI with a model in a custom container that you build, use the low-level AWS SDK for Python (Boto 3). download and import the AWS EI-enabled versions of TensorFlow, Apache MXNet, or PyTorch machine learning frameworks, and write your training script using those frameworks.

Import the EI Version of TensorFlow, MXNet, or PyTorch into Your Docker Container

To use EI with your own container, you need to import either the Amazon EI TensorFlow Serving library, the Amazon EI Apache MXNet library, or the Elastic Inference enabled PyTorch library into your container. The EI-enabled versions of TensorFlow and MXNet are currently available as binary files stored in Amazon S3 locations. You can download the EI-enabled binary for TensorFlow from the Amazon S3 bucket at console.aws.amazon.com/s3/buckets/amazonei-tensorflow. For information about building a container that uses the EI-enabled version of TensorFlow, see https://github.com/aws/sagemaker-tensorflow-container#building-the-sagemaker-elastic-inference-tensorflow-serving-container. You can download the EI-enabled binary for Apache MXNet from the public Amazon S3 bucket at console.aws.amazon.com/s3/buckets/amazonei-apachemxnet. For information about building a container that uses the EI-enabled version of MXNet, see https://github.com/aws/sagemaker-mxnet-container#building-the-sagemaker-elastic-inference-mxnet-container. You can download the Elastic Inference enabled binary for PyTorch from the public Amazon S3 bucket at console.aws.amazon.com/s3/buckets/amazonei-pytorch. For information about building a container that uses the Elastic Inference enabled version of PyTorch, see Building your image.

Create an EI Endpoint with AWS SDK for Python (Boto 3)

To create an endpoint by using AWS SDK for Python (Boto 3), you first create an endpoint configuration. The endpoint configuration specifies one or more models (called production variants) that you want to host at the endpoint. To attach EI to one or more of the production variants hosted at the endpoint, you
specify one of the EI instance types as the `AcceleratorType` field for that `ProductionVariant`. You then pass that endpoint configuration when you create the endpoint.

### Create an Endpoint Configuration

To use EI, you need to specify an accelerator type in the endpoint configuration.

```python
# Create Endpoint Configuration
from time import gmtime, strftime

endpoint_config_name = 'ImageClassificationEndpointConfig-' + strftime("%Y-%m-%d-%H-%M-%S", gmtime())
print(endpoint_config_name)
create_endpoint_config_response = sagemaker.create_endpoint_config(
    EndpointConfigName = endpoint_config_name,
    ProductionVariants=[[
        'InstanceType':'ml.m4.xlarge',
        'InitialInstanceCount':1,
        'ModelName':model_name,
        'VariantName':'AllTraffic',
        'AcceleratorType':'ml.eia2.medium']])
print("Endpoint Config Arn: " + create_endpoint_config_response['EndpointConfigArn'])
```

### Create an Endpoint

After you create an endpoint configuration with an accelerator type, you can create an endpoint.

```python
endpoint_name = 'ImageClassificationEndpoint-' + strftime("%Y-%m-%d-%H-%M-%S", gmtime())
endpoint_response = sagemaker.create_endpoint(
    EndpointName=endpoint_name,
    EndpointConfigName=endpoint_config_name)
```

After creating the endpoint, you can invoke it using the `invoke_endpoint` method in a Boto3 runtime object, as you would any other endpoint.

## Best practices to minimize interruptions during GPU driver upgrades

SageMaker Model Deployment upgrades GPU drivers on the ML instances for Real-time, Batch, and Asynchronous Inference options over time to provide customers access to improvements from the driver providers. Below you can see the GPU version supported for each Inference option. Different driver versions can change how your model interacts with the GPUs. Below are some strategies to help you understand how your application works with different driver versions.

### Current versions and supported instance families

Amazon SageMaker Inference supports the following drivers and instance families:

<table>
<thead>
<tr>
<th>Service</th>
<th>GPU</th>
<th>Driver version</th>
<th>Instance types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Real-time</td>
<td>NVIDIA</td>
<td>470.57.02</td>
<td>ml.p2.<em>, ml.p3.</em>, ml.p4d.<em>, ml.g4dn.</em>, ml.g5.*</td>
</tr>
</tbody>
</table>
Troubleshoot your model container with GPU capabilities

If you encounter an issue when running your GPU workload, see the following guidance:

**GPU card detection failure or NVIDIA initialization error**

Run the `nvidia-smi` (NVIDIA System Management Interface) command from within the Docker container. If the NVIDIA System Management Interface detects a GPU detection error or NVIDIA initialization error, it will return the following error message:

```
Failed to initialize NVML: Driver/library version mismatch
```

Based on your use case, follow these best practices to resolve the failure or error:

- Follow the best practice recommendation described in the If you bring your own (BYO) model containers (p. 3142) dropdown.
- Follow the best practice recommendation described in the If you use a CUDA compatibility layer (p. 3142) dropdown.

Refer to the NVIDIA System Management Interface page on the NVIDIA website for more information.

**Best practices for working with mismatched driver versions**

The following provides information on how to update your GPU driver:

**The driver my container depends on is lower than the version on the ML GPU instance**

No action is required. NVIDIA provides backwards compatibility.

**The driver my container depends on is greater than the version on the ML GPU instances**

If it is a minor version difference, no action is required. NVIDIA provides minor version forward compatibility.

If it is a major version difference, the CUDA Compatibility Package will need to be installed. Please refer to CUDA Compatibility Package in the NVIDIA documentation.
Important

The CUDA Compatibility Package is not backwards compatible so it needs to be disabled if the driver version on the instance is greater than the CUDA Compatibility Package version.

If you bring your own (BYO) model containers

Ensure no NVIDIA driver packages are bundled in the image which could cause conflict with on host NVIDIA driver version.

If you use a CUDA compatibility layer

To verify if the platform Nvidia driver version supports the CUDA Compatibility Package version installed in the model container, see the CUDA documentation. If the platform Nvidia driver version does not support the CUDA Compatibility Package version, you can disable or remove the CUDA Compatibility Package from the model container image. If the CUDA compatibility libs version is supported by the latest Nvidia driver version, we suggest that you enable the CUDA Compatibility Package based on the detected Nvidia driver version for future compatibility by adding the code snippet below into the container start up shell script (at the ENTRYPOINT script).

The script demonstrates how to dynamically switch the use of the CUDA Compatibility Package based on the detected Nvidia driver version on the deployed host for your model container. When SageMaker releases a newer Nvidia driver version, the installed CUDA Compatibility Package can be turned off automatically if the CUDA application is supported natively on the new driver.

```
#!/bin/bash

verlte() {
    [ "$1" = "$2" ] || [ "$2" = `echo -e "$1
$2" | sort -V | head -n1` ]
}

if [ -f /usr/local/cuda/compat/libcuda.so.1 ]; then
cat /usr/local/cuda/version.txt
CUDA_COMPAT_MAX_DRIVER_VERSION=$(readlink /usr/local/cuda/compat/libcuda.so.1 |cut -d'.' -f 3-)
echo "CUDA compat package requires Nvidia driver #${CUDA_COMPAT_MAX_DRIVER_VERSION}"
NVIDIA_DRIVER_VERSION=$(sed -n 's/^NVRM.*Kernel Module \([0-9.]*\).*$/\1/p' /proc/driver/nvidia/version 2>/dev/null || true)
echo "Current installed Nvidia driver version is ${NVIDIA_DRIVER_VERSION}"
if [ $(verlte ${CUDA_COMPAT_MAX_DRIVER_VERSION} ${NVIDIA_DRIVER_VERSION}) ]; then
echo "Setup CUDA compatibility libs path to LD_LIBRARY_PATH"
    export LD_LIBRARY_PATH=/usr/local/cuda/compat:$LD_LIBRARY_PATH
    echo $LD_LIBRARY_PATH
else
echo "Skip CUDA compat libs setup as newer Nvidia driver is installed"
fi
else
echo "Skip CUDA compat libs setup as package not found"
fi
```

Model Hosting FAQs

Refer to the following FAQ items for answers to commonly asked questions about SageMaker Inference Hosting.

General Hosting

The following FAQ items answer common general questions for SageMaker Inference.
Q: What deployment options does Amazon SageMaker provide?

A: After you build and train models, Amazon SageMaker provides four options to deploy them so you can start making predictions. Real-Time Inference is suitable for workloads with millisecond latency requirements, payload sizes up to 6 MB, and processing times of up to 60 seconds. Batch Transform is ideal for offline predictions on large batches of data that are available up front. Asynchronous Inference is designed for workloads that do not have sub-second latency requirements, payload sizes up to 1 GB, and processing times of up to 15 minutes. With Serverless Inference, you can quickly deploy machine learning models for inference without having to configure or manage the underlying infrastructure, and you pay only for the compute capacity used to process inference requests, which is ideal for intermittent workloads.

Q: How do I choose a model deployment option in SageMaker?

A: The following diagram can help you choose a SageMaker Hosting model deployment option.

The preceding diagram walks you through the following decision process. If you want to process requests in batches, you might want to choose Batch Transform. Otherwise, if you want to receive inference for each request to your model, you might want to choose Asynchronous Inference, Serverless Inference, or Real-Time Inference. You can choose Asynchronous Inference if you have long processing times or large payloads and want to queue requests. You can choose Serverless Inference if your workload has unpredictable or intermittent traffic. You can choose Real-Time Inference if you have sustained traffic and need lower and consistent latency for your requests.

Q: I've heard SageMaker Inference is expensive. What's the best way to optimize my cost when hosting models?

A: To optimize your costs with SageMaker Inference, you should choose the right hosting option for your use case. You can also use Inference features such as Amazon SageMaker Savings Plans, model optimization with SageMaker Neo, Multi-Model Endpoints and Multi-Container Endpoints, or autoscaling. For tips on how to optimize your Inference costs, see Inference cost optimization best practices (p. 2980).

Q: Why should I use Amazon SageMaker Inference Recommender?

A: You should use Amazon SageMaker Inference Recommender if you need recommendations for the right endpoint configuration to improve performance and reduce costs. Previously, data scientists who wanted to deploy their models had to run manual benchmarks to select the right endpoint configuration. First, they had to select the right machine learning instance type out of more than 70
available instance types based on the resource requirements of their models and sample payloads, and then optimize the model to account for differing hardware. Then, they had to conduct extensive load tests to validate that latency and throughput requirements were met and that the costs were low. Inference Recommender eliminates this complexity by helping you do the following:

- Get started in minutes with an instance recommendation.
- Conduct load tests across instance types to get recommendations on your endpoint configuration within hours.
- Automatically tune container and model server parameters as well as perform model optimizations for a given instance type.

**Q:** What is a model server?

**A:** SageMaker endpoints are HTTP REST endpoints that use a containerized web server, which includes a model server. These containers are responsible for loading up and serving requests for a machine learning model. They implement a web server that responds to /invocations and /ping on port 8080.

Common model servers include TensorFlow Serving, TorchServe and Multi Model Server. SageMaker framework containers have these model servers built in.

**Q:** What is Bring Your Own Container with Amazon SageMaker?

**A:** Everything in SageMaker Inference is containerized. SageMaker provides managed containers for popular frameworks such as TensorFlow, SKlearn, and HuggingFace. For a comprehensive updated list of those images, see Available Images.

Sometimes there are custom frameworks for which you might need to build a container. This approach is known as Bring Your Own Container or BYOC. With the BYOC approach, you provide the Docker image to set up your framework or library. Then, you push the image to Amazon Elastic Container Registry (Amazon ECR) so that you can use the image with SageMaker. For an example of a BYOC approach, see Overview of Containers for Amazon SageMaker.

Alternatively, instead of building an image from scratch, you can extend a container. You can take one of the base images that SageMaker provides and add your dependencies on top of it in your Dockerfile.

**Q:** Do I need to train my models on SageMaker to host them on SageMaker endpoints?

**A:** SageMaker offers the capacity to bring your own trained framework model that you've trained outside of SageMaker and deploy it on any of the SageMaker hosting options.

SageMaker requires you to package the model in a model.tar.gz file and have a specific directory structure. Each framework has its own model structure (see the following question for example structures). For more information, see the SageMaker Python SDK documentation for TensorFlow, PyTorch, and MXNet.

While you can choose from prebuilt framework images such as TensorFlow, PyTorch, and MXNet to host your trained model, you can also build your own container to host your trained models on SageMaker endpoints. For a walkthrough, see the example Jupyter notebook Building your own algorithm container.

**Q:** How should I structure my model if I want to deploy on SageMaker but not train on SageMaker?

**A:** SageMaker requires your model artifacts to be compressed in a .tar.gz file, or a tarball. SageMaker automatically extracts this .tar.gz file into the /opt/ml/model/ directory in your container. The tarball shouldn't contain any symlinks or unnecessary files. If you are making use of one of the framework
containers, such as TensorFlow, PyTorch, or MXNet, the container expects your TAR structure to be as follows:

**TensorFlow**

```
model.tar.gz/
  |--[model_version_number]/
  |   |--variables
  |   |--saved_model.pb
  code/
    |--inference.py
    |--requirements.txt
```

**PyTorch**

```
model.tar.gz/
  |- model.pth
  |- code/
    |- inference.py
    |- requirements.txt  # only for versions 1.3.1 and higher
```

**MXNet**

```
model.tar.gz/
  |- model-symbol.json
  |- model-shapes.json
  |- model-0000.params
  |- code/
    |- inference.py
    |- requirements.txt # only for versions 1.6.0 and higher
```

**Q: When invoking a SageMaker endpoint, I can provide a ContentType and Accept MIME Type. Which one is used to identify the data type being sent and received?**

A: ContentType is the MIME type of the input data in the request body (the MIME type of the data you are sending to your endpoint). The model server uses the ContentType to determine if it can handle the type provided or not.

Accept is the MIME type of the inference response (the MIME type of the data your endpoint returns). The model server uses the Accept type to determine if it can handle returning the type provided or not.

Common MIME types include text/csv, application/json, and application/jsonlines.

**Q: What are the supported data formats for SageMaker Inference?**

A: SageMaker passes any request onto the model container without modification. The container must contain the logic to deserialize the request. For information about the formats defined for built-in algorithms, see [Common Data Formats for Inference](#). If you are building your own container or using a SageMaker Framework container, you can include the logic to accept a request format of your choice.

Similarly, SageMaker also returns the response without modification, and then the client must deserialize the response. In case of the built-in algorithms, they return responses in specific formats. If you are building your own container or using a SageMaker Framework container, you can include the logic to return a response in the format you choose.

**Q: How do I invoke my endpoint with binary data such as videos or images?**

Use the [Invoke Endpoint](#) API call to make inference against your endpoint.
When passing your input as a payload to the InvokeEndpoint API, you must provide the correct type of input data that your model expects. When passing a payload in the InvokeEndpoint API call, the request bytes are forwarded directly to the model container. For example, for an image, you may use application/jpeg for the ContentType, and make sure that your model can perform inference on this type of data. This applies for JSON, CSV, video, or any other type of input with which you may be dealing.

Another factor to consider is payload size limits. In terms of real-time and serverless endpoints, the payload limit is 6 MB. You can split your video into multiple frames and invoke the endpoint with each frame individually. Alternatively, if your use case permits, you can send the whole video in the payload using an asynchronous endpoint, which supports up to 1 GB payloads.

For an example that showcases how to run computer vision inference on large videos with Asynchronous Inference, see this blog post.

**Real-Time Inference**

The following FAQ items answer common questions for SageMaker Real-Time Inference.

**Q: How do I create a SageMaker endpoint?**

**A:** You can create a SageMaker endpoint through AWS-supported tooling such as the AWS SDKs, the SageMaker Python SDK, the AWS Management Console, AWS CloudFormation, and the AWS Cloud Development Kit (AWS CDK).

There are three key entities in endpoint creation: a SageMaker model, a SageMaker endpoint configuration, and a SageMaker endpoint. The SageMaker model points towards the model data and image you are using. The endpoint configuration defines your production variants, which might include the instance type and instance count. You can then use either the create_endpoint API call or the .deploy() call for SageMaker to create an endpoint using the metadata from your model and endpoint configuration.

**Q: Do I need to use the SageMaker Python SDK to create/invoke endpoints?**

**A:** No, you can use the various AWS SDKs (see Invoke/Create for available SDKs) or even call the corresponding web APIs directly.

**Q: What is the difference between Multi-Model Endpoints (MME) and Multi Model Server (MMS)?**

**A:** A Multi-Model Endpoint is a Real-Time Inference option that SageMaker provides. With Multi-Model Endpoints, you can host thousands of models behind one endpoint. Multi Model Server is an open-source framework for serving machine learning models. It provides the HTTP front-end and model management capabilities required by multi-model endpoints to host multiple models within a single container, load models into and unload models out of the container dynamically, and perform inference on a specified loaded model.

**Q: What are the different model deployment architectures supported by Real-Time Inference?**

**A:** SageMaker Real-Time Inference supports various model deployment architecture such as Multi-Model Endpoints, Multi-Container Endpoints, and Serial Inference Pipelines.

**Multi-Model Endpoints (MME)** – MME allows customers to deploy 1000s of hyper-personalized models in a cost effective way. All the models are deployed on a shared-resource fleet. MME works best when the models are of similar size and latency and belong to the same ML framework. These endpoints are ideal for when you have don’t need to call the same model at all times. You can dynamically load respective models onto the SageMaker endpoint to serve your request.
Multi-Container Endpoints (MCE) – MCE allows customers to deploy 15 different containers with diverse ML frameworks and functionalities with no cold starts while only using one SageMaker endpoint. You can directly invoke these containers. MCE is best for when you want to keep all the models in memory.

Serial Inference Pipelines (SIP) – You can use SIP to chain together 2-15 containers on a single endpoint. SIP is mostly suitable for combining preprocessing and model inference in one endpoint and for low latency operations.

Serverless Inference

The following FAQ items answer common questions for Amazon SageMaker Serverless Inference.

Q: What is Amazon SageMaker Serverless Inference?
A: Serverless Inference (p. 2923) is a purpose-built serverless model serving option that makes it easy to deploy and scale ML models. Serverless Inference endpoints automatically start compute resources and scale them in and out depending on traffic, eliminating the need for you to choose instance type, run provisioned capacity, or manage scaling. You can optionally specify the memory requirements for your serverless endpoint. You pay only for the duration of running the inference code and the amount of data processed, not for idle periods.

Q: Why should I use Serverless Inference?
A: Serverless Inference simplifies the developer experience by eliminating the need to provision capacity up front and manage scaling policies. Serverless Inference can scale instantly from tens to thousands of inferences within seconds based on the usage patterns, making it ideal for ML applications with intermittent or unpredictable traffic. For example, a chatbot service used by a payroll processing company experiences an increase in inquiries at the end of the month while traffic is intermittent for rest of the month. Provisioning instances for the entire month in such scenarios is not cost-effective, as you end up paying for idle periods.

Serverless Inference helps address these types of use cases by providing you automatic and fast scaling out of the box without the need for you to forecast traffic up front or manage scaling policies. Additionally, you pay only for the compute time to run your inference code and for data processing, making it ideal for workloads with intermittent traffic.

Q: How do I choose the right memory size for my serverless endpoint?
A: Your serverless endpoint has a minimum RAM size of 1024 MB (1 GB), and the maximum RAM size you can choose is 6144 MB (6 GB). The memory sizes you can choose are 1024 MB, 2048 MB, 3072 MB, 4096 MB, 5120 MB, or 6144 MB. Serverless Inference auto-assigns compute resources proportional to the memory you select. If you choose a larger memory size, your container has access to more vCPUs.

Choose your endpoint's memory size according to your model size. Generally, the memory size should be at least as large as your model size. You may need to benchmark in order to choose the right memory selection for your model based on your latency SLAs. The memory size increments have different pricing; see the Amazon SageMaker pricing page for more information.

Batch Transform

The following FAQ items answer common questions for SageMaker Batch Transform.

Q: How does Batch Transform split my data?
A: For specific file formats such as CSV, RecordIO and TFRecord, SageMaker can split your data into single-record or multi-record mini batches and send this as a payload to your model container. When the value of BatchStrategy is MultiRecord, SageMaker sends the maximum number of records in
each request, up to the \texttt{MaxPayloadInMB} limit. When the value of \texttt{BatchStrategy} is \texttt{SingleRecord}, SageMaker sends individual records in each request.

\textbf{Q: What is the maximum timeout for Batch Transform and payload limit for a single record?}

\textbf{A:} The maximum timeout for Batch Transform is 3600 seconds. The \textit{maximum payload size} for a record (per mini batch) is 100 MB.

\textbf{Q: How do I speed up a Batch Transform job?}

\textbf{A:} If you are using the \texttt{CreateTransformJob} API, you can reduce the time it takes to complete batch transform jobs by using optimal values for parameters such as \texttt{MaxPayloadInMB}, \texttt{MaxConcurrentTransforms}, or \texttt{BatchStrategy}. The ideal value for \texttt{MaxConcurrentTransforms} is equal to the number of compute workers in the batch transform job. If you are using the SageMaker console, you can specify these optimal parameter values in the \textit{Additional configuration} section of the \texttt{Batch transform job configuration} page. SageMaker automatically finds the optimal parameter settings for built-in algorithms. For custom algorithms, provide these values through an \textit{execution-parameters} endpoint.

\textbf{Q: What are the data formats natively supported in Batch Transform?}

\textbf{A:} Batch Transform supports CVS and JSON.

\section*{Asynchronous Inference}

The following FAQ items answer common general questions for SageMaker Asynchronous Inference.

\textbf{Q: What is Amazon SageMaker Asynchronous Inference?}

\textbf{A:} Asynchronous Inference queues incoming requests and processes them asynchronously. This option is ideal for requests with large payload sizes or long processing times that need to be processed as they arrive. Optionally, you can configure auto-scaling settings to scale down the instance count to zero when not actively processing requests.

\textbf{Q: How do I scale my endpoints to 0 when there’s no traffic?}

\textbf{A:} Amazon SageMaker supports automatic scaling (autoscaling) your asynchronous endpoint. Autoscaling dynamically adjusts the number of instances provisioned for a model in response to changes in your workload. Unlike other hosted models SageMaker supports, with Asynchronous Inference you can also scale down your asynchronous endpoints instances to zero. Requests that are received when there are zero instances are queued for processing once the endpoint scales up. For more information, see \textit{Autoscale an asynchronous endpoint}.

Amazon SageMaker Serverless Inference also automatically scales down to zero. You won’t see this because SageMaker manages scaling your serverless endpoints, but if you are not experiencing any traffic, the same infrastructure applies.
Using Docker containers with SageMaker

Amazon SageMaker makes extensive use of Docker containers for build and runtime tasks. SageMaker provides prebuilt Docker images for its built-in algorithms and the supported deep learning frameworks used for training and inference. Using containers, you can train machine learning algorithms and deploy models quickly and reliably at any scale. The topics in this section show how to deploy these containers for your own use cases. For information on how to bring your own containers for use with Amazon SageMaker Studio, see Bring your own SageMaker image (p. 152).

Topics

- Scenarios for Running Scripts, Training Algorithms, or Deploying Models with SageMaker (p. 3149)
- Docker Container Basics (p. 3150)
- Use Prebuilt SageMaker Docker images (p. 3150)
- Adapting Your Own Docker Container to Work with SageMaker (p. 3164)
- Create a container with your own algorithms and models (p. 3180)
- Example Notebooks: Use Your Own Algorithm or Model (p. 3200)
- Troubleshooting your Docker containers (p. 3202)

Scenarios for Running Scripts, Training Algorithms, or Deploying Models with SageMaker

Amazon SageMaker always uses Docker containers when running scripts, training algorithms, and deploying models. However, your level of engagement with containers depends on your use case.

- **Use a built-in SageMaker algorithm or framework.** For most use cases, you can use the built-in algorithms and frameworks without worrying about containers. You can train and deploy these algorithms from the SageMaker console, the AWS Command Line Interface (AWS CLI), a Python notebook, or the Amazon SageMaker Python SDK by specifying the algorithm or framework version when creating your Estimator. The built-in algorithms available are itemized and described in the Use Amazon SageMaker Built-in Algorithms or Pre-trained Models (p. 1096) topic. For more information on the available frameworks, see ML Frameworks and Toolkits (p. 13). For an example of how to train and deploy a built-in algorithm using a Jupyter notebook running in a SageMaker notebook instance, see the Get Started with Amazon SageMaker (p. 33) topic.

- **Use prebuilt SageMaker container images.** Alternatively, you can use the built-in algorithms and frameworks using Docker containers. SageMaker provides containers for its built-in algorithms and prebuilt Docker images for some of the most common machine learning frameworks, such as Apache MXNet, TensorFlow, PyTorch, and Chainer. For a full list of the available SageMaker Images, see Available Deep Learning Containers Images. It also supports machine learning libraries such as scikit-learn and SparkML. If you use the Amazon SageMaker Python SDK, you can deploy the containers by passing the full container URI to their respective SageMaker SDK Estimator class. For the full list of deep learning frameworks currently supported by SageMaker, see Prebuilt SageMaker Docker Images for Deep Learning (p. 3151). For information on the scikit-learn and SparkML prebuilt container images, see Prebuilt Amazon SageMaker Docker Images for Scikit-learn and Spark ML (p. 3151).
For more information about using frameworks with the Amazon SageMaker Python SDK, see their respective topics in Use Machine Learning Frameworks, Python, and R with Amazon SageMaker (p. 13).

- **Extend a prebuilt SageMaker container image.** If you would like to extend a prebuilt SageMaker algorithm or model Docker image, you can modify the SageMaker image to satisfy your needs. For an example, see Extending our PyTorch containers.
- **Adapt an existing container image:** If you would like to adapt a pre-existing container image to work with SageMaker, you need to modify the Docker container to enable either the SageMaker Training or Inference toolkit. For an example that shows how to build your own containers to train and host an algorithm, see Bring Your Own R Algorithm.

# Docker Container Basics

Docker is a program that performs operating system-level virtualization for installing, distributing, and managing software. It packages applications and their dependencies into virtual containers that provide isolation, portability, and security. With Docker, you can ship code faster, standardize application operations, seamlessly move code, and economize by improving resource utilization. For more general information about Docker, see Docker overview.

The following information outlines the most significant aspects of using Docker containers with Amazon SageMaker.

## SageMaker Functions

SageMaker uses Docker containers in the backend to manage training and inference processes. SageMaker abstracts away from this process, so it happens automatically when an estimator is used. While you don't need to use Docker containers explicitly with SageMaker for most use cases, you can use Docker containers to extend and customize SageMaker functionality.

## Containers with SageMaker Studio

SageMaker Studio runs from a Docker container and uses it to manage functionality. As a result, you must create your Docker container following the steps in Bring your own SageMaker image (p. 152).

# Use Prebuilt SageMaker Docker images

Amazon SageMaker provides containers for its built-in algorithms and prebuilt Docker images for some of the most common machine learning frameworks, such as Apache MXNet, TensorFlow, PyTorch, and Chainer. It also supports machine learning libraries such as scikit-learn and SparkML.

You can use these images from your SageMaker notebook instance or SageMaker Studio. You can also extend the prebuilt SageMaker images to include libraries and needed functionality. The following topics give information about the available images and how to use them.

**Note**
For information on Docker images for developing reinforcement learning (RL) solutions in SageMaker, see SageMaker RL Containers.

## Topics

- Prebuilt SageMaker Docker Images for Deep Learning (p. 3151)
- Prebuilt Amazon SageMaker Docker Images for Scikit-learn and Spark ML (p. 3151)
- Train a Deep Graph Network (p. 3153)
- Extend a Prebuilt Container (p. 3156)
Prebuilt SageMaker Docker Images for Deep Learning

SageMaker provides prebuilt Docker images that include deep learning framework libraries and other dependencies needed for training and inference. For a complete list of the available pre-built Docker images, see Deep Learning Containers Images.

If you are not using the Amazon SageMaker Python SDK and one of its estimators to retrieve the pre-built images, you have to retrieve them yourself.

Using the SageMaker Python SDK

With the SageMaker Python SDK, you can train and deploy models using these popular deep learning frameworks. For instructions on installing and using the SDK, see Amazon SageMaker Python SDK. The following table lists the available frameworks and instructions on how to use them with the SageMaker Python SDK:

<table>
<thead>
<tr>
<th>Framework</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>TensorFlow</td>
<td>Using TensorFlow with the SageMaker Python SDK</td>
</tr>
<tr>
<td>MXNet</td>
<td>Using MXNet with the SageMaker Python SDK</td>
</tr>
<tr>
<td>PyTorch</td>
<td>Using PyTorch with the SageMaker Python SDK</td>
</tr>
<tr>
<td>Chainer</td>
<td>Using Chainer with the SageMaker Python SDK</td>
</tr>
<tr>
<td>Hugging Face</td>
<td>Using Hugging Face with the SageMaker Python SDK</td>
</tr>
</tbody>
</table>

Extending Prebuilt SageMaker Docker Images

You can customize these prebuilt containers or extend them to handle any additional functional requirements for your algorithm or model that the prebuilt SageMaker Docker image doesn't support. For an example, see Extending Our PyTorch Containers.

You can also use prebuilt containers to deploy your custom models or models that have been trained in a framework other than SageMaker. For an overview of the process of bringing the trained model artifacts into SageMaker and hosting them at an endpoint, see Bring Your Own Pretrained MXNet or TensorFlow Models into Amazon SageMaker.

Prebuilt Amazon SageMaker Docker Images for Scikit-learn and Spark ML

SageMaker provides prebuilt Docker images that install the scikit-learn and Spark ML libraries. These libraries also include the dependencies needed to build Docker images that are compatible with SageMaker using the Amazon SageMaker Python SDK. With the SDK, you can use scikit-learn for machine learning tasks and use Spark ML to create and tune machine learning pipelines. For instructions on installing and using the SDK, see SageMaker Python SDK.

Using the SageMaker Python SDK

The following table contains links to the GitHub repositories with the source code for the scikit-learn and Spark ML containers. The table also contains links to instructions that show how use these containers with Python SDK estimators to run your own training algorithms and hosting your own models.
Amazon SageMaker Developer Guide

### Specifying the Prebuilt Images Manually

If you are not using the SageMaker Python SDK and one of its estimators to manage the container, you have to retrieve the relevant prebuilt container manually. The SageMaker prebuilt Docker images are stored in Amazon Elastic Container Registry (Amazon ECR). You can push or pull them using their fullname registry addresses. SageMaker uses the following Docker Image URL patterns for scikit-learn and Spark ML:

- `<ACCOUNT_ID>.dkr.ecr.<REGION_NAME>.amazonaws.com/sagemaker-scikit-learn:<SCIKIT-LEARN_VERSION>-cpu-py<PYTHON_VERSION>

  For example, `746614075791.dkr.ecr.us-west-1.amazonaws.com/sagemaker-scikit-learn:0.23-1-cpu-py3`

- `<ACCOUNT_ID>.dkr.ecr.<REGION_NAME>.amazonaws.com/sagemaker-sparkml-serving:<SPARK-ML_VERSION>

  For example, `341280168497.dkr.ecr.ca-central-1.amazonaws.com/sagemaker-sparkml-serving:2.4`

The following table lists the supported values for account IDs and corresponding AWS Region names.

<table>
<thead>
<tr>
<th>ACCOUNT_ID</th>
<th>REGION_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>746614075791</td>
<td>us-west-1</td>
</tr>
<tr>
<td>246618743249</td>
<td>us-west-2</td>
</tr>
<tr>
<td>683313688378</td>
<td>us-east-1</td>
</tr>
<tr>
<td>257758044811</td>
<td>us-east-2</td>
</tr>
<tr>
<td>354813040037</td>
<td>ap-northeast-1</td>
</tr>
<tr>
<td>366743142698</td>
<td>ap-northeast-2</td>
</tr>
<tr>
<td>121021644041</td>
<td>ap-southeast-1</td>
</tr>
<tr>
<td>783357654285</td>
<td>ap-southeast-2</td>

<td>eu-central-1</td>
</tr>
<tr>
<td>341280168497</td>
<td>ca-central-1</td>
</tr>
</tbody>
</table>
Finding Available Images

Use the following commands to find out which versions of the images are available. For example, use the following to find the available sagemaker-sparkml-serving image in the ca-central-1 Region:

```
aws \
  ecr describe-images \
  --region ca-central-1 \
  --registry-id 341280168497 \
  --repository-name sagemaker-sparkml-serving
```

Train a Deep Graph Network

In this overview, you learn how to get started with a deep graph network by using one of the DGL containers in Amazon Elastic Container Registry (Amazon ECR). You can also see links to practical examples for deep graph networks.

What Is a Deep Graph Network?

Deep graph networks refer to a type of neural network that is trained to solve graph problems. A deep graph network uses an underlying deep learning framework like PyTorch or MXNet. The potential for graph networks in practical AI applications is highlighted in the Amazon SageMaker tutorials for Deep Graph Library (DGL). Examples for training models on graph datasets include social networks, knowledge bases, biology, and chemistry.
Several examples are provided using Amazon SageMaker’s deep learning containers that are preconfigured with DGL. If you have special modules you want to use with DGL, you can also build your own container. The examples involve heterographs, which are graphs that have multiple types of nodes and edges, and draw on a variety of applications across disparate scientific fields, such as bioinformatics and social network analysis. DGL provides a wide array of graph neural network implementations for different types models. Some of the highlights include:

- Graph convolutional network (GCN)
- Relational graph convolutional network (R-GCN)
- Graph attention network (GAT)
- Deep generative models of graphs (DGMG)
- Junction tree neural network (JTNN)

Get Started

DGL is available as a deep learning container in Amazon ECR. You can select deep learning containers when you write your estimator function in an Amazon SageMaker notebook. You can also craft your own custom container with DGL by following the Bring Your Own Container guide. The easiest way to get started with a deep graph network uses one of the DGL containers in Amazon ECR.

Note

Backend framework support is limited to PyTorch and MXNet.

Setup
If you are using Amazon SageMaker Studio, you need to clone the examples repository first. If you are using a notebook instance, you can find the examples by choosing the SageMaker icon at bottom of the left toolbar.

**To clone the Amazon SageMaker SDK and notebook examples repository**

1. From the JupyterLab view in Amazon SageMaker, go to the File Browser at the top of the left toolbar. From the File Browser panel, you can see a new navigation at the top of the panel.
2. Choose the icon on the far right to clone a Git repository.
3. Add the repository URL: https://github.com/awslabs/amazon-sagemaker-examples.git
4. Browse the newly added folder and its contents. The DGL examples are stored in the sagemaker-python-sdk folder.

**Run a Graph Network Training Example**

**To train a deep graph network**

1. From the JupyterLab view in Amazon SageMaker, browse the example notebooks and look for DGL folders. Several files may be included to support an example. Examine the README for any prerequisites.
2. Run the .ipynb notebook example.
3. Find the estimator function, and note the line where it is using an Amazon ECR container for DGL and a specific instance type. You may want to update this to use a container in your preferred Region.
4. Run the function to launch the instance and use the DGL container for training a graph network. Charges are incurred for launching this instance. The instance self-terminates when the training is complete.

**Examples**

An example of knowledge graph embedding (KGE) is provided. It uses the Freebase dataset, a knowledge base of general facts. An example use case would be to graph the relationships of persons and predict their nationality.

An example implementation of a graph convolutional network (GCN) shows how you can train a graph network to predict toxicity. A physiology dataset, Tox21, provides toxicity measurements for how substances affect biological responses.

Another GCN example shows you how to train a graph network on a scientific publications bibliography dataset, known as Cora. You can use it to find relationships between authors, topics, and conferences.

The last example is a recommender system for movie reviews. It uses a graph convolutional matrix completion (GCMC) network trained on the MovieLens datasets. These datasets consist of movie titles, genres, and ratings by users.

**Use a Deep Learning Container with DGL**

The following example uses preconfigured deep learning containers. This is the easiest to try since it works out of the box on Amazon SageMaker.

- Semi-supervised classification of a knowledge base using a GCN
Bring Your Own Container with DGL

The following examples enable you to bring your own container (BYOC). Read the BYOC guide and familiarize yourself with that process before trying these. Configuration is required.

- Molecular property prediction of toxicity using a GCN
- Recommender system for movies using a GCMC implementation

Extend a Prebuilt Container

If a prebuilt SageMaker container doesn't fulfill all of your requirements, you can extend the existing image to accommodate your needs. Even if there is direct support for your environment or framework, you may want to add additional functionality or configure your container environment differently. By extending a prebuilt image, you can leverage the included deep learning libraries and settings without having to create an image from scratch. You can extend the container to add libraries, modify settings, and install additional dependencies.

The following tutorial shows how to extend a prebuilt SageMaker image and publish it to Amazon ECR.

Topics
- Requirements to Extend a Prebuilt Container (p. 3156)
- Extend SageMaker Containers to Run a Python Script (p. 3156)

Requirements to Extend a Prebuilt Container

To extend a pre-built SageMaker image, you need to set the following environment variables within your Dockerfile. For more information on environment variables with SageMaker containers, see the SageMaker Training Toolkit GitHub repo.

- SAGEMAKER_SUBMIT_DIRECTORY: The directory within the container in which the Python script for training is located.
- SAGEMAKER_PROGRAM: The Python script that should be invoked and used as the entry point for training.

You can also install additional libraries by including the following in your Dockerfile:

```
RUN pip install <library>
```

The following tutorial shows how to use these environment variables.

Extend SageMaker Containers to Run a Python Script

In this tutorial, you learn how to extend the SageMaker PyTorch container with a Python file that uses the CIFAR-10 dataset. By extending the SageMaker PyTorch container, you utilize the existing training solution made to work with SageMaker. This tutorial extends a training image, but the same steps can be taken to extend an inference image. For a full list of the available images, see Available Deep Learning Containers Images.

To run your own training model using the SageMaker containers, build a Docker container through a SageMaker Notebook instance.

Step 1: Create an SageMaker Notebook Instance

1. Open the SageMaker console.
2. In the left navigation pane, choose Notebook, choose Notebook instances, and then choose Create notebook instance.

3. On the Create notebook instance page, provide the following information:
   a. For Notebook instance name, enter RunScriptNotebookInstance.
   b. For Notebook Instance type, choose ml.t2.medium.
   c. In the Permissions and encryption section, do the following:
      i. For IAM role, choose Create a new role.
      ii. On the Create an IAM role page, choose Specific S3 buckets, specify an Amazon S3 bucket named sagemaker-run-script, and then choose Create role.
         SageMaker creates an IAM role named AmazonSageMaker-ExecutionRole-YYYYMMDDTHHmmsS, such as AmazonSageMaker-ExecutionRole-20190429T110788. Note that the execution role naming convention uses the date and time when the role was created, separated by a T.
   d. For Root Access, choose Enable.
   e. Choose Create notebook instance.

4. On the Notebook instances page, the Status is Pending. It can take a few minutes for Amazon SageMaker to launch a machine learning compute instance—in this case, it launches a notebook instance—and attach an ML storage volume to it. The notebook instance has a preconfigured Jupyter notebook server and a set of Anaconda libraries. For more information, see CreateNotebookInstance.

5. In the Permissions and encryption section, copy the IAM role ARN number, and paste it into a notepad file to save it temporarily. You use this IAM role ARN number later to configure a local training estimator in the notebook instance. The IAM role ARN number looks like the following: 'arn:aws:iam::111122223333:role/service-role/AmazonSageMaker-ExecutionRole-20190429T110788'

6. After the status of the notebook instance changes to InService, choose Open JupyterLab.

Step 2: Create and Upload the Dockerfile and Python Training Scripts

1. After JupyterLab opens, create a new folder in the home directory of your JupyterLab. In the upper-left corner, choose the New Folder icon, and then enter the folder name docker_test_folder.

2. Create a Dockerfile text file in the docker_test_folder directory.
   a. Choose the New Launcher icon (+) in the upper-left corner.
   b. In the right pane under the Other section, choose Text File.
   c. Paste the following Dockerfile sample code into your text file.

```
# SageMaker PyTorch image
FROM 763104351884.dkr.ecr.us-east-1.amazonaws.com/pytorch-training:1.5.1-cpu-py36-ubuntu16.04

ENV PATH=":opt/ml/code:${PATH}"

# this environment variable is used by the SageMaker PyTorch container to determine our user code directory.
ENV SAGEMAKER_SUBMIT_DIRECTORY /opt/ml/code

# /opt/ml and all subdirectories are utilized by SageMaker, use the /code subdirectory to store your user code.
COPY cifar10.py /opt/ml/code/cifar10.py
```
The Dockerfile script performs the following tasks:

- **FROM 763104351884.dkr.ecr.us-east-1.amazonaws.com/pytorch-training:1.5.1-cpu-py36-ubuntu16.04** – Downloads the SageMaker PyTorch base image. You can replace this with any SageMaker base image you want to bring to build containers.
- **ENV SAGEMAKER_SUBMIT_DIRECTORY /opt/ml/code** – Sets /opt/ml/code as the training script directory.
- **COPY cifar10.py /opt/ml/code/cifar10.py** – Copies the script to the location inside the container that is expected by SageMaker. The script must be located in this folder.
- **ENV SAGEMAKER_PROGRAM cifar10.py** – Sets your cifar10.py training script as the entrypoint script.

On the left directory navigation pane, the text file name might automatically be named untitled.txt. To rename the file, right-click the file, choose Rename, rename the file as Dockerfile without the .txt extension, and then press Ctrl+s or Command+s to save the file.

3. Create or upload a training script cifar10.py in the docker_test_folder. You can use the following example script for this exercise.

```python
import ast
import argparse
import logging
import os
import torch
import torch.distributed as dist
import torch.nn as nn
import torch.nn.parallel
import torch.optim
import torch.utils.data
import torch.utils.data.distributed
import torchvision
import torchvision.models
import torchvision.transforms as transforms
import torch.nn.functional as F

logger=logging.getLogger(__name__)
logger.setLevel(logging.DEBUG)
classes=('plane', 'car', 'bird', 'cat', 'deer', 'dog', 'frog', 'horse', 'ship', 'truck')

# https://github.com/pytorch/tutorials/blob/master/beginner_source/blitz/cifar10_tutorial.py#L118
class Net(nn.Module):
    def __init__(self):
        super(Net, self).__init__()
        self.conv1=nn.Conv2d(3, 6, 5)
        self.pool=nn.MaxPool2d(2, 2)
        self.conv2=nn.Conv2d(6, 16, 5)
        self.fc1=nn.Linear(16 * 5 * 5, 120)
        self.fc2=nn.Linear(120, 84)
        self.fc3=nn.Linear(84, 10)
        def forward(self, x):
```
```python
x = self.pool(F.relu(self.conv1(x)))
x = self.pool(F.relu(self.conv2(x)))
x = x.view(-1, 16 * 5 * 5)
x = F.relu(self.fc1(x))
x = F.relu(self.fc2(x))
x = self.fc3(x)
return x

def _train(args):
    is_distributed = len(args.hosts) > 1 and args.dist_backend is not None
    logger.debug("Distributed training - {}".format(is_distributed))

    if is_distributed:

    train_loader = torch.utils.data.DataLoader(trainset, batch_size=args.batch_size,
                                              shuffle=True, num_workers=args.workers)

    testset = torchvision.datasets.CIFAR10(root=args.data_dir, train=False,
                                            download=False, transform=transform)
    test_loader = torch.utils.data.DataLoader(testset, batch_size=args.batch_size,
                                              shuffle=False, num_workers=args.workers)

    logger.info("Model loaded")
    model = Net()

    if torch.cuda.device_count() > 1:
        logger.info("Gpu count: {}".format(torch.cuda.device_count()))
        model = nn.DataParallel(model)

    model = model.to(device)

    criterion = nn.CrossEntropyLoss().to(device)
    optimizer = torch.optim.SGD(model.parameters(), lr=args.lr, momentum=args.momentum)

    for epoch in range(0, args.epochs):
        running_loss = 0.0
        for i, data in enumerate(train_loader):
            # get the inputs
            inputs, labels = data
            inputs, labels = inputs.to(device), labels.to(device)

            # zero the parameter gradients
```
optimizer.zero_grad()
#
outputs=model(inputs)
loss=criterion(outputs, labels)
loss.backward()
optimizer.step()
#
running_loss += loss.item()
if i % 2000 == 1999:  # print every 2000 mini-batches
    print('[%d, %5d] loss: %.3f' %
          (epoch + 1, i + 1, running_loss / 2000))
running_loss=0.0
print('Finished Training')
return _save_model(model, args.model_dir)

def _save_model(model, model_dir):
    logger.info("Saving the model.")
    path=os.path.join(model_dir, 'model.pth')
    torch.save(model.cpu().state_dict(), path)

def model_fn(model_dir):
    logger.info('model_fn')
    device="cuda" if torch.cuda.is_available() else "cpu"

    # The parameters below retrieve their default values from SageMaker environment
    # variables, which are
    # instantiated by the SageMaker containers framework.
    # https://github.com/aws/sagemaker-containers#how-a-script-is-executed-inside-the-
    # container
    parser.add_argument('--hosts', type=str, default=ast.literal_eval(os.environ['SM_HOSTS']))
    parser.add_argument('--current-host', type=str, default=os.environ['SM_CURRENT_HOST'])
    parser.add_argument('--model-dir', type=str, default=os.environ['SM_MODEL_DIR'])
    parser.add_argument('--data-dir', type=str, default=os.environ['SM_CHANNEL_TRAINING'])
Step 3: Build the Container

1. In the JupyterLab home directory, open a Jupyter notebook. To open a new notebook, choose the New Launch icon and then choose **conda_pytorch_p36** in the Notebook section.

2. Run the following command in the first notebook cell to change to the `docker_test_folder` directory:

   ```bash
   % cd ~/SageMaker/docker_test_folder
   ```

   This returns your current directory as follows:

   ```bash
   ! pwd
   ```

   output: /home/ec2-user/SageMaker/docker_test_folder

3. Log in to Docker to access the base container:

   ```bash
   ! aws ecr get-login-password --region us-east-1 | docker login --username AWS --password-stdin 763104351884.dkr.ecr.us-east-1.amazonaws.com
   ```

4. To build the Docker container, run the following Docker build command, including the space followed by a period at the end:

   ```bash
   ! docker build -t pytorch-extended-container-test .
   ```

   The Docker build command must be run from the Docker directory you created, in this case `docker_test_folder`.

   **Note**

   If you get the following error message that Docker cannot find the Dockerfile, make sure the Dockerfile has the correct name and has been saved to the directory.

   ```bash
   unable to prepare context: unable to evaluate symlinks in Dockerfile path:
lstat /home/ec2-user/SageMaker/docker/Dockerfile: no such file or directory
   ```

   Remember that `docker` looks for a file specifically called Dockerfile without any extension within the current directory. If you named it something else, you can pass in the file name manually with the `-f` flag. For example, if you named your Dockerfile `Dockerfile-text.txt`, run the following command:

   ```bash
   ! docker build -t tf-custom-container-test -f Dockerfile-text.txt .
   ```

Step 4: Test the Container

1. To test the container locally in the notebook instance, open a Jupyter notebook. Choose New Launcher and choose Notebook in **conda_pytorch_p36** framework. The rest of the code snippets must run from the Jupyter notebook instance.

2. Download the CIFAR-10 dataset.
import torch
import torchvision
import torchvision.transforms as transforms

def _get_transform():
    return transforms.Compose([transforms.ToTensor(),
                               transforms.Normalize((0.5, 0.5, 0.5), (0.5, 0.5, 0.5))])

def get_train_data_loader(data_dir='/tmp/pytorch/cifar-10-data'):
    transform=_get_transform()
    trainset=torchvision.datasets.CIFAR10(root=data_dir, train=True,
                                          download=True, transform=transform)
    return torch.utils.data.DataLoader(trainset, batch_size=4,
                                        shuffle=True, num_workers=2)

def get_test_data_loader(data_dir='/tmp/pytorch/cifar-10-data'):
    transform=_get_transform()
    testset=torchvision.datasets.CIFAR10(root=data_dir, train=False,
                                          download=True, transform=transform)
    return torch.utils.data.DataLoader(testset, batch_size=4,
                                         shuffle=False, num_workers=2)

trainloader=get_train_data_loader('/tmp/pytorch-example/cifar-10-data')
testloader=get_test_data_loader('/tmp/pytorch-example/cifar-10-data')

3. Set role to the role used to create your Jupyter notebook. This is used to configure your SageMaker Estimator.

   from sagemaker import get_execution_role
   role=get_execution_role()

4. Paste the following example script into the notebook code cell to configure a SageMaker Estimator using your extended container.

   from sagemaker.estimator import Estimator
   hyperparameters={'epochs': 1}
   estimator=Estimator(
       image_uri='pytorch-extended-container-test',
       role=role,
       instance_count=1,
       instance_type='local',
       hyperparameters=hyperparameters
   )
   estimator.fit('file:///tmp/pytorch-example/cifar-10-data')

5. Run the code cell. This test outputs the training environment configuration, the values used for the environmental variables, the source of the data, and the loss and accuracy obtained during training.

   **Step 5: Push the Container to Amazon Elastic Container Registry (Amazon ECR)**

   1. After you successfully run the local mode test, you can push the Docker container to Amazon ECR and use it to run training jobs.
Run the following command lines in a notebook cell.

```
# Specify an algorithm name
algorithm_name=pytorch-extended-container-test
account=$(aws sts get-caller-identity --query Account --output text)
# Get the region defined in the current configuration (default to us-west-2 if none defined)
region=$(aws configure get region)
fullname="${account}.dkr.ecr.${region}.amazonaws.com/${algorithm_name}:latest"
# If the repository doesn’t exist in ECR, create it.
aws ecr describe-repositories --repository-names "$\{algorithm_name\}" > /dev/null 2>&1
if [ $? -ne 0 ]
then
  aws ecr create-repository --repository-name "$\{algorithm_name\}" > /dev/null
fi
# Log into Docker
aws ecr get-login-password --region $\{region\}|docker login --username AWS --password-stdin $\{fullname\}
# Build the docker image locally with the image name and then push it to ECR
# with the full name.
docker build -t $\{algorithm_name\} .
docker tag $\{algorithm_name\} $\{fullname\}
docker push $\{fullname\}
```

2. After you push the container, you can call the Amazon ECR image from anywhere in the SageMaker environment. Run the following code example in the next notebook cell.

If you want to use this training container with SageMaker Studio to use its visualization features, you can also run the following code in a Studio notebook cell to call the Amazon ECR image of your training container.

```
import boto3
client=boto3.client('sts')
account=client.get_caller_identity()['Account']
my_session=boto3.session.Session()
region=my_session.region_name
algorithm_name="pytorch-extended-container-test"
ecr_image='{}.dkr.ecr.{}.amazonaws.com/{}:latest'.format(account, region, algorithm_name)

ecr_image
# This should return something like
# 12-digits-of-your-account.dkr.ecr.us-east-2.amazonaws.com/tf-2.2-test:latest
```

3. Use the ecr_image retrieved from the previous step to configure a SageMaker estimator object. The following code sample configures a SageMaker PyTorch estimator.

```
import sagemaker
```
Step 6: Clean up Resources

To clean up resources when done with the Get Started example

1. Open the SageMaker console, choose the notebook instance RunScriptNotebookInstance, choose Actions, and choose Stop. It can take a few minutes for the instance to stop.
2. After the instance Status changes to Stopped, choose Actions, choose Delete, and then choose Delete in the dialog box. It can take a few minutes for the instance to be deleted. The notebook instance disappears from the table when it has been deleted.
3. Open the Amazon S3 console and delete the bucket that you created for storing model artifacts and the training dataset.
4. Open the IAM console and delete the IAM role. If you created permission policies, you can delete them, too.

Note
The Docker container shuts down automatically after it has run. You don't need to delete it.

Adapting Your Own Docker Container to Work with SageMaker

You can adapt an existing Docker image to work with SageMaker. You may need to use an existing, external Docker image with SageMaker when you have a container that satisfies feature or safety requirements that are not currently supported by a prebuilt SageMaker image. There are two toolkits that allow you to bring your own container and adapt it to work with SageMaker:

- SageMaker Training Toolkit
- SageMaker Inference Toolkit

The following topics show how to adapt your existing image using the SageMaker Training and Inference toolkits:

Topics
- Individual Framework Libraries (p. 3165)
- Using the SageMaker Training and Inference Toolkits (p. 3165)
- Adapting Your Own Training Container (p. 3166)
Individual Framework Libraries

In addition to the SageMaker Training Toolkit and SageMaker Inference Toolkit, SageMaker also provides toolkits specialized for TensorFlow, MXNet, PyTorch, and Chainer. The following table provides links to the GitHub repositories that contain the source code for each framework and their respective serving toolkits. The instructions linked are for using the Python SDK to run training algorithms and host models on SageMaker. The functionality for these individual libraries is included in the SageMaker Training Toolkit and SageMaker Inference Toolkit.

<table>
<thead>
<tr>
<th>Framework</th>
<th>Toolkit Source Code</th>

<td>SageMaker PyTorch Training</td>
</tr>
<tr>
<td></td>
<td>SageMaker PyTorch Inference</td>
</tr>
<tr>
<td>Chainer</td>
<td>SageMaker Chainer SageMaker Containers</td>
</tr>
</tbody>
</table>

Using the SageMaker Training and Inference Toolkits

The SageMaker Training and SageMaker Inference toolkits implement the functionality that you need to adapt your containers to run scripts, train algorithms, and deploy models on SageMaker. When installed, the library defines the following for users:

- The locations for storing code and other resources.
- The entry point that contains the code to run when the container is started. Your Dockerfile must copy the code that needs to be run into the location expected by a container that is compatible with SageMaker.
- Other information that a container needs to manage deployments for training and inference.

SageMaker Toolkits Containers Structure

When SageMaker trains a model, it creates the following file folder structure in the container's /opt/ml directory.

```
/opt/ml
### input
#   ### config
#   #   ### hyperparameters.json
#   #   ### resourceConfig.json
#   ### data
#   #   ### <channel_name>
#          ### <input data>
### model
#```

3165
When you run a model training job, the SageMaker container uses the `/opt/ml/input/` directory, which contains the JSON files that configure the hyperparameters for the algorithm and the network layout used for distributed training. The `/opt/ml/input/` directory also contains files that specify the channels through which SageMaker accesses the data, which is stored in Amazon Simple Storage Service (Amazon S3). The SageMaker containers library places the scripts that the container will run in the `/opt/ml/code/` directory. Your script should write the model generated by your algorithm to the `/opt/ml/model/` directory. For more information, see Use Your Own Training Algorithms (p. 3181).

When you host a trained model on SageMaker to make inferences, you deploy the model to an HTTP endpoint. The model makes real-time predictions in response to inference requests. The container must contain a serving stack to process these requests.

In a hosting or batch transform container, the model files are located in the same folder to which they were written during training.

```
/opt/ml/model
# <model files>
```

For more information, see Use Your Own Inference Code (p. 3191).

**Single Versus Multiple Containers**

You can either provide separate Docker images for the training algorithm and inference code or you can use a single Docker image for both. When creating Docker images for use with SageMaker, consider the following:

- Providing two Docker images can increase storage requirements and cost because common libraries might be duplicated.
- In general, smaller containers start faster for both training and hosting. Models train faster and the hosting service can react to increases in traffic by automatically scaling more quickly.
- You might be able to write an inference container that is significantly smaller than the training container. This is especially common when you use GPUs for training, but your inference code is optimized for CPUs.
- SageMaker requires that Docker containers run without privileged access.
- Both Docker containers that you build and those provided by SageMaker can send messages to the `Stdout` and `Stderr` files. SageMaker sends these messages to Amazon CloudWatch logs in your AWS account.

For more information about how to create SageMaker containers and how scripts are executed inside them, see the SageMaker Training Toolkit and SageMaker Inference Toolkit repositories on GitHub. They also provide lists of important environmental variables and the environmental variables provided by SageMaker containers.

**Adapting Your Own Training Container**

To run your own training model, build a Docker container using the Amazon SageMaker Training Toolkit through an Amazon SageMaker notebook instance.
**Step 1: Create a SageMaker notebook instance**

2. In the left navigation pane, choose **Notebook**, choose **Notebook instances**, and then choose **Create notebook instance**.
3. On the **Create notebook instance** page, provide the following information:
   a. For **Notebook instance name**, enter `RunScriptNotebookInstance`.
   b. For **Notebook Instance type**, choose `ml.t2.medium`.
   c. In the **Permissions and encryption** section, do the following:
      i. For **IAM role**, choose **Create a new role**.
      ii. On the **Create an IAM role** page, choose **Specific S3 buckets**, specify an Amazon S3 bucket named `sagemaker-run-script`, and then choose **Create role**.

   SageMaker creates an IAM role named `AmazonSageMaker-ExecutionRole-YYYYMMDDTHHmmSS`. For example, `AmazonSageMaker-ExecutionRole-20190429T110788`. Note that the execution role naming convention uses the date and time at which the role was created, separated by a T.
   d. For **Root Access**, choose **Enable**.
   e. Choose **Create notebook instance**.
4. On the **Notebook instances** page, the **Status** is **Pending**. It can take a few minutes for Amazon SageMaker to launch a machine learning compute instance—in this case, it launches a notebook instance—and attach an ML storage volume to it. The notebook instance has a preconfigured Jupyter notebook server and a set of Anaconda libraries. For more information, see `CreateNotebookInstance`.

5. In the **Permissions and encryption** section, copy the **IAM role ARN number**, and paste it into a notepad file to save it temporarily. You use this IAM role ARN number later to configure a local training estimator in the notebook instance. The **IAM role ARN number** looks like the following: 
   `arn:aws:iam::111122223333:role/service-role/AmazonSageMaker-ExecutionRole-20190429T110788`

6. After the status of the notebook instance changes to **InService**, choose **Open JupyterLab**.

**Step 2: Create and upload the Dockerfile and Python training scripts**

1. After JupyterLab opens, create a new folder in the home directory of your JupyterLab. In the upper-left corner, choose the **New Folder** icon, and then enter the folder name `docker_test_folder`.
2. Create a **Dockerfile** text file in the `docker_test_folder` directory.
   a. Choose the **New Launcher** icon (+) in the upper-left corner.
   b. In the right pane under the **Other** section, choose **Text File**.
   c. Paste the following **Dockerfile** sample code into your text file.

   ```
   FROM tensorflow/tensorflow:2.2.0rc2-gpu-py3-jupyter
   
   # Install sagemaker-training toolkit that contains the common functionality necessary to create a container compatible with SageMaker and the Python SDK.
   RUN pip3 install sagemaker-training
   
   # Copies the training code inside the container
   COPY train.py /opt/ml/code/train.py
   ```
# Defines train.py as script entrypoint
ENV SAGEMAKER_PROGRAM train.py

The Dockerfile script performs the following tasks:

- **FROM tensorflow/tensorflow:2.2.0rc2-gpu-py3-jupyter** – Downloads the TensorFlow Docker base image. You can replace this with any Docker base image you want to bring to build containers, as well as with AWS pre-built container base images.
- **RUN pip install sagemaker-training** – Installs SageMaker Training Toolkit that contains the common functionality necessary to create a container compatible with SageMaker.
- **COPY train.py /opt/ml/code/train.py** – Copies the script to the location inside the container that is expected by SageMaker. The script must be located in this folder.
- **ENV SAGEMAKER_PROGRAM train.py** – Takes your training script train.py as the entrypoint script copied in the /opt/ml/code folder of the container. This is the only environmental variable that you must specify when you build your own container.

d. On the left directory navigation pane, the text file name might automatically be named untitled.txt. To rename the file, right-click the file, choose Rename, rename the file as Dockerfile without the .txt extension, and then press Ctrl+s or Command+s to save the file.

3. Create or upload a training script train.py in the docker_test_folder. You can use the following example script for this exercise.

```python
import tensorflow as tf

mnist = tf.keras.datasets.mnist
(x_train, y_train), (x_test, y_test) = mnist.load_data()
x_train, x_test = x_train / 255.0, x_test / 255.0

model = tf.keras.models.Sequential([tf.keras.layers.Flatten(input_shape=(28, 28)),
                                     tf.keras.layers.Dense(128, activation='relu'),
                                     tf.keras.layers.Dropout(0.2),
                                     tf.keras.layers.Dense(10, activation='softmax')])

model.compile(optimizer='adam',
              loss='sparse_categorical_crossentropy',
              metrics=['accuracy'])

model.fit(x_train, y_train, epochs=1)
model.evaluate(x_test, y_test)
```

## Step 3: Build the container

1. In the JupyterLab home directory, open a Jupyter notebook. To open a new notebook, choose the New Launch icon and then choose conda_tensorflow2_p36 in the Notebook section.
2. Run the following command in the first notebook cell to change to the docker_test_folder directory:

```bash
% cd ~/SageMaker/docker_test_folder
```
This returns your current directory as follows:

```bash
! pwd
```

output: /home/ec2-user/SageMaker/docker_test_folder

3. To build the Docker container, run the following Docker build command, including the space followed by a period at the end:

```bash
! docker build -t tf-custom-container-test .
```

The Docker build command must be run from the Docker directory you created, in this case `docker_test_folder`.

**Note**
If you get the following error message that Docker cannot find the Dockerfile, make sure the Dockerfile has the correct name and has been saved to the directory.

```bash
unable to prepare context: unable to evaluate symlinks in Dockerfile path: lstat /home/ec2-user/SageMaker/docker/Dockerfile: no such file or directory
```

Remember that `docker` looks for a file specifically called `Dockerfile` without any extension within the current directory. If you named it something else, you can pass in the file name manually with the `-f` flag. For example, if you named your Dockerfile as `Dockerfile-text.txt`, run the following command:

```bash
! docker build -t tf-custom-container-test -f Dockerfile-text.txt .
```

**Step 4: Test the container**

1. To test the container locally in the notebook instance, open a Jupyter notebook. Choose **New Launcher** and choose **Notebook** in `conda_tensorflow_p36` framework.
2. Paste the following example script into the notebook code cell to configure a SageMaker Estimator.

**SageMaker Python SDK v1**

```python
from sagemaker.estimator import Estimator

estimator = Estimator(image_name='tf-custom-container-test',
    role='arn:aws:iam::111122223333:role/role-name',
    instance_count=1,
    instance_type='local')

estimator.fit()
```

**SageMaker Python SDK v2**

```python
from sagemaker.estimator import Estimator

estimator = Estimator(image_uri='tf-custom-container-test',
    role='arn:aws:iam::111122223333:role/role-name',
    instance_count=1,
    instance_type='local')
```
estimator.fit()

3. Replace the 'Put_YourARN_Here' value with the IAM role ARN number you copied to a notepad file when you configured the notebook instance. The ARN should look like the following: 'arn:aws:iam::11112223333:role/service-role/AmazonSageMaker-ExecutionRole-20190429T110788'.

4. Run the code cell. This test outputs the training environment configuration, the values used for the environmental variables, the source of the data, and the loss and accuracy obtained during training.

**Step 5: Push the container to Amazon Elastic Container Registry (Amazon ECR)**

1. After you successfully run the local mode test, you can push the Docker container to Amazon ECR and use it to run training jobs.

Run the following command lines in a notebook cell.

```bash
# Specify an algorithm name
algorithm_name=tf-custom-container-test

account=$(aws sts get-caller-identity --query Account --output text)

# Get the region defined in the current configuration (default to us-west-2 if none defined)
region=$(aws configure get region)
region=${region:-us-west-2}

fullname="${account}.dkr.ecr.${region}.amazonaws.com/${algorithm_name}:latest"

# If the repository doesn't exist in ECR, create it.
aws ecr describe-repositories --repository-names "${algorithm_name}" > /dev/null 2>&1
if [ $? -ne 0 ]
then
aws ecr create-repository --repository-name "${algorithm_name}" > /dev/null
fi

# Get the login command from ECR and execute it directly
aws ecr get-login-password --region ${region}|docker login --username AWS --password-stdin ${fullname}

# Build the docker image locally with the image name and then push it to ECR with the full name.
docker build -t ${algorithm_name} .
docker tag ${algorithm_name} ${fullname}
docker push ${fullname}
```

**Note**

This bash shell script may raise a permission issue similar to the following error message:

"denied: User: [ARN] is not authorized to perform: ecr:InitiateLayerUpload on resource: arn:aws:ecr:us-east-1:[id]:repository/tf-custom-container-test"
Adapting Your Own Training Container

If this error occurs, you need to attach the AmazonEC2ContainerRegistryFullAccess policy to your IAM role. Go to the IAM console, choose Roles from the left navigation pane, look up the IAM role you used for the Notebook instance. Under the Permission tab, choose the Attach policies button, and search the AmazonEC2ContainerRegistryFullAccess policy. Mark the check box of the policy, and choose Attach policy to finish.

2. After you push the container, you can call the Amazon ECR image from anywhere in the SageMaker environment. Run the following code example in the next notebook cell.

If you want to use this training container with SageMaker Studio to use its visualization features, you can also run the following code in a Studio notebook cell to call the Amazon ECR image of your training container.

```python
import boto3

account_id = boto3.client('sts').get_caller_identity().get('Account')
ecr_repository = 'tf-custom-container-test'
tag = '::latest'

region = boto3.session.Session().region_name
uri_suffix = 'amazonaws.com'
if region in ['cn-north-1', 'cn-northwest-1']:
    uri_suffix = 'amazonaws.com.cn'

byoc_image_uri = '{}.dkr.ecr.{}.{}/{}'.format(account_id, region, uri_suffix, ecr_repository + tag)

byoc_image_uri
# This should return something like
# 111122223333.dkr.ecr.us-east-2.amazonaws.com/sagemaker-byoc-test:latest
```

3. Use the ecr_image retrieved from the previous step to configure a SageMaker estimator object. The following code sample configures a SageMaker estimator with the byoc_image_uri and initiates a training job on an Amazon EC2 instance.

SageMaker Python SDK v1

```python
import sagemaker
from sagemaker import get_execution_role
from sagemaker.estimator import Estimator

estimator = Estimator(image_uri=byoc_image_uri,
                      role=get_execution_role(),
                      base_job_name='tf-custom-container-test-job',
                      instance_count=1,
                      instance_type='ml.p2.xlarge')

# start training
estimator.fit()

# deploy the trained model
predictor = estimator.deploy(1, instance_type)
```

SageMaker Python SDK v2

```python
import sagemaker
from sagemaker import get_execution_role
from sagemaker.estimator import Estimator

estimator = Estimator(image_uri=byoc_image_uri,
                      role=get_execution_role(),
                      base_job_name='tf-custom-container-test-job',
                      instance_count=1,
                      instance_type='ml.p2.xlarge')
```

3171
# start training
estimator.fit()

# deploy the trained model
predictor = estimator.deploy(1, instance_type)

For a full example that shows how to test a custom container locally and push it to an Amazon ECR image, see the Building Your Own TensorFlow Container example notebook.

Tip
To profile and debug training jobs to monitor system utilization issues (such as CPU bottlenecks and GPU underutilization) and identify training issues (such as overfitting, overtraining, exploding tensors, and vanishing gradients), use Amazon SageMaker Debugger. For more information, see Amazon SageMaker Debugger is available for any deep learning models that you bring to Amazon SageMaker. The AWS CLI, SageMaker Estimator API, and the Debugger APIs enable you to use any Docker base images to build and customize containers to train your models. To use Debugger with customized containers, you need to make a minimal change to your training script to implement the Debugger hook callback and retrieve tensors from training jobs.

You need the following resources to build a customized container with Debugger.

- Amazon SageMaker Python SDK
- The SMDebug open source client library
- A Docker base image of your choice
- Your training script with a Debugger hook registered – For more information about registering a Debugger hook to your training script, see Register Debugger Hook to Your Training Script (p. 2412).

For an end-to-end example of using Debugger with a custom training container, see the following example notebook.

- Build a Custom Training Container and Debug Training Jobs with Debugger

Tip
This custom container with Debugger guide is an extension of the Adapting Your Own Training Container (p. 3166) guide which walks you thorough how to build and push your custom training container to Amazon ECR.

Prepare to Build a Custom Training Container

To build a docker container, the basic structure of files should look like the following:

```bash
### debugger_custom_container_test_notebook.ipynb  # a notebook to run python snippet codes
```
Register Debugger Hook to Your Training Script

To debug your model training, you need to add a Debugger hook to your training script.

**Note**
This step is required to collect model parameters (output tensors) for debugging your model training. If you only want to monitor and profile, you can skip this hook registration step and exclude the **debugger_hook_config** parameter when constructing an estimator.

The following example code shows the structure of a training script using the Keras ResNet50 model and how to pass the Debugger hook as a Keras callback for debugging. To find a complete training script, see TensorFlow training script with SageMaker Debugger hook.

```python
# An example of training script (your-training-script.py)
import tensorflow.compat.v2 as tf
from tensorflow.keras.applications.resnet50 import ResNet50
import smdebug.tensorflow as smd

def train(batch_size, epoch, model, hook):

    ...

    model.fit(X_train, Y_train,
              batch_size=batch_size,
              epochs=epoch,
              validation_data=(X_valid, Y_valid),
              shuffle=True,

    # smdebug modification: Pass the Debugger hook in
    # the main() as a KerasCallback
    callbacks=[hook])
```
For more information about registering the Debugger hook for the supported frameworks and algorithm, see the following links in the SMDebug client library:

- SMDebug TensorFlow hook
- SMDebug PyTorch hook
- SMDebug MXNet hook
- SMDebug XGBoost hook

In the following example notebooks' training scripts, you can find more examples about how to add the Debugger hooks to training scripts and collect output tensors in detail:

- Debugger in script mode with the TensorFlow 2.1 framework
  To see the difference between using Debugger in a Deep Learning Container and in script mode, open this notebook and put it and the previous Debugger in a Deep Learning Container TensorFlow v2.1 notebook example side by side.
  In script mode, the hook configuration part is removed from the script in which you set the estimator. Instead, the Debugger hook feature is merged into the training script, TensorFlow Keras ResNet training script in script mode. The training script imports the smdebug library in the required TensorFlow Keras environment to communicate with the TensorFlow ResNet50 algorithm. It also manually implements the smdebug hook functionality by adding the `callbacks=[hook]` argument inside the `train` function (in line 49), and by adding the manual hook configuration (in line 89) provided through SageMaker Python SDK.
  This script mode example runs the training job in the TF 2.1 framework for direct comparison with the zero script change in the TF 2.1 example. The benefit of setting up Debugger in script mode is the flexibility to choose framework versions not covered by AWS Deep Learning Containers.

- Using Amazon SageMaker Debugger in a PyTorch Container in Script Mode
  This notebook enables Debugger in script mode in PyTorch v1.3.1 framework. PyTorch v1.3.1 is supported by SageMaker containers, and this example shows details of how to modify a training script. The SageMaker PyTorch estimator is already in script mode by default. In the notebook, the line to activate `script_mode` is not included in the estimator configuration.
  This notebook shows detailed steps to change an original PyTorch training script to a modified version with Debugger enabled. Additionally, this example shows how you can use Debugger built-in rules to detect training issues such as the vanishing gradients problem, and the Debugger trial features to call and analyze the saved tensors.
Create and Configure a Dockerfile

Open your SageMaker JupyterLab and create a new folder, debugger_custom_container_test_folder in this example, to save your training script and Dockerfile. The following code example is a Dockerfile that includes essential docker build commends. Paste the following code into the Dockerfile text file and save it. Upload your training script to the same folder.

```bash
# Specify a docker base image
FROM tensorflow/tensorflow:2.2.0rc2-gpu-py3
RUN /usr/bin/python3 -m pip install --upgrade pip
RUN pip install --upgrade protobuf

# Install required packages to enable the SageMaker Python SDK and the smdebug library
RUN pip install sagemaker-training
RUN pip install smdebug

CMD ["bin/bash"]
```

If you want to use a pre-built AWS Deep Learning Container image, see Available AWS Deep Learning Containers Images.

Build and Push the Custom Training Container to Amazon ECR

Create a test notebook, debugger_custom_container_test_notebook.ipynb, and run the following code in the notebook cell. This will access the debugger_byoc_test_docker directory, build the docker with the specified algorithm_name, and push the docker container to your Amazon ECR.

```python
import boto3

account_id = boto3.client('sts').get_caller_identity().get('Account')
ecr_repository = 'sagemaker-debugger-mnist-byoc-tf2'
tag = ':latest'
region = boto3.session.Session().region_name
uri_suffix = 'amazonaws.com'

if region in ['cn-north-1', 'cn-northwest-1']:
    uri_suffix = 'amazonaws.com.cn'

byoc_image_uri = '{}.dkr.ecr.{}.{}/{}'.format(account_id, region, uri_suffix, ecr_repository + tag)

!docker build -t $ecr_repository docker
!$(aws ecr get-login --region $region --registry-ids $account_id --no-include-email)
!aws ecr create-repository --repository-name $ecr_repository
!docker tag {ecr_repository + tag} $byoc_image_uri
!docker push $byoc_image_uri
```

Tip
If you use one of the AWS Deep Learning Container base images, run the following code to log in to Amazon ECR and access to the Deep Learning Container image repository.
Run and Debug Training Jobs Using the Custom Training Container

After you build and push your docker container to Amazon ECR, configure a SageMaker estimator with your training script and the Debugger-specific parameters. After you execute the estimator.fit(), Debugger will collect output tensors, monitor them, and detect training issues. Using the saved tensors, you can further analyze the training job by using the smdebug core features and tools. Configuring a workflow of Debugger rule monitoring process with Amazon CloudWatch Events and AWS Lambda, you can automate a stopping training job process whenever the Debugger rules spots training issues.

```python
import sagemaker

from sagemaker.estimator import Estimator
from sagemaker.debugger import Rule, DebuggerHookConfig, CollectionConfig, rule_configs

profiler_config = ProfilerConfig(...)  
debugger_hook_config = DebuggerHookConfig(...)  
rules = [
    Rule.sagemaker(rule_configs.built_in_rule()),
    ProfilerRule.sagemaker(rule_configs.BuiltInRule())
]

estimator = Estimator(
    image_uri=byoc_image_uri,
    entry_point="./debugger_custom_container_test_folder/your-training-script.py",
    role=sagemaker.get_execution_role(),
    base_job_name='debugger-custom-container-test',
    instance_count=1,
    instance_type='ml.p3.2xlarge',
)  
```

Step 6: Clean up resources

1. Open the SageMaker console, choose the notebook instance RunScriptNotebookInstance, choose Actions, and choose Stop. It can take a few minutes for the instance to stop.

2. After the instance Status changes to Stopped, choose Actions, choose Delete, and then choose Delete in the dialog box. It can take a few minutes for the instance to be deleted. The notebook instance disappears from the table when it has been deleted.
3. Open the Amazon S3 console and delete the bucket that you created for storing model artifacts and the training dataset.

4. Open the IAM console and delete the IAM role. If you created permission policies, you can delete them, too.

   **Note**
   The Docker container shuts down automatically after it has run. You don’t need to delete it.

### Adapting Your Own Inference Container

If none of the Amazon SageMaker prebuilt inference containers suffice for your situation, and you want to use your own Docker container, use the SageMaker Inference Toolkit to adapt your container to work with SageMaker hosting. To adapt your container to work with SageMaker hosting, create the inference code in one or more Python script files and a Dockerfile that imports the inference toolkit.

The inference code includes an inference handler, a handler service, and an entrypoint. In this example, they are stored as three separate Python files. All three of these Python files must be in the same directory as your Dockerfile.

For an example Jupyter notebook that shows a complete example of extending a container by using the SageMaker inference toolkit, see [Amazon SageMaker Multi-Model Endpoints using your own algorithm container](#).

### Step 1: Create an Inference Handler

The SageMaker inference toolkit is built on the multi-model server (MMS). MMS expects a Python script that implements functions to load the model, pre-process input data, get predictions from the model, and process the output data in a model handler.

#### The model_fn Function

There are default implementations for the model_fn function, named default_model_fn, on the SageMaker PyTorch and MXNet Inference toolkits. The default implementation loads models saved using torchscript, of the form .pt or .pth. If your model requires custom methods to load, or you want to perform extra steps when loading your model, you must implement the model_fn function.

The following simple example shows an implementation of a model_fn function that loads a PyTorch model:

```python
def model_fn(self, model_dir):
    import torch

    logger.info('model_fn')
    device = "cuda" if torch.cuda.is_available() else "cpu"
    with open(os.path.join(model_dir, 'model.pth'), 'rb') as f:
        model = torch.jit.load(f)
    return model.to(device)
```

#### The input_fn Function

The input_fn function is responsible for deserializing your input data so that it can be passed to your model. It takes input data and content type as parameters, and returns deserialized data. The SageMaker inference toolkit provides a default implementation that deserializes the following content types:

- JSON
- CSV
- Numpy array
• NPZ

If your model requires a different content type, or you want to preprocess your input data before sending it to the model, you must implement the `input_fn` function. The following example shows a simple implementation of the `input_fn` function.

```python
from sagemaker_inference import content_types, decoder
def input_fn(self, input_data, content_type):
    """A default input_fn that can handle JSON, CSV and NPZ formats.
    Args:
        input_data: the request payload serialized in the content_type format
        content_type: the request content_type
    Returns: input_data deserialized into torch.FloatTensor or torch.cuda.FloatTensor depending if cuda is available.
    """
    return decoder.decode(input_data, content_type)
```

The `predict_fn` Function

The `predict_fn` function is responsible for getting predictions from the model. It takes the model and the data returned from `input_fn` as parameters, and returns the prediction. There is no default implementation for the `predict_fn`. You must implement it yourself. The following is a simple implementation of the `predict_fn` function for a PyTorch model.

```python
def predict_fn(self, data, model):
    """A default predict_fn for PyTorch. Calls a model on data deserialized in input_fn.
    Runs prediction on GPU if cuda is available.
    Args:
        data: input data (torch.Tensor) for prediction deserialized by input_fn
        model: PyTorch model loaded in memory by model_fn
    Returns: a prediction
    """
    return model(data)
```

The `output_fn` Function

The `output_fn` function is responsible for serializing the data that the `predict_fn` function returns as a prediction. The SageMaker inference toolkit implements a default `output_fn` function that serializes Numpy arrays, JSON, and CSV. If your model outputs any other content type, or you want to perform other post-processing of your data before sending it to the user, you must implement your own `output_fn` function. The following shows a simple `output_fn` function for a PyTorch model.

```python
from sagemaker_inference import encoder
def output_fn(self, prediction, accept):
    """A default output_fn for PyTorch. Serializes predictions from predict_fn to JSON, CSV or NPY format.
    Args:
        prediction: a prediction result from predict_fn
        accept: type which the output data needs to be serialized
    Returns: output data serialized
    """
    return encoder.encode(prediction, accept)
```
Step 2: Implement a Handler Service

The handler service is executed by the model server. The handler service implements initialize and handle methods. The initialize method is invoked when the model server starts, and the handle method is invoked for all incoming inference requests to the model server. For more information, see Custom Service in the Multi-model server documentation. The following is an example of a handler service for a PyTorch model server.

```python
from sagemaker_inference.default_handler_service import DefaultHandlerService
from sagemaker_inference.transformer import Transformer
from sagemaker_pytorch_serving_container.default_inference_handler import DefaultPytorchInferenceHandler

class HandlerService(DefaultHandlerService):
    '''Handler service that is executed by the model server.
    Determines specific default inference handlers to use based on model being used.
    This class extends `DefaultHandlerService`, which define the following:
    - The `handle` method is invoked for all incoming inference requests to the model server.
    - The `initialize` method is invoked at model server start up.
    Based on: https://github.com/awslabs/mxnet-model-server/blob/master/docs/custom_service.md
    '''

    def __init__(self):
        transformer = Transformer(default_inference_handler=DefaultPytorchInferenceHandler())
        super(HandlerService, self).__init__(transformer=transformer)
```

Step 3: Implement an Entrypoint

The entrypoint starts the model server by invoking the handler service. You specify the location of the entrypoint in your Dockerfile. The following is an example of an entrypoint.

```python
from sagemaker_inference import model_server
model_server.start_model_server(handler_service=HANDLER_SERVICE)
```

Step 4: Write a Dockerfile

In your Dockerfile, copy the model handler from step 2 and specify the Python file from the previous step as the entrypoint in your Dockerfile. The following is an example of the lines you can add to your Dockerfile to copy the model handler and specify the entrypoint. For a full example of a Dockerfile for an inference container, see Dockerfile.

```bash
# Copy the default custom service file to handle incoming data and inference requests
COPY model_handler.py /home/model-server/model_handler.py

# Define an entrypoint script for the docker image
ENTRYPOINT ["python", "/usr/local/bin/entrypoint.py"]
```

Step 5: Build and Register Your Container

Now you can build your container and register it in Amazon Elastic Container Registry (Amazon ECR). The following shell script from the sample notebook builds the container and uploads it to an Amazon ECR repository in your AWS account.
Create a container with your own algorithms and models

If none of the existing SageMaker containers meet your needs and you don’t have an existing container of your own, you may need to create a new Docker container. The following sections show how to create Docker containers with your training and inference algorithms for use with SageMaker.

**Topics**

- Use Your Own Training Algorithms (p. 3181)
- Use Your Own Inference Code (p. 3191)
Use Your Own Training Algorithms

This section explains how Amazon SageMaker interacts with a Docker container that runs your custom training algorithm. Use this information to write training code and create a Docker image for your training algorithms.

Topics
- How Amazon SageMaker Runs Your Training Image (p. 3181)
- How Amazon SageMaker Provides Training Information (p. 3185)
- Run Training with EFA (p. 3188)
- How Amazon SageMaker Signals Algorithm Success and Failure (p. 3190)
- How Amazon SageMaker Processes Training Output (p. 3191)

How Amazon SageMaker Runs Your Training Image

Amazon SageMaker processes your training image using a Docker container entrypoint script. By default, SageMaker looks for a script called train inside your container. You can also provide your own custom entrypoint by using the ContainerArguments and ContainerEntrypoint parameters of the AlgorithmSpecification API. If you use your own custom entrypoint, you have the added flexibility to run it as a standalone script without rebuilding your images.

This section shows how to run a training image without using the SageMaker training toolkit library. If you're unfamiliar with manually configuring a Docker container, we recommend that you use the toolkit instead. For more information about how to use the training toolkit, see Adapting Your Own Training Container (p. 3166).

You have two options to manually configure your Docker container to run your image. You can use the CreateTrainingJob API and a Docker container with an entrypoint instruction contained inside of it. Alternatively, you can use the CreateTrainingJob API, and pass your training script from outside of your Docker container.

Run a training job with an entrypoint script bundled inside the Docker container

SageMaker can run an entrypoint script bundled inside your Docker container.

- By default, Amazon SageMaker runs the following container.

```bash
docker run image train
```

- SageMaker overrides any default CMD statements in a container by specifying the train argument after the image name. In your Docker container, use the following exec form of the ENTRYPONT instruction.

```bash
ENTRYPOINT ["executable", "param1", "param2", ...]
```

The following example shows how to specify a python entrypoint instruction called k-means-algorithm.py.

```bash
ENTRYPOINT ["python", "k-means-algorithm.py"]
```

The exec form of the ENTRYPONT instruction starts the executable directly, not as a child of /bin/sh. This enables it to receive signals like SIGTERM and SIGKILL from SageMaker APIs. The following conditions apply when using the SageMaker APIs.
The `CreateTrainingJob` API has a stopping condition that directs SageMaker to stop model training after a specific time.

The following shows the `StopTrainingJob` API. This API issues the equivalent of the `docker stop`, with a 2-minute timeout command to gracefully stop the specified container.

```
docker stop -t 120
```

The command attempts to stop the running container by sending a SIGTERM signal. After the 2-minute timeout, the API sends SIGKILL and forcibly stops the containers. If the container handles the SIGTERM gracefully and exits within 120 seconds from receiving it, no SIGKILL is sent.

If you want access to the intermediate model artifacts after SageMaker stops the training, add code to handle saving artifacts in your SIGTERM handler.

- If you plan to use GPU devices for model training, make sure that your containers are `nvidia-docker` compatible. Include only the CUDA toolkit on containers; don't bundle NVIDIA drivers with the image. For more information about `nvidia-docker`, see NVIDIA/nvidia-docker.
- You can't use the `tini` initializer as your entrypoint script in SageMaker containers because it gets confused by the `train` and `serve` arguments.
- `/opt/ml` and all subdirectories are reserved by SageMaker training. When building your algorithm's Docker image, make sure that you don't place any data that's required by your algorithm in this directory. Because if you do, the data may no longer be visible during training.

### Run a training job with an entrypoint script outside the Docker container

You can use your own Docker container for training and pass in an entrypoint script from outside the Docker container. There are some benefits to structuring your entrypoint script outside the container. If you update your entrypoint script, you don't need to rebuild the Docker container. You can also use several different scripts to run in the same container.

Specify the location of your training script using the `ContainerEntrypoint` and `ContainerArguments` parameters of the `AlgorithmSpecification` API. These entrypoints and arguments behave in the same manner as Docker entrypoints and arguments. The values in these parameters override the corresponding `ENTRYPOINT` or `CMD` provided as part of the Docker container.

When you pass your custom entrypoint script to your Docker training container, the inputs that you provide determine the behavior of the container.

- For example, if you provide only `ContainerEntrypoint`, the request syntax using the `CreateTrainingJob` API is as follows.

```
{
   "AlgorithmSpecification": {
      "ContainerEntrypoint": ["string"],
      ...
   }
}
```

Then, the SageMaker training backend runs your custom entrypoint as follows.

```
docker run --entrypoint <ContainerEntrypoint> image
```
To bundle your shell or Python scripts inside your Docker image, or to provide the script in an Amazon S3 bucket or by using the AWS Command Line Interface (CLI), continue to the following section.

**Bundle your shell script in a Docker container**

If you want to bundle your custom shell script inside your Docker image, use the following steps.

1. Bundle your shell script inside your Docker container. The following code snippet copies a custom entrypoint script `custom_entrypoint.sh` from the current working directory to a Docker container located in `mydir`. The following example assumes that the base Docker image has Python installed.

   ```
   FROM <base-docker-image>:<tag>
   
   # Copy custom entrypoint from current dir to /mydir on container
   COPY ./custom_entrypoint.sh /mydir/
   
   2. Build and push a Docker container to the Amazon Elastic Container Registry (Amazon ECR) by following the instructions at [Pushing a Docker image](https://docs.aws.amazon.com/AmazonElasticContainerRegistry/latest/userguide/creating-docker-images.html) in the Amazon ECR User Guide.

   3. Launch the training job by running the following AWS CLI command.

Note

If `ContainerEntrypoint` is provided, the SageMaker training backend runs the image with the given entrypoint and overrides the default `ENTRYPOINT` in the image.

- If you provide only `ContainerArguments`, SageMaker assumes that the Docker container contains an entrypoint script. The request syntax using the `CreateTrainingJob` API is as follows.

```json
{
   "AlgorithmSpecification": {
      "ContainerArguments": ["arg1", "arg2"],
      ...
   }
}
```

The SageMaker training backend runs your custom entrypoint as follows.

```bash
docker run image <ContainerArguments>
```

- If you provide both the `ContainerEntrypoint` and `ContainerArguments`, then the request syntax using the `CreateTrainingJob` API is as follows.

```json
{
   "AlgorithmSpecification": {
      "ContainerEntrypoint": ["string"],
      "ContainerArguments": ["arg1", "arg2"],
      ...
   }
}
```

The SageMaker training backend runs your custom entrypoint as follows.

```bash
docker run --entrypoint <ContainerEntrypoint> image <ContainerArguments>
```

You can use any supported `InputDataConfig` source in the `CreateTrainingJob` API to provide an entrypoint script to run your training image.
Bundle your Python script in a Docker container

To bundle your custom Python script inside your Docker image, use the following steps.

1. Bundle your Python script in your Dockerfile. The following code snippet copies a custom entrypoint script `custom_entrypoint.py` from the current working directory to a Docker container located in `mydir`.

```bash
FROM <base-docker-image>:<tag>
# Copy custom entrypoint from current dir to /mydir on container
COPY ./custom_entrypoint.py /mydir/
```

2. Launch the training job by running the following AWS CLI command.

```bash
aws --region <your-region> sagemaker create-training-job
--training-job-name <your-training-job-name>
--role-arn <your-execution-role-arn>
--algorithm-specification '{
  "TrainingInputMode": "File", 
  "TrainingImage": "<your-ecr-image>", 
  "ContainerEntrypoint": ["/bin/sh"], 
  "ContainerArguments": ["/mydir/custom_entrypoint.sh"]}
--output-data-config '{"S3OutputPath": "s3://custom-entrypoint-output-bucket/"}'
--resource-config
{"VolumeSizeInGB":10,"InstanceCount":1,"InstanceType":"ml.m5.2xlarge"}
--stopping-condition '{"MaxRuntimeInSeconds": 180}'
```

Provide your entrypoint script in an Amazon S3 bucket

To provide a custom entrypoint script using an S3 bucket, use the `S3DataSource` parameter of the `DataSource` API to specify the location of the script. If you use the `S3DataSource` parameter, the following are required.

- The `InputMode` must be of the type `File`.
- The `S3DataDistributionType` must be `FullyReplicated`.

The following example has a script called `custom_entrypoint.sh` placed in a path to an S3 bucket `s3://<bucket-name>/<bucket prefix>/custom_entrypoint.sh`.

```bash
#!/bin/bash
echo "Running custom_entrypoint.sh"
echo "Hello you have provided the following arguments: "$@"
```

Next, you must set the configuration of the input data channel to run a training job. Do this either by using the AWS CLI directly or with a JSON file.
Using AWS CLI with a JSON file

To use AWS CLI with a JSON file, ensure that all of the following fields use the request syntax defined in the CreateTrainingJob API.

```json
// run-my-training-job.json
{
    "AlgorithmSpecification": {
        "ContainerEntrypoint": ["/bin/sh"],
        "ContainerArguments": ["/opt/ml/input/data/<your_channel_name>/custom_entrypoint.sh"],
        ...
    },
    "InputDataConfig": [
        {
            "ChannelName": "<your_channel_name>",
            "DataSource": {
                "S3DataSource": {
                    "S3DataDistributionType": "FullyReplicated",
                    "S3DataType": "S3Prefix",
                    "S3Uri": "s3://<bucket-name>/<bucket_prefix>",
                }},
            "InputMode": "File",
            ...
        }
    }
}
```

Next, run the AWS CLI command to launch the training job from the JSON file as follows.

```bash
aws sagemaker create-training-job --cli-input-json file://run-my-training-job.json
```

Using AWS CLI directly

To use AWS CLI directly without a JSON file, use the following code structure.

```bash
aws --region <your-region> sagemaker create-training-job \
    --training-job-name <your-training-job-name> \
    --role-arn <your-execution-role-arn> \
    --algorithm-specification '{ 
        "TrainingInputMode": "File", 
        "TrainingImage": "<your-ecr-image>", 
        "ContainerEntrypoint": ["/bin/sh"], 
        "ContainerArguments": ["/opt/ml/input/data/<your_channel_name>/custom_entrypoint.sh"]}
    --input-data-config '{
        "ChannelName": ",
        "DataSource": {
            "S3DataSource": {
                "S3DataDistributionType": "FullyReplicated",
                "S3DataType": "S3Prefix",
                "S3Uri": "s3://<bucket-name>/<bucket_prefix>",
            }
        }},

    --stopping-condition '{"MaxRuntimeInSeconds": 180}'}
```

How Amazon SageMaker Provides Training Information

This section explains how SageMaker makes training information, such as training data, hyperparameters, and other configuration information, available to your Docker container.
When you send a `CreateTrainingJob` request to SageMaker to start model training, you specify the Amazon Elastic Container Registry (Amazon ECR) path of the Docker image that contains the training algorithm. You also specify the Amazon Simple Storage Service (Amazon S3) location where training data is stored and algorithm-specific parameters. SageMaker makes this information available to the Docker container so that your training algorithm can use it. This section explains how we make this information available to your Docker container. For information about creating a training job, see `CreateTrainingJob`. For more information on the way that SageMaker containers organize information, see *Using the SageMaker Training and Inference Toolkits* (p. 3165).

**Topics**

- Hyperparameters (p. 3186)
- Environment Variables (p. 3186)
- Input Data Configuration (p. 3186)
- Training Data (p. 3187)
- Distributed Training Configuration (p. 3188)

### Hyperparameters

SageMaker makes the hyperparameters in a `CreateTrainingJob` request available in the Docker container in the `/opt/ml/input/config/hyperparameters.json` file.

### Environment Variables

The following environment variables are set in the container:

- `TRAINING_JOB_NAME` – Specified in the `TrainingJobName` parameter of the `CreateTrainingJob` request.
- `TRAINING_JOB_ARN` – The Amazon Resource Name (ARN) of the training job returned as the `TrainingJobArn` in the `CreateTrainingJob` response.
- All environment variables specified in the `Environment` parameter in the `CreateTrainingJob` request.

### Input Data Configuration

You specify data channel information in the `InputDataConfig` parameter in a `CreateTrainingJob` request. SageMaker makes this information available in the `/opt/ml/input/config/inputdataconfig.json` file in the Docker container.

For example, suppose that you specify three data channels (train, evaluation, and validation) in your request. SageMaker provides the following JSON:

```json
{
  "train" : {
    "ContentType": "trainingContentType",
    "TrainingInputMode": "File",
    "S3DistributionType": "FullyReplicated",
    "RecordWrapperType": "None"},
  "evaluation" : {
    "ContentType": "evalContentType",
    "TrainingInputMode": "File",
    "S3DistributionType": "FullyReplicated",
    "RecordWrapperType": "None"},
  "validation" : {
    "TrainingInputMode": "File",
    "S3DistributionType": "FullyReplicated",
    "RecordWrapperType": "None"}
}
```
Note
SageMaker provides only relevant information about each data channel (for example, the channel name and the content type) to the container, as shown. S3DistributionType will be set as FullyReplicated if specify EFS or FSxLustre as input data sources.

Training Data
The TrainingInputMode parameter in the AlgorithmSpecification of the CreateTrainingJob request specifies how the training dataset is made available. The following input modes are available:

- **File mode**
  - TrainingInputMode parameter written to inputdataconfig.json: "File"
  - Data channel directory in the Docker container: /opt/ml/input/data/channel_name
  - Supported data sources: Amazon Simple Storage Service (Amazon S3), Amazon Elastic File System (Amazon EFS), and Amazon FSx for Lustre

  A directory is created for each channel. For example, if you have three channels named training, validation, and testing, SageMaker makes three directories in the Docker container:
  - /opt/ml/input/data/training
  - /opt/ml/input/data/validation
  - /opt/ml/input/data/testing

  **Note**
  Channels that use file system data sources such as Amazon EFS and Amazon FSx must use File mode. If a file system is specified, the directory path provided in the channel is mounted at /opt/ml/input/data/channel_name.

- **FastFile mode**
  - TrainingInputMode parameter written to inputdataconfig.json: "FastFile"
  - Data channel directory in the Docker container: /opt/ml/input/data/channel_name
  - Supported data sources: Amazon S3

  The channel directory is mounted as read-only.

  Algorithms that support File mode can seamlessly work with FastFile mode with no code changes.

  **Note**
  Channels that use FastFile mode must use a S3DataType of "S3Prefix".

  FastFile mode presents a folder view that uses the forward slash (/) as the delimiter for grouping Amazon S3 objects into folders. S3Uri prefixes must not correspond to a partial folder name. For example, if an Amazon S3 dataset contains s3://my-bucket/train-01/data.csv, then neither s3://my-bucket/train nor s3://my-bucket/train-01 are allowed as S3Uri prefixes.

  A trailing forward slash is recommended to define a channel corresponding to a folder. For example, the s3://my-bucket/train-01/ channel for the train-01 folder. Without the trailing forward slash, the channel would be ambiguous if there existed another folder s3://my-bucket/train-011/ or file s3://my-bucket/train-01.txt/.

- **Pipe mode**
  - TrainingInputMode parameter written to inputdataconfig.json: "Pipe"
  - Data channel directory in the Docker container: /opt/ml/input/data/channel_name_epoch_number
  - Supported data sources: Amazon S3

  You need to read from a separate pipe for each channel. For example, if you have three channels named training, validation, and testing, you need to read from the following pipes:
  - /opt/ml/input/data/training_0, /opt/ml/input/data/training_1, ...
• /opt/ml/input/data/validation_0, /opt/ml/input/data/validation_1, ...
• /opt/ml/input/data/testing_0, /opt/ml/input/data/testing_1, ...

Read the pipes sequentially. For example, if you have a channel called training, read the pipes in this sequence:

1. Open /opt/ml/input/data/training_0 in read mode and read it to end-of-file (EOF) or, if you are done with the first epoch, close the pipe file early.
2. After closing the first pipe file, look for /opt/ml/input/data/training_1 and read it until you have completed the second epoch, and so on.

If the file for a given epoch doesn't exist yet, your code may need to retry until the pipe is created. There is no sequencing restriction across channel types. For example, you can read multiple epochs for the training channel and only start reading the validation channel when you are ready. Or, you can read them simultaneously if your algorithm requires that.

For an example of a Jupyter notebook that shows how to use Pipe mode when bringing your own container, see Bring your own pipe-mode algorithm to Amazon SageMaker.

Distributed Training Configuration

If you're performing distributed training with multiple containers, SageMaker makes information about all containers available in the /opt/ml/input/config/resourceconfig.json file.

To enable inter-container communication, this JSON file contains information for all containers. SageMaker makes this file available for both File and Pipe mode algorithms. The file provides the following information:

- current_host—The name of the current container on the container network. For example, algo-1. Host values can change at any time. Don't write code with specific values for this variable.
- hosts—The list of names of all containers on the container network, sorted lexicographically. For example, ["algo-1", "algo-2", "algo-3"] for a three-node cluster. Containers can use these names to address other containers on the container network. Host values can change at any time. Don't write code with specific values for these variables.
- network_interface_name—The name of the network interface that is exposed to your container. For example, containers running the Message Passing Interface (MPI) can use this information to set the network interface name.
- Do not use the information in /etc/hostname or /etc/hosts because it might be inaccurate.
- Hostname information may not be immediately available to the algorithm container. We recommend adding a retry policy on hostname resolution operations as nodes become available in the cluster.

The following is an example file on node 1 in a three-node cluster:

```json
{
    "current_host": "algo-1",
    "hosts": ["algo-1","algo-2","algo-3"],
    "network_interface_name": "eth1"
}
```

Run Training with EFA

SageMaker provides integration with EFA devices to accelerate High Performance Computing (HPC) and machine learning applications. This integration allows you to leverage an EFA device when running your distributed training jobs. You can add EFA integration to an existing Docker container that you bring
to SageMaker. The following information outlines how to configure your own container to use an EFA device for your distributed training jobs.

Prerequisites

Your container must satisfy the SageMaker Training container specification.

Install EFA and required packages

Your container must download and install the EFA software. This allows your container to recognize the EFA device, and provides compatible versions of Libfabric and Open MPI.

Any tools like MPI and NCCL must be installed and managed inside the container to be used as part of your EFA-enabled training job. The following example shows how to modify the Dockerfile of your EFA-enabled container to install EFA, MPI, OFI, NCCL, and NCCL-TEST.

Note

When using PyTorch with EFA on your container, the NCCL version of your container should match the NCCL version of your PyTorch installation. To verify the PyTorch NCCL version, use the following command:

```
torch.cuda.nccl.version()
```

ARG OPEN_MPI_PATH=/opt/amazon/openmpi/
ENV NCCL_VERSION=2.7.8
ENV EFA_VERSION=1.11.2
ENV BRANCH_OFI=1.1.1

#################################################
## EFA and MPI SETUP
RUN cd $HOME 
   && curl -O https://s3-us-west-2.amazonaws.com/aws-efa-installer/aws-efa-installer-
   ${EFA_VERSION}.tar.gz 
   && tar -xf aws-efa-installer-$EFA_VERSION.tar.gz 
   && cd aws-efa-installer 
   && ./efa_installer.sh -y --skip-kmod -g 
   ENV PATH="$OPEN_MPI_PATH/bin:$PATH"
   ENV LD_LIBRARY_PATH="$OPEN_MPI_PATH/lib/:$LD_LIBRARY_PATH"

#################################################
## NCCL, OFI, NCCL-TEST SETUP
RUN cd $HOME 
   && git clone https://github.com/NVIDIA/nccl.git -b v${NCCL_VERSION}-1 
   && cd nccl 
   && make -j64 src.build BUILDDIR=/usr/local 

RUN apt-get update && apt-get install -y autoconf
RUN cd $HOME 
   && git clone https://github.com/aws/aws-ofi-nccl.git -b v${BRANCH_OFI} 
   && cd aws-ofi-nccl 
   && ./autogen.sh 
   && ./configure --with-libfabric=/opt/amazon/efa 
   && make & make install 

RUN cd $HOME 
   && git clone https://github.com/NVIDIA/nccl-tests 
   && cd nccl-tests 
   && make MPI=1 MPI_HOME=/opt/amazon/openmpi CUDA_HOME=/usr/local/cuda NCCL_HOME=/usr/local

3189
Considerations when creating your container

The EFA device is mounted to the container as /dev/infiniband/uverbs0 under the list of devices accessible to the container. On P4d instances, the container has access to 4 EFA devices. The EFA devices can be found in the list of devices accessible to the container as:

- /dev/infiniband/uverbs0
- /dev/infiniband/uverbs1
- /dev/infiniband/uverbs2
- /dev/infiniband/uverbs3

To get information about hostname, peer hostnames, and network interface (for MPI) from the resourceconfig.json file provided to each container instances, see Distributed Training Configuration. Your container handles regular TCP traffic among peers through the default Elastic Network Interfaces (ENI), while handling OFI (kernel bypass) traffic through the EFA device.

Verify that your EFA device is recognized

To verify that the EFA device is recognized, run the following command from within your container.

```
/opt/amazon/efa/bin/fi_info -p efa
```

Your output should look similar to the following.

```
provider: efa
  fabric: EFA-fe80::e5:56ff:fe34:56a8
  domain: efa_0-rdm
  version: 2.0
  type: FI_EP_RDM
  protocol: FI_PROTO_EFA
provider: efa
  fabric: EFA-fe80::e5:56ff:fe34:56a8
  domain: efa_0-dgrm
  version: 2.0
  type: FI_EP_DGRAM
  protocol: FI_PROTO_EFA
provider: efa;ofi_rxd
  fabric: EFA-fe80::e5:56ff:fe34:56a8
  domain: efa_0-drgm
  version: 1.0
  type: FI_EP_RDM
  protocol: FI_PROTO_RXD
```

Running a training job with EFA

Once you've created an EFA-enabled container, you can run a training job with EFA using a SageMaker Estimator the same way as you would with any other Docker image. For more information on registering your container and using it for training, see Adapting Your Own Training Container.

How Amazon SageMaker Signals Algorithm Success and Failure

A training algorithm indicates whether it succeeded or failed using the exit code of its process.

A successful training execution should exit with an exit code of 0 and an unsuccessful training execution should exit with a non-zero exit code. These will be converted to Completed and Failed in the TrainingJobStatus returned by DescribeTrainingJob. This exit code convention is standard and is easily implemented in all languages. For example, in Python, you can use `sys.exit(1)` to signal a failure exit, and simply running to the end of the main routine will cause Python to exit with code 0.
In the case of failure, the algorithm can write a description of the failure to the failure file. See next section for details.

**How Amazon SageMaker Processes Training Output**

As your algorithm runs in a container, it generates output including the status of the training job and model and output artifacts. Your algorithm should write this information to the following files, which are located in the container's `/output` directory. Amazon SageMaker processes the information contained in this directory as follows:

- `/opt/ml/model` – Your algorithm should write all final model artifacts to this directory. SageMaker copies this data as a single object in compressed tar format to the S3 location that you specified in the `CreateTrainingJob` request. If multiple containers in a single training job write to this directory they should ensure no file/directory names clash. SageMaker aggregates the result in a tar file and uploads to S3. SageMaker aggregates the result in a TAR file and uploads to S3 at the end of the training job.

- `/opt/ml/output` – Your algorithm should write artifacts you want to store other than the final model to this directory. SageMaker copies this data as a single object in compressed tar format to the S3 location that you specified in the `CreateTrainingJob` request. If multiple containers in a single training job write to this directory they should ensure no file/directory names clash. SageMaker aggregates the result in a TAR file and uploads to S3 at the end of the training job.

- `/opt/ml/output/failure` – If training fails, after all algorithm output (for example, logging) completes, your algorithm should write the failure description to this file. In a `DescribeTrainingJob` response, SageMaker returns the first 1024 characters from this file as `FailureReason`.

**Use Your Own Inference Code**

You can use Amazon SageMaker to interact with Docker containers and run your own inference code in one of two ways:

- To use your own inference code with a persistent endpoint to get one prediction at a time, use SageMaker hosting services.
- To use your own inference code to get predictions for an entire dataset, use SageMaker batch transform.

**Topics**
- Use Your Own Inference Code with Hosting Services (p. 3191)
- Use Your Own Inference Code with Batch Transform (p. 3197)

**Use Your Own Inference Code with Hosting Services**

This section explains how Amazon SageMaker interacts with a Docker container that runs your own inference code for hosting services. Use this information to write inference code and create a Docker image.

**Topics**
- How SageMaker Runs Your Inference Image (p. 3192)
- How SageMaker Loads Your Model Artifacts (p. 3193)
- How Containers Serve Requests (p. 3193)
- How Your Container Should Respond to Inference Requests (p. 3193)
- How Your Container Should Respond to Health Check (Ping) Requests (p. 3193)
• Use a Private Docker Registry for Real-Time Inference Containers (p. 3194)

How SageMaker Runs Your Inference Image

To configure a container to run as an executable, use an ENTRYPOINT instruction in a Dockerfile. Note the following:

• For model inference, SageMaker runs the container as:

  ```bash
docker run image serve
  ```

  SageMaker overrides default CMD statements in a container by specifying the `serve` argument after the image name. The `serve` argument overrides arguments that you provide with the CMD command in the Dockerfile.

• We recommend that you use the `exec` form of the ENTRYPOINT instruction:

  ```python
  ENTRYPOINT ["executable", "param1", "param2"]
  ```

  For example:

  ```python
  ENTRYPOINT ["python", "k_means_inference.py"]
  ```

  The `exec` form of the ENTRYPOINT instruction starts the executable directly, not as a child of `/bin/sh`. This enables it to receive signals like `SIGTERM` and `SIGKILL` from the SageMaker API operations, which is a requirement.

  For example, when you use the `CreateEndpoint` API to create an endpoint, SageMaker provisions the number of ML compute instances required by the endpoint configuration, which you specify in the request. SageMaker runs the Docker container on those instances.

  If you reduce the number of instances backing the endpoint (by calling the `UpdateEndpointWeightsAndCapacities` API), SageMaker runs a command to stop the Docker container on the instances that are being terminated. The command sends the `SIGTERM` signal, then it sends the `SIGKILL` signal thirty seconds later.

  If you update the endpoint (by calling the `UpdateEndpoint` API), SageMaker launches another set of ML compute instances and runs the Docker containers that contain your inference code on them. Then it runs a command to stop the previous Docker containers. To stop a Docker container, command sends the `SIGTERM` signal, then it sends the `SIGKILL` signal 30 seconds later.

• SageMaker uses the container definition that you provided in your `CreateModel` request to set environment variables and the DNS hostname for the container as follows:

  • It sets environment variables using the `ContainerDefinition.Environment string-to-string map`. 
• It sets the DNS hostname using the `ContainerDefinition.ContainerHostname`.

• If you plan to use GPU devices for model inferences (by specifying GPU-based ML compute instances in your `CreateEndpointConfig` request), make sure that your containers are `nvidia-docker` compatible. Don't bundle NVIDIA drivers with the image. For more information about `nvidia-docker`, see `NVIDIA/nvidia-docker`.

• You can't use the `tini` initializer as your entry point in SageMaker containers because it gets confused by the `train` and `serve` arguments.

How SageMaker Loads Your Model Artifacts

In your `CreateModel` request, the container definition includes the `ModelDataUrl` parameter, which identifies the S3 location where model artifacts are stored. SageMaker uses this information to determine from where to copy the model artifacts. It copies the artifacts to the `/opt/ml/model` directory for use by your inference code.

The `ModelDataUrl` must point to a tar.gz file. Otherwise, SageMaker won't download the file.

If you trained your model in SageMaker, the model artifacts are saved as a single compressed tar file in Amazon S3. If you trained your model outside SageMaker, you need to create this single compressed tar file and save it in a S3 location. SageMaker decompresses this tar file into `/opt/ml/model` directory before your container starts.

How Containers Serve Requests

Containers need to implement a web server that responds to `/invocations` and `/ping` on port 8080.

How Your Container Should Respond to Inference Requests

To obtain inferences, the client application sends a POST request to the SageMaker endpoint. For more information, see the `InvokeEndpoint` API. SageMaker passes the request to the container, and returns the inference result from the container to the client. Note the following:

• SageMaker strips all POST headers except those supported by `InvokeEndpoint`. SageMaker might add additional headers. Inference containers must be able to safely ignore these additional headers.

• To receive inference requests, the container must have a web server listening on port 8080 and must accept POST requests to the `/invocations` endpoint.

• A customer's model containers must accept socket connection requests within 250 ms.

• A customer's model containers must respond to requests within 60 seconds. The model itself can have a maximum processing time of 60 seconds before responding to the `/invocations`. If your model is going to take 50-60 seconds of processing time, the SDK socket timeout should be set to be 70 seconds.

How Your Container Should Respond to Health Check (Ping) Requests

The `CreateEndpoint` and `UpdateEndpoint` API calls result in SageMaker starting new inference containers. Soon after container startup, SageMaker starts sending periodic GET requests to the `/ping` endpoint.

The simplest requirement on the container is to respond with an HTTP 200 status code and an empty body. This indicates to SageMaker that the container is ready to accept inference requests at the `/invocations` endpoint.
If the container does not begin to pass health checks, by consistently responding with 200s, during the 4 minutes after startup, `CreateEndPoint` will fail, leaving the endpoint in a failed state, and the update requested by `UpdateEndpoint` will not be completed.

While the minimum bar is for the container to return a static 200, a container developer can use this functionality to perform deeper checks. The request timeout on `/ping` attempts is 2 seconds.

**Use a Private Docker Registry for Real-Time Inference Containers**

Amazon SageMaker hosting enables you to use images stored in Amazon ECR to build your containers for real-time inference by default. Optionally, you can build containers for real-time inference from images in a private Docker registry. The private registry must be accessible from an Amazon VPC in your account. Models that you create based on the images stored in your private Docker registry must be configured to connect to the same VPC where the private Docker registry is accessible. For information about connecting your model to a VPC, see *Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC* (p. 3650).

Your Docker registry must be secured with a TLS certificate from a known public certificate authority (CA).

**Note**

Your private Docker registry must allow inbound traffic from the security groups you specify in the VPC configuration for your model, so that SageMaker hosting is able to pull model images from your registry.

SageMaker can pull model images from DockerHub if there's a path to the open internet inside your VPC.

**Topics**

- *Store Images in a Private Docker Registry other than Amazon Elastic Container Registry* (p. 3194)
- *Use an Image from a Private Docker Registry for Real-time Inference* (p. 3194)
- *Allow SageMaker to authenticate to a private Docker registry* (p. 3196)
- *Create the Lambda function* (p. 3196)
- *Give your execution role permission to Lambda* (p. 3197)
- *Create an interface VPC endpoint for Lambda* (p. 3197)

**Store Images in a Private Docker Registry other than Amazon Elastic Container Registry**

To use a private Docker registry to store your images for SageMaker real-time inference, create a private registry that is accessible from your Amazon VPC. For information about creating a Docker registry, see *Deploy a registry server* in the Docker documentation. The Docker registry must comply with the following:

- The registry must be a *Docker Registry HTTP API V2* registry.
- The Docker registry must be accessible from the same VPC that you specify in the `VpcConfig` parameter that you specify when you create your model.

**Use an Image from a Private Docker Registry for Real-time Inference**

When you create a model and deploy it to SageMaker hosting, you can specify that it use an image from your private Docker registry to build the inference container. Specify this in the `ImageConfig` object in the `PrimaryContainer` parameter that you pass to a call to the `create_model` function.

**To use an image stored in your private Docker registry for your inference container**

1. Create the image configuration object and specify a value of `Vpc` for the `RepositoryAccessMode` field.
2. If your private Docker registry requires authentication, add a RepositoryAuthConfig object to the image configuration object. For the RepositoryCredentialsProviderArn field of the RepositoryAuthConfig object, specify the Amazon Resource Name (ARN) of an AWS Lambda function that provides credentials that allows SageMaker to authenticate to your private Docker Registry. For information about how to create the Lambda function to provide authentication, see Allow SageMaker to authenticate to a private Docker registry (p. 3196).

```python
image_config = {
    'RepositoryAccessMode': 'Vpc',
    'RepositoryAuthConfig': {
        'RepositoryCredentialsProviderArn':
            'arn:aws:lambda:Region:Acct:function:FunctionName'
    }
}
```

3. Create the primary container object that you want to pass to create_model, using the image configuration object that you created in the previous step.

Provide your image in digest form. If you provide your image using the :latest tag, there is a risk that SageMaker pulls a newer version of the image than intended. Using the digest form ensures that SageMaker pulls the intended image version.

```python
primary_container = {
    'ContainerHostname': 'ModelContainer',
    'Image': 'myteam.myorg.com/docker-local/my-inference-image:<IMAGE-TAG>',
    'ImageConfig': image_config
}
```

4. Specify the model name and the execution role that you want to pass to create_model.

```python
model_name = 'vpc-model'
execution_role_arn = 'arn:aws:iam::123456789012:role/SageMakerExecutionRole'
```

5. Specify one or more security groups and subnets for the VPC configuration for your model. Your private Docker registry must allow inbound traffic from the security groups that you specify. The subnets that you specify must be in the same VPC as your private Docker registry.

```python
vpc_config = {
    'SecurityGroupIds': ['sg-0123456789abcdef0'],
    'Subnets': ['subnet-0123456789abcdef0','subnet-0123456789abcdef1']
}
```

```python
import boto3
sm = boto3.client('sagemaker')
```

7. Create the model by calling create_model, using the values you specified in the previous steps for the PrimaryContainer and VpcConfig parameters.

```python
try:
    resp = sm.create_model(
        ModelName=model_name,
        PrimaryContainer=primary_container,
        ExecutionRoleArn=execution_role_arn,
        VpcConfig=vpc_config,
    )
```
8. Finally, call `create_endpoint_config` and `create_endpoint` to create the hosting endpoint, using the model that you created in the previous step.

```python
endpoint_config_name = 'my-endpoint-config'
sm.create_endpoint_config(
    EndpointConfigName=endpoint_config_name,
    ProductionVariants=[
        {'VariantName': 'MyVariant',
         'ModelName': model_name,
         'InitialInstanceCount': 1,
         'InstanceType': 'ml.t2.medium'},
    ],
)
endpoint_name = 'my-endpoint'
sm.create_endpoint(
    EndpointName=endpoint_name,
    EndpointConfigName=endpoint_config_name,
)
sm.describe_endpoint(EndpointName=endpoint_name)
```

**Allow SageMaker to authenticate to a private Docker registry**

To pull an inference image from a private Docker registry that requires authentication, create an AWS Lambda function that provides credentials, and provide the Amazon Resource Name (ARN) of the Lambda function when you call `create_model`. When SageMaker runs `create_model`, it calls the Lambda function that you specified to get credentials to authenticate to your Docker registry.

**Create the Lambda function**

Create an AWS Lambda function that returns a response with the following form:

```python
def handler(event, context):
    response = {
        "Credentials": {"Username": "username", "Password": "password"}
    }
    return response
```

Depending on how you set up authentication for your private Docker registry, the credentials that your Lambda function returns can mean either of the following:

- If you set up your private Docker registry to use basic authentication, this is the `username` and `password` to authenticate to the registry.
- If you set up your private Docker registry to use bearer token authentication, the `username` and `password` are sent to your authorization server, which returns a Bearer token that can then be used to authenticate to the private Docker registry.
Give your execution role permission to Lambda

The execution role that you use to call create_model must have permissions to call AWS Lambda functions. Add the following to the permissions policy of your execution role.

```
{
    "Effect": "Allow",
    "Action": [
        "lambda:InvokeFunction"
    ],
    "Resource": [
        "arn:aws:lambda:*:*:function:*myLambdaFunction*"
    ]
}
```

Where `myLambdaFunction` is the name of your Lambda function. For information about editing a role permissions policy, see Modifying a role permissions policy (console) in the AWS Identity and Access Management User Guide.

**Note**

An execution role with the AmazonSageMakerFullAccess managed policy attached to it has permission to call any Lambda function with SageMaker in its name.

Create an interface VPC endpoint for Lambda

Create an interface endpoint so that your Amazon VPC can communicate with your AWS Lambda function without sending traffic over the internet. For information about how to do this, see Configuring interface VPC endpoints for Lambda in the AWS Lambda Developer Guide.

SageMaker hosting sends a request through your VPC to `lambda.region.amazonaws.com`, to call your Lambda function. If you choose Private DNS Name when you create your interface endpoint, Amazon Route 53 routes the call to the Lambda interface endpoint. If you use a different DNS provider, make sure to map `lambda.region.amazonaws.com` to your Lambda interface endpoint.

Use Your Own Inference Code with Batch Transform

This section explains how Amazon SageMaker interacts with a Docker container that runs your own inference code for batch transform. Use this information to write inference code and create a Docker image.

**Topics**
- How SageMaker Runs Your Inference Image (p. 3197)
- How SageMaker Loads Your Model Artifacts (p. 3198)
- How Containers Serve Requests (p. 3199)
- How Your Container Should Respond to Inference Requests (p. 3199)
- How Your Container Should Respond to Health Check (Ping) Requests (p. 3200)

**How SageMaker Runs Your Inference Image**

To configure a container to run as an executable, use an ENTRYPOINT instruction in a Dockerfile. Note the following:

- For batch transforms, SageMaker runs the container as:

```
docker run image serve
```
SageMaker overrides default CMD statements in a container by specifying the `serve` argument after the image name. The `serve` argument overrides arguments that you provide with the CMD command in the Dockerfile.

- We recommend that you use the exec form of the ENTRYPOINT instruction:

  ```
  ENTRYPOINT ["executable", "param1", "param2"]
  ```

  For example:

  ```
  ENTRYPOINT ["python", "k_means_inference.py"]
  ```

- SageMaker sets environment variables specified in `CreateModel` and `CreateTransformJob` on your container. Additionally, the following environment variables are populated:
  - `SAGEMAKER_BATCH` is always set to `true` when the container runs in Batch Transform.
  - `SAGEMAKER_MAX_PAYLOAD_IN_MB` is set to the largest size payload that is sent to the container via HTTP.
  - `SAGEMAKER_BATCH_STRATEGY` is set to `SINGLE_RECORD` when the container is sent a single record per call to invocations and `MULTI_RECORD` when the container gets as many records as will fit in the payload.
  - `SAGEMAKER_MAX_CONCURRENT_TRANSFORMS` is set to the maximum number of /invocations requests that can be opened simultaneously.

  **Note**
  The last three environment variables come from the API call made by the user. If the user doesn't set values for them, they aren't passed. In that case, either the default values or the values requested by the algorithm (in response to the /execution-parameters) are used.

- If you plan to use GPU devices for model inferences (by specifying GPU-based ML compute instances in your `CreateTransformJob` request), make sure that your containers are nvidia-docker compatible. Don't bundle NVIDIA drivers with the image. For more information about nvidia-docker, see [NVIDIA/nvidia-docker](https://github.com/NVIDIA/nvidia-docker).

- You can't use the `init` initializer as your entry point in SageMaker containers because it gets confused by the train and serve arguments.

### How SageMaker Loads Your Model Artifacts

In a `CreateModel` request, container definitions include the `ModelDataUrl` parameter, which identifies the location in Amazon S3 where model artifacts are stored. When you use SageMaker to run inferences, it uses this information to determine from where to copy the model artifacts. It copies the artifacts to the `/opt/ml/model` directory in the Docker container for use by your inference code.

The `ModelDataUrl` parameter must point to a tar.gz file. Otherwise, SageMaker can't download the file. If you train a model in SageMaker, it saves the artifacts as a single compressed tar file in Amazon S3. If you train a model in another framework, you need to store the model artifacts in Amazon S3 as a compressed tar file. SageMaker decompresses this tar file and saves it in the `/opt/ml/model` directory in the container before the batch transform job starts.
How Containers Serve Requests

Containers must implement a web server that responds to invocations and ping requests on port 8080. For batch transforms, you have the option to set algorithms to implement execution-parameters requests to provide a dynamic runtime configuration to SageMaker. SageMaker uses the following endpoints:

- ping—Used to periodically check the health of the container. SageMaker waits for an HTTP 200 status code and an empty body for a successful ping request before sending an invocations request. You might use a ping request to load a model into memory to generate inference when invocations requests are sent.
- (Optional) execution-parameters—Allows the algorithm to provide the optimal tuning parameters for a job during runtime. Based on the memory and CPUs available for a container, the algorithm chooses the appropriate MaxConcurrentTransforms, BatchStrategy, and MaxPayloadInMB values for the job.

Before calling the invocations request, SageMaker attempts to invoke the execution-parameters request. When you create a batch transform job, you can provide values for the MaxConcurrentTransforms, BatchStrategy, and MaxPayloadInMB parameters. SageMaker determines the values for these parameters using this order of precedence:

1. The parameter values that you provide when you create the CreateTransformJob request.
2. The values that the model container returns when SageMaker invokes the execution-parameters endpoint.
3. The default parameter values, listed in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>MaxConcurrentTransforms</td>
<td>1</td>
</tr>
<tr>
<td>BatchStrategy</td>
<td>MULTI_RECORD</td>
</tr>
<tr>
<td>MaxPayloadInMB</td>
<td>6</td>
</tr>
</tbody>
</table>

The response for a GET execution-parameters request is a JSON object with keys for MaxConcurrentTransforms, BatchStrategy, and MaxPayloadInMB parameters. This is an example of a valid response:

```json
{
    "MaxConcurrentTransforms": 8,
    "BatchStrategy": "MULTI_RECORD",
    "MaxPayloadInMB": 6
}
```

How Your Container Should Respond to Inference Requests

To obtain inferences, Amazon SageMaker sends a POST request to the inference container. The POST request body contains data from Amazon S3. Amazon SageMaker passes the request to the container, and returns the inference result from the container, saving the data from the response to Amazon S3.

To receive inference requests, the container must have a web server listening on port 8080 and must accept POST requests to the /invocations endpoint. The inference request timeout and max retries can be configured through ModelClientConfig.
How Your Container Should Respond to Health Check (Ping) Requests

The simplest requirement on the container is to respond with an HTTP 200 status code and an empty body. This indicates to SageMaker that the container is ready to accept inference requests at the /invocations endpoint.

While the minimum bar is for the container to return a static 200, a container developer can use this functionality to perform deeper checks. The request timeout on /ping attempts is 2 seconds.

Example Notebooks: Use Your Own Algorithm or Model

The following Jupyter notebooks show how to use your own algorithms or pretrained models from an Amazon SageMaker notebook instance. For links to the GitHub repositories with the prebuilt Dockerfiles for the TensorFlow, MXNet, Chainer, and PyTorch frameworks and instructions on using the AWS SDK for Python (Boto3) estimators to run your own training algorithms on SageMaker Learner and your own models on SageMaker hosting, see Prebuilt SageMaker Docker Images for Deep Learning (p. 3151)

Setup

1. Create a SageMaker notebook instance. For instructions on how to create and access Jupyter notebook instances, see Use Amazon SageMaker Notebook Instances (p. 291).
2. Open the notebook instance you created.
3. Choose the SageMaker Examples tab for a list of all SageMaker example notebooks.
4. Open the sample notebooks from the Advanced Functionality section in your notebook instance or from GitHub using the provided links. To open a notebook, choose its Use tab, then choose Create copy.

Host Models Trained in Scikit-learn

To learn how to host models trained in Scikit-learn for making predictions in SageMaker by injecting them into first-party k-means and XGBoost containers, see the following sample notebooks.

• kmeans_bring_your_own_model
• xgboost_bring_your_own_model

Package TensorFlow and Scikit-learn Models for Use in SageMaker

To learn how to package algorithms that you have developed in TensorFlow and scikit-learn frameworks for training and deployment in the SageMaker environment, see the following notebooks. They show you how to build, register, and deploy your own Docker containers using Dockerfiles.

• tensorflow_bring_your_own
• scikit_bring_your_own
Train and Deploy a Neural Network on SageMaker

To learn how to train a neural network locally using MXNet or TensorFlow, and then create an endpoint from the trained model and deploy it on SageMaker, see the following notebooks. The MXNet model is trained to recognize handwritten numbers from the MNIST dataset. The TensorFlow model is trained to classify irises.

- `mxnet_mnist_byom`
- `tensorflow_iris_byom`

Training Using Pipe Mode

To learn how to use a Dockerfile to build a container that calls the `train.py` script and uses pipe mode to custom train an algorithm, see the following notebook. In pipe mode, the input data is transferred to the algorithm while it is training. This can decrease training time compared to using file mode.

- `pipe_bring_your_own`

Bring Your Own R Model

To learn how to use an R container to train and host a model with the R kernel installed in a notebook, see the following notebook. To take advantage of the AWS SDK for Python (Boto3), we use Python within the notebook. You can achieve the same results in R by invoking command line arguments.

- `r_bring_your_own`

Extend a Prebuilt PyTorch Container Image

To learn how to extend a prebuilt SageMaker PyTorch container image when you have additional functional requirements for your algorithm or model that the prebuilt Docker image doesn't support, see the following notebook.

- `pytorch_extending_our_containers`

Train and Debug Training Jobs on a Custom Container

To learn how to train and debug training jobs using SageMaker Debugger, see the following notebook. A training script provided through this example uses the TensorFlow Keras ResNet 50 model and the CIFAR10 dataset. A Docker custom container is built with the training script and pushed to Amazon ECR. While the training job is running, Debugger collects tensor outputs and identifies debugging problems. With `smdebug` client library tools, you can set a `smdebug` trial object that calls the training job and debugging information, check the training and Debugger rule status, and retrieve tensors saved in an Amazon S3 bucket to analyze training issues.

- `build_your_own_container_with_debugger`
Troubleshooting your Docker containers

The following are common errors that you might run into when using Docker containers with SageMaker. Each error is followed by a solution to the error.

- **Error: SageMaker has lost the Docker daemon.**
  To fix this error, restart Docker using the following command.

  ```
  sudo service docker restart
  ```

- **Error: The /tmp directory of your Docker container has run out of space.**
  Docker containers use the / and /tmp partitions to store code. These partitions can fill up easily when using large code modules in local mode. The SageMaker Python SDK supports specifying a custom temp directory for your local mode root directory to avoid this issue.

  To specify the custom temp directory in the EBS volume storage, create a file at the following path `~/.sagemaker/config.yaml` and add the following configuration. The directory that you specify as `container_root` must already exist. The SageMaker Python SDK will not try to create it.

  ```
  local:
    container_root: /home/ec2-user/SageMaker/temp
  ```

  With this configuration, local mode uses the /temp directory and not the default /tmp directory.
SageMaker Workflows

You can manage your Amazon SageMaker training and inference workflows using Amazon SageMaker Studio and the Amazon SageMaker Python SDK. With the available tools, you can simplify your SageMaker process and integrate it into your existing project.

The following workflow technologies are supported.

- **Amazon SageMaker Model Building Pipelines** (p. 3203): SageMaker’s tool for building and managing end-to-end ML pipelines.
- **Airflow Workflows**: SageMaker APIs to export configurations for creating and managing Airflow workflows.
- **Kubernetes Orchestration** (p. 3327): SageMaker custom operators for your Kubernetes cluster, as well as custom components for Kubeflow Pipelines.
- **AWS Step Functions**: Create multi-step machine learning workflows in Python that orchestrate SageMaker infrastructure without having to provision your resources separately.

For more information on managing SageMaker training and inference, see Amazon SageMaker Python SDK Workflows.

Topics

- Amazon SageMaker Model Building Pipelines (p. 3203)
- Automate MLOps with SageMaker Projects (p. 3281)
- Amazon SageMaker ML Lineage Tracking (p. 3309)
- Kubernetes Orchestration (p. 3327)
- Amazon SageMaker Workflows FAQ (p. 3385)

Amazon SageMaker Model Building Pipelines

Amazon SageMaker Model Building Pipelines is a tool for building machine learning pipelines that take advantage of direct SageMaker integration. Because of this integration, you can create a pipeline and set up SageMaker Projects for orchestration using a tool that handles much of the step creation and management for you. SageMaker Pipelines provides the following advantages over other AWS workflow offerings:

**SageMaker Integration**

SageMaker Pipelines is integrated directly with SageMaker, so you don't need to interact with any other AWS services. You also don't need to manage any resources because SageMaker Pipelines is a fully managed service, which means that it creates and manages resources for you.

**SageMaker Python SDK Integration**

Because SageMaker Pipelines is integrated with the SageMaker Python SDK, you can create your pipelines programmatically using a high-level Python interface that you might already be familiar
with. To view the SageMaker Python SDK API reference, see Pipelines. For SageMaker Python SDK code examples, see Amazon SageMaker Model Building Pipelines.

SageMaker Studio Integration

SageMaker Studio offers an environment to manage the end-to-end SageMaker Pipelines experience. Using Studio, you can bypass the AWS console for your entire workflow management. For more information on managing SageMaker Pipelines from SageMaker Studio, see View, Track, and Execute SageMaker Pipelines in SageMaker Studio (p. 3266).

Data Lineage Tracking

With SageMaker Pipelines you can track the history of your data within the pipeline execution. Amazon SageMaker ML Lineage Tracking lets you analyze where the data came from, where it was used as an input, and the outputs that were generated from it. For example, you can view the models created from an individual dataset, and you can view the datasets that went into creating an individual model. For more information, see Amazon SageMaker ML Lineage Tracking (p. 3309).

Step Reuse

With SageMaker Pipelines, you can designate steps for caching. When a step is cached, it is indexed for reuse later if the same step is executed again. As a result, you can reuse the output from previous step executions of the same step in the same pipeline without having to run the step again. For more information on step caching, see Caching Pipeline Steps (p. 3230).

Topics

- SageMaker Pipelines Overview (p. 3204)
- Create and Manage SageMaker Pipelines (p. 3250)

SageMaker Pipelines Overview

An Amazon SageMaker Model Building Pipelines pipeline is a series of interconnected steps that are defined using the Pipelines SDK. This pipeline definition encodes a pipeline using a directed acyclic graph (DAG) that can be exported as a JSON definition. This DAG gives information on the requirements for and relationships between each step of your pipeline. The structure of a pipeline's DAG is determined by the data dependencies between steps. These data dependencies are created when the properties of a step's output are passed as the input to another step. The following image is an example of a pipeline DAG:
The following topics describe fundamental SageMaker Pipelines concepts. For a tutorial describing the implementation of these concepts, see Create and Manage SageMaker Pipelines (p. 3250).

**Topics**
- Pipeline Structure and Execution (p. 3205)
- IAM Access Management (p. 3206)
- Cross-Account Support for SageMaker Pipelines (p. 3208)
- Pipeline Parameters (p. 3209)
- Pipeline Steps (p. 3211)
- Property Files and JsonGet (p. 3229)
- Caching Pipeline Steps (p. 3230)
- Retry Policy for Pipeline Steps (p. 3235)
- Baseline calculation, drift detection and lifecycle with ClarifyCheck and QualityCheck steps in Amazon SageMaker Model Building Pipelines (p. 3238)

- Amazon SageMaker Experiments Integration (p. 3245)
- Local Mode (p. 3248)
- Troubleshooting Amazon SageMaker Model Building Pipelines (p. 3249)

**Pipeline Structure and Execution**

**Topics**
Pipeline Structure

An Amazon SageMaker Model Building Pipelines instance is composed of a name, parameters, and steps. Pipeline names must be unique within an (account, region) pair. All parameters used in step definitions must be defined in the pipeline. Pipeline steps listed automatically determine their order of execution by their data dependencies on one another. The SageMaker Pipelines service resolves the relationships between steps in the data dependency DAG to create a series of steps that the execution completes. The following is an example of a pipeline structure.

```python
from sagemaker.workflow.pipeline import Pipeline

pipeline_name = f"AbalonePipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[
        processing_instance_type,
        processing_instance_count,
        training_instance_type,
        model_approval_status,
        input_data,
        batch_data,
    ],
    steps=[step_process, step_train, step_eval, step_cond],
)
```

Pipeline Execution using Parallelism Configuration

By default, a pipeline performs all steps that are available to run in parallel. You can control this behavior by using the `ParallelismConfiguration` property when creating or updating a pipeline, as well as when starting or retrying a pipeline execution.

Parallelism configurations are applied per execution. For example, if two executions are started they can each run a maximum of 50 steps concurrently, for a total of 100 concurrently running steps. Also, `ParallelismConfiguration(s)` specified when starting, retrying or updating an execution take precedence over parallelism configurations defined in the pipeline.

Example Creating a pipeline execution with `ParallelismConfiguration`

```python
pipeline = Pipeline(
    name="myPipeline",
    steps=[step_process, step_train]
)

pipeline.create(role, parallelism_config={"MaxParallelExecutionSteps": 50})
```

IAM Access Management

The following sections describe the AWS Identity and Access Management (IAM) requirements for Amazon SageMaker Model Building Pipelines. For an example of how you can implement these permissions, see Prerequisites (p. 3251).

Topics

- Pipeline Role Permissions (p. 3207)
- Pipeline Step Permissions (p. 3207)
- Service Control Policies with Pipelines (p. 3207)

### Pipeline Role Permissions

Your pipeline requires an IAM pipeline execution role that is passed to SageMaker Pipelines when you create a pipeline. The role for the SageMaker instance that is creating the pipeline must have the `iam:PassRole` permission for the pipeline execution role in order to pass it. For more information on IAM roles, see [IAM Roles](#).

Your pipeline execution role requires the following permissions:

- To pass any role to a SageMaker job within a pipeline, the `iam:PassRole` permission for the role that is being passed.
- Create and Describe permissions for each of the job types in the pipeline.
- Amazon S3 permissions to use the `JsonGet` function. You control access to your Amazon S3 resources using resource-based policies and identity-based policies. A resource-based policy is applied to your Amazon S3 bucket and grants SageMaker Pipelines access to the bucket. An identity-based policy gives your pipeline the ability to make Amazon S3 calls from your account. For more information on resource-based policies and identity-based policies, see [Identity-based policies and resource-based policies](#).

```json
{
    "Action": ["s3:GetObject"],
    "Resource": "arn:aws:s3:::<your-bucket-name>/*",
    "Effect": "Allow"
}
```

### Pipeline Step Permissions

SageMaker Pipelines include steps that run SageMaker jobs. In order for the pipeline steps to run these jobs, they require an IAM role in your account that provides access for the needed resource. This role is passed to the SageMaker service principal by your pipeline. For more information on IAM roles, see [IAM Roles](#).

By default, each step takes on the pipeline execution role. You can optionally pass a different role to any of the steps in your pipeline. This ensures that the code in each step does not have the ability to impact resources used in other steps unless there is a direct relationship between the two steps specified in the pipeline definition. You pass these roles when defining the processor or estimator for your step. For examples of how to include these roles in these definitions, see the [SageMaker Python SDK documentation](#).

### Service Control Policies with Pipelines

Service control policies (SCPs) are a type of organization policy that you can use to manage permissions in your organization. SCPs offer central control over the maximum available permissions for all accounts in your organization. By using SageMaker Pipelines within your organization, you can ensure that data scientists manage your pipeline executions without having to interact with the AWS console.

If you're using a VPC with your SCP that restricts access to Amazon S3, you need to take steps to allow your pipeline to access other Amazon S3 resources.

To allow SageMaker Pipelines to access Amazon S3 outside of your VPC with the `JsonGet` function, update your organization's SCP to ensure that the role using SageMaker Pipelines can access Amazon S3. To do this, create an exception for roles that are being used by the SageMaker Pipelines executor via the pipeline execution role using a principal tag and condition key.
To allow SageMaker Pipelines to access Amazon S3 outside of your VPC

1. Create a unique tag for your pipeline execution role following the steps in Tagging IAM users and roles.
2. Grant an exception in your SCP using the Aws:PrincipalTag IAM condition key for the tag you created. For more information, see Creating, updating, and deleting service control policies.

Cross-Account Support for SageMaker Pipelines

You can use cross-account support for Amazon SageMaker Model Building Pipelines to share pipeline entities across AWS accounts and access shared pipelines through direct API calls.

Set up cross-account pipeline sharing

SageMaker uses AWS Resource Access Manager (AWS RAM) to help you securely share your pipeline entities across accounts.

Create a resource share

1. Select Create a resource share through the AWS RAM console.
2. When specifying resource share details, choose the SageMaker Pipelines resource type and select one or more pipelines that you want to share. When you share a pipeline with any other account, all of its executions are also shared implicitly.
3. Associate permissions with your resource share. Choose either the default read-only permission policy or the extended pipeline execution permission policy. For more detailed information, see Permission policies for SageMaker Pipelines resources (p. 3208).

   Note
   If you select the extended pipeline execution policy, note that any start, stop, and retry commands called by shared accounts use resources in the AWS account that shared the pipeline.
4. Use AWS account IDs to specify the accounts to which you want to grant access to your shared resources.
5. Review your resource share configuration and select Create resource share. It may take a few minutes for the resource share and principal associations to complete.

For more information, see Sharing your AWS resources in the AWS Resource Access Manager User Guide.

Get responses to your resource share invitation

Once the resource share and principal associations are set, the specified AWS accounts receive an invitation to join the resource share. The AWS accounts must accept the invite to gain access to any shared resources.

For more information on accepting a resource share invite through AWS RAM, see Using shared AWS resources in the AWS Resource Access Manager User Guide.

Permission policies for SageMaker Pipelines resources

When creating your resource share, choose one of two supported permission policies to associate with the SageMaker pipeline resource type. Both policies grant access to any selected pipeline and all of its executions.

Default read-only permissions

The AWSRAMDefaultPermissionSageMakerPipeline policy allows the following read-only actions:
Extended pipeline execution permissions

The AWSRAMPermissionSageMakerPipelineAllowExecution policy includes all of the read-only permissions from the default policy and also allows shared accounts to start, stop, and retry pipeline executions.

**Note**

Be mindful of AWS resource usage when using the extended pipeline execution permission policy. With this policy, shared accounts are allowed to start, stop, and retry pipeline executions. Any resources used for shared pipeline executions are consumed by the owner account.

The extended pipeline execution permission policy allows the following actions:

- `sagemaker:DescribePipeline`
- `sagemaker:DescribePipelineDefinitionForExecution`
- `sagemaker:DescribePipelineExecution`
- `sagemaker:ListPipelineExecutions`
- `sagemaker:ListPipelineExecutionSteps`
- `sagemaker:ListPipelineParametersForExecution`
- `sagemaker:StartPipelineExecution`
- `sagemaker:StopPipelineExecution`
- `sagemaker:RetryPipelineExecution`
- `sagemaker:Search`

Access shared pipeline entities through direct API calls

Once cross-account pipeline sharing is set up, you can call the following SageMaker API actions using a pipeline ARN:

**Note**

You can only call API commands if they are included in the permissions associated with your resource share. If you select the AWSRAMPermissionSageMakerPipelineAllowExecution policy, then the start, stop, and retry commands use resources in the AWS account that shared the pipeline.

- `DescribePipeline`
- `DescribePipelineDefinitionForExecution`
- `DescribePipelineExecution`
- `ListPipelineExecutions`
- `ListPipelineExecutionSteps`
- `ListPipelineParametersForExecution`
- `StartPipelineExecution`
- `StopPipelineExecution`
- `RetryPipelineExecution`

Pipeline Parameters

You can introduce variables into your pipeline definition using parameters. You can reference parameters that you define throughout your pipeline definition. Parameters have a default value, which you can
override by specifying parameter values when starting a pipeline execution. The default value must be an instance matching the parameter type. All parameters used in step definitions must be defined in your pipeline definition. Amazon SageMaker Model Building Pipelines supports the following parameter types:

- **ParameterString** – Representing a string parameter.
- **ParameterInteger** – Representing an integer parameter.
- **ParameterFloat** – Representing a float parameter.
- **ParameterBoolean** – Representing a Boolean Python type.

Parameters take the following format:

```python
<parameter> = <parameter_type>(
    name="<parameter_name>",
    default_value=<default_value>
)
```

The following example shows a sample parameter implementation.

```python
from sagemaker.workflow.parameters import (ParameterInteger,
                                          ParameterString,
                                          ParameterFloat,
                                          ParameterBoolean)

processing_instance_count = ParameterInteger(
    name="ProcessingInstanceCount",
    default_value=1
)
```

You pass the parameter when creating your pipeline as shown in the following example.

```python
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[
        processing_instance_count
    ],
    steps=[step_process]
)
```

You can also pass a parameter value that differs from the default value to a pipeline execution, as shown in the following example.

```python
execution = pipeline.start(
    parameters=dict(
        ProcessingInstanceType="ml.c5.xlarge",
        ModelApprovalStatus="Approved"
    )
)
```

You can manipulate parameters with SageMaker Python SDK functions like `sagemaker.workflow.functions.Join`. For more information on parameters, see [SageMaker Pipelines Parameters](#). For known limitations of SageMaker Pipelines Parameters, see [Limitations - Parameterization](#) in the Amazon SageMaker Python SDK.
Pipeline Steps

SageMaker Pipelines are composed of steps. These steps define the actions that the pipeline takes and the relationships between steps using properties.

Topics

- Step Types (p. 3211)
- Step Properties (p. 3227)
- Step Parallelism (p. 3227)
- Data Dependency Between Steps (p. 3227)
- Custom Dependency Between Steps (p. 3228)
- Use a Custom Image in a Step (p. 3229)

Step Types

The following describes the requirements of each step type and provides an example implementation of the step. These are not functional implementations because they don't provide the resource and inputs needed. For a tutorial that implements these steps, see Create and Manage SageMaker Pipelines (p. 3250).

Amazon SageMaker Model Building Pipelines support the following step types:

- Processing (p. 3211)
- Training (p. 3213)
- Tuning (p. 3213)
- Model (p. 3214)
- CreateModel (p. 3216)
- RegisterModel (p. 3216)
- Transform (p. 3217)
- Condition (p. 3218)
- Callback (p. 3218)
- Lambda (p. 3220)
- ClarifyCheck (p. 3222)
- QualityCheck (p. 3224)
- EMR (p. 3225)
- Fail (p. 3226)

Processing Step

Use a processing step to create a processing job for data processing. For more information on processing jobs, see Process Data and Evaluate Models.

A processing step requires a processor, a Python script that defines the processing code, outputs for processing, and job arguments. The following example shows how to create a ProcessingStep definition.

```python
from sagemaker.sklearn.processing import SKLearnProcessor
sklearn_processor = SKLearnProcessor(framework_version='1.0-1',
```
Pass runtime parameters

The following example shows how to pass runtime parameters from a PySpark processor to a ProcessingStep.

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.spark.processing import PySparkProcessor
from sagemaker.processing import ProcessingInput, ProcessingOutput
from sagemaker.workflow.steps import ProcessingStep

pipeline_session = PipelineSession()

pyspark_processor = PySparkProcessor(  
    framework_version='2.4',  
    role=<role>,  
    instance_type='ml.m5.xlarge',  
    instance_count=1,  
    sagemaker_session=pipeline_session,
)

step_args = pyspark_processor.run(  
    inputs=[ProcessingInput(source=<input_data>, destination="/opt/ml/processing/input"),],  
    outputs=[  
        ProcessingOutput(output_name="train", source="/opt/ml/processing/train"),  
        ProcessingOutput(output_name="validation", source="/opt/ml/processing/validation"),  
        ProcessingOutput(output_name="test", source="/opt/ml/processing/test"),  
    ],  
    code="preprocess.py",  
    arguments=None,
)

step_process = ProcessingStep(  
    name="AbaloneProcess",  
    step_args=step_args,
)
```

For more information on processing step requirements, see the `sagemaker.workflow.steps.ProcessingStep` documentation. For an in-depth example, see Define a
**Processing Step for Feature Engineering** in the Orchestrate Jobs to Train and Evaluate Models with Amazon SageMaker Pipelines example notebook.

**Training Step**

You use a training step to create a training job to train a model. For more information on training jobs, see Train a Model with Amazon SageMaker.

A training step requires an estimator, as well as training and validation data inputs. The following example shows how to create a TrainingStep definition. For more information on training step requirements, see the sagemaker.workflow.steps.TrainingStep documentation.

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.inputs import TrainingInput
from sagemaker.workflow.steps import TrainingStep
from sagemaker.xgboost.estimator import XGBoost
pipeline_session = PipelineSession()
xgb_estimator = XGBoost(..., sagemaker_session=pipeline_session)
step_args = xgb_estimator.fit(
    inputs={
        "train": TrainingInput(
            s3_data=step_process.properties.ProcessingOutputConfig.Outputs["train"].S3Output.S3Uri,
            content_type="text/csv"
        ),
        "validation": TrainingInput(
            s3_data=step_process.properties.ProcessingOutputConfig.Outputs["validation"].S3Output.S3Uri,
            content_type="text/csv"
        )
    }
)
step_train = TrainingStep(
    name="TrainAbaloneModel",
    step_args=step_args,
)
```

**Tuning Step**

You use a tuning step to create a hyperparameter tuning job, also known as hyperparameter optimization (HPO). A hyperparameter tuning job runs multiple training jobs, each one producing a model version. For more information on hyperparameter tuning, see Perform Automatic Model Tuning with SageMaker (p. 2436).

The tuning job is associated with the SageMaker experiment for the pipeline, with the training jobs created as trials. For more information, see Experiments Integration (p. 3245).

A tuning step requires a HyperparameterTuner and training inputs. You can retrain previous tuning jobs by specifying the warm_start_config parameter of the HyperparameterTuner. For more information on hyperparameter tuning and warm start, see Run a Warm Start Hyperparameter Tuning Job (p. 2459).

You use the get_top_model_s3_uri method of the sagemaker.workflow.steps.TuningStep class to get the model artifact from one of the top-performing model versions. For a notebook that shows how to use a tuning step in a SageMaker pipeline, see sagemaker-pipelines-tuning-step.ipynb.
Important
Tuning steps were introduced in Amazon SageMaker Python SDK v2.48.0 and Amazon SageMaker Studio v3.8.0. You must update Studio before you use a tuning step or the pipeline DAG doesn't display. To update Studio, see Shut down and Update SageMaker Studio (p. 179).

The following example shows how to create a TuningStep definition.

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.tuner import HyperparameterTuner
from sagemaker.inputs import TrainingInput
from sagemaker.workflow.steps import TuningStep
tuner = HyperparameterTuner(..., sagemaker_session=PipelineSession())
step_tuning = TuningStep(
    name = "HPTuning",
    step_args = tuner.fit(inputs=TrainingInput(s3_data="s3://my-bucket/my-data"))
)
```

Get the best model version

The following example shows how to get the best model version from the tuning job using the `get_top_model_s3_uri` method. At most, the top 50 performing versions are available ranked according to `HyperParameterTuningJobObjective`. The top_k argument is an index into the versions, where top_k=0 is the best-performing version and top_k=49 is the worst-performing version.

```python
best_model = Model(
    image_uri=image_uri,
    model_data=step_tuning.get_top_model_s3_uri(
        top_k=0,
        s3_bucket=sagemaker_session.default_bucket()
    ),
    ...)
```

For more information on tuning step requirements, see the `sagemaker.workflow.steps.TuningStep` documentation.

Model Step

Use a ModelStep to create or register a SageMaker model. For more information on ModelStep requirements, see the `sagemaker.workflow.model_step.ModelStep` documentation.

Create a model

You can use a ModelStep to create a SageMaker model. A ModelStep requires model artifacts and information about the SageMaker instance type that you need to use to create the model. For more information on SageMaker models, see Train a Model with Amazon SageMaker.

The following example shows how to create a ModelStep definition.

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.model import Model
from sagemaker.workflow.model_step import ModelStep
step_train = TrainingStep(...) model = Model(
    image_uri=pytorch Estimator.training_image_uri(),
    model_data=step_train.properties.ModelArtifacts.S3ModelArtifacts,
    sagemaker_session=PipelineSession(),
)```
role=role,
)

step_model_create = ModelStep(
    name="MyModelCreationStep",
    step_args=model.create(instance_type="ml.m5.xlarge"),
)

Register a model

You can use a ModelStep to register a sagemaker.model.Model or a sagemaker.pipeline.PipelineModel with the Amazon SageMaker model registry. A PipelineModel represents an inference pipeline, which is a model composed of a linear sequence of containers that process inference requests. For more information about how to register a model, see Register and Deploy Models with Model Registry (p. 2982).

The following example shows how to create a ModelStep that registers a PipelineModel.

```python
import time
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.sklearn import SKLearnModel
from sagemaker.xgboost import XGBoostModel

pipeline_session = PipelineSession()

code_location = 's3://[0]/[1]/code'.format(bucket_name, prefix)

sklearn_model = SKLearnModel(
    model_data=processing_step.properties.ProcessingOutputConfig.Outputs['model'].S3Output.S3Uri,
    entry_point='inference.py',
    source_dir='sklearn_source_dir/',
    code_location=code_location,
    framework_version='1.0-1',
    role=role,
    sagemaker_session=pipeline_session,
    py_version='py3'
)

xgboost_model = XGBoostModel(
    model_data=training_step.properties.ModelArtifacts.S3ModelArtifacts,
    entry_point='inference.py',
    source_dir='xgboost_source_dir/',
    code_location=code_location,
    framework_version='0.90-2',
    py_version='py3',
    sagemaker_session=pipeline_session,
    role=role
)

from sagemaker.workflow.pipeline_step import PipelineStep
from sagemaker import PipelineModel

pipeline_model = PipelineModel(
    models=[sklearn_model, xgboost_model],
    role=role,sagemaker_session=pipeline_session,
)

register_model_step_args = pipeline_model.register(
    content_types=['application/json'],
    response_types=['application/json'],
    inference_instances=['ml.t2.medium', "ml.m5.xlarge"],
    transform_instances=['ml.m5.xlarge'],
)
CreateModel Step

**Important**

We recommend using Model Step (p. 3214) to create models as of v2.90.0 of the SageMaker Python SDK. CreateModelStep will continue to work in previous versions of the SageMaker Python SDK, but is no longer actively supported.

You use a CreateModel step to create a SageMaker model. For more information on SageMaker models, see Train a Model with Amazon SageMaker.

A create model step requires model artifacts and information about the SageMaker instance type that you need to use to create the model. The following example shows how to create a CreateModel step definition. For more information on CreateModel step requirements, see the sagemaker.workflow.steps.CreateModelStep documentation.

```python
from sagemaker.workflow.steps import CreateModelStep

step_create_model = CreateModelStep(
    name="AbaloneCreateModel",
    model=best_model,
    inputs=inputs
)
```

RegisterModel Step

**Important**

We recommend using Model Step (p. 3214) to register models as of v2.90.0 of the SageMaker Python SDK. RegisterModel will continue to work in previous versions of the SageMaker Python SDK, but is no longer actively supported.

You use a RegisterModel step to register a sagemaker.model.Model or a sagemaker.pipeline.PipelineModel with the Amazon SageMaker model registry. A PipelineModel represents an inference pipeline, which is a model composed of a linear sequence of containers that process inference requests.

For more information about how to register a model, see Register and Deploy Models with Model Registry (p. 2982). For more information on RegisterModel step requirements, see the sagemaker.workflow.step_collections.RegisterModel documentation.

The following example shows how to create a RegisterModel step that registers a PipelineModel.

```python
import time
from sagemaker.sklearn import SKLearnModel
from sagemaker.xgboost import XGBoostModel

code_location = 's3://{0}/{1}/code'.format(bucket_name, prefix)

sklearn_model = SKLearnModel(model_data=processing_step.properties.ProcessingOutputConfig.Outputs['model'].S3Output.S3Uri,
    entry_point='inference.py',
    source_dir='sklearn_source_dir/',
    code_location=code_location,
    framework_version='1.0-1',
    )
```
role=role,
sagemaker_session=sagemaker_session,
py_version='py3')

xgboost_model =
XGBoostModel(model_data=training_step.properties.ModelArtifacts.S3ModelArtifacts,
entry_point='inference.py',
source_dir='xgboost_source_dir/',
code_location=code_location,
framework_version='0.90-2',
py_version='py3',
sagemaker_session=sagemaker_session,
role=role)

from sagemaker.workflow.step_collections import RegisterModel
from sagemaker import PipelineModel
pipeline_model =
PipelineModel(models=[sklearn_model, xgboost_model], role=role, sagemaker_session=sagemaker_session)

step_register = RegisterModel(
    name="AbaloneRegisterModel",
    model=pipeline_model,
    content_types=['application/json'],
    response_types=['application/json'],
    inference_instances=['ml.t2.medium', 'ml.m5.xlarge'],
    transform_instances=['ml.m5.xlarge'],
    model_package_group_name='sipgroup',
    approval_status=model_approval_status,
    model_metrics=model_metrics
)

if model isn’t provided, the register model step requires an estimator as shown in the following example.

from sagemaker.workflow.step_collections import RegisterModel

step_register = RegisterModel(
    name="AbaloneRegisterModel",
    estimator=xgb_train,
    model_data=step_train.properties.ModelArtifacts.S3ModelArtifacts,
    content_types=['text/csv'],
    response_types=['text/csv'],
    inference_instances=['ml.t2.medium', 'ml.m5.xlarge'],
    transform_instances=['ml.m5.xlarge'],
    model_package_group_name=model_package_group_name,
    approval_status=model_approval_status,
    model_metrics=model_metrics
)

Transform Step

You use a transform step for batch transformation to run inference on an entire dataset. For more information about batch transformation, see Run Batch Transforms with Inference Pipelines (p. 2795).

A transform step requires a transformer and the data on which to run batch transformation. The following example shows how to create a Transform step definition. For more information on Transform step requirements, see the sagemaker.workflow.steps.TransformStep documentation.

from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.transformer import Transformer
from sagemaker.inputs import TransformInput
from sagemaker.workflow.steps import TransformStep
transformer = Transformer(...)
Condition Step

You use a condition step to evaluate the condition of step properties to assess which action should be taken next in the pipeline.

A condition step requires a list of conditions, a list of steps to run if the condition evaluates to `true`, and a list of steps to run if the condition evaluates to `false`. The following example shows how to create a `ConditionStep` definition.

```python
from sagemaker.workflow.conditions import ConditionLessThanOrEqualTo
from sagemaker.workflow.condition_step import (ConditionStep,
                                           JsonGet)

cond_lte = ConditionLessThanOrEqualTo(
    left=JsonGet(
        step_name=step_eval.name,
        property_file=evaluation_report,
        json_path="regression_metrics.mse.value"),
    right=6.0)

step_cond = ConditionStep(
    name="AbaloneMSECond",
    conditions=[cond_lte],
    if_steps=[step_register, step_create_model, step_transform],
    else_steps=[])
```

For more information on `ConditionStep` requirements, see the `sagemaker.workflow.condition_step.ConditionStep` API reference. For more information on supported conditions, see `Amazon SageMaker Model Building Pipelines - Conditions` in the SageMaker Python SDK documentation.

Callback Step

You use a Callback step to incorporate additional processes and AWS services into your workflow that aren't directly provided by Amazon SageMaker Model Building Pipelines. When a Callback step runs, the following procedure occurs:

- SageMaker Pipelines sends a message to a customer-specified Amazon Simple Queue Service (Amazon SQS) queue. The message contains a SageMaker Pipelines–generated token and a customer-supplied list of input parameters. After sending the message, SageMaker Pipelines waits for a response from the customer.
- The customer retrieves the message from the Amazon SQS queue and starts their custom process.
When the process finishes, the customer calls one of the following APIs and submits the SageMaker Pipelines-generated token:
- `SendPipelineExecutionStepSuccess`, along with a list of output parameters
- `SendPipelineExecutionStepFailure`, along with a failure reason
The API call causes SageMaker Pipelines to either continue the pipeline process or fail the process.

For more information on Callback step requirements, see the `sagemaker.workflow.callback_step.CallbackStep` documentation. For a complete solution, see Extend SageMaker Pipelines to include custom steps using callback steps.

**Important**
Callback steps were introduced in Amazon SageMaker Python SDK v2.45.0 and Amazon SageMaker Studio v3.6.2. You must update Studio before you use a Callback step or the pipeline DAG doesn't display. To update Studio, see Shut down and Update SageMaker Studio (p. 179).

The following sample demonstrates an implementation of the preceding procedure.

```python
from sagemaker.workflow.callback_step import CallbackStep

step_callback = CallbackStep(
    name="MyCallbackStep",
    sqs_queue_url="https://sqs.us-east-2.amazonaws.com/012345678901/MyCallbackQueue",
    inputs={...},
    outputs=[...]
)

callback_handler_code = ''
    import boto3
    import json
    def handler(event, context):
        sagemaker_client=boto3.client("sagemaker")
        for record in event['Records']:
            payload=json.loads(record['body'])
            token=payload['token']
            # Custom processing
            # Call SageMaker to complete the step
            sagemaker_client.send_pipeline_execution_step_success(
                CallbackToken=token,
                OutputParameters={...}
            )
    

**Note**
Output parameters for CallbackStep should not be nested. For example, if you use a nested dictionary as your output parameter, then the dictionary is treated as a single string (ex. `{"output1": "{\"nested_output1\": "my-output\"\"}"}`). If you provide a nested value, then when you try to refer to a particular output parameter, a non-retryable client error is thrown.

**Stopping behavior**
A pipeline process doesn't stop while a Callback step is running.

When you call `StopPipelineExecution` on a pipeline process with a running Callback step, SageMaker Pipelines sends an additional Amazon SQS message to the specified SQS queue. The body of the SQS
message contains a **Status** field, which is set to Stopping. The following shows an example SQS message body.

```json
{
    "token": "26vcYbeWsZ",
    "pipelineExecutionArn": "arn:aws:sagemaker:us-east-2:012345678901:pipeline/callback-pipeline/execution/7pinimwddh3a",
    "arguments": {
        "number": 5,
        "stringArg": "some-arg",
        "inputData": "s3://sagemaker-us-west-2-012345678901/abalone/abalone-dataset.csv"
    },
    "status": "Stopping"
}
```

You should add logic to your Amazon SQS message consumer to take any needed action (for example, resource cleanup) upon receipt of the message, followed by a call to `SendPipelineExecutionStepSuccess` or `SendPipelineExecutionStepFailure`. Only when SageMaker Pipelines receives one of these calls does it stop the pipeline process.

**Lambda Step**

You use a Lambda step to run an AWS Lambda function. You can run an existing Lambda function, or SageMaker can create and run a new Lambda function. For a notebook that shows how to use a Lambda step in a SageMaker pipeline, see `sagemaker-pipelines-lambda-step.ipynb`.

**Important**

Lambda steps were introduced in Amazon SageMaker Python SDK v2.51.0 and Amazon SageMaker Studio v3.9.1. You must update Studio before you use a Lambda step or the pipeline DAG doesn't display. To update Studio, see *Shut down and Update SageMaker Studio* (p. 179).

SageMaker provides the `sagemaker.lambda_helper.Lambda` class to create, update, invoke, and delete Lambda functions. Lambda has the following signature.

```
Lambda(
    function_arn,       # Only required argument to invoke an existing Lambda function
    # The following arguments are required to create a Lambda function:
    function_name,
    execution_role_arn,
    zipped_code_dir,    # Specify either zipped_code_dir and s3_bucket, OR script
    s3_bucket,          # S3 bucket where zipped_code_dir is uploaded
    script,             # Path of Lambda function script
    handler,            # Lambda handler specified as "lambda_script.lambda_handler"
    timeout,            # Maximum time the Lambda function can run before the lambda step fails
    ...
)
```

The `sagemaker.workflow.lambda_step.LambdaStep` class has a `lambda_func` argument of type Lambda. To invoke an existing Lambda function, the only requirement is to supply the Amazon Resource Name (ARN) of the function to `function_arn`. If you don't supply a value for `function_arn`, you must specify `handler` and one of the following:

- **zipped_code_dir** – The path of the zipped Lambda function
- **s3_bucket** – Amazon S3 bucket where `zipped_code_dir` is to be uploaded
- **script** – The path of the Lambda function script file
The following example shows how to create a Lambda step definition that invokes an existing Lambda function.

```python
from sagemaker.workflow.lambda_step import LambdaStep
from sagemaker.lambda_helper import Lambda

step_lambda = LambdaStep(
    name="ProcessingLambda",
    lambda_func=Lambda(
    ),
    inputs={
        s3_bucket = s3_bucket,
        data_file = data_file
    },
    outputs=[
        "train_file", "test_file"
    ]
)
```

The following example shows how to create a Lambda step definition that creates and invokes a Lambda function using a Lambda function script.

```python
from sagemaker.workflow.lambda_step import LambdaStep
from sagemaker.lambda_helper import Lambda

step_lambda = LambdaStep(
    name="ProcessingLambda",
    lambda_func=Lambda(
        function_name="split-dataset-lambda",
        execution_role_arn=execution_role_arn,
        script="lambda_script.py",
        handler="lambda_script.lambda_handler",
    ),
    inputs={
        s3_bucket = s3_bucket,
        data_file = data_file
    },
    outputs=[
        "train_file", "test_file"
    ]
)
```

**Inputs and outputs**

If your Lambda function has inputs or outputs, these must also be defined in your Lambda step.

**Note**

Input and output parameters should not be nested. For example, if you use a nested dictionary as your output parameter, then the dictionary is treated as a single string (ex. `{"output1": 
  "}`). If you provide a nested value and try to refer to it later, a non-retryable client error is thrown.

When defining the Lambda step, inputs must be a dictionary of key-value pairs. Each value of the inputs dictionary must be a primitive type (string, integer, or float). Nested objects are not supported. If left undefined, the inputs value defaults to None.

The outputs value must be a list of keys. These keys refer to a dictionary defined in the output of the Lambda function. Like inputs, these keys must be primitive types, and nested objects are not supported.
Timeout and stopping behavior

The Lambda class has a timeout argument that specifies the maximum time that the Lambda function can run. The default value is 120 seconds with a maximum value of 10 minutes. If the Lambda function is running when the timeout is met, the Lambda step fails; however, the Lambda function continues to run.

A pipeline process can't be stopped while a Lambda step is running because the Lambda function invoked by the Lambda step can't be stopped. If you attempt to stop the process while the Lambda function is running, the pipeline waits for the Lambda function to finish or until the timeout is hit, whichever occurs first, and then stops. If the Lambda function finishes, the pipeline process status is Stopped. If the timeout is hit the pipeline process status is Failed.

ClarifyCheck Step

You can use the ClarifyCheck step to conduct baseline drift checks against previous baselines for bias analysis and model explainability. You can then generate and register your baselines with the model.register() method and pass the output of that method to Model Step (p. 3214) using step_args. These baselines for drift check can be used by Amazon SageMaker Model Monitor for your model endpoints so that you don't need to do a baseline suggestion separately. The ClarifyCheck step can also pull baselines for drift check from the model registry. The ClarifyCheck step leverages the Amazon SageMaker Clarify prebuilt container that provides a range of model monitoring capabilities, including constraint suggestion and constraint validation against a given baseline. For more information, see Getting Started with a SageMaker Clarify Container.

Configuring the ClarifyCheck step

You can configure the ClarifyCheck step to conduct only one of the following check types each time it's used in a pipeline.

- Data bias check
- Model bias check
- Model explainability check

You do this by setting the clarify_check_config parameter with one of the following check type values:

- DataBiasCheckConfig
- ModelBiasCheckConfig
- ModelExplainabilityCheckConfig

The ClarifyCheck step launches a processing job that runs the SageMaker Clarify prebuilt container and requires dedicated configurations for the check and the processing job. ClarifyCheckConfig and CheckJobConfig are helper functions for these configurations that are aligned with how the SageMaker Clarify processing job computes for checking model bias, data bias, or model explainability. For more information, see Run SageMaker Clarify Processing Jobs for Bias Analysis and Explainability (p. 2627).

Controlling step behaviors for drift check

The ClarifyCheck step requires the following two boolean flags to control its behavior:

- skip_check: This parameter indicates if the drift check against the previous baseline is skipped or not. If it is set to False, the previous baseline of the configured check type must be available.
- register_new_baseline: This parameter indicates if a newly calculated baseline can be accessed through step property BaselineUsedForDriftCheckConstraints. If it is set to False, the
previous baseline of the configured check type also must be available. This can be accessed through the `BaselineUsedForDriftCheckConstraints` property.

For more information, see Baseline calculation, drift detection and lifecycle with ClarifyCheck and QualityCheck steps in Amazon SageMaker Model Building Pipelines (p. 3238).

**Working with baselines**

You can optionally specify the `model_package_group_name` to locate the existing baseline and the ClarifyCheck step pulls the `DriftCheckBaselines` on the latest approved model package in the model package group. Or, you can provide a previous baseline through the `supplied_baseline_constraints` parameter. If you specify both the `model_package_group_name` and the `supplied_baseline_constraints`, the ClarifyCheck step uses the baseline specified by the `supplied_baseline_constraints` parameter.

For more information on using the ClarifyCheck step requirements, see the `sagemaker.workflow.steps.ClarifyCheckStep` in the Amazon SageMaker SageMaker SDK for Python. For an Amazon SageMaker Studio notebook that shows how to use ClarifyCheck step in SageMaker Pipelines, see sagemaker-pipeline-model-monitor-clarify-steps.ipynb.

**Example: Create a ClarifyCheck step for data bias check**

```python
from sagemaker.workflow.check_job_config import CheckJobConfig
from sagemaker.workflow.clarify_check_step import DataBiasCheckConfig, ClarifyCheckStep
from sagemaker.workflow.execution_variables import ExecutionVariables

check_job_config = CheckJobConfig(
    role=role,
    instance_count=1,
    instance_type="ml.c5.xlarge",
    volume_size_in_gb=120,
    sagemaker_session=sagemaker_session,
)

data_bias_data_config = DataConfig(
    s3_data_input_path=step_process.properties.ProcessingOutputConfig.Outputs["train"].S3Output.S3Uri,
    s3_output_path=Join(on='/', values=['s3://', your_bucket, base_job_prefix, ExecutionVariables.PIPELINE_EXECUTION_ID, 'databiascheckstep']),
    label=0,
    dataset_type="text/csv",
    s3_analysis_config_output_path=data_bias_analysis_cfg_output_path,
)

data_bias_config = BiasConfig(
    label_values_or_threshold=[15.0],
    facet_name=[8],
    facet_values_or_threshold=[[0.5]]
)

data_bias_check_config = DataBiasCheckConfig(
    data_config=data_bias_data_config,
    data_bias_config=data_bias_config,
)

data_bias_check_step = ClarifyCheckStep(
    name="DataBiasCheckStep",
    clarify_check_config=data_bias_check_config,
    check_job_config=check_job_config,
    skip_check=False,
    register_new_baseline=False,
    supplied_baseline_constraints="s3://sagemaker-us-west-2-111122223333/baseline/analysis.json",
    model_package_group_name="MyModelPackageGroup"
)
QualityCheck Step

You can use the QualityCheck step to conduct baseline suggestions and drift checks against a previous baseline for data quality or model quality in a pipeline. You can then generate and register your baselines with the `model.register()` method and pass the output of that method to `Model Step` (p. 3214) using `step_args`. Model Monitor can use these baselines for drift check for your model endpoints so that you don’t need to do a baseline suggestion separately. The QualityCheck step can also pull baselines for drift check from the model registry. The QualityCheck step leverages the Amazon SageMaker Model Monitor prebuilt container, which has a range of model monitoring capabilities including constraint suggestion, statistics generation, and constraint validation against a baseline. For more information, see Amazon SageMaker Model Monitor prebuilt container (p. 2899).

Configuring the QualityCheck step

You can configure the QualityCheck step to conduct only one of the following check types each time it’s used in a pipeline.

- Data quality check
- Model quality check

You do this by setting the `quality_check_config` parameter with one of the following check type values:

- `DataQualityCheckConfig`
- `ModelQualityCheckConfig`

The QualityCheck step launches a processing job that runs the Model Monitor prebuilt container and requires dedicated configurations for the check and the processing job. The `QualityCheckConfig` and `CheckJobConfig` are helper functions for these configurations that are aligned with how Model Monitor creates a baseline for the model quality or data quality monitoring. For more information on the Model Monitor baseline suggestions, see Create a Baseline (p. 2865) and Create a Model Quality Baseline (p. 2871).

Controlling step behaviors for drift check

The QualityCheck step requires the following two Boolean flags to control its behavior:

- `skip_check`: This parameter indicates if the drift check against the previous baseline is skipped or not. If it is set to `False`, the previous baseline of the configured check type must be available.
- `register_new_baseline`: This parameter indicates if a newly calculated baseline can be accessed through step properties `BaselineUsedForDriftCheckConstraints` and `BaselineUsedForDriftCheckStatistics`. If it is set to `False`, the previous baseline of the configured check type must also be available. These can be accessed through the `BaselineUsedForDriftCheckConstraints` and `BaselineUsedForDriftCheckStatistics` properties.

For more information, see Baseline calculation, drift detection and lifecycle with ClarifyCheck and QualityCheck steps in Amazon SageMaker Model Building Pipelines (p. 3238).

Working with baselines

You can specify a previous baseline directly through the `supplied_baseline_statistics` and `supplied_baseline_constraints` parameters, or you can simply specify the
model_package_group_name and the QualityCheck step pulls the DriftCheckBaselines on the latest approved model package in the model package group. When you specify the model_package_group_name, the supplied_baseline_constraints, and supplied_baseline_statistics, the QualityCheck step uses the baseline specified by supplied_baseline_constraints and supplied_baseline_statistics on the check type of the QualityCheck step you are running.

For more information on using the QualityCheck step requirements, see the sagemaker.workflow.steps.QualityCheckStep in the Amazon SageMaker SageMaker SDK for Python. For an Amazon SageMaker Studio notebook that shows how to use QualityCheck step in SageMaker Pipelines, see sagemaker-pipeline-model-monitor-clarify-steps.ipynb.

Example Create a QualityCheck step for data quality check

```python
from sagemaker.workflow.check_job_config import CheckJobConfig
from sagemaker.workflow.quality_check_step import DataQualityCheckConfig, QualityCheckStep
from sagemaker.workflow.execution_variables import ExecutionVariables

check_job_config = CheckJobConfig(
    role=role,
    instance_count=1,
    instance_type="ml.c5.xlarge",
    volume_size_in_gb=120,
    sagemaker_session=sagemaker_session,
)

data_quality_check_config = DataQualityCheckConfig(
    baseline_dataset=step_process.properties.ProcessingOutputConfig.Outputs["train"].S3Output.S3Uri,
    dataset_format=DatasetFormat.csv(header=False, output_columns_position="START"),
    output_s3_uri=Join(on='/', values=['s3://', your_bucket, base_job_prefix, ExecutionVariables.PIPELINE_EXECUTION_ID, 'dataqualitycheckstep'])
)

data_quality_check_step = QualityCheckStep(
    name="DataQualityCheckStep",
    skip_check=False,
    register_new_baseline=False,
    quality_check_config=data_quality_check_config,
    check_job_config=check_job_config,
    supplied_baseline_statistics="s3://sagemaker-us-west-2-555555555555/baseline/statistics.json",
    supplied_baseline_constraints="s3://sagemaker-us-west-2-555555555555/baseline/constraints.json",
    model_package_group_name="MyModelPackageGroup"
)
```

Amazon EMR Step

You can use the Amazon SageMaker Model Building Pipelines Amazon EMR step to process EMR steps to a running Amazon EMR cluster. For more information, see Getting started with Amazon EMR.

The Amazon EMR step requires an EMRStepConfig having the Amazon S3 location of the JAR to be used by the Amazon EMR cluster and any arguments to be passed, as well as the Amazon EMR cluster ID.

**Note**

- Amazon EMR steps require that the role passed to your pipeline has additional permissions. You should attach the AWS managed policy: AmazonSageMakerPipelinesIntegrations to your pipeline role, or ensure that the role includes the permissions in that policy.
- Amazon EMR on EKS is not supported.
- You can only run an EMR step on a cluster that is in one of the following states: STARTING, BOOTSTRAPPING, RUNNING, or WAITING.
- You can have at most 256 EMR steps in PENDING on an EMR cluster; EMR steps submitted beyond that limit result in the pipeline execution failing. You may consider using Retry Policy for Pipeline Steps (p. 3235).

**Example Create an Amazon EMR step definition that launches a new job on an EMR cluster.**

```python
from sagemaker.workflow.emr_step import EMRStep, EMRStepConfig

emr_config = EMRStepConfig(
    jar="s3://path/to/jar/MyJar.jar",  # required, S3 path to jar
    args=['--verbose', '--force'],  # optional list of arguments to pass to the jar
    main_class="com.my.Main1",  # optional main class, this can be omitted if jar above has
    properties=[  # optional list of Java properties that are set when the step runs
        
        "key": "mapred.tasktracker.map.tasks.maximum",
        "value": "2"
    ],
    
    "key": "mapreduce.map.sort.spill.percent",
    "value": "0.90"
    
    "key": "mapreduce.tasktracker.reduce.tasks.maximum",
    "value": "5"
    
)

step_emr = EMRStep (  # required
    name="EMRSampleStep",  # required
    cluster_id="j-1YONHTCP3YZK",  # required
    step_config=emr_config,  # required
    display_name="My EMR Step",
    description="Pipeline step to execute EMR job"
)
```

**Fail Step**

You use a FailStep to stop an Amazon SageMaker Model Building Pipelines execution when a desired condition or state is not achieved and to mark that pipeline's execution as failed. The FailStep also allows you to enter a custom error message, indicating the cause of the pipeline's execution failure.

**Note**

When a FailStep and other pipeline steps execute concurrently, the pipeline does not terminate until all concurrent steps are completed.

**Limitations for using FailStep**

- You cannot add a FailStep to the DependsOn list of other steps. For more information, see Custom Dependency Between Steps (p. 3228).
- Other steps cannot reference the FailStep. It is always the last step in a pipeline's execution.
- You cannot retry a pipeline execution ending with a FailStep.

You can create the FailStep ErrorMessage in the form of a static text string. Alternatively, you can also use Pipeline Parameters a Join operation, or other step properties to create a more informative error message.
Example

The following example code snippet uses a FailStep with an ErrorMessage configured with Pipeline Parameters and a Join operation.

```python
from sagemaker.workflow.fail_step import FailStep
from sagemaker.workflow.functions import Join
from sagemaker.workflow.parameters import ParameterInteger

mse_threshold_param = ParameterInteger(name="MseThreshold", default_value=5)
step_fail = FailStep(
    name="AbaloneMSEFail",
    error_message=Join(
        on=" ", values=["Execution failed due to MSE >", mse_threshold_param]
    ),
)
```

Step Properties

The properties attribute is used to add data dependencies between steps in the pipeline. These data dependencies are then used by SageMaker Pipelines to construct the DAG from the pipeline definition. These properties can be referenced as placeholder values and are resolved at runtime.

The properties attribute of a SageMaker Pipelines step matches the object returned by a Describe call for the corresponding SageMaker job type. For each job type, the Describe call returns the following response object:

- ProcessingStep – DescribeProcessingJob
- TrainingStep – DescribeTrainingJob
- TransformStep – DescribeTransformJob

To check which properties are referrable for each step type during data dependency creation, see Data Dependency - Property Reference in the Amazon SageMaker Python SDK.

Step Parallelism

When a step does not depend on any other step, it is run immediately upon pipeline execution. However, executing too many pipeline steps in parallel can quickly exhaust available resources. Control the number of concurrent steps for a pipeline execution with ParallelismConfiguration.

The following example uses ParallelismConfiguration to set the concurrent step limit to five.

```python
pipeline.create(
    parallelism_config=ParallelismConfiguration(5),
)
```

Data Dependency Between Steps

You define the structure of your DAG by specifying the data relationships between steps. To create data dependencies between steps, pass the properties of one step as the input to another step in the pipeline. The step receiving the input isn’t started until after the step providing the input finishes running.

A data dependency uses JsonPath notation in the following format. This format traverses the JSON property file, which means you can append as many `<property>` instances as needed to reach the desired nested property in the file. For more information on JsonPath notation, see the JsonPath repo.
The following shows how to specify an Amazon S3 bucket using the ProcessingOutputConfig property of a processing step.

```
step_process.properties.ProcessingOutputConfig.Outputs["train_data"].S3Output.S3Uri
```

To create the data dependency, pass the bucket to a training step as follows.

```
from sagemaker.workflow.pipeline_context import PipelineSession
sklearn_train = SKLearn(..., sagemaker_session=PipelineSession())
step_train = TrainingStep(
  name="CensusTrain",
  step_args=sklearn_train.fit(inputs=TrainingInput(
    s3_data=step_process.properties.ProcessingOutputConfig.Outputs["train_data"].S3Output.S3Uri
  ))
)
```

To check which properties are referrable for each step type during data dependency creation, see Data Dependency - Property Reference in the Amazon SageMaker Python SDK.

**Custom Dependency Between Steps**

When you specify a data dependency, SageMaker Pipelines provides the data connection between the steps. Alternatively, one step can access the data from a previous step without directly using SageMaker Pipelines. In this case, you can create a custom dependency that tells SageMaker Pipelines not to start a step until after another step has finished running. You create a custom dependency by specifying a step's DependsOn attribute.

As an example, the following defines a step C that starts only after both step A and step B finish running.

```
{
    'Steps': [
        {'Name': 'A', ...},
        {'Name': 'B', ...},
        {'Name': 'C', 'DependsOn': ['A', 'B']}
    ]
}
```

SageMaker Pipelines throws a validation exception if the dependency would create a cyclic dependency.

The following example creates a training step that starts after a processing step finishes running.

```
processing_step = ProcessingStep(...)  
training_step = TrainingStep(...)  
training_step.add_depends_on([processing_step])
```

The following example creates a training step that doesn't start until two different processing steps finish running.

```
processing_step_1 = ProcessingStep(...)  
processing_step_2 = ProcessingStep(...)  
```
training_step = TrainingStep(...)
training_step.add_depends_on([processing_step_1, processing_step_2])

The following provides an alternate way to create the custom dependency.

training_step.add_depends_on([processing_step_1])
training_step.add_depends_on([processing_step_2])

The following example creates a training step that receives input from one processing step and waits for a different processing step to finish running.

processing_step_1 = ProcessingStep(...)
processing_step_2 = ProcessingStep(...)

training_step = TrainingStep(
    inputs=TrainingInput(
        s3_data=processing_step_1.properties.ProcessingOutputConfig.Outputs["train_data"].S3Output.S3Uri
    ),
    training_step.add_depends_on([processing_step_2])

The following example shows how to retrieve a string list of the custom dependencies of a step.

custom_dependencies = training_step.depends_on

Use a Custom Image in a Step

You can use any of the available SageMaker Deep Learning Container images when you create a step in your pipeline.

You can also use your own container with pipeline steps. Because you can't create an image from within Amazon SageMaker Studio, you must create your image using another method before using it with Amazon SageMaker Model Building Pipelines.

To use your own container when creating the steps for your pipeline, include the image URI in the estimator definition. For more information on using your own container with SageMaker, see Using Docker Containers with SageMaker.

Property Files and JsonGet

Use property files to store information from the output of a processing step. This is particularly useful when analyzing the results of a processing step to decide how a conditional step should be executed. The JsonGet function processes a property file and enables you to use JsonPath notation to query the property JSON file. For more information on JsonPath notation, see the JsonPath repo.

To store a property file for later use, you must first create a PropertyFile instance with the following format. The path parameter is the name of the JSON file to which the property file is saved. Any output_name must match the output_name of the ProcessingOutput that you define in your processing step. This enables the property file to capture the ProcessingOutput in the step.

from sagemaker.workflow.properties import PropertyFile
When you create your ProcessingStep instance, add the property_files parameter to list all of the parameter files that the Amazon SageMaker Model Building Pipelines service must index. This saves the property file for later use.

```
property_files=[<property_file_instance>]
```

To use your property file in a condition step, add the property_file to the condition that you pass to your condition step as shown in the following example to query the JSON file for your desired property using the json_path parameter.

```
cond_lte = ConditionLessThanOrEqualTo(
    left=JsonGet(
        step_name=step_eval.name,
        property_file=<property_file_instance>,
        json_path="mse"
    ),
    right=6.0
)
```

For more in-depth examples, see Property File in the Amazon SageMaker Python SDK.

### Caching Pipeline Steps

When you use step signature caching, SageMaker Pipelines tries to find a previous run of your current pipeline step with the same values for certain attributes. If found, SageMaker Pipelines propagates the outputs from the previous run rather than recomputing the step. The attributes checked are specific to the step type, and are listed in Default cache key attributes by pipeline step type (p. 3233).

You must opt in to step caching — it is off by default. When you turn on step caching, you must also define a timeout. This timeout defines how old a previous run can be to remain a candidate for reuse.

Step caching only considers successful runs — it never reuses failed runs. A previous run of a pipeline step is considered successful when the run itself and the entire pipeline are both successful. When multiple successful runs exist within the timeout period, SageMaker Pipelines uses the result for the most recent successful run. If no successful runs match in the timeout period, SageMaker Pipelines reruns the step. If the executor finds a previous run that meets the criteria but is still in progress, both steps continue running and update the cache if they're successful.

Step caching is only scoped for individual pipelines, so you can't reuse a step from another pipeline even if there is a step signature match.

Step caching is available for the following step types:

- Processing (p. 3211)
- Training (p. 3213)
- Tuning (p. 3213)
- Transform (p. 3217)
- ClarifyCheck (p. 3222)
- QualityCheck (p. 3224)
### Turn on step caching

To turn on step caching, you must add a `CacheConfig` property to the step definition.

CacheConfig properties use the following format in the pipeline definition file:

```json
{
   "CacheConfig": {
      "Enabled": false,
      "ExpireAfter": "<time>"
   }
}
```

The `Enabled` field indicates whether caching is turned on for the particular step. You can set the field to `true`, which tells SageMaker to try to find a previous run of the step with the same attributes. Or, you can set the field to `false`, which tells SageMaker to run the step every time the pipeline runs. `ExpireAfter` is a string in ISO 8601 duration format that defines the timeout period. The `ExpireAfter` duration can be a year, month, week, day, hour, or minute value. Each value consists of a number followed by a letter indicating the unit of duration. For example:

- "30d" = 30 days
- "5y" = 5 years
- "T16m" = 16 minutes
- "30dT5h" = 30 days and 5 hours.

The following discussion describes the procedure to turn on caching for new or pre-existing pipelines using the Amazon SageMaker Python SDK.

#### Turn on caching for new pipelines

For new pipelines, initialize a `CacheConfig` instance with `enable_caching=True` and provide it as an input to your pipeline step. The following example turns on caching with a 1-hour timeout period for a training step:

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.workflow.steps import CacheConfig

cache_config = CacheConfig(enable_caching=True, expire_after="PT1H")
estimator = Estimator(..., sagemaker_session=PipelineSession())

step_train = TrainingStep(
   name="TrainAbaloneModel",
   step_args=estimator.fit(inputs=inputs),
   cache_config=cache_config
)
```

#### Turn on caching for pre-existing pipelines
To turn on caching for pre-existing, already-defined pipelines, turn on the `enable_caching` property for the step, and set `expire_after` to a timeout value. Lastly, update the pipeline with `pipeline.upsert()` or `pipeline.update()`. Once you run it again, the following code example turns on caching with a 1-hour timeout period for a training step:

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.workflow.steps import CacheConfig
from sagemaker.workflow.pipeline import Pipeline

cache_config = CacheConfig(enable_caching=True, expire_after="PT1H")
estimator = Estimator(..., sagemaker_session=PipelineSession())

step_train = TrainingStep(
    name="TrainAbaloneModel",
    step_args=estimator.fit(inputs=inputs),
    cache_config=cache_config
)

# define pipeline
pipeline = Pipeline(
    steps=[step_train]
)

# additional step for existing pipelines
pipeline.update()
# or, call upsert() to update the pipeline
# pipeline.upsert()
```

Alternatively, update the cache config after you have already defined the (pre-existing) pipeline, allowing one continuous code run. The following code sample demonstrates this method:

```python
# turn on caching with timeout period of one hour
pipeline.steps[0].cache_config.enable_caching = True
pipeline.steps[0].cache_config.expire_after = "PT1H"

# additional step for existing pipelines
pipeline.update()
# or, call upsert() to update the pipeline
# pipeline.upsert()
```

For more detailed code examples and a discussion about how Python SDK parameters affect caching, see Caching Configuration in the Amazon SageMaker Python SDK documentation.

**Turn off step caching**

A pipeline step does not rerun if you change any attributes that are not listed in Default cache key attributes by pipeline step type (p. 3233) for its step type. However, you may decide that you want the pipeline step to rerun anyway. In this case, you need to turn off step caching.

To turn off step caching, set the `Enabled` attribute in the step definition's `CacheConfig` property in the step definition to `false`, as shown in the following code snippet:

```json
{
    "CacheConfig": {
        "Enabled": false,
        "ExpireAfter": "<time>"
    }
}
```

Note that the `ExpireAfter` attribute is ignored when `Enabled` is `false`.

3232
To turn off caching for a pipeline step using the Amazon SageMaker Python SDK, define the pipeline of your pipeline step, turn off the enable_caching property, and update the pipeline.

Once you run it again, the following code example turns off caching for a training step:

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.workflow.steps import CacheConfig
from sagemaker.workflow.pipeline import Pipeline

cache_config = CacheConfig(enable_caching=False, expire_after="PT1H")
estimator = Estimator(..., sagemaker_session=PipelineSession())

step_train = TrainingStep(
    name="TrainAbaloneModel",
    step_args=estimator.fit(inputs=inputs),
    cache_config=cache_config
)

# define pipeline
pipeline = Pipeline(
    steps=[step_train]
)

# update the pipeline
pipeline.update()
# or, call upsert() to update the pipeline
# pipeline.upsert()

Alternatively, turn off the enable_caching property after you have already defined the pipeline, allowing one continuous code run. The following code sample demonstrates this solution:

```python
# turn off caching for the training step
pipeline.steps[0].cache_config.enable_caching = False

# update the pipeline
pipeline.update()
# or, call upsert() to update the pipeline
# pipeline.upsert()

For more detailed code examples and a discussion about how Python SDK parameters affect caching, see Caching Configuration in the Amazon SageMaker Python SDK documentation.

**Default cache key attributes by pipeline step type**

When deciding whether to reuse a previous pipeline step or rerun the step, SageMaker Pipelines checks to see if certain attributes have changed. If the set of attributes is different from all previous runs within the timeout period, the step runs again. These attributes include input artifacts, app or algorithm specification, and environment variables.

The following list shows each pipeline step type and the attributes that, if changed, initiate a rerun of the step. For more information about which Python SDK parameters are used to create the following attributes, see Caching Configuration in the Amazon SageMaker Python SDK documentation.

**Processing step**

- AppSpecification
- Environment
- ProcessingInputs. This attribute contains information about the preprocessing script. If the contents of the preprocessing script change, the processing step is rerun.
Training step

- AlgorithmSpecification
- CheckpointConfig
- DebugHookConfig
- DebugRuleConfigurations
- Environment
- HyperParameters
- InputDataConfig. This attribute contains information about the training script. If the contents of the training script change, the training step is rerun.

Tuning step

- HyperParameterTuningJobConfig
- TrainingJobDefinition. This attribute is composed of multiple child attributes, not all of which cause the step to rerun. The child attributes that could incur a rerun (if changed) are:
  - AlgorithmSpecification
  - HyperParameterRanges
  - InputDataConfig
  - StaticHyperParameters
  - TuningObjective
  - TrainingJobDefinitions

Transform step

- DataProcessing
- Environment
- ModelName
- TransformInput

ClarifyCheck Step (p. 3222)

- ClarifyCheckConfig
- CheckJobConfig
- SkipCheck
- RegisterNewBaseline
- ModelPackageGroupName
- SuppliedBaselineConstraints

QualityCheck Step (p. 3224)

- QualityCheckConfig
- CheckJobConfig
- SkipCheck
- RegisterNewBaseline
• ModelPackageGroupName
• SuppliedBaselineConstraints
• SuppliedBaselineStatistics

EMR Step
• ClusterId
• StepConfig

Cached data access control

When a SageMaker pipeline runs, it caches the parameters and metadata associated with the SageMaker jobs launched by the pipeline and saves them for reuse in subsequent runs. This metadata is accessible through a variety of sources in addition to cached pipeline steps, and includes the following types:

• Describe*Job requests
• CloudWatch Logs
• CloudWatch Events
• CloudWatch Metrics
• SageMaker Search

Note that access to each data source in the list is controlled by its own set of IAM permissions. Removing a particular role’s access to one data source does not affect the level of access to the others. For example, an account admin might remove IAM permissions for Describe*Job requests from a caller’s role. While the caller can no longer make Describe*Job requests, they can still retrieve the metadata from a pipeline run with cached steps as long as they have permission to run the pipeline. If an account admin wants to remove access to the metadata from a particular SageMaker job completely, they need to remove permissions for each of the relevant services that provide access to the data.

Retry Policy for Pipeline Steps

Retry policies help you automatically retry your SageMaker Pipelines steps after an error occurs. Any pipeline step can encounter exceptions, and exceptions happen for various reasons. In some cases, a retry can resolve these issues. With a retry policy for pipeline steps, you can choose whether to retry a particular pipeline step or not.

The retry policy only supports the following pipeline steps:

• Processing Step (p. 3211)
• Training Step (p. 3213)
• Tuning Step (p. 3213)

Note
The SageMaker hyperparameter tuning job already conducts retries internally so it does not retry the SageMaker.JOB_INTERNAL_ERROR exception type, even if a retry policy is configured. If you really want to retry, you can program your own Retry Strategy using the SageMaker API.

• CreateModel Step (p. 3216)
• RegisterModel Step (p. 3216)
• Transform Step (p. 3217)
Supported exception types for the retry policy

The retry policy for pipeline steps supports the following exception types:

- **Step.SERVICE_FAULT**: These exceptions occur when an internal server error or transient error happens when calling downstream services. SageMaker Pipelines retries on this type of error automatically. With a retry policy, you can override the default retry operation for this exception type.

- **Step.THROTTLING**: Throttling exceptions can occur while calling the downstream services. SageMaker Pipelines retries on this type of error automatically. With a retry policy, you can override the default retry operation for this exception type.

- **SageMaker.JOB_INTERNAL_ERROR**: These exceptions occur when the SageMaker job returns InternalServerError. In this case, starting a new job may fix a transient issue.

- **SageMaker.CAPACITY_ERROR**: The SageMaker job may encounter Amazon EC2 InsufficientCapacityErrors, which leads to the SageMaker job's failure. You can retry by starting a new SageMaker job to avoid the issue.

- **SageMaker.RESOURCE_LIMIT**: You can exceed the resource limit quota when running a SageMaker job. You can wait and retry running the SageMaker job after a short period and see if resources are released.

The JSON schema for the retry policy

The retry policy for Pipelines has the following JSON schema:

```json
"RetryPolicy": {
  "ExceptionType": [String],
  "IntervalSeconds": Integer,
  "BackoffRate": Double,
  "MaxAttempts": Integer,
  "ExpireAfterMin": Integer
}
```

- **ExceptionType**: This field requires the following exception types in a string array format.
  - Step.SERVICE_FAULT
  - Step.THROTTLING
  - SageMaker.JOB_INTERNAL_ERROR
  - SageMaker.CAPACITY_ERROR
  - SageMaker.RESOURCE_LIMIT

- **IntervalSeconds** (optional): The number of seconds before the first retry attempt (1 by default). IntervalSeconds has a maximum value of 43200 seconds (12 hours).

- **BackoffRate** (optional): The multiplier by which the retry interval increases during each attempt (2.0 by default).

- **MaxAttempts** (optional): A positive integer that represents the maximum number of retry attempts (5 by default). If the error recurs more times than MaxAttempts specifies, retries cease and normal error handling resumes. A value of 0 specifies that errors are never retried. MaxAttempts has a maximum value of 20.

- **ExpireAfterMin** (optional): A positive integer that represents the maximum timespan of retry. If the error recurs after ExpireAfterMin minutes counting from the step gets executed, retries cease and normal error handling resumes. A value of 0 specifies that errors are never retried. ExpireAfterMin has a maximum value of 14,400 minutes (10 days).

**Note**

Only one of MaxAttempts or ExpireAfterMin can be given, but not both; if both are not specified, MaxAttempts becomes the default. If both properties are identified within one policy, then the retry policy generates a validation error.
Configuring a retry policy

The following is an example of a training step with a retry policy.

```json
{
    "Steps": [
        {
            "Name": "MyTrainingStep",
            "Type": "Training",
            "RetryPolicies": [
                {
                    "ExceptionType": [
                        "SageMaker.JOB_INTERNAL_ERROR",
                        "SageMaker.CAPACITY_ERROR"
                    ],
                    "IntervalSeconds": 1,
                    "BackoffRate": 2,
                    "MaxAttempts": 5
                }
            ]
        }
    ]
}
```

The following is an example of how to build a `TrainingStep` in SDK for Python (Boto3) with a retry policy.

```python
from sagemaker.workflow.retry import (StepRetryPolicy,
                                      StepExceptionTypeEnum,
                                      SageMakerJobExceptionTypeEnum,
                                      SageMakerJobStepRetryPolicy)

step_train = TrainingStep(
    name="MyTrainingStep",
    xxx,
    retry_policies=[
        // override the default
        StepRetryPolicy(
            exception_types=[
                StepExceptionTypeEnum.SERVICE_FAULT,
                StepExceptionTypeEnum.THROTTLING
            ],
            expire_after_mins=5,
            interval_seconds=10,
            backoff_rate=2.0
        ),
        // retry when resource limit quota gets exceeded
        SageMakerJobStepRetryPolicy(
            exception_types=[SageMakerJobExceptionTypeEnum.RESOURCE_LIMIT],
            expire_after_mins=120,
            interval_seconds=60,
            backoff_rate=2.0
        ),
        // retry when job failed due to transient error or EC2 ICE.
        SageMakerJobStepRetryPolicy(
            failure_reason_types=[
                SageMakerJobExceptionTypeEnum.INTERNAL_ERROR,
                SageMakerJobExceptionTypeEnum.CAPACITY_ERROR,
            ]
        ),
        max_attempts=10,
        interval_seconds=30,
    ]
)
```
Baseline calculation, drift detection and lifecycle with ClarifyCheck and QualityCheck steps in Amazon SageMaker Model Building Pipelines

The following topic discusses how baselines and model versions evolve in the Amazon SageMaker Model Building Pipelines when using the ClarifyCheck (p. 3222) and QualityCheck (p. 3224) steps.

For the ClarifyCheck step, a baseline is a single file that resides in the step properties with the suffix constraints. For the QualityCheck step, a baseline is a combination of two files that resides in the step properties: one with the suffix statistics and the other with the suffix constraints. In the following topics we discuss these properties with a prefix that describes how they are used, impacting baseline behavior and lifecycle in these two pipeline steps. For example, the ClarifyCheck step always calculates and assigns the new baselines in the CalculatedBaselineConstraints property and the QualityCheck step does the same in the CalculatedBaselineConstraints and CalculatedBaselineStatistics properties.

Baseline calculation and registration for ClarifyCheck and QualityCheck steps

Both the ClarifyCheck and QualityCheck steps always calculate new baselines based on step inputs through the underlying processing job run. These newly calculated baselines are accessed through the properties with the prefix CalculatedBaseline. You can record these properties as the ModelMetrics of your model package in the Model Step (p. 3214). This model package can be registered with 5 different baselines. You can register it with one for each check type: data bias, model bias, and model explainability from running the ClarifyCheck step and model quality, and data quality from running the QualityCheck step. The register_new_baseline parameter dictates the value set in the properties with the prefix BaselineUsedForDriftCheck after a step runs.

The following table of potential use cases shows different behaviors resulting from the step parameters you can set for the ClarifyCheck and QualityCheck steps:

<table>
<thead>
<tr>
<th>Possible use case that you may consider for selecting this configuration</th>
<th>skip_check / register_new_base</th>
<th>Does step do a drift check?</th>
<th>Value of step property CalculatedBaselineConstraints</th>
<th>Value of step property BaselineUsedForDriftCheck</th>
</tr>
</thead>
<tbody>
<tr>
<td>You are doing regular retraining with checks enabled to get a new model version, but you want to carry over the previous baselines as the DriftCheckBaselines in the model registry for</td>
<td>False/False</td>
<td>Drift check runs against existing baselines</td>
<td>New baselines calculated by running the step</td>
<td>Baseline from the latest approved model in Model Registry or the baseline supplied as step parameter</td>
</tr>
<tr>
<td>Possible use case that you may consider for selecting this configuration</td>
<td>skip_check/register_new_baselines</td>
<td>Does step do a drift check?</td>
<td>Value of step property CalculatedBaseline</td>
<td>Value of step property BaselineUsedForDriftCheck</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
<td>---</td>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>Your new model version.</td>
<td></td>
<td>False/ True</td>
<td>Drift check runs against existing baselines</td>
<td>New baselines calculated by running the step (value of property CalculatedBaseline)</td>
</tr>
<tr>
<td>You are doing regular retraining with checks enabled to get a new model version, but you want to refresh the DriftCheckBaselines in the model registry with the newly calculated baselines for your new model version.</td>
<td></td>
<td>False/ True</td>
<td>No drift check</td>
<td>New baselines calculated by running Baseline from the latest approved model in the model registry or the baseline supplied as step parameter</td>
</tr>
</tbody>
</table>
### Possible use case that you may consider for selecting this configuration

<table>
<thead>
<tr>
<th>skip_check / register_new_baseline</th>
<th>Does step do a drift check?</th>
<th>Value of step property CalculatedBaseline</th>
<th>Value of step property BaselineUsedForDriftCheck</th>
</tr>
</thead>
<tbody>
<tr>
<td>True/ True</td>
<td>No drift check</td>
<td>New baselines calculated by running the step (value of property CalculatedBaseline)</td>
<td>Newly calculated baseline by running the step (value of property CalculatedBaseline)</td>
</tr>
</tbody>
</table>

This happens in the following cases:

- You are starting the initial run of the pipeline, building your first model version, and generating the initial baselines.
- You are initiating the pipeline to retrain a new model version because there is a violation detected by Model Monitor on the endpoint for a particular type of check. If you want to skip the check against the previous baseline and refresh the DriftCheckBaselines with the newly calculated baseline in the model registry directly.

When you register a model with Model Step (p. 3214), you can register the BaselineUsedForDriftCheck property as DriftCheckBaselines. These baseline files can then be used by Model Monitor for model and data quality checks. In addition, these baselines can also be used in the ClarifyCheckStep and QualityCheck step to compare newly trained models against the existing models that are registered in the model registry for future pipeline runs.

**Drift Detection against Previous Baselines in SageMaker Pipelines**

In the case of the QualityCheck step, when you initiate the pipeline for regular retraining to get a new model version, you may want to run the training step if the data quality and the data bias has issues (p. 2869) on the baselines of your previous approved model version. You also may not want to register the newly trained model version if the model quality, model bias, or model explainability violates the registered baseline of your previous approved model version when running the ClarifyCheck step. In these cases, you can enable the checks you want by setting the
skip_check property of the corresponding check step set to False, resulting in the ClarifyCheck and QualityCheck step failing if violation is detected against previous baselines. The pipeline process then does not proceed so that the model drifted from the baseline isn't registered. ClarifyCheck and QualityCheck steps are able to get DriftCheckBaselines of the latest approved model version of a given model package group against which to compare. Previous baselines can also be supplied directly through supplied_baseline_constraints (in addition to supplied_baseline_statistics if it is a QualityCheck step) and are always prioritized over any baselines pulled from the model package group.

**Baseline and model version lifecycle and evolution with SageMaker Pipelines**

By setting register_new_baseline of your ClarifyCheck and QualityCheck step to False, your previous baseline is accessible through the step property prefix BaselineUsedForDriftCheck. You can then register these baselines as the DriftCheckBaselines in the new model version when you register a model with Model Step (p. 3214). Once you approve this new model version in the model registry, the DriftCheckBaseline in this model version becomes available for the ClarifyCheck and QualityCheck steps in the next pipeline process. If you want to refresh the baseline of a certain check type for future model versions, you can set register_new_baseline to True so that the properties with prefix BaselineUsedForDriftCheck become the newly calculated baseline. In these ways, you can preserve your preferred baselines for a model trained in the future, or refresh the baselines for drift checks when needed, managing your baseline evolution and lifecycle throughout your model training iterations.

The following diagram illustrates a model-version-centric view of the baseline evolution and lifecycle.
Pipeline Run 1: initial run

Pipeline Run 2: Scheduled retraining new model version (Check Succeeded)

Pipeline Run 3: Scheduled retraining new model version (Check Succeeded)

Pipeline Run 4: Drift detected on endpoint, suggest and register new baselines

Pipeline Run 5: Scheduled retraining new model version (Check Succeeded)
Amazon EventBridge Integration

You can schedule your Amazon SageMaker Model Building Pipelines executions using Amazon EventBridge. Amazon SageMaker Model Building Pipelines is supported as a target in Amazon EventBridge. This allows you to initiate the execution of your model building pipeline based on any event in your event bus. With EventBridge, you can automate your pipeline executions and respond automatically to events such as training job or endpoint status changes. Events include a new file being uploaded to your Amazon S3 bucket, a change in status of your Amazon SageMaker endpoint due to drift, and Amazon Simple Notification Service (SNS) topics.

The following SageMaker Pipelines actions can be automatically initiated:

- StartPipelineExecution

For more information on scheduling SageMaker jobs, see Automating SageMaker with Amazon EventBridge.

Schedule a Pipeline with Amazon EventBridge

To start a pipeline execution with Amazon CloudWatch Events, you must create an EventBridge rule. When you create a rule for events, you specify a target action to take when EventBridge receives an event that matches the rule. When an event matches the rule, EventBridge sends the event to the specified target and initiates the action defined in the rule.

The following tutorials show how to schedule a pipeline execution with EventBridge using the EventBridge console or the AWS CLI.

Prerequisites

- A role that EventBridge can assume with the SageMaker::StartPipelineExecution permission. This role can be created automatically if you create a rule from the EventBridge console; otherwise, you need to create this role yourself. For information on creating a SageMaker role, see SageMaker Roles.
- An Amazon SageMaker Pipeline to schedule. To create an Amazon SageMaker Pipeline, see Define a Pipeline.

Create an EventBridge rule using the EventBridge console

The following procedure shows how to create an EventBridge rule using the EventBridge console.

1. Navigate to the EventBridge console.
2. Select Rules on the left hand side.
3. Select Create Rule.
4. Enter a name and description for your rule.
5. Select how you want to initiate this rule. You have the following choices for your rule:
   - Event pattern: Your rule is initiated when an event matching the pattern occurs. You can choose a predefined pattern that matches a certain type of event, or you can create a custom pattern. If you select a predefined pattern, you can edit the pattern to customize it. For more information on Event patterns, see Event Patterns in CloudWatch Events.
   - Schedule: Your rule is initiated regularly on a specified schedule. You can use a fixed-rate schedule that initiates regularly for a specified number of minutes, hour, or weeks. You can also use a cron expression to create a more fine-grained schedule, such as “the first Monday of each month at 8am.” Schedule is not supported on a custom or partner event bus.
6. Select your desired Event bus.
7. Select the target(s) to invoke when an event matches your event pattern or when the schedule is initiated. You can add up to 5 targets per rule. Select SageMaker Pipeline in the target dropdown list.

8. Select the pipeline you want to initiate from the pipeline dropdown list.

9. Add parameters to pass to your pipeline execution using a name and value pair. Parameter values can be static or dynamic. For more information on Amazon SageMaker Pipeline parameters, see AWS::Events::Rule SagemakerPipelineParameters.

   • Static values are passed to the pipeline execution every time the pipeline is initiated. For example, if 
     "Name": "Instance_type", "Value": "ml.4xlarge" is specified in the parameter list, then it is passed as a parameter in StartPipelineExecutionRequest every time EventBridge initiates the pipeline.

   • Dynamic values are specified using a JSON path. EventBridge parses the value from an event payload, then passes it to the pipeline execution. For example: $.detail.param.value

10. Select the role to use for this rule. You can either use an existing role or create a new one.

11. (Optional) Add tags.

12. Select Create to finalize your rule.

Your rule is now in effect and ready to initiate your pipeline executions.

Create an EventBridge rule using the AWS CLI

The following procedure shows how to create an EventBridge rule using the AWS CLI.

1. Create a rule to be initiated. When creating an EventBridge rule using the AWS CLI, you have two options for how your rule is initiated, event pattern and schedule.

   • **Event pattern**: Your rule is initiated when an event matching the pattern occurs. You can choose a predefined pattern that matches a certain type of event, or you can create a custom pattern. If you select a predefined pattern, you can edit the pattern to customize it. You can create a rule with event pattern using the following command:

     
     ```
     aws events put-rule --name <RULE_NAME> --event-pattern <YOUR_EVENT_PATTERN> --description <RULE_DESCRIPTION> --role-arn <ROLE_TO_EXECUTE_PIPELINE> --tags <TAGS>
     ```

   • **Schedule**: Your rule is initiated regularly on a specified schedule. You can use a fixed-rate schedule that initiates regularly for a specified number of minutes, hour, or weeks. You can also use a cron expression to create a more fine-grained schedule, such as "the first Monday of each month at 8am." Schedule is not supported on a custom or partner event bus. You can create a rule with schedule using the following command:

     ```
     aws events put-rule --name <RULE_NAME> --schedule-expression <YOUR_CRON_EXPRESSION> --description <RULE_DESCRIPTION> --role-arn <ROLE_TO_EXECUTE_PIPELINE> --tags <TAGS>
     ```

2. Add target(s) to invoke when an event matches your event pattern or when the schedule is initiated. You can add up to 5 targets per rule. For each target, you must specify:

   • ARN: The resource ARN of your pipeline.

   • Role ARN: The ARN of the role EventBridge should assume to execute the pipeline.

   • Parameters: Amazon SageMaker pipeline parameters to pass.

3. Run the following command to pass a Amazon SageMaker pipeline as a target to your rule using put-targets:

     ```
     aws events put-targets --rule <RULE_NAME> --event-bus-name <EVENT_BUS_NAME> --targets "["
     ```
Amazon SageMaker Experiments Integration

Amazon SageMaker Model Building Pipelines is closely integrated with Amazon SageMaker Experiments. By default, when SageMaker Pipelines creates and executes a pipeline, the following SageMaker Experiments entities are created if they don't exist:

- An experiment for the pipeline
- A trial for every execution of the pipeline
- A trial component that's added to the trial for each SageMaker job created in a pipeline execution step

You can compare metrics such as model training accuracy across multiple pipeline executions just as you can compare such metrics across multiple trials of a SageMaker model training experiment.

The following sample shows the relevant parameters of the `Pipeline` class in the Amazon SageMaker Python SDK.

```python
Pipeline(
  name="MyPipeline",
  parameters=[],
  pipeline_experiment_config=PipelineExperimentConfig(
    ExecutionVariables.PIPELINE_NAME,
    ExecutionVariables.PIPELINE_EXECUTION_ID
  ),
  steps=[...]
)
```

If you don't want an experiment and trial created for the pipeline, set `pipeline_experiment_config` to `None`.

**Note**
Experiments integration was introduced in the Amazon SageMaker Python SDK v2.41.0.

The following naming rules apply based on what you specify for the `ExperimentName` and `TrialName` parameters of `pipeline_experiment_config`:

- If you don't specify `ExperimentName`, the pipeline name is used for the experiment name.

  If you do specify `ExperimentName`, it's used for the experiment name. If an experiment with that name exists, the pipeline-created trials are added to the existing experiment. If an experiment with that name doesn't exist, a new experiment is created.

- If you don't specify `TrialName`, the pipeline execution ID is used for the trial name.

  If you do specify `TrialName`, it's used for the trial name. If a trial with that name exists, the pipeline-created trial components are added to the existing trial. If a trial with that name doesn't exist, a new trial is created.

**Note**
The experiment entities aren't deleted when the pipeline that created the entities is deleted. You can use the SageMaker Experiments API to delete the entities. For more information, see Clean Up Amazon SageMaker Experiment Resources (p. 2251).
For information about how to view the SageMaker Experiment entities associated with a pipeline, see View Experiment Entities Created by SageMaker Pipelines (p. 3273). For more information on SageMaker Experiments, see Manage Machine Learning with Amazon SageMaker Experiments (p. 2231).

The following sections show examples of the previous rules and how they are represented in the pipeline definition file. For more information on pipeline definition files, see SageMaker Pipelines Overview (p. 3204).

Topics
- Default Behavior (p. 3246)
- Disable Experiments Integration (p. 3246)
- Specify a Custom Experiment Name (p. 3247)
- Specify a Custom Trial Name (p. 3247)

Default Behavior

Create a pipeline

The pipeline_experiment_config is omitted. ExperimentName defaults to the pipeline name. TrialName defaults to the execution ID.

```python
pipeline_name = f"MyPipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[],
    steps=[step_train]
)
```

Pipeline definition file

```json
{
    "Version": "2020-12-01",
    "Parameters": [
        {
            "Name": "InputDataSource"        
        },
        {
            "Name": "InstanceCount",
            "Type": "Integer",
            "DefaultValue": 1
        }
    ],
    "PipelineExperimentConfig": {
        "ExperimentName": {"Get": "Execution.PipelineName"},
        "TrialName": {"Get": "Execution.PipelineExecutionId"}
    },
    "Steps": [...]
}
```

Disable Experiments Integration

Create a pipeline

The pipeline_experiment_config is set to None.

```python
pipeline_name = f"MyPipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[],
)```
pipeline_experiment_config=None,
    steps=[step_train]
)

Pipeline definition file

This is the same as the preceding default example, without the PipelineExperimentConfig.

Specify a Custom Experiment Name

A custom experiment name is used. The trial name is set to the execution ID, as with the default behavior.

Create a pipeline

```python
pipeline_name = f"MyPipeline"
pipeline = Pipeline(    name=pipeline_name,
    parameters=[...],
    pipeline_experiment_config=PipelineExperimentConfig(        "CustomExperimentName",
        ExecutionVariables.PIPELINE_EXECUTION_ID
    ),
    steps=[step_train]
)
```

Pipeline definition file

```json
{
    "PipelineExperimentConfig": {
        "ExperimentName": "CustomExperimentName",
        "TrialName": {"Get": "Execution.PipelineExecutionId"}
    },
    "Steps": [...]
}
```

Specify a Custom Trial Name

A custom trial name is used and appended with the execution ID. The experiment name is set to the pipeline name, as with the default behavior.

Create a pipeline

```python
pipeline_name = f"MyPipeline"
pipeline = Pipeline(    name=pipeline_name,
    parameters=[...],
    pipeline_experiment_config=PipelineExperimentConfig(        ExecutionVariables.PIPELINE_NAME,
        Join(on="-", values=["CustomTrialName", ExecutionVariables.PIPELINE_EXECUTION_ID])
    ),
    steps=[step_train]
)
```

Pipeline definition file

```json
{
    "PipelineExperimentConfig": {
        "ExperimentName": {"Get": "Execution.PipelineName"},
        "TrialName": {"Get": "Execution.PipelineExecutionId"}
    },
    "Steps": [...]
}
```
Local Mode

SageMaker Pipelines local mode is an easy way to test your training, processing and inference scripts, as well as the runtime compatibility of pipeline parameters before you execute your pipeline on the managed SageMaker service. By using local mode, you can test your SageMaker pipeline locally using a smaller dataset. This allows quick and easy debugging of errors in user scripts and the pipeline definition itself without incurring the costs of using the managed service.

Pipelines local mode leverages SageMaker jobs local mode under the hood. This is a feature in the SageMaker Python SDK that allows you to run SageMaker built-in or custom images locally using Docker containers. Pipelines local mode is built on top of SageMaker jobs local mode. Therefore, you can expect to see the same results as if you were running those jobs separately. For example, local mode still uses Amazon S3 to upload model artifacts and processing outputs. If you want data generated by local jobs to reside on local disk, you can use the setup mentioned in Local Mode.

Pipeline local mode currently supports the following step types:

- Training Step (p. 3213)
- Processing Step (p. 3211)
- Transform Step (p. 3217)
- Model Step (with Create Model arguments only)
- Condition Step (p. 3218)
- Fail Step (p. 3226)

As opposed to the managed Pipelines service which allows multiple steps to execute in parallel using Parallelism Configuration, the local pipeline executor runs the steps sequentially. Therefore, overall execution performance of a local pipeline may be poorer than one that runs on the cloud - this mostly depends on the size of the dataset, algorithm, as well as the power of your local computer. Also note that Pipelines runs in local mode are not recorded in SageMaker Experiments.

Note

Pipelines local mode is not compatible with SageMaker algorithms such as XGBoost. If you want to use these algorithms, you must use them in script mode.

In order to execute a pipeline locally, the sagemaker_session fields associated with the pipeline steps and the pipeline itself need to be of type LocalPipelineSession. The following example shows how you can define a SageMaker pipeline to execute locally.

```python
from sagemaker.workflow.pipeline_context import LocalPipelineSession

local_pipeline_session = LocalPipelineSession()

pytorch_estimator = PyTorch(
    sagemaker_session=local_pipeline_session,
    role=sagemaker.get_execution_role(),
    instance_type="ml.c5.xlarge",
)```
instance_count=1,
framework_version="1.8.0",
py_version="py36",
entry_point="/entry_point.py",

step = TrainingStep(
    name="MyTrainingStep",
    step_args=pytorch_estimator.fit(
        inputs=TrainingInput(s3_data="s3://my-bucket/my-data/train"),
    )
)

pipeline = Pipeline(
    name="MyPipeline",
    steps=[step],
sagemaker_session=local_pipeline_session
)

pipeline.create(
    role_arn=sagemaker.get_execution_role(),
    description="local pipeline example"
)

// pipeline will execute locally
execution = pipeline.start()
steps = execution.list_steps()

training_job_name = steps['PipelineExecutionSteps'][0]['Metadata']['TrainingJob']['Arn']
step_outputs = pipeline_session.sagemaker_client.describe_training_job(TrainingJobName = training_job_name)

Once you are ready to execute the pipeline on the managed SageMaker Pipelines service, you can do so by replacing LocalPipelineSession in the previous code snippet with PipelineSession (as shown in the following code sample) and rerunning the code.

```python
from sagemaker.workflow.pipeline_context import PipelineSession
pipeline_session = PipelineSession()
```

**Troubleshooting Amazon SageMaker Model Building Pipelines**

When using Amazon SageMaker Model Building Pipelines, you might run into issues for various reasons. This topic provides information about common errors and how to resolve them.

**Pipeline Definition Issues**

Your pipeline definition might not be formatted correctly. This can result in your execution failing or your job being inaccurate. These errors can be caught when the pipeline is created or when an execution occurs. If your definition doesn't validate, SageMaker Pipelines returns an error message identifying the character where the JSON file is malformed. To fix this problem, review the steps created using the SageMaker Python SDK for accuracy.

You can only include steps in a pipeline definition once. Because of this, steps cannot exist as part of a condition step and a pipeline in the same pipeline.

**Examining Pipeline Logs**

You can view the status of your steps using the following command:
Each step includes the following information:

- The ARN of the entity launched by the pipeline, such as SageMaker job ARN, model ARN, or model package ARN.
- The failure reason includes a brief explanation of the step failure.
- If the step is a condition step, it includes whether the condition is evaluated to true or false.
- If the execution reuses a previous job execution, the CacheHit lists the source execution.

You can also view the error messages and logs in the Amazon SageMaker Studio interface. For information about how to see the logs in Studio, see View a Pipeline Execution (p. 3270).

**Missing Permissions**

Correct permissions are required for the role that creates the pipeline execution, and the steps that create each of the jobs in your pipeline execution. Without these permissions, you may not be able to submit your pipeline execution or run your SageMaker jobs as expected. To ensure that your permissions are properly set up, see IAM Access Management (p. 3206).

**Job Execution Errors**

You may run into issues when executing your steps because of issues in the scripts that define the functionality of your SageMaker jobs. Each job has a set of CloudWatch logs. To view these logs from Studio, see View a Pipeline Execution (p. 3270). For information about using CloudWatch logs with SageMaker, see Log Amazon SageMaker Events with Amazon CloudWatch (p. 3675).

**Property File Errors**

You may have issues when incorrectly implementing property files with your pipeline. To ensure that your implementation of property files works as expected, see Property Files and JsonGet (p. 3229).

### Create and Manage SageMaker Pipelines

You can use Amazon SageMaker Model Building Pipelines to create end-to-end workflows that manage and deploy SageMaker jobs. SageMaker Pipelines comes with SageMaker Python SDK integration, so you can build each step of your pipeline using a Python-based interface.

After your pipeline is deployed, you can view the directed acyclic graph (DAG) for your pipeline and manage your executions using Amazon SageMaker Studio. Using SageMaker Studio, you can get information about your current and historical pipelines, compare executions, see the DAG for your executions, get metadata information, and more. To learn how to view pipelines from SageMaker Studio, see View, Track, and Execute SageMaker Pipelines in SageMaker Studio (p. 3266).

#### Topics
- Define a Pipeline (p. 3250)
- Run a pipeline (p. 3263)
- View, Track, and Execute SageMaker Pipelines in SageMaker Studio (p. 3266)

### Define a Pipeline

To orchestrate your workflows with Amazon SageMaker Model Building Pipelines, you need to generate a directed acyclic graph (DAG) in the form of a JSON pipeline definition. The following image is a representation of the pipeline DAG that you create in this tutorial:
You can generate your JSON pipeline definition using the SageMaker Python SDK. The following tutorial shows how to generate a pipeline definition for a pipeline that solves a regression problem to determine the age of an abalone based on its physical measurements. For a Jupyter notebook that includes the content in this tutorial that you can run, see Orchestrating Jobs with Amazon SageMaker Model Building Pipelines.

**Topics**
- Prerequisites (p. 3251)
- Create a Pipeline (p. 3252)

**Prerequisites**

To run the following tutorial you must do the following:

- Set up your notebook instance as outlined in [Create a notebook instance](#). This gives your role permissions to read and write to Amazon S3, and create training, batch transform, and processing jobs in SageMaker.
- Grant your notebook permissions to get and pass its own role as shown in [Modifying a role permissions policy](#). Add the following JSON snippet to attach this policy to your role. Replace `<your-role-arn>` with the ARN used to create your notebook instance.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "sts:AssumeRole",
            "Principal": {
                "Service": "sagemaker.amazonaws.com"
            }
        }
    ]
}
```
Create and Manage Pipelines

Trust the SageMaker service principal by following the steps in Modifying a role trust policy. Add the following statement fragment to the trust relationship of your role:

```json
{
    "Sid": "",
    "Effect": "Allow",
    "Principal": {
        "Service": "sagemaker.amazonaws.com"
    },
    "Action": "sts:AssumeRole"
}
```

Set Up Your Environment

Create a new SageMaker session using the following code block. This returns the role ARN for the session. This role ARN should be the execution role ARN that you set up as a prerequisite.

```python
import boto3
import sagemaker
import sagemaker.session

region = boto3.Session().region_name
sagemaker_session = sagemaker.session.Session()
role = sagemaker_session.get_execution_role()
default_bucket = sagemaker_session.default_bucket()
model_package_group_name = f"AbaloneModelPackageGroupName"
```

Create a Pipeline

Run the following steps from your SageMaker notebook instance to create a pipeline including steps for preprocessing, training, evaluation, conditional evaluation, and model registration.

Step 1: Download the Dataset

This notebook uses the UCI Machine Learning Abalone Dataset. The dataset contains the following features:

- `length` – The longest shell measurement of the abalone.
- `diameter` – The diameter of the abalone perpendicular to its length.
- `height` – The height of the abalone with meat in the shell.
- `whole_weight` – The weight of the whole abalone.
- `shucked_weight` – The weight of the meat removed from the abalone.
- `viscera_weight` – The weight of the abalone viscera after bleeding.
- `shell_weight` – The weight of the abalone shell after meat removal and drying.
- `sex` – The sex of the abalone. One of 'M', 'F', or 'I', where 'I' is an infant abalone.
• rings – The number of rings in the abalone shell.

The number of rings in the abalone shell is a good approximation for its age using the formula
age = rings + 1.5. However, obtaining this number is a time-consuming task. You must cut the shell
through the cone, stain the section, and count the number of rings through a microscope. However,
the other physical measurements are easier to determine. This notebook uses the dataset to build a
predictive model of the variable rings using the other physical measurements.

To download the dataset

1. Download the dataset into your account's default Amazon S3 bucket.

   ```
   !mkdir -p data
   local_path = "data/abalone-dataset.csv"
   s3 = boto3.resource("s3")
   s3.Bucket(f"sagemaker-servicecatalog-seedcode-{region}").download_file("
   "dataset/abalone-dataset.csv",
   local_path
   )
   base_uri = f"s3://[default_bucket]/abalone"
   input_data_uri = sagemaker.s3.S3Uploader.upload(
   local_path=local_path,
   desired_s3_uri=base_uri,
   )
   print(input_data_uri)
   ```

2. Download a second dataset for batch transformation after your model is created.

   ```
   local_path = "data/abalone-dataset-batch"
   s3 = boto3.resource("s3")
   s3.Bucket(f"sagemaker-servicecatalog-seedcode-{region}").download_file("
   "dataset/abalone-dataset-batch",
   local_path
   )
   base_uri = f"s3://[default_bucket]/abalone"
   batch_data_uri = sagemaker.s3.S3Uploader.upload(
   local_path=local_path,
   desired_s3_uri=base_uri,
   )
   print(batch_data_uri)
   ```

Step 2: Define Pipeline Parameters

This code block defines the following parameters for your pipeline:

• processing_instance_count – The instance count of the processing job.
• input_data – The Amazon S3 location of the input data.
• batch_data – The Amazon S3 location of the input data for batch transformation.
• model_approval_status – The approval status to register the trained model with for CI/CD. For
  more information, see Automate MLOps with SageMaker Projects (p. 3281).

   ```
   from sagemaker.workflow.parameters import (ParameterInteger,
   ```
Step 3: Define a Processing Step for Feature Engineering

This section shows how to create a processing step to prepare the data from the dataset for training.

To create a processing step

1. Create a directory for the processing script.

```
!mkdir -p abalone
```

2. Create a file in the /abalone directory named preprocessing.py with the following content. This preprocessing script is passed in to the processing step for execution on the input data. The training step then uses the preprocessed training features and labels to train a model, and the evaluation step uses the trained model and preprocessed test features and labels to evaluate the model. The script uses scikit-learn to do the following:

- Fill in missing sex categorical data and encode it so it’s suitable for training.
- Scale and normalize all numerical fields except for rings and sex.
- Split the data into training, test, and validation datasets.

```
# Because this is a headerless CSV file, specify the column names here.
feature_columns_names = [
    "sex",
    "length",
    "diameter",
    "height",
]
"whole_weight",
"shucked_weight",
"viscera_weight",
"shell_weight",
]
label_column = "rings"

feature_columns_dtype = {
    "sex": str,
    "length": np.float64,
    "diameter": np.float64,
    "height": np.float64,
    "whole_weight": np.float64,
    "shucked_weight": np.float64,
    "viscera_weight": np.float64,
    "shell_weight": np.float64
}

label_column_dtype = {"rings": np.float64}

def merge_two_dicts(x, y):
    z = x.copy()
    z.update(y)
    return z

if __name__ == '__main__':
    base_dir = '/opt/ml/processing'
    
    df = pd.read_csv(f'{base_dir}/input/abalone-dataset.csv',
                    header=None,
                    names=feature_columns_names + [label_column],
                    dtype=merge_two_dicts(feature_columns_dtype, label_column_dtype)
    )
    numeric_features = list(feature_columns_names)
    numeric_features.remove("sex")
    numeric_transformer = Pipeline(
        steps=[
            ("imputer", SimpleImputer(strategy="median")),
            ("scaler", StandardScaler())
        ]
    )
    
    categorical_features = ["sex"]
    categorical_transformer = Pipeline(
        steps=[
            ("imputer", SimpleImputer(strategy="constant", fill_value="missing")),
            ("onehot", OneHotEncoder(handle_unknown="ignore"))
        ]
    )
    
    preprocess = ColumnTransformer(
        transformers=[
            ("num", numeric_transformer, numeric_features),
            ("cat", categorical_transformer, categorical_features)
        ]
    )
    
    y = df.pop("rings")
    X_pre = preprocess.fit_transform(df)
    y_pre = y.to_numpy().reshape(len(y), 1)
    X = np.concatenate((y_pre, X_pre), axis=1)
    np.random.shuffle(X)
3. Create an instance of an `SKLearnProcessor` to pass in to the processing step.

```python
from sagemaker.sklearn.processing import SKLearnProcessor

framework_version = "0.23-1"

sklearn_processor = SKLearnProcessor(
    framework_version=framework_version,
    instance_type="ml.m5.xlarge",
    instance_count=processing_instance_count,
    base_job_name="sklearn-abalone-process",
    role=role,
)
```

4. Create a processing step. This step takes in the `SKLearnProcessor`, the input and output channels, and the `preprocessing.py` script that you created. This is very similar to a processor instance's `run` method in the SageMaker Python SDK. The `input_data` parameter passed into `ProcessingStep` is the input data of the step itself. This input data is used by the processor instance when it runs.

   Note the "train", "validation", and "test" named channels specified in the output configuration for the processing job. Step Properties such as these can be used in subsequent steps and resolve to their runtime values at execution.

```python
from sagemaker.processing import ProcessingInput, ProcessingOutput
from sagemaker.workflow.steps import ProcessingStep

step_process = ProcessingStep(
    name="AbaloneProcess",
    processor=sklearn_processor,
    inputs=[
        ProcessingInput(source=input_data, destination="/opt/ml/processing/input"),
    ],
    outputs=[
        ProcessingOutput(output_name="train", source="/opt/ml/processing/train"),
        ProcessingOutput(output_name="validation", source="/opt/ml/processing/validation"),
        ProcessingOutput(output_name="test", source="/opt/ml/processing/test")
    ],
    code="abalone/preprocessing.py",
)
```

**Step 4: Define a Training step**

This section shows how to use the SageMaker XGBoost Algorithm to train a model on the training data output from the processing steps.

**To define a training step**

1. Specify the model path where you want to save the models from training.
2. Configure an estimator for the XGBoost algorithm and the input dataset. The training instance type is passed into the estimator. A typical training script loads data from the input channels, configures training with hyperparameters, trains a model, and saves a model to `model_dir` so that it can be hosted later. SageMaker uploads the model to Amazon S3 in the form of a `model.tar.gz` at the end of the training job.

```python
from sagemaker.estimator import Estimator

image_uri = sagemaker.image_uris.retrieve(
    framework="xgboost",
    region=region,
    version="1.0-1",
    py_version="py3",
    instance_type="ml.m5.xlarge"
)
xgb_train = Estimator(
    image_uri=image_uri,
    instance_type="ml.m5.xlarge",
    instance_count=1,
    output_path=model_path,
    role=role,
)
xgb_train.set_hyperparameters(
    objective="reg:linear",
    num_round=50,
    max_depth=5,
    eta=0.2,
    gamma=4,
    min_child_weight=6,
    subsample=0.7,
    silent=0
)
```

3. Create a `TrainingStep` using the estimator instance and properties of the `ProcessingStep`. In particular, pass in the S3Uri of the "train" and "validation" output channel to the `TrainingStep`.

```python
from sagemaker.inputs import TrainingInput
from sagemaker.workflow.steps import TrainingStep

step_train = TrainingStep(
    name="AbaloneTrain",
    estimator=xgb_train,
    inputs={
        "train": TrainingInput(
            s3_data=step_process.properties.ProcessingOutputConfig.Outputs["train"].S3Output.S3Uri,
            content_type="text/csv"
        ),
        "validation": TrainingInput(
            s3_data=step_process.properties.ProcessingOutputConfig.Outputs["validation"].S3Output.S3Uri,
            content_type="text/csv"
        )
    }
)
```
Step 5: Define a Processing Step for Model Evaluation

This section shows how to create a processing step to evaluate the accuracy of the model. The result of this model evaluation is used in the condition step to determine which execute path to take.

To define a processing step for model evaluation

1. Create a file in the /abalone directory named evaluation.py. This script is used in a processing step to perform model evaluation. It takes a trained model and the test dataset as input, then produces a JSON file containing classification evaluation metrics.

```python
##writefile abalone/evaluation.py
import json
import pathlib
import pickle
import tarfile
import joblib
import numpy as np
import pandas as pd
import xgboost
from sklearn.metrics import mean_squared_error

if __name__ == '__main__':
    model_path = f'/opt/ml/processing/model/model.tar.gz'
    with tarfile.open(model_path) as tar:
        tar.extractall(path='.')
    model = pickle.load(open('xgboost-model', 'rb'))
    test_path = '/opt/ml/processing/test/test.csv'
    df = pd.read_csv(test_path, header=None)
    y_test = df.iloc[:, 0].to_numpy()
    df.drop(df.columns[0], axis=1, inplace=True)
    X_test = xgboost.DMatrix(df.values)
    predictions = model.predict(X_test)
    mse = mean_squared_error(y_test, predictions)
    std = np.std(y_test - predictions)
    report_dict = {
        "regression_metrics": {
            "mse": {
                "value": mse,
                "standard_deviation": std
            }
        }
    }

output_dir = '/opt/ml/processing/evaluation'
pathlib.Path(output_dir).mkdir(parents=True, exist_ok=True)

evaluation_path = f'{output_dir}/evaluation.json'
with open(evaluation_path, 'w') as f:
    f.write(json.dumps(report_dict))
```
2. Create an instance of a `ScriptProcessor` that is used to create a `ProcessingStep`.

```python
from sagemaker.processing import ScriptProcessor

script_eval = ScriptProcessor(
    image_uri=image_uri,
    command=['python3'],
    instance_type='ml.m5.xlarge',
    instance_count=1,
    base_job_name='script-abalone-eval',
    role=role,
)
```

3. Create a `ProcessingStep` using the processor instance, the input and output channels, and the `evaluation.py` script. In particular, pass in the `S3ModelArtifacts` property from the `step_train` training step, as well as the `S3Uri` of the "test" output channel of the `step_process` processing step. This is very similar to a processor instance's `run` method in the SageMaker Python SDK.

```python
from sagemaker.workflow.properties import PropertyFile

evaluation_report = PropertyFile(
    name='EvaluationReport',
    output_name='evaluation',
    path='evaluation.json'
)

step_eval = ProcessingStep(
    name='AbaloneEval',
    processor=script_eval,
    inputs=[
        ProcessingInput(
            source=step_train.properties.ModelArtifacts.S3ModelArtifacts,
            destination='/opt/ml/processing/model'
        ),
        ProcessingInput(
            source=step_process.properties.ProcessingOutputConfig.Outputs['test'].S3Output.S3Uri,
            destination='/opt/ml/processing/test'
        )
    ],
    outputs=[
        ProcessingOutput(output_name='evaluation', source='/opt/ml/processing/evaluation'),
    ],
    code='abalone/evaluation.py',
    property_files=[evaluation_report],
)
```

**Step 6: Define a CreateModelStep for Batch Transformation**

**Important**
We recommend using Model Step (p. 3214) to create models as of v2.90.0 of the SageMaker Python SDK. CreateModelStep will continue to work in previous versions of the SageMaker Python SDK, but is no longer actively supported.

This section shows how to create a SageMaker model from the output of the training step. This model is used for batch transformation on a new dataset. This step is passed into the condition step and only executes if the condition step evaluates to true.
To define a CreateModelStep for batch transformation

   ```python
   from sagemaker.model import Model

   model = Model(
       image_uri=image_uri,
       model_data=step_train.properties.ModelArtifacts.S3ModelArtifacts,
       sagemaker_session=sagemaker_session,
       role=role,
   )
   ```

2. Define the model input for your SageMaker model.

   ```python
   from sagemaker.inputs import CreateModelInput

   inputs = CreateModelInput(
       instance_type="ml.m5.large",
       accelerator_type="ml.eia1.medium",
   )
   ```

3. Create your CreateModelStep using the CreateModelInput and SageMaker model instance you defined.

   ```python
   from sagemaker.workflow.steps import CreateModelStep

   step_create_model = CreateModelStep(
       name="AbaloneCreateModel",
       model=model,
       inputs=inputs,
   )
   ```

Step 7: Define a TransformStep to Perform Batch Transformation

This section shows how to create a TransformStep to perform batch transformation on a dataset after the model is trained. This step is passed into the condition step and only executes if the condition step evaluates to true.

To define a TransformStep to perform batch transformation

1. Create a transformer instance with the appropriate compute instance type, instance count, and desired output Amazon S3 bucket URI. Pass in the ModelName property from the step_create_model CreateModel step.

   ```python
   from sagemaker.transformer import Transformer

   transformer = Transformer(
       model_name=step_create_model.properties.ModelName,
       instance_type="ml.m5.xlarge",
       instance_count=1,
       output_path=f"s3://{default_bucket}/AbaloneTransform"
   )
   ```
2. Create a TransformStep using the transformer instance you defined and the batch_data pipeline parameter.

```python
from sagemaker.inputs import TransformInput
from sagemaker.workflow.steps import TransformStep

step_transform = TransformStep(
    name="AbaloneTransform",
    transformer=transformer,
    inputs=TransformInput(data=batch_data)
)
```

**Step 8: Define a RegisterModel Step to Create a Model Package**

**Important**
We recommend using Model Step (p. 3214) to register models as of v2.90.0 of the SageMaker Python SDK. RegisterModel will continue to work in previous versions of the SageMaker Python SDK, but is no longer actively supported.

This section shows how to construct an instance of RegisterModel. The result of executing RegisterModel in a pipeline is a model package. A model package is a reusable model artifacts abstraction that packages all ingredients necessary for inference. It consists of an inference specification that defines the inference image to use along with an optional model weights location. A model package group is a collection of model packages. You can use a ModelPackageGroup for SageMaker Pipelines to add a new version and model package to the group for every pipeline execution. For more information about model registry, see Register and Deploy Models with Model Registry (p. 2982).

This step is passed into the condition step and only executes if the condition step evaluates to True.

**To define a RegisterModel step to create a model package**

- Construct a RegisterModel step using the estimator instance you used for the training step. Pass in the S3ModelArtifacts property from the step_train training step and specify a ModelPackageGroup. SageMaker Pipelines creates this ModelPackageGroup for you.

```python
from sagemaker.model_metrics import MetricsSource, ModelMetrics
from sagemaker.workflow.step_collections import RegisterModel

model_metrics = ModelMetrics(
    model_statistics=MetricsSource(
        s3_uri="{}//evaluation.json".format(
            step_eval.arguments["ProcessingOutputConfig"]['Outputs'][0]['S3Output'])
        ["S3Uri"]
    ),
    content_type="application/json"
)

step_register = RegisterModel(
    name="AbaloneRegisterModel",
    estimator=xgb_train,
    model_data=step_train.properties.ModelArtifacts.S3ModelArtifacts,
    content_types=["text/csv"],
    response_types=["text/csv"],
    inference_instances=["ml.t2.medium", "ml.m5.xlarge"],
    transform_instances=["ml.m5.xlarge"],
    model_package_group_name=model_package_group_name,
    approval_status=model_approval_status,
    model_metrics=model_metrics
```
Step 9: Define a Condition Step to Verify Model Accuracy

A ConditionStep allows SageMaker Pipelines to support conditional execution in your pipeline DAG based on the condition of step properties. In this case, you only want to register a model package if the accuracy of that model, as determined by the model evaluation step, exceeds the required value. If the accuracy exceeds the required value, the pipeline also creates a SageMaker Model and runs batch transformation on a dataset. This section shows how to define the Condition step.

To define a condition step to verify model accuracy

1. Define a ConditionLessThanOrEqualTo condition using the accuracy value found in the output of the model evaluation processing step, step_eval. Get this output using the property file you indexed in the processing step and the respective JSONPath of the mean squared error value, "mse".

   ```python
   from sagemaker.workflow.conditions import ConditionLessThanOrEqualTo
   from sagemaker.workflow.condition_step import ConditionStep
   from sagemaker.workflow.functions import JsonGet

   cond_lte = ConditionLessThanOrEqualTo(
       left=JsonGet(
           step_name=step_eval.name, 
           property_file=evaluation_report, 
           json_path="regression_metrics.mse.value" 
       ),
       right=6.0
   )
   ```

2. Construct a ConditionStep. Pass the ConditionEquals condition in, then set the model package registration and batch transformation steps as the next steps if the condition passes.

   ```python
   step_cond = ConditionStep(
       name="AbaloneMSECond",
       conditions=[cond_lte],
       if_steps=[step_register, step_create_model, step_transform],
       else_steps=[],
   )
   ```

Step 10: Create a pipeline

Now that you've created all of the steps, combine them into a pipeline.

To create a pipeline

1. Define the following for your pipeline: name, parameters, and steps. Names must be unique within an (account, region) pair.

   **Note**
   A step can only appear once in either the pipeline's step list or the if/else step lists of the condition step. It cannot appear in both.

   ```python
   from sagemaker.workflow.pipeline import Pipeline

   pipeline_name = f"AbalonePipeline"
   ```
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[
        processing_instance_count,
        model_approval_status,
        input_data,
        batch_data,
    ],
    steps=[step_process, step_train, step_eval, step_cond],
)

2. (Optional) Examine the JSON pipeline definition to ensure that it's well-formed.

```python
import json
json.loads(pipeline.definition())
```

This pipeline definition is ready to submit to SageMaker. In the next tutorial, you submit this pipeline to SageMaker and start an execution.

**Next step:** Run a pipeline (p. 3263)

### Run a pipeline

After you've created a pipeline definition using the SageMaker Python SDK, you can submit it to SageMaker to start your execution. The following tutorial shows how to submit a pipeline, start an execution, examine the results of that execution, and delete your pipeline.

**Topics**

- Prerequisites (p. 3263)
- Step 1: Start the Pipeline (p. 3263)
- Step 2: Examine a Pipeline Execution (p. 3264)
- Step 3: Override Default Parameters for a Pipeline Execution (p. 3265)
- Step 4: Stop and Delete a Pipeline Execution (p. 3266)

### Prerequisites

This tutorial requires the following:

- A SageMaker notebook instance.
- A SageMaker Pipelines pipeline definition. This tutorial assumes you're using the pipeline definition created by completing the Define a Pipeline (p. 3250) tutorial.

### Step 1: Start the Pipeline

First, you need to start the pipeline.

**To start the pipeline**

1. Examine the JSON pipeline definition to ensure that it's well-formed.

```python
import json
json.loads(pipeline.definition())
```
2. Submit the pipeline definition to the SageMaker Pipelines service to create a pipeline if it doesn’t exist, or update the pipeline if it does. The role passed in is used by SageMaker Pipelines to create all of the jobs defined in the steps.

```python
pipeline.upsert(role_arn=role)
```

3. Start a pipeline execution.

```python
execution = pipeline.start()
```

### Step 2: Examine a Pipeline Execution

Next, you need to examine the pipeline execution.

**To examine a pipeline execution**

1. Describe the pipeline execution status to ensure that it has been created and started successfully.

```python
execution.describe()
```

2. Wait for the execution to finish.

```python
execution.wait()
```

3. List the execution steps and their status.

```python
execution.list_steps()
```

Your output should look like the following:

```json
[{'StepName': 'AbaloneTransform',
'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 27, 870000, tzinfo=tzlocal()),
'EndTime': datetime.datetime(2020, 11, 21, 2, 45, 50, 492000, tzinfo=tzlocal()),
'StepStatus': 'Succeeded',
'CacheHitResult': {'SourcePipelineExecutionArn': ''},
{'StepName': 'AbaloneRegisterModel',
'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 26, 929000, tzinfo=tzlocal()),
'EndTime': datetime.datetime(2020, 11, 21, 2, 41, 28, 15000, tzinfo=tzlocal()),
'StepStatus': 'Succeeded',
'CacheHitResult': {'SourcePipelineExecutionArn': ''},
'Metadata': {'RegisterModel': {'Arn': 'arn:aws:sagemaker:us-east-2:111122223333:model-package/abalonemodelpackagegroupname/1'}}},
{'StepName': 'AbaloneCreateModel',
'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 26, 895000, tzinfo=tzlocal()),
'EndTime': datetime.datetime(2020, 11, 21, 2, 41, 27, 708000, tzinfo=tzlocal()),
'StepStatus': 'Succeeded',
'CacheHitResult': {'SourcePipelineExecutionArn': ''},
'Metadata': {'Model': {'Arn': 'arn:aws:sagemaker:us-east-2:111122223333:model/pipelines-cfvy1tjuxdq8-abalonemodelpackagegroupname/1'}}},
{'StepName': 'AbaloneMSECond',
'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 25, 558000, tzinfo=tzlocal()),
'EndTime': datetime.datetime(2020, 11, 21, 2, 41, 26, 329000, tzinfo=tzlocal()),
'StepStatus': 'Succeeded',
'CacheHitResult': {'SourcePipelineExecutionArn': ''},
'Metadata': {'Condition': {'Outcome': 'True'}}},
{'StepName': 'AbaloneEval',
'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 25, 15000, tzinfo=tzlocal()),
'EndTime': datetime.datetime(2020, 11, 21, 2, 41, 26, 15000, tzinfo=tzlocal()),
'StepStatus': 'Succeeded',
'CacheHitResult': {'SourcePipelineExecutionArn': ''},
'Metadata': {'EvaluateModel': {'Arn': 'arn:aws:sagemaker:us-east-2:111122223333:evaluate-model/pipelines-cfvy1tjuxdq8-abaloneevalatemodel-jl94rai0ra'}}},
{'StepName': 'AbaloneEVAL',
'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 25, 15000, tzinfo=tzlocal()),
'EndTime': datetime.datetime(2020, 11, 21, 2, 41, 26, 15000, tzinfo=tzlocal()),
'StepStatus': 'Succeeded',
'CacheHitResult': {'SourcePipelineExecutionArn': ''},
'Metadata': {'EvaluateModel': {'Arn': 'arn:aws:sagemaker:us-east-2:111122223333:evaluate-model/pipelines-cfvy1tjuxdq8-abaloneevalatemodel-jl94rai0ra'}}}
```
4. After your pipeline execution is complete, download the resulting `evaluation.json` file from Amazon S3 to examine the report.

```python
evaluation_json = sagemaker.s3.S3Downloader.read_file("/{}/evaluation.json".format(step_eval.arguments["ProcessingOutputConfig"]['Outputs'][0]['S3Output']['S3Uri']))
json.loads(evaluation_json)
```

## Step 3: Override Default Parameters for a Pipeline Execution

You can run additional executions of the pipeline by specifying different pipeline parameters to override the defaults.

**To override default parameters**

1. Create the pipeline execution. This starts another pipeline execution with the model approval status override set to "Approved". This means that the model package version generated by the `RegisterModel` step is automatically ready for deployment through CI/CD pipelines, such as with SageMaker Projects. For more information, see [Automate MLOps with SageMaker Projects](p. 3281).

```python
evaluation = pipeline.start(
    parameters=dict(
        ModelApprovalStatus="Approved",
    )
)
```

2. Wait for the execution to finish.

```python
evaluation.wait()
```

3. List the execution steps and their status.

```python
evaluation.list_steps()
```

4. After your pipeline execution is complete, download the resulting `evaluation.json` file from Amazon S3 to examine the report.
evaluation_json = sagemaker.s3.S3Downloader.read_file("/evaluation.json".format( 
    step_eval.arguments["ProcessingOutputConfig"]["Outputs"][0]["S3Output"]["S3Uri"] 
))
json.loads(evaluation_json)

### Step 4: Stop and Delete a Pipeline Execution

When you're finished with your pipeline, you can stop any ongoing executions and delete the pipeline.

**To stop and delete a pipeline execution**

1. Stop the pipeline execution.

   ```python
   execution.stop()
   ```

2. Delete the pipeline.

   ```python
   pipeline.delete()
   ```

### View, Track, and Execute SageMaker Pipelines in SageMaker Studio

To view, track, and execute Amazon SageMaker Pipelines in Amazon SageMaker Studio, you must sign in to Studio. For more information, see [Onboard to Amazon SageMaker Domain](#).

**Topics**

- [View a Pipeline](#)
- [View a Pipeline Execution](#)
- [View Experiment Entities Created by SageMaker Pipelines](#)
- [Execute a Pipeline](#)
- [Track the Lineage of a SageMaker ML Pipeline](#)

#### View a Pipeline

This procedure shows you how to directly find a pipeline and view its details page. You can also find pipelines that are part of a project listed in the project's details page. For information on finding a pipeline that is part of a project, see [Automate MLOps with SageMaker Projects](#).

**To view a list of pipelines**

1. In the left sidebar of Studio, choose the **SageMaker resources** icon (Arial).
2. Select **Pipelines** from the dropdown list.

3. Drag the right border of the **SageMaker resources** pane to the right to view all the columns. Use search to narrow the list of pipelines.

Search is a two-step process. First, you enter characters that match the column name you want to search. Second, you enter characters to match the item in that column.

You can have multiple search filters. An example, the following screenshot limits the displayed pipelines to those with a name that starts with `aba` and created by `Me`. For more information on searching in Studio, see [Search Experiments Using Amazon SageMaker Studio](p. 2246).
4. Open a pipeline to view details about the pipeline. The pipeline details tab opens and displays a list of pipeline executions. You can start an execution or choose one of the other tabs for more information about the pipeline. Use the Settings icon (⚙️) to choose which columns to display.

5. From the pipeline details page, choose one of the following tabs to view details about the pipeline:
   - **Executions** – Details about the executions. You can start an execution from this tab or the **Graph** tab.
   - **Graph** – The DAG for the pipeline.
- **Parameters** – Includes the model approval status.

- **Settings** – The metadata associated with the pipeline. You can download the pipeline definition file and edit the pipeline name and description from this tab.
View a Pipeline Execution

This procedure shows you how to view a pipeline execution. For information on how to view a list of pipeline executions, and how to use SageMaker search to narrow the executions in the list, see View a Pipeline (p. 3266).

To view details of a pipeline execution

1. In the execution list, open an execution to view details about the execution. The execution details tab opens and displays a graph of the steps in the pipeline. You can choose one of the other tabs to view information about the pipeline execution, which is similar to that shown when viewing the pipeline details.

2. Use search to find a step in the graph. Type characters that match a step name. You can drag the graph around or use the resizing icons on the lower-left side of the graph. The inset on the lower-right side of the graph displays where you are in the graph.

3. Choose one of the steps in the graph to see details about the step. In the preceding screenshot, a training step is chosen and displays the following tabs:
• **Input** – The training inputs. If an input source is from Amazon Simple Storage Service (Amazon S3), choose the link to view the file in the Amazon S3 console.

• **Output** – The training outputs, such as metrics, charts, files, and evaluation outcome. The graphs were produced using the Tracker APIs.

**View Experiment Entities Created by SageMaker Pipelines**

When you create a pipeline and specify `pipeline_experiment_config`, SageMaker Pipelines creates the following SageMaker Experiments entities by default if they don't exist:

- An experiment for the pipeline
- A trial for every execution of the pipeline
- A trial component for each SageMaker job created in a pipeline step
For information on how experiments are integrated with pipelines, see Amazon SageMaker Experiments Integration (p. 3245). For more information on SageMaker Experiments, see Manage Machine Learning with Amazon SageMaker Experiments (p. 2231).

You can get to the list of trial components associated with a pipeline from either the pipeline executions list or the experiments list.

**To view the trial components list from the pipeline executions list**

1. To view the pipeline executions list, follow the first four steps in View a Pipeline (p. 3266).
2. On the top right of the screen, choose the **Settings** icon (⚙️) to open **TABLE PROPERTIES**.
3. Select **Experiment**. If experiment integration wasn't disabled when the pipeline was created, the experiment name and trial name are displayed in the executions list.

   **Note**
   Experiments integration was introduced in v2.41.0 of the Amazon SageMaker Python SDK. Pipelines created with an earlier version of the SDK aren't integrated with experiments by default.

4. Select one or more executions, open (right-click) the selection, then choose **View trial components generated by execution**.

**To view the trial components list from the experiments list**

1. In the left sidebar of Studio, choose the **SageMaker resources** icon (🔍).
2. Select **Experiments and trials** from the dropdown list.
3. Use search to filter the list to experiments created by a pipeline.
   a. Drag the right border of the **SageMaker resources** pane to the right until you can see the **Experiment type** column.
   b. In the search box, enter ex and choose **Experiment type**.
   c. In **Filter by values**, choose **Pipeline**, then choose **Apply**.

   To further narrow the search, you can add additional filters. For more information, see Search Experiments Using Amazon SageMaker Studio (p. 2246).
4. Open (right-click) an experiment name and choose **Open in trial component list**.
List of trial components

Execute a Pipeline

This procedure shows you how to execute a pipeline. For information on how to view a list of pipeline executions, see View a Pipeline (p. 3266).

To start a pipeline execution

1. From the Executions or Graph tab in the execution list, choose Start an execution.
2. Enter or update the following required information:
   • **Name** – Must be unique to your account in the AWS Region.
   • **ProcessingInstanceType** – The instance type for processing.
   • **ProcessingInstanceCount** – The number of instances to use for processing.
   • **TrainingInstanceType** – The instance type for training.
   • **ModelApprovalStatus** – For your convenience.
   • **InputData** – The S3 URI of the input data.

3. Choose **Submit**.
   • To see details of the execution or to stop the execution, choose **View details** on the status banner.
   • To stop the execution, choose **Stop** on the status banner.
   • To resume the execution from where it was stopped, choose **Resume** on the status banner.
Note
If your pipeline fails, the status banner will show **Failed** status. After troubleshooting the failed step, choose *Retry* on the status banner to resume running the pipeline from that step.

For a list of registered models, see **Automate MLOps with SageMaker Projects** (p. 3281).

**Track the Lineage of a SageMaker ML Pipeline**

In this tutorial, you use Amazon SageMaker Studio to track the lineage of an Amazon SageMaker ML Pipeline.

The pipeline was created by the **Orchestrating Jobs with Amazon SageMaker Model Building Pipelines** notebook in the **Amazon SageMaker example GitHub repository**. For detailed information on how the pipeline was created, see **Define a Pipeline** (p. 3250).

Lineage tracking in Studio is centered around a directed acyclic graph (DAG). The DAG represents the steps in a pipeline. From the DAG you can track the lineage from any step to any other step. The following diagram displays the steps in the pipeline. These steps appear as a DAG in Studio.

![Diagram of pipeline with steps labeled](image)

**Prerequisites**

- Access to Amazon SageMaker Studio. For more information, see **Onboard to Amazon SageMaker Domain** (p. 35).

- Familiarity with the SageMaker Studio user interface. For more information, see **Amazon SageMaker Studio UI Overview** (p. 118).

- (Recommended) A completed run of the example notebook.

**To track the lineage of a pipeline**

1. Sign in to SageMaker Studio.
2. In the left sidebar of Studio, choose the **SageMaker resources** icon ( ![SageMaker icon](image) ).
3. In the drop-down menu, select **Pipelines**.
4. Use the **Search** box to filter the pipelines list. To view all available columns, drag the right border of the pane to the right. For more information, see *Search Experiments Using Amazon SageMaker Studio* (p. 2246).

The following screenshot shows the list filtered by a name that starts with "aba" and that was created on 12/5/20.
5. Double-click the AbalonePipeline pipeline to view the execution list and other details about the pipeline. The following screenshot shows the **TABLE PROPERTIES** pane open where you can choose which properties to view.

6. Choose the **Settings** tab and then choose **Download pipeline definition file**. You can view the file to see how the pipeline graph was defined.

7. On the **Execution** tab, double-click the first row in the execution list to view its execution graph and other details about the execution. Note that the graph matches the diagram displayed at the beginning of the tutorial.

You can drag the graph around (select an area not on the graph itself) or use the resizing icons on the lower-left side of the graph. The inset on the lower-right side of the graph displays your location in the graph.
8. On the **Graph** tab, choose the AbaloneProcess step to view details about the step.

9. Find the Amazon S3 paths to the training, validation, and test datasets in the **Output** tab, under **Files**.

   **Note**
   To get the full paths, right-click the path and then choose **Copy cell contents**.

   ```
   s3://sagemaker-eu-west-1-acct-id/sklearn-abalone-process-2020-12-05-17-28-28-509/output/train
   ```
10. Choose the AbaloneTrain step.

11. Find the Amazon S3 path to the model artifact in the **Output** tab, under **Files**:

   s3://sagemaker-eu-west-1-acct-id/AbaloneTrain/pipelines-6locnsqz4bfu-AbaloneTrain-NtfEpI0Ahu/output/model.tar.gz

12. Choose the AbaloneRegisterModel step.

13. Find the ARN of the model package in the **Output** tab, under **Files**:

   arn:aws:sagemaker:eu-west-1:acct-id:model-package/abalonemodelpackagegroupname/2

### Automate MLOps with SageMaker Projects

Create end-to-end ML solutions with CI/CD by using SageMaker projects.

Use SageMaker projects to create an MLOps solution to orchestrate and manage:

- Building custom images for processing, training, and inference
- Data preparation and feature engineering
- Training models
- Evaluating models
- Deploying models
- Monitoring and updating models
Why MLOps?

As you move from running individual artificial intelligence and machine learning (AI/ML) projects to using AI/ML to transform your business at scale, the discipline of ML Operations (MLOps) can help. MLOps accounts for the unique aspects of AI/ML projects in project management, CI/CD, and quality assurance, helping you improve delivery time, reduce defects, and make data science more productive. MLOps refers to a methodology that is built on applying DevOps practices to machine learning workloads. For a discussion of DevOps principles, see the white paper Introduction to DevOps on AWS. To learn more about implementation using AWS services, see Practicing CI/CD on AWS and Infrastructure as Code.

Like DevOps, MLOps relies on a collaborative and streamlined approach to the machine learning development lifecycle where the intersection of people, process, and technology optimizes the end-to-end activities required to develop, build, and operate machine learning workloads. MLOps focuses on the intersection of data science and data engineering in combination with existing DevOps practices to streamline model delivery across the machine learning development lifecycle. MLOps is the discipline of integrating ML workloads into release management, CI/CD, and operations. MLOps requires the integration of software development, operations, data engineering, and data science.

Challenges with MLOps

Although MLOps can provide valuable tools to help you scale your business, you might face certain issues as you integrate MLOps into your machine learning workloads.

Project management

- ML projects involve data scientists, a relatively new role, and one not often integrated into cross-functional teams. These new team members often speak a very different technical language than product owners and software engineers, compounding the usual problem of translating business requirements into technical requirements.

Communication and collaboration

- Building visibility on ML projects and enabling collaboration across different stakeholders such as data engineers, data scientists, ML engineers, and DevOps is becoming increasingly important to ensure successful outcomes.

Everything is code
• Use of production data in development activities, longer experimentation lifecycles, dependencies on data pipelines, retraining deployment pipelines, and unique metrics in evaluating the performance of a model.

• Models often have a lifecycle independent of the applications and systems integrating with those models.

• The entire end-to-end system is reproducible through versioned code and artifacts. DevOps projects use Infrastructure-as-Code (IaC) and Configuration-as-Code (CaC) to build environments, and Pipelines-as-Code (PaC) to ensure consistent CI/CD patterns. The pipelines have to integrate with Big Data and ML training workflows. That often means that the pipeline is a combination of a traditional CI/CD tool and another workflow engine. There are important policy concerns for many ML projects, so the pipeline may also need to enforce those policies. Biased input data produces biased results, an increasing concern for business stakeholders.

CI/CD

• In MLOps, the source data is a first-class input, along with source code. That’s why MLOps calls for versioning the source data and initiating pipeline runs when the source or inference data changes.

• Pipelines must also version the ML models, along with inputs and other outputs, in order to provide for traceability.

• Automated testing must include proper validation of the ML model during build phases and when the model is in production.

• Build phases may include model training and retraining, a time-consuming and resource-intensive process. Pipelines must be granular enough to only perform a full training cycle when the source data or ML code changes, not when related components change.

• Because machine learning code is typically a small part of an overall solution, a deployment pipeline may also incorporate the additional steps required to package a model for consumption as an API by other applications and systems.

Monitoring and logging

• The feature engineering and model training phases needed to capture model training metrics as well as model experiments. Tuning an ML model requires manipulating the form of the input data as well as algorithm hyperparameters, and systematically capture those experiments. Experiment tracking helps data scientists work more effectively and gives a reproducible snapshot of their work.

• Deployed ML models require monitoring of the data passed to the model for inference, along with the standard endpoint stability and performance metrics. The monitoring system must also capture the quality of model output, as evaluated by an appropriate ML metric.

Benefits of MLOps

Adopting MLOps practices gives you faster time-to-market for ML projects by delivering the following benefits.

• **Productivity**: Providing self-service environments with access to curated data sets lets data engineers and data scientists move faster and waste less time with missing or invalid data.

• **Repeatability**: Automating all the steps in the MLDC helps you ensure a repeatable process, including how the model is trained, evaluated, versioned, and deployed.

• **Reliability**: Incorporating CI/CD practices allows for the ability to not only deploy quickly but with increased quality and consistency.

• **Auditability**: Versioning all inputs and outputs, from data science experiments to source data to trained model, means that we can demonstrate exactly how the model was built and where it was deployed.
Data and model quality: MLOps lets us enforce policies that guard against model bias and track changes to data statistical properties and model quality over time.

What is a SageMaker Project?

SageMaker Projects help organizations set up and standardize developer environments for data scientists and CI/CD systems for MLOps engineers. Projects also help organizations set up dependency management, code repository management, build reproducibility, and artifact sharing.

You can provision SageMaker Projects from the AWS Service Catalog using custom or SageMaker-provided templates. For information about the AWS Service Catalog, see What Is AWS Service Catalog. With SageMaker Projects, MLOps engineers and organization admins can define their own templates or use SageMaker-provided templates. The SageMaker-provided templates bootstrap the ML workflow with source version control, automated ML pipelines, and a set of code to quickly start iterating over ML use cases.

When Should You Use a SageMaker Project?

While notebooks are helpful for model building and experimentation, a team of data scientists and ML engineers sharing code needs a more scalable way to maintain code consistency and strict version control.

Every organization has its own set of standards and practices that provide security and governance for its AWS environment. SageMaker provides a set of first-party templates for organizations that want to quickly get started with ML workflows and CI/CD. The templates include projects that use AWS-native services for CI/CD, such as AWS CodeBuild, AWS CodePipeline, and AWS CodeCommit. The templates also offer the option to create projects that use third-party tools, such as Jenkins and GitHub. For a list of the project templates that SageMaker provides, see Use SageMaker-Provided Project Templates (p. 3289).

Organizations often need tight control over the MLOps resources that they provision and manage. Such responsibility assumes certain tasks, including configuring IAM roles and policies, enforcing resource tags, enforcing encryption, and decoupling resources across multiple accounts. SageMaker Projects can support all these tasks through custom template offerings where organizations use AWS CloudFormation templates to define the resources needed for an ML workflow. Data Scientists can choose a template to bootstrap and pre-configure their ML workflow. These custom templates are created as AWS Service Catalog products and you can provision them in the Studio UI under Organization Templates. The AWS Service Catalog is a service that helps organizations create and manage catalogs of products that are approved for use on AWS. For more information about creating custom templates, see Build Custom SageMaker Project Templates – Best Practices.

SageMaker Projects can help you manage your Git repositories so that you can collaborate more efficiently across teams, ensure code consistency, and support CI/CD. SageMaker Projects can help you with the following tasks:

- Organize all entities of the ML lifecycle under one project.
- Establish a single-click approach to set up standard ML infrastructure for model training and deployment that incorporates best practices.
- Create and share templates for ML infrastructure to serve multiple use cases.
- Leverage SageMaker-provided pre-built templates to quickly start focusing on model building, or create custom templates with organization-specific resources and guidelines.
- Integrate with tools of your choice by extending the project templates. For an example, see Create a SageMaker Project to integrate with GitLab and GitLab Pipelines.
- Organize all entities of the ML lifecycle under one project.
What is in a SageMaker Project?

Customers have the flexibility to set up their projects with the resources that best serve their use case. The example below showcases the MLOps setup for an ML workflow, including model training and deployment.

A typical project with a SageMaker-provided template might include the following:

- One or more repositories with sample code to build and deploy ML solutions. These are working examples that you can clone locally and modify for your needs. You own this code and can take advantage of the version-controlled repositories for your tasks.
- A SageMaker pipeline that defines steps for data preparation, training, model evaluation, and model deployment, as shown in the following diagram.
- A CodePipeline or Jenkins pipeline that runs your SageMaker pipeline every time you check in a new version of the code. For information about CodePipeline, see What is AWS CodePipeline. For information about Jenkins, see Jenkins User Documentation.

- A model group that contains model versions. Every time you approve the resulting model version from a SageMaker pipeline run, you can deploy it to a SageMaker endpoint.

Each SageMaker project has a unique name and ID that are applied as tags to all of the SageMaker and AWS resources created in the project. With the name and ID, you can view all of the entities associated with your project. These include:

- Pipelines
- Registered models
- Deployed models (endpoints)
- Datasets
- AWS Service Catalog products
- CodePipeline and Jenkins pipelines
- CodeCommit and third-party Git repositories

Do I Need to Create a Project to Use SageMaker Pipelines?

No. SageMaker pipelines are standalone entities just like training jobs, processing jobs, and other SageMaker jobs. You can create, update, and run pipelines directly within a notebook by using the SageMaker Python SDK without using a SageMaker project.

Projects provide an additional layer to help you organize your code and adopt operational best practices that you need for a production-quality system.

SageMaker Studio Permissions Required to Use Projects

Users can view SageMaker provided project templates and create projects with those templates when you grant Projects permissions for users. You can grant these permissions when you onboard or update Amazon SageMaker Studio. There are two permissions to grant.

1. Grant Projects permissions for the Studio administrator to permit the Studio administrator to view the SageMaker-provided templates in the AWS Service Catalog console. The administrator can see what other Studio users create if you grant them permission to use SageMaker projects. The administrator can also view the AWS CloudFormation template that the SageMaker-provided project templates define in the AWS Service Catalog console. For information about using the AWS Service Catalog console, see What Is AWS Service Catalog in the AWS Service Catalog User Guide.

2. Allow Studio users who are configured to use the same execution role as the domain to create projects. This grants Studio users permission to use the SageMaker-provided project templates to create a project from within Studio.

**Important**

Do not manually create your roles. Always create roles through Studio Settings using the steps described in the following procedure.

For users who use any role other than the domain's execution role to view and use SageMaker-provided project templates, you need to grant Projects permissions to the individual user profiles.
The following procedures show how to grant Projects permissions after you onboard to Studio. For more information about onboarding to Studio, see Onboard to Amazon SageMaker Domain (p. 35).

**To grant Projects permissions for the administrator and domain execution role users**

1. Open the SageMaker console.
2. Choose Control Panel.
3. If you choose Quick setup to set up your SageMaker Domain, you have permissions to use project templates by default.
4. If you choose Standard setup to set up your SageMaker Domain, make sure you turn on the following options when you configure Studio settings:
   - Enable Amazon SageMaker project templates and Amazon SageMaker JumpStart for this account
   - Enable Amazon SageMaker project templates and Amazon SageMaker JumpStart for Studio users
   - Create the roles which are needed to use the latest updated AWS Service catalog of products for Projects and JumpStart
5. To confirm that your SageMaker Domain has active project template permissions:
   a. Open the SageMaker console.
   b. Choose Control Panel.
   c. Choose the Settings icon in the upper-right corner of the Domain card.
   d. Choose Studio Settings in the left side panel.
   e. Under Projects and JumpStart, make sure the following options are turned on:
      - Enable Amazon SageMaker project templates and Amazon SageMaker JumpStart for this account
      - Enable Amazon SageMaker project templates and Amazon SageMaker JumpStart for Studio users
      - Create the roles which are needed to use the latest updated AWS Service catalog of products for Projects and JumpStart
6. To view a list of your roles:
   a. Open the SageMaker console.
   b. Choose Control Panel.

A list of your roles appears in the Apps card under Projects.

**Important**
As of July 25, we require additional roles to use project templates. Here is the complete list of roles you should see under Projects:
AmazonSageMakerServiceCatalogProductsLaunchRole
AmazonSageMakerServiceCatalogProductsUseRole
AmazonSageMakerServiceCatalogProductsApiGatewayRole
AmazonSageMakerServiceCatalogProductsCloudformationRole
AmazonSageMakerServiceCatalogProductsCodeBuildRole
AmazonSageMakerServiceCatalogProductsCodePipelineRole
AmazonSageMakerServiceCatalogProductsEventsRole
AmazonSageMakerServiceCatalogProductsFirehoseRole
AmazonSageMakerServiceCatalogProductsGlueRole

3287
Create an MLOps Project using Amazon SageMaker Studio

This procedure demonstrates how to create an MLOps project using Amazon SageMaker Studio.

Prerequisites

- An IAM account or IAM Identity Center to sign in to Studio. For information, see Onboard to Amazon SageMaker Domain (p. 35).
- Permission to use SageMaker-provided project templates. For information, see SageMaker Studio Permissions Required to Use Projects (p. 3286).
- Basic familiarity with the Studio user interface. For information, see Amazon SageMaker Studio UI Overview (p. 118).

To create a project in Studio

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. In the Studio sidebar, choose the SageMaker resources icon (остоячая стрелка).
3. Select Projects from the dropdown list.
4. Choose Create project.

   The Create project tab opens displaying a list of available templates.
5. For SageMaker project templates, choose SageMaker templates. For more information about project templates, see MLOps Project Templates (p. 3288).
6. Choose MLOps template for model building, training, and deployment.
7. Choose Select project template.

   The Create project tab changes to display Project details.
8. Enter the following information:

   - For Project details, enter a name and description for your project.
   - Optionally, add tags, which are key-value pairs that you can use to track your projects.
9. Choose Create project and wait for the project to appear in the Projects list.

MLOps Project Templates

An Amazon SageMaker project template automates the setup and implementation of MLOps for your projects. A SageMaker project template is an AWS Service Catalog product that SageMaker makes available to Amazon SageMaker Studio users. These AWS Service Catalog products are visible in your AWS Service Catalog console after you enable permissions when you onboard or update Amazon SageMaker Studio. For information about enabling permissions to use SageMaker project templates, see SageMaker Studio Permissions Required to Use Projects (p. 3286). Use SageMaker project templates to create a project that is an end-to-end MLOps solution.

If you are an administrator, you can create custom project templates from scratch or modify one of the project templates provided by SageMaker. Studio users in your organization can use these custom project templates to create their projects.
Use SageMaker-Provided Project Templates

Amazon SageMaker provides project templates that create the infrastructure you need to create an MLOps solution for continuous integration and continuous deployment (CI/CD) of ML models. Use these templates to process data, extract features, train and test models, register the models in the SageMaker model registry, and deploy the models for inference. You can customize the seed code and the configuration files to suit your requirements.

**Important**

As of July 25, 2022, we require additional roles to use project templates. For a complete list of required roles and instructions on how to create them, see SageMaker Studio Permissions Required to Use Projects (p. 3286). If you do not have the new roles, you will get the error message `CodePipeline is not authorized to perform AssumeRole on role arn:aws:iam::xxx:role/service-role/AmazonSageMakerServiceCatalogProductsCodePipelineRole` when you try to create a new project and cannot proceed.

SageMaker project templates offer you the following choice of code repositories, workflow automation tools, and pipeline stages:

- **Code repository**: AWS CodeCommit or third-party Git repositories such as GitHub and Bitbucket
- **CI/CD workflow automation**: AWS CodePipeline or Jenkins
- **Pipeline stages**: Model building and training, model deployment, or both

The following discussion provides an overview of each template you can choose when you create your SageMaker project. You can also view the available templates in Studio by following Step 1: Create the Project of the Project walkthrough.

For step-by-step instructions on how to create a real project, you can follow one of the project walkthroughs:

- If you want to use the template MLOps template for model building, training, and deployment (p. 3290), see SageMaker MLOps Project Walkthrough (p. 3300).
- If you want to use the template MLOps template for model building, training, and deployment with third-party Git repositories using CodePipeline (p. 3293), see SageMaker MLOps Project Walkthrough Using Third-party Git Repos (p. 3305).
- If you want to use the template MLOps template for model building, training, and deployment with third-party Git repositories using Jenkins (p. 3294), see Create Amazon SageMaker projects using third-party source control and Jenkins.

**Topics**

- MLOps template for model building, training, and deployment (p. 3290)
- MLOps template for model building, training, deployment, and Amazon SageMaker Model Monitor (p. 3292)
- MLOps template for image building, model building, and model deployment (p. 3293)
- MLOps template for model building, training, and deployment with third-party Git repositories using CodePipeline (p. 3293)
- MLOps template for model building, training, and deployment with third-party Git repositories using Jenkins (p. 3294)
MLOps template for model building, training, and deployment

This template is a combination of the following two templates, each of which can be used independently, and contains all of the resources provided in those templates.

- **Code repository**: AWS CodeCommit
- **CI/CD workflow automation**: AWS CodePipeline

**MLOps template for model building and training**

Use this template when you want an MLOps solution to process data, extract features, train and test models, and register the models in the SageMaker model registry.

This template provides the following resources:

- An AWS CodeCommit repository that contains sample code that creates an Amazon SageMaker Model Building Pipelines pipeline in Python code and shows how to create and update the SageMaker pipeline. This repository also has a Python Jupyter Notebook that you can open and run in Studio.

- An AWS CodePipeline pipeline that has source and build steps. The source step points to the CodeCommit repository. The build step gets the code from that repository, creates and updates the SageMaker pipeline, starts a pipeline execution, and waits for the pipeline execution to complete.

- An Amazon S3 bucket to store artifacts, including CodePipeline and CodeBuild artifacts, and any artifacts generated from the SageMaker pipeline runs.

The following diagram illustrates the workflow and AWS resources used by this template to help you build and train your models.
MLOps template for model deployment

Use this template to automate the deployment of models in the SageMaker model registry to SageMaker endpoints for real-time inference. This template recognizes changes in the model registry. When a new model version is registered and approved, it automatically initiates a deployment.

The template provisions a CodeCommit repository with configuration files to specify the model deployment steps, AWS CloudFormation templates to define endpoints as infrastructure, and seed code for testing the endpoint.

This template provides the following resources:

- An AWS CodeCommit repository that contains sample code that deploys models to endpoints in staging and production environments.
- An AWS CodePipeline pipeline that has source, build, deploy-to-staging, and deploy-to-production steps. The source step points to the CodeCommit repository, and the build step gets the code from that repository and generates CloudFormation stacks to deploy. The deploy-to-staging and deploy-to-production steps deploy the CloudFormation stacks to their respective environments. There is a manual approval step between the staging and production build steps, so that a MLOps engineer must approve the model before it is deployed to production.

There is also a programmatic approval step with placeholder tests in the example code in the CodeCommit repository. You can add additional tests to replace the placeholders tests.

- An Amazon S3 bucket to store artifacts, including CodePipeline and CodeBuild artifacts, and any artifacts generated from the SageMaker pipeline runs.
- A CloudWatch event to initiate the pipeline when a model package version is approved or rejected.

The following diagram illustrates the workflow and AWS resources used by this template to help you deploy your models.
As previously mentioned, see Project Walkthrough for a demonstration that uses this template to create a real project.

MLOps template for model building, training, deployment, and Amazon SageMaker Model Monitor

This template is an extension of the MLOps template for model building, training, and deployment. It includes both the model building, training, and deployment components of the template, and an additional Amazon SageMaker Model Monitor template that provides the following types of monitoring:

- **Data Quality** – Monitor drift in data quality.
- **Model Quality** – Monitor drift in model quality metrics, such as accuracy.
- **Bias Drift for Models in Production** – Monitor bias in a model's predictions.

- **Code repository**: AWS CodeCommit
- **CI/CD workflow automation**: AWS CodePipeline

MLOps template for Amazon SageMaker Model Monitor

You can use this template for an MLOps solution to deploy one or more of the Amazon SageMaker data quality, model quality, model bias, and model explainability monitors to monitor a deployed model on a SageMaker inference endpoint.

This template provides the following resources:
• An AWS CodeCommit repository that contains sample Python code that gets the baselines used by the monitors from the SageMaker Model Registry, and updates the template’s parameters for the staging and production environments. It also contains a AWS CloudFormation template to create the Amazon SageMaker Model Monitors.

• An AWS CodePipeline pipeline that has source, build, and deploy steps. The source step points to the CodePipeline repository. The build step gets the code from that repository, gets the baseline from the Model Registry, and updates template parameters for the staging and production environments. The deploy steps deploy the configured monitors into the staging and production environments. The manual approval step, within the DeployStaging stage, requires you to verify that the production SageMaker endpoint is InService before approving and moving to the DeployProd stage.

• The template uses the same S3 bucket created by the MLOps template for model building, training, and deployment to store the monitors’ outputs.

• Two Amazon EventBridge events rules initiate the Amazon SageMaker Model Monitor AWS CodePipeline every time the staging SageMaker endpoint is updated, or a code change is committed to the CodePipeline repository.

MLOps template for image building, model building, and model deployment

This template is an extension of the MLOps template for model building, training, and deployment (p. 3290). It includes both the model building, training, and deployment components of that template and the following options:

• Include processing image–building pipeline
• Include training image–building pipeline
• Include inference image–building pipeline

For each of the components selected during project creation, the following are created by using the template:

• An Amazon ECR repository
• A SageMaker Image
• A CodeCommit repository containing a Dockerfile that you can customize
• A CodePipeline that is initiated by changes to the CodePipeline repository
• A CodeBuild project that builds a Docker image and registers it in the Amazon ECR repository
• An EventBridge rule that initiates the CodePipeline on a schedule

When the CodePipeline is initiated, it builds a new Docker container and registers it with an Amazon ECR repository. When a new container is registered with the Amazon ECR repository, a new ImageVersion is added to the SageMaker image. This initiates the model building pipeline, which in turn initiates the deployment pipeline.

The newly created image is used in the model building, training, and deployment portions of the workflow where applicable.

MLOps template for model building, training, and deployment with third-party Git repositories using CodePipeline

• Code repository: Third-party Git. Establish the AWS CodeStar connection from your AWS account to your GitHub user or organization. Add a tag with the key sagemaker and value true to this AWS CodeStar connection.
• CI/CD workflow automation: AWS CodePipeline
This template provides the following resources:

- Associations with one or more customer-specified Git repositories.
- An AWS CodePipeline pipeline that has source, build, deploy-to-staging, and deploy-to-production steps. The source step points to the third-party Git repository and the build step gets the code from that repository and generates CloudFormation stacks to deploy. The deploy-to-staging and deploy-to-production steps deploy the CloudFormation stacks to their respective environments. There is a manual approval step between the staging and production build steps, so that a MLOps engineer must approve the model before it is deployed to production.
- An AWS CodeBuild project to populate the Git repositories with the seed code information. This requires an AWS CodeStar connection from your AWS account to your account on the Git repository host.
- An Amazon S3 bucket to store artifacts, including CodePipeline and CodeBuild artifacts, and any artifacts generated from the SageMaker pipeline runs.

As previously mentioned, see Project Walkthrough Using Third-party Git Repos for a demonstration that uses this template to create a real project.

**MLOps template for model building, training, and deployment with third-party Git repositories using Jenkins**

- **Code repository**: Third-party Git. Establish the AWS CodeStar connection from your AWS account to your GitHub user or organization. Add a tag with the key `sagemaker` and value `true` to this AWS CodeStar connection.
- **CI/CD workflow automation**: Jenkins

This template provides the following resources:

- Associations with one or more customer-specified Git repositories.
- Seed code to generate Jenkins pipelines that have source, build, deploy-to-staging, and deploy-to-production steps. The source step points to the customer-specified Git repository. The build step gets the code from that repository and generates two CloudFormation stacks. The deploy steps deploy the CloudFormation stacks to their respective environments. There is an approval step between the staging step and the production step.
- An AWS CodeBuild project to populate the Git repositories with the seed code information. This requires an AWS CodeStar connection from your AWS account to your account on the Git repository host.
- An Amazon S3 bucket to store artifacts of the SageMaker project and SageMaker pipeline.

The template creates the association between your project and the source control repositories, but you need to perform additional manual steps to establish communication between your AWS account and Jenkins. For the detailed steps, see Create Amazon SageMaker projects using third-party source control and Jenkins.

The instructions help you build the architecture shown in the following diagram, with GitHub as the source control repository in this example. As shown, you are attaching your Git repository to the project to check in and manage code versions. Jenkins initiates the model build pipeline when it detects changes to the model build code in the Git repository. You are also connecting the project to Jenkins to orchestrate your model deployment steps, which start when you approve the model registered in the model registry, or when Jenkins detects changes to the model deployment code.
In summary, the steps guide you through the following tasks:

1. Establish the connection between your AWS and GitHub accounts.
2. Create the Jenkins account and import needed plugins.
3. Create the Jenkins IAM user and permissions policy.
4. Set the AWS credentials for the Jenkins IAM user on your Jenkins server.
5. Create an API token for communication with your Jenkins server.
6. Use a CloudFormation template to set up an EventBridge rule to monitor the model registry for newly-approved models.
7. Create the SageMaker project, which seeds your GitHub repositories with model build and deploy code.
8. Create your Jenkins model build pipeline with the model build seed code.
9. Create your Jenkins model deploy pipeline with the model deploy seed code.

Update SageMaker Projects to Use Third-Party Git Repositories

The managed policy attached to the AmazonSageMakerServiceCatalogProductsUseRole role was updated on July 27, 2021 for use with the third-party Git templates. Users who onboard to Amazon SageMaker Studio after this date and enable project templates use the new policy. Users who onboarded prior to this date must update the policy to use these templates. Use one of the following options to update the policy:

- Delete role and toggle Studio settings
  1. In the IAM console, delete AmazonSageMakerServiceCatalogProductsUseRole.
  2. In the Studio control panel, choose Edit Settings.
  3. Toggle both settings and then choose Submit.
- In the IAM console, add the following permissions to AmazonSageMakerServiceCatalogProductsUseRole:

```json
{
    "Effect": "Allow",
    "Action": [
        "codestar-connections:UseConnection"
    ],
    "Resource": "arn:aws:codestar-connections:*:*:connection/**",
    "Condition": {
        "StringEqualsIgnoreCase": {
```
Create Custom Project Templates

If the SageMaker-provided templates do not meet your needs (for example, you want to have more complex orchestration in the CodePipeline with multiple stages or custom approval steps), create your own templates.

We recommend starting by using SageMaker-provided templates to understand how to organize your code and resources and build on top of it. To do this, after you enable administrator access to the SageMaker templates, log in to the https://console.aws.amazon.com/servicecatalog/, choose Portfolios, then choose Imported. For information about AWS Service Catalog, see Overview of AWS Service Catalog in the AWS Service Catalog User Guide.

Create your own project templates to customize your MLOps project. SageMaker project templates are AWS Service Catalog–provisioned products to provision the resources for your MLOps project.

To create a custom project template, complete the following steps.

1. Create a portfolio. For information, see Step 3: Create an AWS Service Catalog Portfolio.
2. Create a product. A product is a CloudFormation template. You can create multiple versions of the product. For information, see Step 4: Create an AWS Service Catalog Product.

For the product to work with SageMaker projects, add the following parameters to your product template.

```
SageMakerProjectName:
  Type: String
  Description: Name of the project

SageMakerProjectId:
  Type: String
  Description: Service generated Id of the project.
```

**Important**

We recommend that you wrap the CodeCommit repository into the SageMaker code repository for the project's repositories to be visible in VPC mode. The sample template and required addition are shown in the following code samples.

Original (sample) template:

```
ModelBuildCodeCommitRepository:
  Type: AWS::CodeCommit::Repository
  Properties:
    # Max allowed length: 100 chars
    RepositoryName: !Sub sagemaker-${SageMakerProjectName}-${SageMakerProjectId}-modelbuild # max: 10+33+15+10=68
```

3296
RepositoryDescription: !Sub SageMaker Model building workflow infrastructure as code for the Project ${SageMakerProjectName}

Code:

S3:
  Bucket: !Sub ${SEEDCODE_BUCKETNAME}
  Key: toolchain/model-building-workflow-v1.0.zip
  BranchName: main

Additional content to add in VPC mode:

SageMakerRepository:
  Type: AWS::SageMaker::CodeRepository
  Properties:
    GitConfig:
      RepositoryUrl: !GetAtt ModelBuildCodeCommitRepository.CloneUrlHttp
      Branch: main

3. Add a launch constraint. A launch constraint designates an IAM role that AWS Service Catalog assumes when a user launches a product. For information, see [Step 6: Add a Launch Constraint to Assign an IAM Role](#).

4. Provision the product on [https://console.aws.amazon.com/servicecatalog/](https://console.aws.amazon.com/servicecatalog/) to test the template. If you are satisfied with your template, continue to the next step to make the template available in Studio.

5. Grant access to the AWS Service Catalog portfolio that you created in step 1 to your Studio execution role. Use either the Studio domain execution role or a user role that has Studio access. For information about adding a role to the portfolio, see [Step 7: Grant End Users Access to the Portfolio](#).

6. To make your project template available in your Organization templates list in Studio, create a tag with the following key and value to the AWS Service Catalog product you created in step 2.

   • **key**: sagemaker:studio-visibility
   • **value**: true

After you complete these steps, Studio users in your organization can create a project with the template you created by following the steps in [Create an MLOps Project using Amazon SageMaker Studio](#) and choosing Organization templates when you choose a template.

### View Project Resources

After you create a project, view the resources associated with the project in Amazon SageMaker Studio.

#### To create a project in Studio

1. Sign in to Studio. For more information, see [Onboard to Amazon SageMaker Domain](#).
2. Choose SageMaker Resources, and then choose Projects.
3. Double-click the name of the project for which you want to view details.

   A tab with the project details appears.

On the project details tab, you can view the following entities associated with the project.

- **Repositories**: Code repositories (repos) associated with this project. If you use a SageMaker-provided template when you create your project, it creates a AWS CodeCommit repo or a third-party Git repo. For more information about CodeCommit, see [What is AWS CodeCommit](#).
- **Pipelines**: SageMaker ML pipelines that define steps to prepare data, train, and deploy models. For information about SageMaker ML pipelines, see [Create and Manage SageMaker Pipelines](#).
• Experiments: One or more Amazon SageMaker Autopilot experiments associated with the project. For information about Autopilot, see Automate model development with Amazon SageMaker Autopilot (p. 318).

• Model groups: Groups of model versions that were created by pipeline executions in the project. For information about model groups, see Create a Model Group (p. 2983).

• Endpoints: SageMaker endpoints that host deployed models for real-time inference. When a model version is approved, it is deployed to an endpoint.

• Settings: Settings for the project. This includes the name and description of the project, information about the project template and SourceModelPackageGroupName, and metadata about the project.

Update an MLOps Project in Amazon SageMaker Studio

This procedure demonstrates how to update an MLOps project in Amazon SageMaker Studio. You can update the Description, template version, and template parameters.

Prerequisites

• An IAM account or IAM Identity Center to sign in to Studio. For information, see Onboard to Amazon SageMaker Domain (p. 35).

• Basic familiarity with the Studio user interface. For information, see Amazon SageMaker Studio UI Overview (p. 118).

• Add the following custom inline policies to the specified roles:

User-created role having AmazonSageMakerFullAccess

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action":[
            "servicecatalog:CreateProvisionedProductPlan",
            "servicecatalog:DescribeProvisionedProductPlan",
            "servicecatalog:DeleteProvisionedProductPlan"
         ],
         "Resource": "*"
      }
   ]
}
```

AmazonSageMakerServiceCatalogProductsLaunchRole

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "cloudformation:CreateChangeSet",
            "cloudformation:DeleteChangeSet",
            "cloudformation:DescribeChangeSet"
         ],
         "Resource": "arn:aws:cloudformation:*:*:stack/SC-*"
      },
      {
```
"Effect": "Allow",
"Action": [
   "codecommit:PutRepositoryTriggers"
],
"Resource": "arn:aws:codecommit:*:*:sagemaker-*"
"

To update a project in Studio

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. In the Studio sidebar, choose the SageMaker resources icon (🔍).
3. Select Projects from the dropdown list.
   A list of your projects appears.
4. You can open the Project update dialog box in one of the following ways:
   a. You can open it from the projects list.
      Right-click the target project and choose Update from the dropdown list.
   b. You can open it from the project tab.
      i. Double-click the project in the projects list.
      ii. Choose Update from the Actions menu in the upper-right corner of the project tab.
5. In the Update project dialog box, you can edit the Description, template version, and template parameters.
6. Choose Show Diff.
   A dialog box displays your original and updated project settings. Any change in your project settings can modify or delete resources in the current project. The dialog box displays these changes as well.
7. You may need to wait a few minutes for the Update button to become active. Choose Update.
8. The project update may take a few minutes to complete. Select Settings in the project tab and ensure the parameters have been updated correctly.

Delete an MLOps Project using Amazon SageMaker Studio

This procedure demonstrates how to delete an MLOps project using Amazon SageMaker Studio.

Prerequisites

Note
You can only delete projects in Studio that you have created. This condition is part of the service catalog permission servicecatalog:TerminateProvisionedProduct in the AmazonSageMakerFullAccess policy. If needed, you can update this policy to remove this condition.

• An IAM account or IAM Identity Center to sign in to Studio. For information, see Onboard to Amazon SageMaker Domain (p. 35).
• Basic familiarity with the Studio user interface. For information, see Amazon SageMaker Studio UI Overview (p. 118).
To delete a project in Amazon SageMaker Studio

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. In the Studio sidebar, choose the SageMaker resources icon ( ).
3. Select Projects from the dropdown list.
4. Select the target project from the dropdown list. If you don't see your project, type the project name and apply the filter to find your project.
5. **You can delete a Studio project in one of the following ways:**
   a. You can delete the project from the projects list.
      Right-click the target project and choose **Delete** from the dropdown list.
      **Note**
      This functionality is supported in Studio version v3.17.1 or higher. For more information, see Shut down and Update SageMaker Studio (p. 179).
   b. You can delete a project from the Project details section.
      i. Once you've found your project, double-click it to view its details.
      ii. Choose **Delete** from the Actions menu.
6. Confirm your choice by choosing Delete from the Delete Project window.

**SageMaker MLOps Project Walkthrough**

This walkthrough uses the template MLOps template for model building, training, and deployment (p. 3290) to demonstrate using MLOps projects to create a CI/CD system to build, train, and deploy models.

**Prerequisites**

To complete this walkthrough, you need:

- An IAM account or IAM Identity Center to sign in to Studio. For information, see Onboard to Amazon SageMaker Domain (p. 35).
- Permission to use SageMaker-provided project templates. For information, see SageMaker Studio Permissions Required to Use Projects (p. 3286).
- Basic familiarity with the Studio user interface. For information, see Amazon SageMaker Studio UI Overview (p. 118).

**Topics**

- Step 1: Create the Project (p. 3300)
- Step 2: Clone the Code Repository (p. 3301)
- Step 3: Make a Change in the Code (p. 3302)
- Step 4: Approve the Model (p. 3304)
- (Optional) Step 5: Deploy the Model Version to Production (p. 3304)
- Step 6: Clean Up Resources (p. 3304)

**Step 1: Create the Project**

In this step, you create a SageMaker MLOps project by using a SageMaker-provided project template to build, train, and deploy models.
To create the SageMaker MLOps project

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. Choose SageMaker resources, and then select Projects from the dropdown list.
3. Choose Create project.

   The Create project tab appears.
4. For SageMaker project templates, choose Organization templates, then choose MLOps template for model building, training, and deployment.
5. For Project details, enter a name and description for your project.

When the project appears in the Projects list with a Status of Created, move on to the next step.

Important
As of July 25, 2022, we require additional roles to use project templates. If you see the error message CodePipeline is not authorized to perform AssumeRole on role arn:aws:iam::xxx:role/service-role/AmazonSageMakerServiceCatalogProductsCodePipelineRole, see Steps 5-6 of SageMaker Studio Permissions Required to Use Projects (p. 3286) for a complete list of required roles and instructions on how to create them.

Step 2: Clone the Code Repository

After you create the project, two CodeCommit repositories are created in the project. One of the repositories contains code to build and train a model, and one contains code to deploy the model. In this step, you clone the repository to your local SageMaker project that contains the code to build and train the model to the local Studio environment so that you can work with the code.

To clone the code repository

1. Choose SageMaker resources, and then select Projects from the dropdown list.
2. Find the name of the project you created in the previous step and double-click on it to open the project tab for your project.
3. In the project tab, choose Repositories, and in the Local path column for the repository that ends with modelbuild, choose clone repo....
4. In the dialog box that appears, accept the defaults and choose Clone repository.
When clone of the repository is complete, the local path appears in the **Local path** column. Choose the path to open the local folder that contains the repository code in Studio.

**Step 3: Make a Change in the Code**

Now make a change to the pipeline code that builds the model and check in the change to initiate a new pipeline run. The pipeline run registers a new model version.

**To make a code change**

1. In Studio, choose the file browser icon (folder), and navigate to the pipelines/abalone folder. Double-click pipeline.py to open the code file.
2. In the pipeline.py file, find the line that sets the training instance type.

   ```python
   training_instance_type = ParameterString(
       name="TrainingInstanceType", default_value="ml.m5.xlarge"
   )
   ``

   Change `ml.m5.xlarge` to `ml.m5.large`, then type Ctrl+S to save the change.
3. Choose the **Git** icon (git). Stage, commit, and push the change in pipeline.py. For information about using Git in Studio, see [Clone a Git Repository in SageMaker Studio](#).
After pushing your code change, the MLOps system initiates a run of the pipeline that creates a new model version. In the next step, you approve the new model version to deploy it to production.

**Step 4: Approve the Model**

Now you approve the new model version that was created in the previous step to initiate a deployment of the model version to a SageMaker endpoint.

**To approve the model version**

1. Choose SageMaker resources, and then select Projects from the dropdown list.
2. Find the name of the project you created in the first step and double-click on it to open the project tab for your project.
3. In the project tab, choose Model groups, then double-click the name of the model group that appears.
5. In the model Update model version status dialog box, in the Status dropdown list, select Approve, then choose Update status.

Approving the model version causes the MLOps system to deploy the model to staging. To view the endpoint, choose the Endpoints tab on the project tab.

**(Optional) Step 5: Deploy the Model Version to Production**

Now you can deploy the model version to the production environment.

**Note**

To complete this step, you need to be an administrator in your Studio domain. If you are not an administrator, skip this step.

**To deploy the model version to the production environment**

1. Log in to the CodePipeline console at https://console.aws.amazon.com/codepipeline/
2. Choose Pipelines, then choose the pipeline with the name sagemaker-projectname-projectid-modeldeploy, where projectname is the name of your project, and projectid is the ID of your project.
3. In the DeployStaging stage, choose Review.
4. In the Review dialog box, choose Approve.

Approving the DeployStaging stage causes the MLOps system to deploy the model to production. To view the endpoint, choose the Endpoints tab on the project tab in Studio.

**Step 6: Clean Up Resources**

To stop incurring charges, clean up the resources that were created in this walkthrough. To do this, complete the following steps.

**Note**

To delete the AWS CloudFormation stack and the Amazon S3 bucket, you need to be an administrator in Studio. If you are not an administrator, ask your administrator to complete those steps.

1. In the Studio sidebar, choose the SageMaker resources icon (✔).
2. Choose Projects from the dropdown list.
3. Select the target project from the dropdown list. If you don't see your project, type the project name and apply the filter to find your project.
4. You can delete a Studio project in one of the following ways:
   a. You can delete the project from the projects list.
      
      Right-click the target project and choose Delete from the dropdown list.
      
      Note
      This functionality is supported in Studio version v3.17.1 or higher. For more information, see Shut down and Update SageMaker Studio (p. 179).
   b. You can delete a project from the Project details section.
      
      i. When you've found your project, double-click it to view its details in the main panel.
      ii. Choose Delete from the Actions menu.
5. Confirm your choice by choosing Delete from the Delete Project window.
   
   This deletes the AWS Service Catalog provisioned product that the project created. This includes the CodeCommit, CodePipeline, and CodeBuild resources created for the project.
6. Delete the AWS CloudFormation stacks that the project created. There are two stacks, one for staging and one for production. The names of the stacks are sagemaker-projectname-project-id-deploy-staging and sagemaker-projectname-project-id-deploy-prod, where projectname is the name of your project, and project-id is the ID of your project.
   
   For information about how to delete a AWS CloudFormation stack, see Deleting a stack on the AWS CloudFormation console in the AWS CloudFormation User Guide.
7. Delete the Amazon S3 bucket that the project created. The name of the bucket is sagemaker-project-project-id, where project-id is the ID of your project.

SageMaker MLOps Project Walkthrough Using Third-party Git Repos

This walkthrough uses the template MLOps template for model building, training, and deployment with third-party Git repositories using CodePipeline (p. 3293) to demonstrate how to use MLOps projects to create a CI/CD system to build, train, and deploy models.

Prerequisites

To complete this walkthrough, you need:

- An IAM or IAM Identity Center account to sign in to Studio. For information, see Onboard to Amazon SageMaker Domain (p. 35).
- Permission to use SageMaker-provided project templates. For information, see SageMaker Studio Permissions Required to Use Projects (p. 3286).
- Basic familiarity with the Studio user interface. For information, see Amazon SageMaker Studio UI Overview (p. 118).
- Two GitHub repositories initialized with a README. You input these repositories into the project template, which will seed these repos with model build and deploy code.

Topics

- Step 1: Set up the GitHub connection (p. 3306)
- Step 2: Create the Project (p. 3306)
• Step 3: Make a Change in the Code (p. 3307)
• Step 4: Approve the Model (p. 3307)
• (Optional) Step 5: Deploy the Model Version to Production (p. 3308)
• Step 6: Clean Up Resources (p. 3308)

Step 1: Set up the GitHub connection

In this step, you connect to your GitHub repositories using an AWS CodeStar connection. The SageMaker project uses this connection to access your source code repositories.

To set up the GitHub connection:
1. Log in to the CodePipeline console at https://console.aws.amazon.com/codepipeline/
2. Under Settings in the navigation pane, choose Connections.
3. Choose Create connection.
4. For Select a provider, select GitHub.
5. For Connection name, enter a name.
6. Choose Connect to GitHub.
7. If the AWS Connector GitHub app isn't previously installed, choose Install new app.
   This displays a list of all the GitHub personal accounts and organizations to which you have access.
8. Choose the account where you want to establish connectivity for use with SageMaker projects and GitHub repositories.
9. Choose Configure.
10. You can optionally select your specific repositories or choose All repositories.
11. Choose Save. When the app is installed, you're redirected to the Connect to GitHub page and the installation ID is automatically populated.
12. Choose Connect.
13. Add a tag with the key sagemaker and value true to this AWS CodeStar connection.
14. Copy the connection ARN to save for later. You use the ARN as a parameter in the project creation step.

Step 2: Create the Project

In this step, you create a SageMaker MLOps project by using a SageMaker-provided project template to build, train, and deploy models.

To create the SageMaker MLOps project
1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. Choose SageMaker resources, and then select Projects from the dropdown list.
3. Choose Create project.
   The Create project tab appears.
4. For SageMaker project templates, choose MLOps template for model building, training, and deployment with third-party Git repositories.
5. Choose Select project template.
6. Under ModelBuild CodeRepository Info, provide the following parameters:
• For **URL**, enter the URL of your Git repository for the model build code in https://*git-url*.git format.

• For **Branch**, enter the branch to use from your Git repository for pipeline activities.

• For **Full Repository Name**, enter the Git repository name in the format of *username/repository name* or *organization/repository name*.

• For **Codestar Connection ARN**, enter the ARN of the AWS CodeStar connection you created in Step 1.

• The **Sample Code** toggle switch lets you choose whether to populate the repository with model build seed code. We can leave it on for this demo.

7. Under **ModelDeploy CodeRepository Info**, provide the following parameters:

• For **URL**, enter the URL of your Git repository for the model deploy code in https://*git-url*.git format.

• For **Branch**, enter the branch to use from your Git repository for pipeline activities.

• For **Full Repository Name**, enter the Git repository name in the format of *username/repository name* or *organization/repository name*.

• For **Codestar Connection ARN**, enter the ARN of the AWS CodeStar connection you created in Step 1.

• The **Sample Code** toggle switch lets you choose whether to populate the repository with model deployment seed code. We can leave it on for this demo.

8. Choose **Create Project**.

The project appears in the **Projects** list with a **Status** of **Created**.

**Step 3: Make a Change in the Code**

Now make a change to the pipeline code that builds the model and commit the change to initiate a new pipeline run. The pipeline run registers a new model version.

**To make a code change**

1. In your model build GitHub repo, navigate to the pipelines/abalone folder. Double-click **pipeline.py** to open the code file.

2. In the **pipeline.py** file, find the line that sets the training instance type.

   ```python
   training_instance_type = ParameterString(
       name="TrainingInstanceType", default_value="ml.m5.xlarge"
   )
   ```

   Open the file for editing, change `ml.m5.xlarge` to `ml.m5.large`, then commit.

After you commit your code change, the MLOps system initiates a run of the pipeline that creates a new model version. In the next step, you approve the new model version to deploy it to production.

**Step 4: Approve the Model**

Now you approve the new model version that was created in the previous step to initiate a deployment of the model version to a SageMaker endpoint.

**To approve the model version**

1. Choose **SageMaker resources**, and then select **Projects** from the dropdown list.
2. Find the name of the project you created in the first step and double-click on it to open the project tab for your project.

3. In the project tab, choose **Model groups**, then double-click the name of the model group that appears.

   The model group tab appears.

4. In the model group tab, double-click **Version 2**. The **Version 2** tab opens. Choose **Update status**.

5. In the model **Update model version status** dialog box, in the **Status** dropdown list, select **Approve** and then choose **Update status**.

   Approving the model version causes the MLOps system to deploy the model to staging. To view the endpoint, choose the **Endpoints** tab on the project tab.

### (Optional) Step 5: Deploy the Model Version to Production

Now you can deploy the model version to the production environment.

**Note**
To complete this step, you need to be an administrator in your Studio domain. If you are not an administrator, skip this step.

**To deploy the model version to the production environment**

1. Log in to the CodePipeline console at [https://console.aws.amazon.com/codepipeline/](https://console.aws.amazon.com/codepipeline/)

2. Choose **Pipelines**, then choose the pipeline with the name `sagemaker-projectname-projectid-modeldeploy`, where `projectname` is the name of your project, and `projectid` is the ID of your project.

3. In the **DeployStaging** stage, choose **Review**.

4. In the **Review** dialog box, choose **Approve**.

   Approving the **DeployStaging** stage causes the MLOps system to deploy the model to production. To view the endpoint, choose the **Endpoints** tab on the project tab in Studio.

### Step 6: Clean Up Resources

To stop incurring charges, clean up the resources that were created in this walkthrough.

**Note**
To delete the AWS CloudFormation stack and the Amazon S3 bucket, you need to be an administrator in Studio. If you are not an administrator, ask your administrator to complete those steps.

1. In the Studio sidebar, choose the **SageMaker resources** icon (🔍).

2. Choose **Projects** from the dropdown list.

3. Select the target project from the dropdown list. If you don’t see your project, type the project name and apply the filter to find your project.

4. **You can delete a Studio project in one of the following ways:**

   a. **You can delete the project from the projects list.**

      Right-click the target project and choose **Delete** from the dropdown list.

      **Note**
      This functionality is supported in Studio version v3.17.1 or higher. For more information, see [Shut down and Update SageMaker Studio](p. 179).
b. **You can delete a project from the Project details section.**
   i. When you've found your project, double-click it to view its details in the main panel.
   ii. Choose **Delete** from the **Actions** menu.

5. Confirm your choice by choosing **Delete** from the **Delete Project** window.

This deletes the AWS Service Catalog provisioned product that the project created. This includes the CodeCommit, CodePipeline, and CodeBuild resources created for the project.

6. Delete the AWS CloudFormation stacks that the project created. There are two stacks, one for staging and one for production. The names of the stacks are `sagemaker-projectname-project-id-deploy-staging` and `sagemaker-projectname-project-id-deploy-prod`, where `projectname` is the name of your project, and `project-id` is the ID of your project.

   For information about how to delete a AWS CloudFormation stack, see Deleting a stack on the AWS CloudFormation console in the **AWS CloudFormation User Guide**.

7. Delete the Amazon S3 bucket that the project created. The name of the bucket is `sagemaker-project-project-id`, where `project-id` is the ID of your project.

---

**Amazon SageMaker ML Lineage Tracking**

Amazon SageMaker ML Lineage Tracking creates and stores information about the steps of a machine learning (ML) workflow from data preparation to model deployment. With the tracking information, you can reproduce the workflow steps, track model and dataset lineage, and establish model governance and audit standards.

With SageMaker Lineage Tracking data scientists and model builders can do the following:

- Keep a running history of model discovery experiments.
- Establish model governance by tracking model lineage artifacts for auditing and compliance verification.

**Topics**

- Lineage Tracking Entities (p. 3310)
- Amazon SageMaker–Created Tracking Entities (p. 3312)
- Manually Create Tracking Entities (p. 3314)
- Querying Lineage Entities (p. 3317)
- Cross-Account Lineage Tracking (p. 3323)

The following diagram shows an example lineage graph that Amazon SageMaker automatically creates in an end-to-end model training and deployment ML workflow.
Tracking entities maintain a representation of all the elements of your end-to-end machine learning workflow. You can use this representation to establish model governance, reproduce your workflow, and maintain a record of your work history.

Amazon SageMaker automatically creates tracking entities for trial components and their associated trials and experiments when you create SageMaker jobs such as processing jobs, training jobs, and batch transform jobs. In additional to auto tracking, you can also manually create tracking entities to model custom steps in your workflow. For more information, see Manage Machine Learning with Amazon SageMaker Experiments (p. 2231).

SageMaker also automatically creates tracking entities for the other steps in a workflow so you can track the workflow from end to end. For more information, see Amazon SageMaker–Created Tracking Entities (p. 3312).

You can create additional entities to supplement those created by SageMaker. For more information, see Manually Create Tracking Entities (p. 3314).

SageMaker reuses any existing entities rather than creating new ones. For example, there can be only one artifact with a unique SourceUri.
Key concepts for querying lineage

- **Lineage** – Metadata that tracks the relationships between various entities in your ML workflows.
- **QueryLineage** – The action to inspect your lineage and discover relationships between entities.
- **Lineage entities** – The metadata elements of which your lineage is composed.
- **Cross-account lineage** – Your ML workflow may span more than one account. With cross-account lineage, you can configure multiple accounts to automatically create lineage associations between shared entity resources. QueryLineage then can return entities even from these shared accounts.

The following tracking entities are defined:

**Experiment entities**

- **Trial component** – A stage of a machine learning trial. Includes processing jobs, training jobs, and batch transform jobs.
- **Trial** – A combination of trial components that generally produces a model.
- **Experiment** – A grouping of trials generally focused on solving a specific use case.

**Lineage entities**

- **Trial Component** – Represents processing, training, and transform jobs in the lineage. Also part of experiment management.
- **Context** – Provides a logical grouping of other tracking or experiment entities. Conceptually, experiments and trials are contexts. Some examples are an endpoint and a model package.
- **Action** – Represents an action or activity. Generally, an action involves at least one input artifact or output artifact. Some examples are a workflow step and a model deployment.
- **Artifact** – Represents a URI addressable object or data. An artifact is generally either an input or an output to a trial component or action. Some examples include a dataset (S3 bucket URI), or an image (Amazon ECR registry path).
- **Association** – Links other tracking or experiment entities, such as an association between the location of training data and a training job.

An association has an optional **AssociationType** property. The following values are available along with the suggested use for each type. SageMaker places no restrictions on their use:

- **ContributedTo** – The source contributed to the destination or had a part in enabling the destination. For example, the training data contributed to the training job.
- **AssociatedWith** – The source is connected to the destination. For example, an approval workflow is associated with a model deployment.
- **DerivedFrom** – The destination is a modification of the source. For example, a digest output of a channel input for a processing job is derived from the original inputs.
- **Produced** – The source generated the destination. For example, a training job produced a model artifact.
- **SameAs** – When the same lineage entity used in different accounts.

**Common properties**

- **Type property**

  The action, artifact, and context entities have a **type** property, **ActionType**, **ArtifactType**, and **ContextType**, respectively. This property is a custom string which can associate meaningful information with the entity and be used as a filter in the List APIs.
• **Source property**

The action, artifact, and context entities have a Source property. This property provides the underlying URI that the entity represents. Some examples are:
- An UpdateEndpoint action where the source is the EndpointArn.
- An image artifact for a processing job where the source is the ImageUri.
- An Endpoint context where the source is the EndpointArn.

• **Metadata property**

The action and artifact entities have an optional Metadata property which can provide the following information:
- ProjectId – For example, the ID of the SageMaker MLOps project to which a model belongs.
- GeneratedBy – For example, the SageMaker pipeline execution that registered a model package version.
- Repository – For example, the repository that contains an algorithm.
- CommitId – For example, the commit ID of an algorithm version.

### Amazon SageMaker–Created Tracking Entities

Amazon SageMaker automatically creates tracking entities for SageMaker jobs, models, model packages, and endpoints if the data is available. There is no limit to the number of lineage entities created by SageMaker.

For information on how you can manually create tracking entities, see [Manually Create Tracking Entities](p. 3314).

**Topics**
- Tracking Entities for SageMaker Jobs (p. 3312)
- Tracking Entities for Model Packages (p. 3313)
- Tracking Entities for Endpoints (p. 3313)

### Tracking Entities for SageMaker Jobs

SageMaker creates a trial component for and associated with each SageMaker job. SageMaker creates artifacts to track the job metadata and associations between each artifact and the job.

Artifacts are created for the following job properties and associated with the Amazon Resource Name (ARN) of the SageMaker job. The artifact SourceUri is listed in parentheses.

**Training Job**
- The image that contains the training algorithm (TrainingImage).
- The data source of each input channel (S3Uri).
- The location for the model (S3OutputPath).
- The location for the managed spot checkpoint data (S3Uri).

**Processing Job**
- The container to be run by the processing job (ImageUri).
- The data location for each processing input and processing output (S3Uri).
Transform Job

- The input data source to be transformed (S3Uri).
- The results of the transform (S3OutputPath).

**Note**
Amazon Simple Storage Service (Amazon S3) artifacts are tracked based on the Amazon S3 URI values provided to the Create API, for example `CreateTrainingJob`, and not on the Amazon S3 key and hash or etag values from each file.

Tracking Entities for Model Packages

The following entities are created:

Model Packages

- A context for each model package group.
- An artifact for each model package.
- An association between each model package artifact and the context for each model package group to which the package belongs to.
- An action for the creation of a model package version.
- An association between the model package artifact and the creation action.
- An association between the model package artifact and each model package group context to which the package belongs to.
- Inference containers
  - An artifact for the image used in each container defined in the model package.
  - An artifact for the model used in each container.
  - An association between each artifact and the model package artifact.
- Algorithms
  - An artifact for each algorithm defined in the model package.
  - An artifact for the model created by each algorithm.
  - An association between each artifact and the model package artifact.

Tracking Entities for Endpoints

The following entities are created by Amazon SageMaker:

Endpoints

- A context for each endpoint
- An action for the model deployment that created each endpoint
- An artifact for each model deployed to the endpoint
- An artifact for the image used in the model
- An artifact for the model package for the model
- An artifact for each image deployed to the endpoint
- An association between each artifact and the model deployment action
Manually Create Tracking Entities

You can manually create tracking entities for any property. For information on the tracking entities that Amazon SageMaker automatically creates, see Amazon SageMaker–Created Tracking Entities (p. 3312).

You can add tags to all entities except associations. Tags are arbitrary key-value pairs that provide custom information. You can filter or sort a list or search query by tags. For more information, see Tagging AWS resources in the AWS General Reference.

For a sample notebook that demonstrates how to create lineage entities, see the Amazon SageMaker Lineage notebook in the Amazon SageMaker example GitHub repository.

Topics
• Manually Create Entities (p. 3314)
• Manually Track a Workflow (p. 3315)
• Limits (p. 3316)

Manually Create Entities

The following procedure shows you how to create and associate artifacts between a SageMaker training job and endpoint. You perform the following steps:

Import tracking entities and associations

1. Import the lineage tracking entities.

import sys
!{sys.executable} -m pip install -q sagemaker
from sagemaker import get_execution_role
from sagemaker.session import Session
from sagemaker.lineage import context, artifact, association, action
import boto3
boto_session = boto3.Session(region_name=region)
sagemaker_client = boto_session.client("sagemaker")

2. Create the input and output artifacts.

code_location_arn = artifact.Artifact.create(
    artifact_name='source-code-location',
    source_uri='s3://...',
    artifact_type='code-location'
).artifact_arn

# Similar constructs for train_data_location_arn and test_data_location_arn
model_location_arn = artifact.Artifact.create(
    artifact_name='model-location',
    source_uri='s3://...',
    artifact_type='model-location'
).artifact_arn

3. Train the model and get the trial_component_arn that represents the training job.

4. Associate the input artifacts and output artifacts with the training job (trial component).

input_artifacts = [code_location_arn, train_data_location_arn, test_data_location_arn, model_location_arn]
for artifact_arn in input_artifacts:
try:
    association.Association.create(
        source_arn=artifact_arn,
        destination_arn=trial_component_arn,
        association_type='ContributedTo'
    )
except:
    logging.info('association between {} and {} already exists', artifact_arn, trial_component_arn)

output_artifacts = [model_location_arn]
for artifact_arn in output_artifacts:
    try:
        association.Association.create(
            source_arn=trial_component_arn,
            destination_arn=artifact_arn,
            association_type='Produced'
        )
    except:
        logging.info('association between {} and {} already exists', artifact_arn, trial_component_arn)

5. Create the inference endpoint.

predictor = mnist_estimator.deploy(initial_instance_count=1,
    instance_type='ml.m4.xlarge')

6. Create the endpoint context.

from sagemaker.lineage import context

describe_endpoint = sagemaker_client.describe_endpoint(EndpointName=predictor.endpoint_name)
endpoint_arn = describe_endpoint['EndpointArn']

endpoint_context_arn = context.Context.create(
    context_name=predictor.endpoint_name,
    context_type='Endpoint',
    source_uri=endpoint_arn
).context_arn

7. Associate the training job (trial component) and endpoint context.

association.Association.create(
    source_arn=trial_component_arn,
    destination_arn=endpoint_context_arn
)

**Manually Track a Workflow**

You can manually track the workflow created in the previous section.

Given the endpoint Amazon Resource Name (ARN) from the previous example, the following procedure shows you how to track the workflow back to the datasets used to train the model that was deployed to the endpoint. You perform the following steps:

**To track a workflow from endpoint to training data source**

1. Import the tracking entities.

   ```python
   import sys
   ```
Manually Create Entities

```python
!{sys.executable} -m pip install -q sagemaker
from sagemaker import get_execution_role
from sagemaker.session import Session
from sagemaker.lineage import context, artifact, association, action
import boto3
boto_session = boto3.Session(region_name=region)
sagemaker_client = boto_session.client("sagemaker")

2. Get the endpoint context from the endpoint ARN.

```python
endpoint_context_arn = sagemaker_client.list_contexts(
    SourceUri=endpoint_arn)['ContextSummaries'][0]['ContextArn']
```

3. Get the trial component from the association between the trial component and the endpoint context.

```python
trial_component_arn = sagemaker_client.list_associations(
    DestinationArn=endpoint_context_arn)['AssociationSummaries'][0]['SourceArn']
```

4. Get the training data location artifact from the association between the trial component and the endpoint context.

```python
train_data_location_artifact_arn = sagemaker_client.list_associations(
    DestinationArn=trial_component_arn, SourceType='Model')['AssociationSummaries'][0][
    'SourceArn']
```

5. Get the training data location from the training data location artifact.

```python
train_data_location = sagemaker_client.describe_artifact(
    Arn=train_data_location_artifact_arn)['Source']['SourceUri']
print(train_data_location)
```

Response:

s3://sagemaker-sample-data-us-east-2/mxnet/mnist/train

Limits

You can create an association between any entities, experiment, and lineage, except the following:

- You cannot create an association between two experiment entities. Experiment entities consist of experiments, trials, and trial components.
- You can create an association with another association.

An error occurs if you try to create an entity that already exists.

Maximum number of manually created lineage entities

- Actions: 3000
- Artifacts: 6000
- Associations: 6000
- Contexts: 500
There is no limit to the number of lineage entities automatically created by Amazon SageMaker.

**Querying Lineage Entities**

Amazon SageMaker automatically generates graphs of lineage entities as you use them. You can query this data to answer a variety of questions. You can query your lineage entities to:

- Retrieve all data sets that went into the creation of a model.
- Retrieve all jobs that went into the creation of an endpoint.
- Retrieve all models that use a data set.
- Retrieve all endpoints that use a model.
- Retrieve which endpoints are derived from a certain data set.
- Retrieve the pipeline execution that created a training job.
- Retrieve the relationships between entities for investigation, governance, and reproducibility.
- Retrieve all downstream trials that use the artifact.
- Retrieve all upstream trials that use the artifact.
- Retrieve a list of artifacts that use the provided S3 uri.
- Retrieve upstream artifacts that use the dataset artifact.
- Retrieve downstream artifacts that use the dataset artifact.
- Retrieve datasets that use the image artifact.
- Retrieve actions that use the context.
- Retrieve processing jobs that use the endpoint.
- Retrieve transform jobs that use the endpoint.
- Retrieve trial components that use the endpoint.
- Retrieve the ARN for the pipeline execution associated with the model package group.
- Retrieve all artifacts that use the action.
- Retrieve all upstream datasets that use the model package approval action.
- Retrieve model package from model package approval action.
- Retrieve downstream endpoint contexts that use the endpoint.
- Retrieve the ARN for the pipeline execution associated with the trial component.
- Retrieve datasets that use the trial component.
- Retrieve models that use the trial component.
- Explore your lineage for visualization.

**Topics**

- Getting Started with Querying Lineage Entities (p. 3318)

**Limitations**

- Lineage querying is not available in the following Regions:
  - Asia Pacific (Osaka) – ap-northeast-3
  - Europe (Milan) – eu-south-1
  - Africa (Cape Town) – af-south
  - Asia Pacific (Jakarta) – ap-southeast-3
• The maximum depth of relationships to discover is currently limited to 10.
• Filtering is limited to the following properties: last modified date, created date, type, and lineage entity type.

**Getting Started with Querying Lineage Entities**

The easiest way to get started is either via the:

• Amazon SageMaker SDK for Python which has defined many common use cases.
• For a notebook that demonstrates how to use SageMaker Lineage APIs to query relationships across the lineage graph, see sagemaker-lineage-multihop-queries.ipynb.

The following examples show how to use the LineageQuery and LineageFilter APIs to construct queries to answer questions about the Lineage Graph and extract entity relationships for a few use cases.

**Example Using the LineageQuery API to find entity associations**

```python
from sagemaker.lineage.context import Context, EndpointContext
from sagemaker.lineage.action import Action
from sagemaker.lineage.association import Association
from sagemaker.lineage.artifact import Artifact, ModelArtifact, DatasetArtifact
from sagemaker.lineage.query import (LineageQuery, LineageFilter, LineageSourceEnum, LineageEntityEnum, LineageQueryDirectionEnum,
)

# Find the endpoint context and model artifact that should be used for the lineage queries.
contexts = Context.list(source_uri=endpoint_arn)
context_name = list(contexts)[0].context_name
endpoint_context = EndpointContext.load(context_name=context_name)

query_filter = LineageFilter(entities=[LineageEntityEnum.ARTIFACT], sources=[LineageSourceEnum.DATASET])

# Providing this 'LineageFilter' to the 'LineageQuery' constructs a query that traverses through the given context 'endpoint_context'
# and find all datasets.
query_result = LineageQuery(sagemaker_session).query(start_arns=[endpoint_context.context_arn], query_filter=query_filter, direction=LineageQueryDirectionEnum.ASCENDANTS, include_edges=False,
)

# Parse through the query results to get the lineage objects corresponding to the datasets
dataset_artifacts = []
for vertex in query_result.vertices:
    ...
```

**Example Find all the datasets associated with an endpoint**

```python
# Define the LineageFilter to look for entities of type 'ARTIFACT' and the source of type 'DATASET'.
query_filter = LineageFilter(
    entities=[LineageEntityEnum.ARTIFACT], sources=[LineageSourceEnum.DATASET]
)

# Providing this 'LineageFilter' to the 'LineageQuery' constructs a query that traverses through the given context 'endpoint_context'
# and find all datasets.
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[endpoint_context.context_arn],
    query_filter=query_filter,
    direction=LineageQueryDirectionEnum.ASCENDANTS,
    include_edges=False,
)

# Parse through the query results to get the lineage objects corresponding to the datasets
dataset_artifacts = []
for vertex in query_result.vertices:
    ...
```
dataset_artifacts.append(vertex.to_lineage_object().source.source_uri)

pp.pprint(dataset_artifacts)

Example Find the models associated with an endpoint

# Define the LineageFilter to look for entities of type `ARTIFACT` and the source of type `MODEL`.
query_filter = LineageFilter(
    entities=[LineageEntityEnum.ARTIFACT], sources=[LineageSourceEnum.MODEL]
)

# Providing this `LineageFilter` to the `LineageQuery` constructs a query that traverses through the given context `endpoint_context`
# and find all datasets.
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[endpoint_context.context_arn],
    query_filter=query_filter,
    direction=LineageQueryDirectionEnum.ASCENDANTS,
    include_edges=False,
)

# Parse through the query results to get the lineage objects corresponding to the model
model_artifacts = []
for vertex in query_result.vertices:
    model_artifacts.append(vertex.to_lineage_object().source.source_uri)

# The results of the `LineageQuery` API call return the ARN of the model deployed to the endpoint along with
# the S3 URI to the model.tar.gz file associated with the model
pp.pprint(model_artifacts)

Example Find the trial components associated with the endpoint

# Define the LineageFilter to look for entities of type `TRIAL_COMPONENT` and the source of type `TRAINING_JOB`.
query_filter = LineageFilter(
    entities=[LineageEntityEnum.TRIAL_COMPONENT],
    sources=[LineageSourceEnum.TRAINING_JOB],
)

# Providing this `LineageFilter` to the `LineageQuery` constructs a query that traverses through the given context `endpoint_context`
# and find all datasets.
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[endpoint_context.context_arn],
    query_filter=query_filter,
    direction=LineageQueryDirectionEnum.ASCENDANTS,
    include_edges=False,
)

# Parse through the query results to get the ARNs of the training jobs associated with this endpoint
trial_components = []
for vertex in query_result.vertices:
    trial_components.append(vertex.arn)

pp.pprint(trial_components)
Example Changing the focal point of lineage

The LineageQuery can be modified to have different start_arns which changes the focal point of lineage. In addition, the LineageFilter can take multiple sources and entities to expand the scope of the query.

In the following we use the model as the lineage focal point and find the endpoints and datasets associated with it.

```python
# Get the ModelArtifact
model_artifact_summary = list(Artifact.list(source_uri=model_package_arn))[0]
model_artifact = ModelArtifact.load(artifact_arn=model_artifact_summary.artifact_arn)
query_filter = LineageFilter(
    entities=[LineageEntityEnum.ARTIFACT],
    sources=[LineageSourceEnum.ENDPOINT, LineageSourceEnum.DATASET],
)
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[model_artifact.artifact_arn],  # Model is the starting artifact
    query_filter=query_filter,
    # Find all the entities that descend from the model, i.e. the endpoint
    direction=LineageQueryDirectionEnum.DESCENDANTS,
    include_edges=False,
)
associations = []
for vertex in query_result.vertices:
    associations.append(vertex.to_lineage_object().source.source_uri)

query_result = LineageQuery(sagemaker_session).query(
    start_arns=[model_artifact.artifact_arn],  # Model is the starting artifact
    query_filter=query_filter,
    # Find all the entities that ascend from the model, i.e. the datasets
    direction=LineageQueryDirectionEnum.ASCENDANTS,
    include_edges=False,
)
for vertex in query_result.vertices:
    associations.append(vertex.to_lineage_object().source.source_uri)
p.p.pprint(associations)
```

Example Using LineageQueryDirectionEnum.BOTH to find ascendent and descendent relationships

When the direction is set to BOTH, the query traverses the graph to find ascendent and descendent relationships. This traversal takes place not only from the starting node, but from each node that is visited. For example; if a training job is run twice and both models generated by the training job are deployed to endpoints, the result of the query with direction set to BOTH shows both endpoints. This is because the same image is used for training and deploying the model. Since the image is common to the model, the start_arn and both the endpoints, appear in the query result.

```python
query_filter = LineageFilter(
    entities=[LineageEntityEnum.ARTIFACT],
    sources=[LineageSourceEnum.ENDPOINT, LineageSourceEnum.DATASET],
)
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[model_artifact.artifact_arn],  # Model is the starting artifact
    query_filter=query_filter,
```
# This specifies that the query should look for associations both ascending and
descending for the start
  direction=LineageQueryDirectionEnum.BOTH,
  include_edges=False,
)
associations = []
for vertex in query_result.vertices:
  associations.append(vertex.to_lineage_object().source.source_uri)
pp.pprint(associations)

Example Directions in LineageQuery - ASCENDANTS vs. DESCENDANTS

To understand the direction in the Lineage Graph, take the following entity relationship graph - Dataset -> Training Job -> Model -> Endpoint

The endpoint is a descendant of the model, and the model is a descendant of the dataset. Similarly, the model is an ascendant of the endpoint. The direction parameter can be used to specify whether the query should return entities that are descendants or ascendants of the entity in start_arns. If the start_arns contains a model and the direction is DESCENDANTS, the query returns the endpoint. If the direction is ASCENDANTS, the query returns the dataset.

# In this example, we'll look at the impact of specifying the direction as ASCENDANT or DESCENDANT in a `LineageQuery`.
query_filter = LineageFilter(
  entities=[LineageEntityEnum.ARTIFACT],
  sources=[
    LineageSourceEnum.ENDPOINT,
    LineageSourceEnum.MODEL,
    LineageSourceEnum.DATASET,
    LineageSourceEnum.TRAINING_JOB,
  ],
)
query_result = LineageQuery(sagemaker_session).query(
  start_arns=[model_artifact.artifact_arn],
  query_filter=query_filter,
  direction=LineageQueryDirectionEnum.ASCENDANTS,
  include_edges=False,
)
ascendant_artifacts = []
# The lineage entity returned for the Training Job is a TrialComponent which can't be converted to a
# lineage object using the method `to_lineage_object()` so we extract the TrialComponent ARN.
for vertex in query_result.vertices:
  try:
    ascendant_artifacts.append(vertex.to_lineage_object().source.source_uri)
  except:
    ascendant_artifacts.append(vertex.arn)
print("Ascendant artifacts : ")
pp.pprint(ascendant_artifacts)
query_result = LineageQuery(sagemaker_session).query(
  start_arns=[model_artifact.artifact_arn],
  query_filter=query_filter,
  direction=LineageQueryDirectionEnum.DESCENDANTS,
  include_edges=False,
)
descendant_artifacts = []
for vertex in query_result.vertices:
    try:
        descendant_artifacts.append(vertex.to_lineage_object().source.source_uri)
    except:
        # Handling TrialComponents.
        descendant_artifacts.append(vertex.arn)

print("Descendant artifacts : ")
pp.pprint(descendant_artifacts)

Example SDK helper functions to make lineage queries easier

The classes EndpointContext, ModelArtifact, and DatasetArtifact have helper functions that are wrappers over the LineageQuery API to make certain lineage queries easier to leverage. The following example shows how to use these helper function.

# Find all the datasets associated with this endpoint
datasets = []
dataset_artifacts = endpoint_context.dataset_artifacts()
for dataset in dataset_artifacts:
    datasets.append(dataset.source.source_uri)
print("Datasets : ", datasets)

# Find the training jobs associated with the endpoint
training_job_artifacts = endpoint_context.training_job_arns()
training_jobs = []
for training_job in training_job_artifacts:
    training_jobs.append(training_job)
print("Training Jobs : ", training_jobs)

# Get the ARN for the pipeline execution associated with this endpoint (if any)
pipeline_executions = endpoint_context.pipeline_execution_arn()
if pipeline_executions:
    for pipeline in pipelines_executions:
        print(pipeline)

# Here we use the `ModelArtifact` class to find all the datasets and endpoints associated with the model

dataset_artifacts = model_artifact.dataset_artifacts()
endpoint_contexts = model_artifact.endpoint_contexts()
datasets = [dataset.source.source_uri for dataset in dataset_artifacts]
endpoints = [endpoint.source.source_uri for endpoint in endpoint_contexts]
print("Datasets associated with this model : ")
pp.pprint(datasets)
print("Endpoints associated with this model : ")
pp.pprint(endpoints)

# Here we use the `DatasetArtifact` class to find all the endpoints hosting models that were trained with a particular dataset
# Find the artifact associated with the dataset
dataset_artifact_arn = list(Artifact.list(source_uri=training_data))[0].artifact_arn
dataset_artifact = DatasetArtifact.load(artifact_arn=dataset_artifact_arn)

dataset_artifact_arn = list(Artifact.list(source_uri=training_data))[0].artifact_arn
dataset_artifact = DatasetArtifact.load(artifact_arn=dataset_artifact_arn)

# Find the endpoints that used this training dataset
endpoint_contexts = dataset_artifact.endpoint_contexts()
datasets = [endpoint.source.source_uri for endpoint in endpoint_contexts]
Example Getting a Lineage graph visualization

A helper class `Visualizer` is provided in the sample notebook `visualizer.py` to help plot the lineage graph. When the query response is rendered, a graph with the lineage relationships from the `StartArns` is displayed. From the `StartArns` the visualization shows the relationships with the other lineage entities returned in the `query_lineage` API action.

```python
# Graph APIs
# Here we use the boto3 `query_lineage` API to generate the query response to plot.
from visualizer import Visualizer
query_response = sm_client.query_lineage(
    StartArns=[endpoint_context.context_arn], Direction="Ascendants", IncludeEdges=True
)
 viz = Visualizer()
 viz.render(query_response, "Endpoint")
 query_response = sm_client.query_lineage(
    StartArns=[model_artifact.artifact_arn], Direction="Ascendants", IncludeEdges=True
)
 viz.render(query_response, "Model")
```

Cross-Account Lineage Tracking

Amazon SageMaker supports tracking lineage entities from a different AWS account. Other AWS accounts can share their lineage entities with you and you can access these lineage entities through direct API calls or SageMaker lineage queries.

SageMaker uses AWS Resource Access Manager to help you securely share your lineage resources. You can share your resources through the AWS RAM console.

Set Up Cross-Account Lineage Tracking

You can group and share your

- Tracking entities maintain a representation of all the elements of your end-to-end machine learning workflow. You can use this representation to establish model governance, reproduce your workflow, and maintain a record of your work history.

- Amazon SageMaker automatically creates tracking entities for trial components and their associated trials and experiments when you create SageMaker jobs such as processing jobs, training jobs, and batch transform jobs. In additional to auto tracking, you can also Manually Create Tracking Entities (p. 3314) to model custom steps in your workflow. For more information, see Manage Machine Learning with Amazon SageMaker Experiments (p. 2231).

- SageMaker also automatically creates tracking entities for the other steps in a workflow so you can track the workflow from end to end. For more information, see Amazon SageMaker–Created Tracking Entities (p. 3312).

- You can create additional entities to supplement those created by SageMaker. For more information, see Manually Create Tracking Entities (p. 3314).

- SageMaker reuses any existing entities rather than creating new ones. For example, there can be only one artifact with a unique `SourceUri`.
Key concepts for querying lineage

• **Lineage** – Metadata that tracks the relationships between various entities in your ML workflows.

• **QueryLineage** – The action to inspect your lineage and discover relationships between entities.

• **Lineage entities** – The metadata elements of which your lineage is composed.

• **Cross-account lineage** – Your ML workflow may span more than one account. With cross-account lineage, you can configure multiple accounts to automatically create lineage associations between shared entity resources. QueryLineage then can return entities even from these shared accounts.

The following tracking entities are defined:

**Experiment entities**

• Trial component – A stage of a machine learning trial. Includes processing jobs, training jobs, and batch transform jobs.

• Trial – A combination of trial components that generally produces a model.

• Experiment – A grouping of trials generally focused on solving a specific use case.

**Lineage entities**

• Trial Component – Represents processing, training, and transform jobs in the lineage. Also part of experiment management.

• Context – Provides a logical grouping of other tracking or experiment entities. Conceptually, experiments and trials are contexts. Some examples are an endpoint and a model package.

• Action – Represents an action or activity. Generally, an action involves at least one input artifact or output artifact. Some examples are a workflow step and a model deployment.

• Artifact – Represents a URI addressable object or data. An artifact is generally either an input or an output to a trial component or action. Some examples include a dataset (S3 bucket URI), or an image (Amazon ECR registry path).

• Association – Links other tracking or experiment entities, such as an association between the location of training data and a training job. An association has an optional AssociationType property. The following values are available along with the suggested use for each type. SageMaker places no restrictions on their use:
  • ContributedTo – The source contributed to the destination or had a part in enabling the destination. For example, the training data contributed to the training job.
  • AssociatedWith – The source is connected to the destination. For example, an approval workflow is associated with a model deployment.
  • DerivedFrom - The destination is a modification of the source. For example, a digest output of a channel input for a processing job is derived from the original inputs.
  • Produced – The source generated the destination. For example, a training job produced a model artifact.
  • SameAs – When the same lineage entity used in different accounts.

**Common properties**

• **Type property**
The action, artifact, and context entities have a `type` property, `ActionType`, `ArtifactType`, and `ContextType`, respectively. This property is a custom string which can associate meaningful information with the entity and be used as a filter in the List APIs.

- **Source property**
The action, artifact, and context entities have a `Source` property. This property provides the underlying URI that the entity represents. Some examples are:
  - An UpdateEndpoint action where the source is the `EndpointArn`.
  - An image artifact for a processing job where the source is the `ImageUri`.
  - An Endpoint context where the source is the `EndpointArn`.

- **Metadata property**
The action and artifact entities have an optional `Metadata` property which can provide the following information:
  - `ProjectId` – For example, the ID of the SageMaker MLOps project to which a model belongs.
  - `GeneratedBy` – For example, the SageMaker pipeline execution that registered a model package version.
  - `Repository` – For example, the repository that contains an algorithm.
  - `CommitId` – For example, the commit ID of an algorithm version.

(p. 3310) through a lineage group in Amazon SageMaker. SageMaker supports only one default lineage group per account. SageMaker creates the default lineage group whenever a lineage entity is created in your account. Every lineage entity owned by your account is assigned to this default lineage group. To share lineage entities with another account, you share this default lineage group with that account.

**Note**
You can share all lineage tracking entities in a lineage group or none.

Create a resource share for your lineage entities using AWS Resource Access Manager console. For more information, see [Sharing your AWS resources](https://docs.aws.amazon.com/ram/latest/userguide/awssource-sharing-resource.html) in the *AWS Resource Access Manager User Guide*.

**Note**
After the resource share is created, it can take a few minutes for the resource and principal associations to complete. Once the association is set, the shared account receives an invitation to join the resource share. The shared account must accept the invite to gain access to shared resources. For more information on accepting a resource share invite in AWS RAM, see [Using shared AWS resources](https://docs.aws.amazon.com/ram/latest/userguide/using-shared-resource-sharing.html) in the *AWS Resource Access Manager User Guide*.

### Your cross-account lineage tracking resource policy
Amazon SageMaker supports only one type of resource policy. The SageMaker resource policy must allow all of the following operations:

```
"sagemaker:DescribeAction"
"sagemaker:DescribeArtifact"
"sagemaker:DescribeContext"
"sagemaker:DescribeTrialComponent"
"sagemaker:AddAssociation"
"sagemaker:DeleteAssociation"
"sagemaker:QueryLineage"
```
Example The following is a SageMaker resource policy created using AWS Resource Access Manager for creating a resource share for an accounts lineage group.

```json
{

    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "FullLineageAccess",
            "Effect": "Allow",
            "Principal": {
                "AWS": "123456789012" #account-id
            },
            "Action": [
                "sagemaker:DescribeAction",
                "sagemaker:DescribeArtifact",
                "sagemaker:DescribeContext",
                "sagemaker:DescribeTrialComponent",
                "sagemaker:AddAssociation",
                "sagemaker:DeleteAssociation",
                "sagemaker:QueryLineage"
            ],
        }
    ]
}
```

**Tracking Cross-Account Lineage Entities**

With cross-account lineage tracking you can associate lineage entities in different accounts using the same AddAssociation API action. When you associate two lineage entities, SageMaker validates if you have permissions to perform the AddAssociation API action on both lineage entities. SageMaker then establishes the association. If you don't have the permissions, SageMaker does not create the association.

Once the cross-account association is established, you can access either lineage entity from the other through the QueryLineage API action. For more information, see [Querying Lineage Entities](p. 3317).

In addition to SageMaker automatically creating lineage entities, if you have cross-account access, SageMaker connects artifacts that reference the same object or data. If the data from one account is used in lineage tracking by different accounts, SageMaker creates an artifact in each account to track that data. With cross-account lineage, whenever SageMaker creates new artifacts, SageMaker checks if there are other artifacts created for the same data that are also shared with you. SageMaker then establishes associations between the newly created artifact and each of the artifacts shared with you with the AssociationType set to SameAs. You can then use the QueryLineage API action to traverse the lineage entities in your own account to lineage entities shared with you but owned by a different AWS account. For more information, see [Querying Lineage Entities](p. 3317).

**Topics**

- Accessing lineage resources from a different accounts (p. 3326)
- Authorization for querying cross-account lineage entities (p. 3327)

**Accessing lineage resources from a different accounts**

Once the cross-account access for sharing lineage has been set up, you can call the following SageMaker API actions directly with the ARN to describe the shared lineage entities from another account:

- **DescribeAction**
- **DescribeArtifact**
• DescribeContext
• DescribeTrialComponent

You can also manage Associations for lineage entities owned by different accounts that are shared with you, using the following SageMaker API actions:

• AddAssociation
• DeleteAssociation

For a notebook that demonstrates how to use SageMaker Lineage APIs to query lineage across accounts, see sagemaker-lineage-cross-account-with-ram.ipynb.

Authorization for querying cross-account lineage entities

Amazon SageMaker must validate that you have permissions to perform the QueryLineage API action on the StartArns. This is enforced through the resource policy attached to the LineageGroup. The result from this action includes all the lineage entities to which you have access, whether they are owned by your account or shared by another account. For more information, see Querying Lineage Entities (p. 3317).

Kubernetes Orchestration

You can orchestrate your SageMaker training and inference jobs with SageMaker Operators for Kubernetes and SageMaker Components for Kubeflow Pipelines. SageMaker Operators for Kubernetes make it easier for developers and data scientists using Kubernetes to train, tune, and deploy machine learning (ML) models in SageMaker. SageMaker Components for Kubeflow Pipelines allow you to move your data processing and training jobs from the Kubernetes cluster to SageMaker's machine learning-optimized managed service.

Contents

• SageMaker Operators for Kubernetes (p. 3327)
• SageMaker Components for Kubeflow Pipelines (p. 3370)

SageMaker Operators for Kubernetes

SageMaker Operators for Kubernetes make it easier for developers and data scientists using Kubernetes to train, tune, and deploy machine learning (ML) models in SageMaker. You can install these SageMaker Operators on your Kubernetes cluster in Amazon Elastic Kubernetes Service (Amazon EKS) to create SageMaker jobs natively using the Kubernetes API and command-line Kubernetes tools such as kubectl. This guide shows you how to set up the operators. The guide also explains how to use the operators to run model training, hyperparameter tuning, and inference (real-time and batch).

Important
The new version of SageMaker Operators for Kubernetes uses AWS Controllers for Kubernetes (ACK). For more information, see Migrate resources to the new SageMaker Operators for Kubernetes (p. 3367) or go directly to the ACK documentation.

There is no additional charge to use these operators. You do incur charges for any SageMaker resources that you use through these operators. The procedures and guidelines here assume you are familiar with Kubernetes and its basic commands.

Contents
What is an operator?

Kubernetes is built on top of what is called the controller pattern. This pattern allows applications and tools to listen to a central state manager (ETCD) and act when something happens. Examples of such applications include cloud-controller-manager and controller-manager. The controller pattern allows you to create decoupled experiences and not have to worry about how other components are integrated. To add new capabilities to Kubernetes, developers can extend the Kubernetes API by creating a custom resource that contains their application-specific or domain-specific logic and components. Operators in Kubernetes allow users to natively invoke these custom resources and automate associated workflows.

Permissions overview

The SageMaker Operators for Kubernetes allow you to manage jobs in SageMaker from your Kubernetes cluster. The operators access SageMaker resources on your behalf. The IAM role that the operator assumes to interact with AWS resources differs from the credentials you use to access the Kubernetes cluster. The role also differs from the role that SageMaker assumes when running your machine learning jobs. The following image explains this design and flow.
Authentication Layers in the SageMaker Operator for Kubernetes

Developer machine authenticates with cluster via RBAC and AWS credentials (if using AWS)

Kubernetes Cluster

SageMaker Operator for Kubernetes

Operator authenticates with SageMaker via IAM Role+Authentication Provider with SageMakerFullAccess permissions.

Amazon SageMaker

Training Job

SageMaker accesses AWS resources by assuming an IAM role (TrainingJob.RoleArn)

Amazon S3

Amazon EC2

(+ other AWS services)
Migrate resources to the new operator

The new Amazon SageMaker Operators for Kubernetes use AWS Controllers for Kubernetes (ACK) to train, tune, and deploy machine learning models with Amazon SageMaker. The new operators are not backwards compatible, so be sure to migrate any existing SageMaker Operators for Kubernetes resources from the old operator to the new operator. To get started with migrating resources, see Migrate resources to the new SageMaker Operators for Kubernetes (p. 3367).

IAM role-based setup and operator deployment

The following sections describe the steps to set up and deploy the operator.

Warning
The following steps do not install the latest version of SageMaker Operators for Kubernetes. To install the new SageMaker Operators for Kubernetes, see Migrate resources to the new SageMaker Operators for Kubernetes (p. 3367).

Prerequisites

This guide assumes that you've completed the following prerequisites:

- Installed the following tools on the client machine used to access your Kubernetes cluster:
  - kubectl Version 1.13 or later. Use a kubectl version that is within one minor version of your Amazon EKS cluster control plane. For example, a 1.13 kubectl client works with Kubernetes 1.13 and 1.14 clusters. OpenID Connect (OIDC) is not supported in versions earlier than 1.13.
  - eksctl Version 0.7.0 or later
  - AWS CLI Version 1.16.232 or later
  - (optional) Helm Version 3.0 or later
  - aws-iam-authenticator
  - Have IAM permissions to create roles and attach policies to roles.
  - Created a Kubernetes cluster on which to run the operators. It should either be Kubernetes version 1.13 or 1.14. For automated cluster creation using eksctl, see Getting Started with eksctl. It takes 20 to 30 minutes to provision a cluster.

Cluster-scoped deployment

Before you can deploy your operator using an IAM role, associate an OpenID Connect (OIDC) provider with your role to authenticate with the IAM service.

Create an OpenID Connect Provider for Your Cluster

The following instructions show how to create and associate an OIDC provider with your Amazon EKS cluster.

1. Set the local CLUSTER_NAME and AWS_REGION environment variables as follows:

```
# Set the Region and cluster
export CLUSTER_NAME="<your cluster name>"
export AWS_REGION="<your region>"
```

2. Use the following command to associate the OIDC provider with your cluster. For more information, see Enabling IAM Roles for Service Accounts on your Cluster.

```
eksctl utils associate-iam-oidc-provider --cluster ${CLUSTER_NAME} \
    --region ${AWS_REGION} --approve
```

Your output should look like the following:
Now that the cluster has an OIDC identity provider, you can create a role and give a Kubernetes ServiceAccount permission to assume the role.

Get the OIDC ID

To set up the ServiceAccount, obtain the OpenID Connect issuer URL using the following command:

```sh
aws eks describe-cluster --name ${CLUSTER_NAME} --region ${AWS_REGION} --query cluster.identity.oidc.issuer --output text
```

The command returns a URL like the following:

```sh
https://oidc.eks.${AWS_REGION}.amazonaws.com/id/D48675832CA65BD10A532F5970IDCID
```

In this URL, the value D48675832CA65BD10A532F5970IDCID is the OIDC ID. The OIDC ID for your cluster is different. You need this OIDC ID value to create a role.

If your output is None, it means that your client version is old. To work around this, run the following command:

```sh
aws eks describe-cluster --region ${AWS_REGION} --query cluster --name ${CLUSTER_NAME} --output text | grep OIDC
```

The OIDC URL is returned as follows:

```sh
OIDC https://oidc.eks.us-east-1.amazonaws.com/id/D48675832CA65BD10A532F5970IDCID
```

Create an IAM Role

1. Create a file named `trust.json` and insert the following trust relationship code block into it. Be sure to replace all `<OIDC ID>`, `<AWS account number>`, and `<EKS Cluster region>` placeholders with values corresponding to your cluster.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Federated": "arn:aws:iam::<AWS account number>:oidc-provider/oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>"
      },
      "Action": "sts:AssumeRoleWithWebIdentity",
      "Condition": {
        "StringEquals": {
          "oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>:aud": "sts.amazonaws.com",
        }
      }
    }
  ]
}
```
1. Run the following command to create a role with the trust relationship defined in `trust.json`. This role enables the Amazon EKS cluster to get and refresh credentials from IAM.

```bash
aws iam create-role --region ${AWS_REGION} --role-name <role name> --assume-role-policy-document file://trust.json --output=text
```

Your output should look like the following:

|--------------|-----------------------------------------------------------------
| ASSUMEROLEPOLICYDOCUMENT | 2012-10-17 |
| STATEMENT    | sts:AssumeRoleWithWebIdentity Allow |
| PRINCIPAL    | arn:aws:iam::123456789012:oidc-provider/oidc.eks.us-east-1.amazonaws.com/id/ |

Take note of ROLE ARN; you pass this value to your operator.

### Attach the AmazonSageMakerFullAccess Policy to the Role

To give the role access to SageMaker, attach the `AmazonSageMakerFullAccess` policy. If you want to limit permissions to the operator, you can create your own custom policy and attach it.

To attach AmazonSageMakerFullAccess, run the following command:

```bash
aws iam attach-role-policy --role-name <role name> --policy-arn arn:aws:iam::aws:policy/AmazonSageMakerFullAccess
```

The Kubernetes ServiceAccount `sagemaker-k8s-operator-default` should have AmazonSageMakerFullAccess permissions. Confirm this when you install the operator.

### Deploy the Operator

When deploying your operator, you can use either a YAML file or Helm charts.

#### Deploy the Operator Using YAML

This is the simplest way to deploy your operators. The process is as follows:

1. Download the installer script using the following command:

   ```bash
   ```

2. Edit the `installer.yaml` file to replace `eks.amazonaws.com/role-arn`. Replace the ARN here with the Amazon Resource Name (ARN) for the OIDC-based role you've created.

3. Use the following command to deploy the cluster:

   ```bash
   kubectl apply -f installer.yaml
   ```

#### Deploy the Operator Using Helm Charts

Use the provided Helm Chart to install the operator.
1. Clone the Helm installer directory using the following command:

   ```bash
git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
   ```

2. Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/installer` folder. Edit the `rolebased/values.yaml` file, which includes high-level parameters for the chart. Replace the role ARN here with the Amazon Resource Name (ARN) for the OIDC-based role you've created.

3. Install the Helm Chart using the following command:

   ```bash
   kubectl create namespace sagemaker-k8s-operator-system
   helm install --namespace sagemaker-k8s-operator-system sagemaker-operator rolebased/
   ```

   If you decide to install the operator into a namespace other than the one specified, you need to adjust the namespace defined in the IAM role trust.json file to match.

4. After a moment, the chart is installed with a randomly generated name. Verify that the installation succeeded by running the following command:

   ```bash
   helm ls
   ```

   Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>NAMESPACE</th>
<th>CHART</th>
<th>REVISION</th>
<th>UPDATED</th>
</tr>
</thead>
<tbody>
<tr>
<td>sagemaker-operator</td>
<td>sagemaker-k8s-operator-system</td>
<td>sagemaker-k8s-operator-system</td>
<td>1</td>
<td>2019-11-20</td>
</tr>
<tr>
<td>23:14:59.6777082 +0000 UTC deployed</td>
<td>sagemaker-k8s-operator-0.1.0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

   **Verify the operator deployment**

   1. You should be able to see the SageMaker Custom Resource Definitions (CRDs) for each operator deployed to your cluster by running the following command:

      ```bash
      kubectl get crd | grep sagemaker
      ```

      Your output should look like the following:

      | CRD Name                                                      | Creation Time       |
      |--------------------------------------------------------------|---------------------|
      | batchtransformjobs.sagemaker.aws.amazon.com                  | 2019-11-20T17:12:34Z|
      | endpointconfigs.sagemaker.aws.amazon.com                     | 2019-11-20T17:12:34Z|
      | hostingdeployments.sagemaker.aws.amazon.com                  | 2019-11-20T17:12:34Z|
      | hyperparametertuningjobs.sagemaker.aws.amazon.com            | 2019-11-20T17:12:34Z|
      | models.sagemaker.aws.amazon.com                              | 2019-11-20T17:12:34Z|
      | trainingjobs.sagemaker.aws.amazon.com                        | 2019-11-20T17:12:34Z|

   2. Ensure that the operator pod is running successfully. Use the following command to list all pods:

      ```bash
      kubectl -n sagemaker-k8s-operator-system get pods
      ```

      You should see a pod named `sagemaker-k8s-operator-controller-manager-*****` in the namespace `sagemaker-k8s-operator-system` as follows:

      | NAME                                                      | READY | STATUS     | RESTARTS |
      |----------------------------------------------------------|-------|------------|----------|
      | sagemaker-k8s-operator-controller-manager-12345678-r8abc  | 2/2   | Running    | 0        |
      | 23s                                                       |       |            |          |
Namespace-scoped deployment

You have the option to install your operator within the scope of an individual Kubernetes namespace. In this mode, the controller only monitors and reconciles resources with SageMaker if the resources are created within that namespace. This allows for finer-grained control over which controller is managing which resources. This is useful for deploying to multiple AWS accounts or controlling which users have access to particular jobs.

This guide outlines how to install an operator into a particular, predefined namespace. To deploy a controller into a second namespace, follow the guide from beginning to end and change out the namespace in each step.

Create an OpenID Connect Provider for Your Amazon EKS cluster

The following instructions show how to create and associate an OIDC provider with your Amazon EKS cluster.

1. Set the local CLUSTER_NAME and AWS_REGION environment variables as follows:

   ```shell
   # Set the region and cluster
   export CLUSTER_NAME="<your cluster name>"
   export AWS_REGION="<your region>"
   ```

2. Use the following command to associate the OIDC provider with your cluster. For more information, see Enabling IAM Roles for Service Accounts on your Cluster.

   ```shell
   eksctl utils associate-iam-oidc-provider --cluster ${CLUSTER_NAME} --region ${AWS_REGION} --approve
   ```

   Your output should look like the following:

   ```shell
   [ ] eksctl version 0.10.1
   [ ] using region us-east-1
   [ ] IAM OpenID Connect provider is associated with cluster "my-cluster" in "us-east-1"
   ```

   Now that the cluster has an OIDC identity provider, create a role and give a Kubernetes ServiceAccount permission to assume the role.

   **Get your OIDC ID**

   To set up the ServiceAccount, first obtain the OpenID Connect issuer URL using the following command:

   ```shell
   aws eks describe-cluster --name ${CLUSTER_NAME} --region ${AWS_REGION} --query cluster.identity.oidc.issuer --output text
   ```

   The command returns a URL like the following:

   ```shell
   https://oidc.eks.${AWS_REGION}.amazonaws.com/id/D48675832CA65BD10A532F597OIDCID
   ```

   In this URL, the value D48675832CA65BD10A532F597OIDCID is the OIDC ID. The OIDC ID for your cluster will be different. You need this OIDC ID value to create a role.

   If your output is None, it means that your client version is old. To work around this, run the following command:

   ```shell
   aws eks describe-cluster --region ${AWS_REGION} --query cluster --name ${CLUSTER_NAME} --output text | grep OIDC
   ```
The OIDC URL is returned as follows:

OIDC https://oidc.eks.us-east-1.amazonaws.com/id/D48675832CA65BD10A532F5970IDCID

Create your IAM Role

1. Create a file named `trust.json` and insert the following trust relationship code block into it. Be sure to replace all `<OIDC ID>`, `<AWS account number>`, `<EKS Cluster region>`, and `<Namespace>` placeholders with values corresponding to your cluster. For the purposes of this guide, `my-namespace` is used for the `<Namespace>` value.

   ```json
   {
   "Version": "2012-10-17",
   "Statement": [
   {
   "Effect": "Allow",
   "Principal": {
   "Federated": "arn:aws:iam::<AWS account number>:oidc-provider/oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>"
   },
   "Action": "sts:AssumeRoleWithWebIdentity",
   "Condition": {
   "StringEquals": {
   "oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>:aud": "sts.amazonaws.com",
   "oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>:sub": "system:serviceaccount:<Namespace>:sagemaker-k8s-operator-default"
   }
   }
   }
   ]
   }
   ```

2. Run the following command to create a role with the trust relationship defined in `trust.json`. This role enables the Amazon EKS cluster to get and refresh credentials from IAM.

   ```bash
   aws iam create-role --region ${AWS_REGION} --role-name <role name> --assume-role-policy-document file://trust.json --output=text
   
   Your output should look like the following:
   
   ABCDEFSFDODNBSEXAMPLE     my-role
   ASSUMEROLEPOLICYDOCUMENT    2012-10-17
   STATEMENT    sts:AssumeRoleWithWebIdentity    Allow
   STRINGEQUALS    sts.amazonaws.com
   PRINCIPAL    arn:aws:iam::123456789012:oidc-provider/oidc.eks.us-east-1.amazonaws.com/id/
   
   Take note of ROLE ARN. You pass this value to your operator.

   **Attach the AmazonSageMakerFullAccess Policy to your Role**

   To give the role access to SageMaker, attach the AmazonSageMakerFullAccess policy. If you want to limit permissions to the operator, you can create your own custom policy and attach it.

   To attach AmazonSageMakerFullAccess, run the following command:

   ```bash
   aws iam attach-role-policy --role-name <role name> --policy-arn arn:aws:iam::123456789012:policy/AmazonSageMakerFullAccess
   ```
aws iam attach-role-policy --role-name <role name> --policy-arn arn:aws:iam::aws:policy/AmazonSageMakerFullAccess

The Kubernetes ServiceAccount sagemaker-k8s-operator-default should have AmazonSageMakerFullAccess permissions. Confirm this when you install the operator.

**Deploy the Operator to Your Namespace**

When deploying your operator, you can use either a YAML file or Helm charts.

**Deploy the Operator to Your Namespace Using YAML**

There are two parts to deploying an operator within the scope of a namespace. The first is the set of CRDs that are installed at a cluster level. These resource definitions only need to be installed once per Kubernetes cluster. The second part is the operator permissions and deployment itself.

If you have not already installed the CRDs into the cluster, apply the CRD installer YAML using the following command:

```
kubectl apply -f https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/release/rolebased/namespaced/crd.yaml
```

To install the operator onto the cluster:

1. Download the operator installer YAML using the following command:

   ```
   ```

2. Update the installer YAML to place the resources into your specified namespace using the following command:

   ```
   sed -i -e 's/PLACEHOLDER-NAMESPACE/<YOUR NAMESPACE>/g' operator.yaml
   ```

3. Edit the `operator.yaml` file to place resources into your eks.amazonaws.com/role-arn. Replace the ARN here with the Amazon Resource Name (ARN) for the OIDC-based role you've created.

4. Use the following command to deploy the cluster:

   ```
   kubectl apply -f operator.yaml
   ```

**Deploy the Operator to Your Namespace Using Helm Charts**

There are two parts needed to deploy an operator within the scope of a namespace. The first is the set of CRDs that are installed at a cluster level. These resource definitions only need to be installed once per Kubernetes cluster. The second part is the operator permissions and deployment itself. When using helm charts you have to first create the namespace using `kubectl`.

1. Clone the Helm installer directory using the following command:

   ```
   git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
   ```

2. Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/installer/namespaced` folder. Edit the `rolebased/values.yaml` file, which includes high-level parameters for the chart. Replace the role ARN here with the Amazon Resource Name (ARN) for the OIDC-based role you've created.
3. Install the Helm Chart using the following command:

```
helm install crds crd_chart/
```

4. Create the required namespace and install the operator using the following command:

```
kubectl create namespace <namespace>
helm install --namespace <namespace> op operator_chart/
```

5. After a moment, the chart is installed with the name `sagemaker-operator`. Verify that the installation succeeded by running the following command:

```
helm ls
```

Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>NAMESPACE</th>
<th>REVISION</th>
<th>UPDATED</th>
</tr>
</thead>
<tbody>
<tr>
<td>sagemaker-operator</td>
<td>my-namespace</td>
<td>1</td>
<td>2019-11-20 23:14:59.6777082 +0000 UTC</td>
</tr>
</tbody>
</table>

Verify the operator deployment to your namespace

1. You should be able to see the SageMaker Custom Resource Definitions (CRDs) for each operator deployed to your cluster by running the following command:

```
kubectl get crd | grep sagemaker
```

Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>CREATION-TIME</th>
</tr>
</thead>
<tbody>
<tr>
<td>batchtransformjobs.sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
</tr>
<tr>
<td>endpointconfigs.sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
</tr>
<tr>
<td>hostingdeployments.sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
</tr>
<tr>
<td>hyperparametertuningjobs.sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
</tr>
<tr>
<td>models.sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
</tr>
<tr>
<td>trainingjobs.sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
</tr>
</tbody>
</table>

2. Ensure that the operator pod is running successfully. Use the following command to list all pods:

```
kubectl -n my-namespace get pods
```

You should see a pod named `sagemaker-k8s-operator-controller-manager-*****` in the namespace `my-namespace` as follows:

<table>
<thead>
<tr>
<th>NAME</th>
<th>READY</th>
<th>STATUS</th>
<th>RESTARTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>sagemaker-k8s-operator-controller-manager-12345678-r8abc</td>
<td>2/2</td>
<td>Running</td>
<td>0</td>
</tr>
</tbody>
</table>

Install the SageMaker logs kubectl plugin

As part of the SageMaker Operators for Kubernetes, you can use the smlogs plugin for kubectl. This enables SageMaker CloudWatch logs to be streamed with kubectl. kubectl must be installed onto
your `PATH`. The following commands place the binary in the `sagemaker-k8s-bin` directory in your home directory, and add that directory to your `PATH`.

```bash
export os="linux"
wget https://amazon-sagemaker-operator-for-k8s-us-east-1.s3.amazonaws.com/kubectl-smlogs-plugin/v1/${os}.amd64.tar.gz
tar xvzf ${os}.amd64.tar.gz

# Move binaries to a directory in your homedir.
mkdir ~/sagemaker-k8s-bin
cp ./kubectl-smlogs.${os}.amd64/kubectl-smlogs ~/sagemaker-k8s-bin/.

# This line adds the binaries to your PATH in your .bashrc.
echo 'export PATH=$PATH:~/sagemaker-k8s-bin' >> ~/.bashrc

# Source your .bashrc to update environment variables:
source ~/.bashrc
```

Use the following command to verify that the `kubectl` plugin is installed correctly:

```
kubectl smlogs
```

If the `kubectl` plugin is installed correctly, your output should look like the following:

```
View SageMaker logs via Kubernetes

Usage:
    smlogs [command]

Aliases:
    smlogs, SMLogs, Smlogs

Available Commands:
    BatchTransformJob       View BatchTransformJob logs via Kubernetes
    TrainingJob             View TrainingJob logs via Kubernetes
    help                    Help about any command

Flags:
    -h, --help   help for smlogs

Use "smlogs [command] --help" for more information about a command.
```

**Clean up resources**

To uninstall the operator from your cluster, you must first make sure to delete all SageMaker resources from the cluster. Failure to do so causes the operator delete operation to hang. Run the following commands to stop all jobs:

```
# Delete all SageMaker jobs from Kubernetes
kubectl delete --all --all-namespaces hyperparametertrainingjob.sagemaker.aws.amazon.com
kubectl delete --all --all-namespaces trainingjobs.sagemaker.aws.amazon.com
kubectl delete --all --all-namespaces batchtransformjob.sagemaker.aws.amazon.com
kubectl delete --all --all-namespaces hostingdeployment.sagemaker.aws.amazon.com
```

You should see output similar to the following:

```
$ kubectl delete --all --all-namespaces trainingjobs.sagemaker.aws.amazon.com
```

3338
After you delete all SageMaker jobs, see Delete operators (p. 3339) to delete the operator from your cluster.

## Delete operators

### Delete cluster-based operators

**Operators installed using YAML**

To uninstall the operator from your cluster, make sure that all SageMaker resources have been deleted from the cluster. Failure to do so causes the operator delete operation to hang.

**Note**

Before deleting your cluster, be sure to delete all SageMaker resources from the cluster. See Clean up resources (p. 3338) for more information.

After you delete all SageMaker jobs, use kubectl to delete the operator from the cluster:

```
# Delete the operator and its resources
kubectl delete -f /installer.yaml
```

You should see output similar to the following:

```
$ kubectl delete -f raw-yaml/installer.yaml
namespace "sagemaker-k8s-operator-system" deleted
customresourcedefinition.apiextensions.k8s.io "batchtransformjobs.sagemaker.aws.amazon.com" deleted
customresourcedefinition.apiextensions.k8s.io "endpointconfigs.sagemaker.aws.amazon.com" deleted
customresourcedefinition.apiextensions.k8s.io "hostingdeployments.sagemaker.aws.amazon.com" deleted
customresourcedefinition.apiextensions.k8s.io "hyperparametertuningjobs.sagemaker.aws.amazon.com" deleted
customresourcedefinition.apiextensions.k8s.io "models.sagemaker.aws.amazon.com" deleted
"hyperparametertuningjobs.sagemaker.aws.amazon.com" deleted
customresourcedefinition.apiextensions.k8s.io "trainingjobs.sagemaker.aws.amazon.com" deleted
role.rbac.authorization.k8s.io "sagemaker-k8s-operator-leader-election-role" deleted
clusterrole.rbac.authorization.k8s.io "sagemaker-k8s-operator-manager-role" deleted
clusterrole.rbac.authorization.k8s.io "sagemaker-k8s-operator-proxy-role" deleted
rolebinding.rbac.authorization.k8s.io "sagemaker-k8s-operator-leader-election-rolebinding" deleted
clusterrolebinding.rbac.authorization.k8s.io "sagemaker-k8s-operator-leader-election-rolebinding" deleted
clusterrolebinding.rbac.authorization.k8s.io "sagemaker-k8s-operator-manager-rolebinding" deleted
clusterrolebinding.rbac.authorization.k8s.io "sagemaker-k8s-operator-proxy-rolebinding" deleted
service "sagemaker-k8s-operator-controller-manager-metrics-service" deleted
deployment.apps "sagemaker-k8s-operator-controller-manager" deleted
secrets "sagemaker-k8s-operator-abcde" deleted
```
Operators installed using Helm Charts

To delete the operator CRDs, first delete all the running jobs. Then delete the Helm Chart that was used to deploy the operators using the following commands:

```
# get the helm charts
helm ls

# delete the charts
helm delete <chart_name>
```

Delete namespace-based operators

Operators installed with YAML

To uninstall the operator from your cluster, first make sure that all SageMaker resources have been deleted from the cluster. Failure to do so causes the operator delete operation to hang.

**Note**
Before deleting your cluster, be sure to delete all SageMaker resources from the cluster. See [Clean up resources](p. 3338) for more information.

After you delete all SageMaker jobs, use `kubectl` to first delete the operator from the namespace and then the CRDs from the cluster. Run the following commands to delete the operator from the cluster:

```
# Delete the operator using the same yaml file that was used to install the operator
kubectl delete -f operator.yaml

# Now delete the CRDs using the CRD installer yaml

# Now you can delete the namespace if you want
kubectl delete namespace <namespace>
```

Operators installed with Helm Charts

To delete the operator CRDs, first delete all the running jobs. Then delete the Helm Chart that was used to deploy the operators using the following commands:

```
# Delete the operator
helm delete <chart_name>

# delete the crds
helm delete crds

# optionally delete the namespace
kubectl delete namespace <namespace>
```

Troubleshooting

Debugging a Failed Job

- Check the job status by running the following:

```
kubectl get <CRD Type> <job name>
```
If the job was created in SageMaker, you can use the following command to see the STATUS and the SageMaker Job Name:

```
kubectl get <crd type> <job name>
```

You can use `smlogs` to find the cause of the issue using the following command:

```
kubectl smlogs <crd type> <job name>
```

You can also use the `describe` command to get more details about the job using the following command. The output has an additional field that has more information about the status of the job.

```
kubectl describe <crd type> <job name>
```

If the job was not created in SageMaker, then use the logs of the operator's pod to find the cause of the issue as follows:

```
$ kubectl get pods -A | grep sagemaker
# Output:
sagemaker-k8s-operator-system   sagemaker-k8s-operator-controller-manager-5cd7df4d74-wh22z   2/2     Running   0          3h33m
$ kubectl logs -p <pod name> -c manager -n sagemaker-k8s-operator-system
```

Deleting an Operator CRD

If deleting a job is not working, check if the operator is running. If the operator is not running, then you have to delete the finalizer using the following steps:

1. In a new terminal, open the job in an editor using `kubectl edit` as follows:

   ```
kubectl edit <crd type> <job name>
```

2. Edit the job to delete the finalizer by removing the following two lines from the file. Save the file and the job is be deleted.

   ```
finalizers:
- sagemaker-operator-finalizer
```

Images and SMlogs in each Region

The following table lists the available operator images and SMLogs in each region.

<table>
<thead>
<tr>
<th>Region</th>
<th>Controller Image</th>
<th>Linux SMLogs</th>
</tr>
</thead>
<tbody>
<tr>
<td>us-east-1</td>
<td>957583890962.dkr.ecr.us-east-1.amazonaws.com/amazon-sagemaker-operator-for-k8s:v1</td>
<td><a href="https://s3.us-east-1.amazonaws.com/amazon-sagemaker-operator-for-k8s-us-east-1/kubectl-smlogs-plugin/v1/linux.amd64.tar.gz">https://s3.us-east-1.amazonaws.com/amazon-sagemaker-operator-for-k8s-us-east-1/kubectl-smlogs-plugin/v1/linux.amd64.tar.gz</a></td>
</tr>
</tbody>
</table>
Using Amazon SageMaker Jobs

To run an Amazon SageMaker job using the Operators for Kubernetes, you can either apply a YAML file or use the supplied Helm Charts.

Important
The new version of SageMaker Operators for Kubernetes uses AWS Controllers for Kubernetes (ACK). For more information, see Migrate resources to the new SageMaker Operators for Kubernetes (p. 3367) or go directly to the ACK documentation.

All sample operator jobs in the following tutorials use sample data taken from a public MNIST dataset. In order to run these samples, download the dataset into your Amazon S3 bucket. You can find the dataset in Download the MNIST Dataset.

For more ML with the ACK SageMaker controller, see also those SageMaker tutorials.

Contents

- TrainingJob operator (p. 3342)
- HyperParameterTuningJob operator (p. 3347)
- BatchTransformJob operator (p. 3352)
- HostingDeployment operator (p. 3355)
- ProcessingJob operator (p. 3360)
- HostingAutoscalingPolicy (HAP) Operator (p. 3364)

TrainingJob operator

Training job operators reconcile your specified training job spec to SageMaker by launching it for you in SageMaker. You can learn more about SageMaker training jobs in the SageMaker CreateTrainingJob API documentation.

Topics

- Create a TrainingJob Using a YAML File (p. 3342)
- Create a TrainingJob Using a Helm Chart (p. 3343)
- List TrainingJobs (p. 3344)
- Describe a TrainingJob (p. 3344)
- View Logs from TrainingJobs (p. 3346)
- Delete TrainingJobs (p. 3346)

Create a TrainingJob Using a YAML File

1. Download the sample YAML file for training using the following command:
wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/xgboost-mnist-trainingjob.yaml

2. Edit the xgboost-mnist-trainingjob.yaml file to replace the roleArn parameter with your <sagemaker-execution-role>, and outputPath with your Amazon S3 bucket that the SageMaker execution role has write access to. The roleArn must have permissions so that SageMaker can access Amazon S3, Amazon CloudWatch, and other services on your behalf. For more information on creating an SageMaker ExecutionRole, see SageMaker Roles. Apply the YAML file using the following command:

kubectl apply -f xgboost-mnist-trainingjob.yaml

Create a TrainingJob Using a Helm Chart

You can use Helm Charts to run TrainingJobs.

1. Clone the GitHub repository to get the source using the following command:

   git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git

2. Navigate to the amazon-sagemaker-operator-for-k8s/hack/charts/training-jobs/ folder and edit the values.yaml file to replace values like rolearn and outputPath with values that correspond to your account. The RoleARN must have permissions so that SageMaker can access Amazon S3, Amazon CloudWatch, and other services on your behalf. For more information on creating an SageMaker ExecutionRole, see SageMaker Roles.

Create the TrainingJob

With the roles and Amazon S3 buckets replaced with appropriate values in values.yaml, you can create a training job using the following command:

helm install . --generate-name

Your output should look like the following:

|---------------------|-------------------|-------------|----------------------------------|

Verify Your Training Helm Chart

To verify that the Helm Chart was created successfully, run:

helm ls

Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>NAMESPACE</th>
<th>REVISION</th>
<th>UPDATED</th>
</tr>
</thead>
</table>
helm install creates a TrainingJob Kubernetes resource. The operator launches the actual training job in SageMaker and updates the TrainingJob Kubernetes resource to reflect the status of the job in SageMaker. You incur charges for SageMaker resources used during the duration of your job. You do not incur any charges once your job completes or stops.

**Note:** SageMaker does not allow you to update a running training job. You cannot edit any parameter and re-apply the file/config. Either change the metadata name or delete the existing job and create a new one. Similar to existing training job operators like TFJob in Kubeflow, update is not supported.

**List TrainingJobs**

Use the following command to list all jobs created using the Kubernetes operator:

```bash
kubectl get TrainingJob
```

The output listing all jobs should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>SECONDARY-STATUS</th>
<th>CREATION-TIME</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAGEMAKER-JOB-NAME</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>xgboost-mnist-from-for-s3</td>
<td>InProgress</td>
<td>Starting</td>
<td>2019-11-20T23:42:35Z</td>
</tr>
<tr>
<td>xgboost-mnist-from-for-s3-examplef1eab94e0ed4671d5a8f</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A training job continues to be listed after the job has completed or failed. You can remove a TrainingJob job from the list by following the Delete a Training Job steps. Jobs that have completed or stopped do not incur any charges for SageMaker resources.

**TrainingJob Status Values**

The STATUS field can be one of the following values:

- Completed
- InProgress
- Failed
- Stopped
- Stopping

These statuses come directly from the SageMaker official API documentation.

In addition to the official SageMaker status, it is possible for STATUS to be SynchronizingK8sJobWithSageMaker. This means that the operator has not yet processed the job.

**Secondary Status Values**

The secondary statuses come directly from the SageMaker official API documentation. They contain more granular information about the status of the job.

**Describe a TrainingJob**

You can get more details about the training job by using the describe kubectl command. This is typically used for debugging a problem or checking the parameters of a training job. To get information about your training job, use the following command:
kubectl describe trainingjob xgboost-mnist-from-for-s3

The output for your training job should look like the following:

Name: xgboost-mnist-from-for-s3
Namespace: default
Labels: <none>
Annotations: <none>
API Version: sagemaker.aws.amazon.com/v1
Kind: TrainingJob
Metadata:
  Finalizers:

Sage Maker Training Job Name: xgboost-mnist-from-for-s3-6d7fa0af0bef11eb94e0example
Secondary Status: Downloading
Training Job Status: InProgress
Events: <none>

View Logs from TrainingJobs

Use the following command to see the logs from the kmeans-mnist training job:

```bash
cubectl smlogs trainingjob xgboost-mnist-from-for-s3
```

Your output should look similar to the following. The logs from instances are ordered chronologically.

"xgboost-mnist-from-for-s3" has SageMaker TrainingJobName "xgboost-mnist-from-for-s3-123456789" in region "us-east-2", status "InProgress" and secondary status "Starting"

```
xgboost-mnist-from-for-s3-6d7fa0af0bef11eb94e0example/algo-1-1574293123 2019-11-20 23:45:24.7 +0000 UTC Arguments: train
xgboost-mnist-from-for-s3-6d7fa0af0bef11eb94e0example/algo-1-1574293123 2019-11-20 23:45:24.7 +0000 UTC [2019-11-20:23:45:22:INFO] File size need to be processed in the node: 1122.95mb. Available memory size in the node: 8586.0mb
```

Delete TrainingJobs

Use the following command to stop a training job on Amazon SageMaker:

```bash
cubectl delete trainingjob xgboost-mnist-from-for-s3
```

This command removes the SageMaker training job from Kubernetes. This command returns the following output:

```
trainingjob.sagemaker.aws.amazon.com "xgboost-mnist-from-for-s3" deleted
```

If the job is still in progress on SageMaker, the job stops. You do not incur any charges for SageMaker resources after your job stops or completes.

**Note:** SageMaker does not delete training jobs. Stopped jobs continue to show on the SageMaker console. The delete command takes about 2 minutes to clean up the resources from SageMaker.
HyperParameterTuningJob operator

Hyperparameter tuning job operators reconcile your specified hyperparameter tuning job spec to SageMaker by launching it in SageMaker. You can learn more about SageMaker hyperparameter tuning jobs in the SageMaker CreateHyperParameterTuningJob API documentation.

Topics
- Create a HyperparameterTuningJob Using a YAML File (p. 3347)
- Create a HyperparameterTuningJob using a Helm Chart (p. 3347)
- List HyperparameterTuningJobs (p. 3348)
- Describe a HyperparameterTuningJob (p. 3349)
- View Logs from HyperparameterTuningJobs (p. 3351)
- Delete a HyperparameterTuningJob (p. 3352)

Create a HyperparameterTuningJob Using a YAML File

1. Download the sample YAML file for the hyperparameter tuning job using the following command:

   ```bash
   wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/xgboost-mnist-hpo.yaml
   ```

2. Edit the `xgboost-mnist-hpo.yaml` file to replace the `roleArn` parameter with your `sagemaker-execution-role`. For the hyperparameter tuning job to succeed, you must also change the `s3InputPath` and `s3OutputPath` to values that correspond to your account. Apply the updates YAML file using the following command:

   ```bash
   kubectl apply -f xgboost-mnist-hpo.yaml
   ```

Create a HyperparameterTuningJob using a Helm Chart

You can use Helm Charts to run hyperparameter tuning jobs.

1. Clone the GitHub repository to get the source using the following command:

   ```bash
   git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
   ```

2. Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/hyperparameter-tuning-jobs/` folder.

3. Edit the `values.yaml` file to replace the `roleArn` parameter with your `sagemaker-execution-role`. For the hyperparameter tuning job to succeed, you must also change the `s3InputPath` and `s3OutputPath` to values that correspond to your account.

Create the HyperparameterTuningJob

With the roles and Amazon S3 paths replaced with appropriate values in `values.yaml`, you can create a hyperparameter tuning job using the following command:

```bash
helm install . --generate-name
```

Your output should look similar to the following:

```
NAME: chart-1574292948
LAST DEPLOYED: Wed Nov 20 23:35:49 2019
```

3347
NAMESPACE: default
STATUS: deployed
REVISION: 1
TEST SUITE: None
NOTES:
Thanks for installing the sagemaker-k8s-hyperparametertuningjob.

Verify Chart Installation

To verify that the Helm Chart was created successfully, run the following command:

```
helm ls
```

Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>NAMESPACE</th>
<th>REVISION</th>
<th>UPDATED</th>
</tr>
</thead>
<tbody>
<tr>
<td>chart-1474292948 UTC deployed</td>
<td>default</td>
<td>1</td>
<td>2019-11-20 23:35:49.9136092 +0000</td>
</tr>
<tr>
<td>STATUS</td>
<td>CHART APP VERSION</td>
<td></td>
<td></td>
</tr>
<tr>
<td>chart-1574292948 UTC deployed</td>
<td>default</td>
<td>1</td>
<td>2019-11-20 23:35:49.9136092 +0000</td>
</tr>
<tr>
<td>rolebased-1574291698 UTC deployed</td>
<td>default</td>
<td>1</td>
<td>2019-11-20 23:35:49.9136092 +0000</td>
</tr>
</tbody>
</table>

`helm install` creates a HyperParameterTuningJob Kubernetes resource. The operator launches the actual hyperparameter optimization job in SageMaker and updates the HyperParameterTuningJob Kubernetes resource to reflect the status of the job in SageMaker. You incur charges for SageMaker resources used during the duration of your job. You do not incur any charges once your job completes or stops.

**Note:** SageMaker does not allow you to update a running hyperparameter tuning job. You cannot edit any parameter and re-apply the file/config. You must either change the metadata name or delete the existing job and create a new one. Similar to existing training job operators like TFJob in Kubeflow, update is not supported.

List HyperparameterTuningJobs

Use the following command to list all jobs created using the Kubernetes operator:

```
kubectl get hyperparametertuningjob
```

Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>CREATION-TIME</th>
<th>COMPLETED</th>
<th>INPROGRESS</th>
<th>ERRORS</th>
<th>STOPPED</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEST-TRAINING-JOB</td>
<td>Completed</td>
<td>2019-10-17T01:15:52Z</td>
<td>10</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>xgboost-mnist-hpo</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>xgboost92f5e3cf07b11e9bf6c06d6-009-4c7a123</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>xgboost92f5e3cf07b11e9bf6c123</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A hyperparameter tuning job continues to be listed after the job has completed or failed. You can remove a hyperparametertuningjob from the list by following the steps in Delete a Hyperparameter Tuning Job. Jobs that have completed or stopped do not incur any charges for SageMaker resources.

Hyperparameter Tuning Job Status Values

The STATUS field can be one of the following values:

- Completed
- InProgress
• Failed
• Stopped
• Stopping

These statuses come directly from the SageMaker official API documentation.

In addition to the official SageMaker status, it is possible for STATUS to be SynchronizingK8sJobWithSageMaker. This means that the operator has not yet processed the job.

Status Counters

The output has several counters, like COMPLETED and INPROGRESS. These represent how many training jobs have completed and are in progress, respectively. For more information about how these are determined, see TrainingJobStatusCounters in the SageMaker API documentation.

Best TrainingJob

This column contains the name of the TrainingJob that best optimized the selected metric.

To see a summary of the tuned hyperparameters, run:

```bash
kubectl describe hyperparametertuningjob xgboost-mnist-hpo
```

To see detailed information about the TrainingJob, run:

```bash
kubectl describe trainingjobs <job name>
```

Spawned TrainingJobs

You can also track all 10 training jobs in Kubernetes launched by HyperparameterTuningJob by running the following command:

```bash
kubectl get trainingjobs
```

Describe a HyperparameterTuningJob

You can obtain debugging details using the describe kubectl command.

```bash
kubectl describe hyperparametertuningjob xgboost-mnist-hpo
```

In addition to information about the tuning job, the SageMaker Operator for Kubernetes also exposes the best training job found by the hyperparameter tuning job in the describe output as follows:

```

View Logs from HyperparameterTuningJobs

Hyperparameter tuning jobs do not have logs, but all training jobs launched by them do have logs. These logs can be accessed as if they were a normal training job. For more information, see View Logs from Training Jobs.
Delete a HyperparameterTuningJob

Use the following command to stop a hyperparameter job in SageMaker.

```
kubectl delete hyperparametertuningjob xgboost-mnist-hpo
```

This command removes the hyperparameter tuning job and associated training jobs from your Kubernetes cluster and stops them in SageMaker. Jobs that have stopped or completed do not incur any charges for SageMaker resources. SageMaker does not delete hyperparameter tuning jobs. Stopped jobs continue to show on the SageMaker Console.

Your output should look like the following:

```
hyperparametertuningjob.sagemaker.aws.amazon.com "xgboost-mnist-hpo" deleted
```

**Note:** The delete command takes about 2 minutes to clean up the resources from SageMaker.

**BatchTransformJob operator**

Batch transform job operators reconcile your specified batch transform job spec to SageMaker by launching it in SageMaker. You can learn more about SageMaker batch transform job in the SageMaker CreateTransformJob API documentation.

**Topics**
- Create a BatchTransformJob Using a YAML File (p. 3352)
- Create a BatchTransformJob Using a Helm Chart (p. 3352)
- List BatchTransformJobs (p. 3353)
- Describe a BatchTransformJob (p. 3354)
- View Logs from BatchTransformJobs (p. 3355)
- Delete a BatchTransformJob (p. 3355)

**Create a BatchTransformJob Using a YAML File**

1. Download the sample YAML file for the batch transform job using the following command:

   ```
wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/xgboost-mnist-batchtransform.yaml
   ```

2. Edit the file `xgboost-mnist-batchtransform.yaml` to change necessary parameters to replace the inputdataconfig with your input data and s3OutputPath with your Amazon S3 buckets that the SageMaker execution role has write access to.

3. Apply the YAML file using the following command:

   ```
kubectl apply -f xgboost-mnist-batchtransform.yaml
   ```

**Create a BatchTransformJob Using a Helm Chart**

You can use Helm Charts to run batch transform jobs.

**Get the Helm installer directory**

Clone the GitHub repository to get the source using the following command:
git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git

Configure the Helm Chart

Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/batch-transform-jobs/` folder.

Edit the `values.yaml` file to replace the `inputdataconfig` with your input data and `outputPath` with your S3 buckets to which the SageMaker execution role has write access.

Create a BatchTransformJob

1. Use the following command to create a batch transform job:

   ```
   helm install . --generate-name
   ```

   Your output should look like the following:

   ```
   NAME: chart-1574292948
   LAST DEPLOYED: Wed Nov 20 23:35:49 2019
   NAMESPACE: default
   STATUS: deployed
   REVISION: 1
   TEST SUITE: None
   NOTES:
   Thanks for installing the sagemaker-k8s-batch-transform-job.
   ```

2. To verify that the Helm Chart was created successfully, run the following command:

   ```
   helm ls
   ```

   This command creates a `BatchTransformJob` Kubernetes resource. The operator launches the actual transform job in SageMaker and updates the `BatchTransformJob` Kubernetes resource to reflect the status of the job in SageMaker. You incur charges for SageMaker resources used during the duration of your job. You do not incur any charges once your job completes or stops.

   **Note:** SageMaker does not allow you to update a running batch transform job. You cannot edit any parameter and re-apply the file/config. You must either change the metadata name or delete the existing job and create a new one. Similar to existing training job operators like TFJob in Kubeflow, update is not supported.

   List BatchTransformJobs

   Use the following command to list all jobs created using the Kubernetes operator:

   ```
   kubectl get batchtransformjob
   ```
Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>CREATION-TIME</th>
<th>SAGEMAKER-JOB-NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>xgboost-mnist-batch-transform</td>
<td>Completed</td>
<td>2019-11-18T03:44:00Z</td>
<td>xgboost-mnist-</td>
</tr>
<tr>
<td>a88fb19809b511eaac440aa8axgboost</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A batch transform job will continue to be listed after the job has completed or failed. You can remove a hyperparameter tuning job from the list by following the Delete a Batch Transform Job steps. Jobs that have completed or stopped do not incur any charges for SageMaker resources.

**Batch Transform Status Values**

The STATUS field can be one of the following values:

- Completed
- InProgress
- Failed
- Stopped
- Stopping

These statuses come directly from the SageMaker official API documentation.

In addition to the official SageMaker status, it is possible for STATUS to be `SynchronizingK8sJobWithSageMaker`. This means that the operator has not yet processed the job.

**Describe a BatchTransformJob**

You can obtain debugging details using the describe kubectl command.

```
kubectl describe batchtransformjob xgboost-mnist-batch-transform
```

Your output should look like the following:

```
Name:         xgboost-mnist-batch-transform
Namespace:    default
Labels:       <none>
Annotations:  kubectl.kubernetes.io/last-applied-configuration:
               "apiVersion":"sagemaker.aws.amazon.com/v1","kind":"BatchTransformJob","metadata":{"annotations":{},"name":"xgboost-mnist","namespace":...}
API Version:  sagemaker.aws.amazon.com/v1
Kind:         BatchTransformJob

Transform Resources:
   Instance Count:  1
   Instance Type:   ml.m4.xlarge
Status:
   Last Check Time:                2019-11-19T22:50:40Z
   Sage Maker Transform Job Name:  xgboost-mnist-a88fb19809b511eaac440aaSMJOB
   Transform Job Status:           Completed
   Events:                           <none>

**View Logs from BatchTransformJobs**

Use the following command to see the logs from the xgboost-mnist batch transform job:

```
kubectl smlogs batchtransformjob xgboost-mnist-batch-transform
```

**Delete a BatchTransformJob**

Use the following command to stop a batch transform job in SageMaker.

```
kubectl delete batchTransformJob xgboost-mnist-batch-transform
```

Your output should look like the following:

```
batchtransfo...xgboost-mnist" deleted
```

This command removes the batch transform job from your Kubernetes cluster, as well as stops them in SageMaker. Jobs that have stopped or completed do not incur any charges for SageMaker resources. Delete takes about 2 minutes to clean up the resources from SageMaker.

**Note**: SageMaker does not delete batch transform jobs. Stopped jobs continue to show on the SageMaker console.

**HostingDeployment operator**

HostingDeployment operators support creating and deleting an endpoint, as well as updating an existing endpoint, for real-time inference. The hosting deployment operator reconciles your specified hosting deployment job spec to SageMaker by creating models, endpoint-configs and endpoints in SageMaker. You can learn more about SageMaker inference in the SageMaker CreateEndpoint API documentation.

**Topics**

- Configure a HostingDeployment Resource (p. 3356)
- Create a HostingDeployment (p. 3356)
- List HostingDeployments (p. 3356)
- Describe a HostingDeployment (p. 3357)
- Invoking the Endpoint (p. 3358)
- Update HostingDeployment (p. 3359)
- Delete the HostingDeployment (p. 3359)
Configure a HostingDeployment Resource

Download the sample YAML file for the hosting deployment job using the following command:

```
wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/xgboost-mnist-hostingdeployment.yaml
```

The `xgboost-mnist-hostingdeployment.yaml` file has the following components that can be edited as required:

- **ProductionVariants.** A production variant is a set of instances serving a single model. SageMaker load-balances between all production variants according to set weights.
- **Models.** A model is the containers and execution role ARN necessary to serve a model. It requires at least a single container.
- **Containers.** A container specifies the dataset and serving image. If you are using your own custom algorithm instead of an algorithm provided by SageMaker, the inference code must meet SageMaker requirements. For more information, see Using Your Own Algorithms with SageMaker.

Create a HostingDeployment

To create a HostingDeployment, use `kubectl` to apply the file `hosting.yaml` with the following command:

```
kubectl apply -f hosting.yaml
```

SageMaker creates an endpoint with the specified configuration. You incur charges for SageMaker resources used during the lifetime of your endpoint. You do not incur any charges once your endpoint is deleted.

The creation process takes approximately 10 minutes.

List HostingDeployments

To verify that the HostingDeployment was created, use the following command:

```
kubectl get hostingdeployments
```

Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>SAGEMAKER-ENDPOINT-NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>host-xgboost</td>
<td>Creating</td>
<td>host-xgboost-def0e83e0d5f11eaaa450aSMLOGS</td>
</tr>
</tbody>
</table>

HostingDeployment Status Values

The status field can be one of several values:

- **SynchronizingK8sJobWithSageMaker:** The operator is preparing to create the endpoint.
- **ReconcilingEndpoint:** The operator is creating, updating, or deleting endpoint resources. If the HostingDeployment remains in this state, use `kubectl describe` to see the reason in the Additional field.
- **OutOfService:** Endpoint is not available to take incoming requests.
- **Creating:** `CreateEndpoint` is executing.
- **Updating:** `UpdateEndpoint` or `UpdateEndpointWeightsAndCapacities` is executing.
• **SystemUpdating**: Endpoint is undergoing maintenance and cannot be updated or deleted or re-scaled until it has completed. This maintenance operation does not change any customer-specified values such as VPC config, KMS encryption, model, instance type, or instance count.

• **RollingBack**: Endpoint fails to scale up or down or change its variant weight and is in the process of rolling back to its previous configuration. Once the rollback completes, endpoint returns to an **InService** status. This transitional status only applies to an endpoint that has autoscaling enabled and is undergoing variant weight or capacity changes as part of an `UpdateEndpointWeightsAndCapacities` call or when the `UpdateEndpointWeightsAndCapacities` operation is called explicitly.

• **InService**: Endpoint is available to process incoming requests.

• **Deleting**: `DeleteEndpoint` is executing.

• **Failed**: Endpoint could not be created, updated, or re-scaled. Use `DescribeEndpoint:FailureReason` for information about the failure. `DeleteEndpoint` is the only operation that can be performed on a failed endpoint.

### Describe a HostingDeployment

You can obtain debugging details using the `describe kubectl` command.

```
kubectl describe hostingdeployment
```

Your output should look like the following:

```plaintext
Name:         host-xgboost
Namespace:    default
Labels:       <none>
Annotations:  kubectl.kubernetes.io/last-applied-configuration:
    {}" name": "host-xgboost", "metadata": {}"
API Version:  sagemaker.aws.amazon.com/v1
Kind:         HostingDeployment
Metadata:
    Creation Timestamp:  2019-11-22T19:40:00Z
    Finalizers:        1
    Generation:        1
    Resource Version:  4258134
    Self Link:         /apis/sagemaker.aws.amazon.com/v1/namespaces/default/hostingdeployments/host-xgboost
    UID:               def0e83e-0d5f-11ea-aa45-0a3507uiduid
Spec:
    Containers:
        Container Hostname:  xgboost
        Image:               123456789012.dkr.ecr.us-east-2.amazonaws.com/xgboost:latest
        Model Data URL:      s3://my-bucket/inference/xgboost-mnist/model.tar.gz
    Models:
        Containers:        xgboost
        Execution Role Arn: arn:aws:iam::123456789012:role/service-role/AmazonSageMaker-ExecutionRole
        Name:               xgboost-model
        Primary Container:  xgboost
        Production Variants:
            Initial Instance Count:  1
            Instance Type:          ml.c5.large
            Model Name:             xgboost-model
            Variant Name:           all-traffic
            Region:                 us-east-2
```

3357
The status field provides more information using the following fields:

- **Additional**: Additional information about the status of the hosting deployment. This field is optional and only gets populated in case of error.
- **Creation Time**: When the endpoint was created in SageMaker.
- **Endpoint ARN**: The SageMaker endpoint ARN.
- **Endpoint Config Name**: The SageMaker name of the endpoint configuration.
- **Endpoint Name**: The SageMaker name of the endpoint.
- **Endpoint Status**: The status of the endpoint.
- **Endpoint URL**: The HTTPS URL that can be used to access the endpoint. For more information, see Deploy a Model on SageMaker Hosting Services.
- **FailureReason**: If a create, update, or delete command fails, the cause is shown here.
- **Last Check Time**: The last time the operator checked the status of the endpoint.
- **Last Modified Time**: The last time the endpoint was modified.
- **Model Names**: A key-value pair of HostingDeployment model names to SageMaker model names.

### Invoking the Endpoint

Once the endpoint status is InService, you can invoke the endpoint in two ways: using the AWS CLI, which does authentication and URL request signing, or using an HTTP client like cURL. If you use your own client, you need to do AWS v4 URL signing and authentication on your own.

To invoke the endpoint using the AWS CLI, run the following command. Make sure to replace the Region and endpoint-name with your endpoint's Region and SageMaker endpoint name. This information can be obtained from the output of `kubectl describe`.

```
# Invoke the endpoint with mock input data.
aws sagemaker-runtime invoke-endpoint \   --region us-east-2 \   --endpoint-name <endpoint name> \   --body $(seq 784 | xargs echo | sed 's/ /,/g') \   >(cat) \   --content-type text/csv > /dev/null
```

For example, if your Region is `us-east-2` and your endpoint config name is `host-xgboost-f56b6b280d7511ea824b129926example`, then the following command would invoke the endpoint:

```
aws sagemaker-runtime invoke-endpoint \   --region us-east-2 \   --endpoint-name host-xgboost-f56b6b280d7511ea824b1299example \   --body $(seq 784 | xargs echo | sed 's/ /,/g') \   >(cat) \   --content-type text/csv > /dev/null
```

```
4.95847082138
3358
```
Here, 4.95847082138 is the prediction from the model for the mock data.

**Update HostingDeployment**

1. Once a HostingDeployment has a status of InService, it can be updated. It might take about 10 minutes for HostingDeployment to be in service. To verify that the status is InService, use the following command:

   ```
kubectl get hostingdeployments
   ```

2. The HostingDeployment can be updated before the status is InService. The operator waits until the SageMaker endpoint is InService before applying the update.

   To apply an update, modify the `hosting.yaml` file. For example, change the `initialInstanceCount` field from 1 to 2 as follows:

   ```yaml
   apiVersion: sagemaker.aws.amazon.com/v1
   kind: HostingDeployment
   metadata:
     name: host-xgboost
   spec:
     region: us-east-2
     productionVariants:
     - variantName: all-traffic
       modelName: xgboost-model
       initialInstanceCount: 2
       instanceType: ml.c5.large
     models:
     - name: xgboost-model
       executionRoleArn: arn:aws:iam::123456789012:role/service-role/AmazonSageMaker-ExecutionRole
       primaryContainer: xgboost
       containers:
       - xgboost
         containerHostname: xgboost
         modelDataUrl: s3://my-bucket/inference/xgboost-mnist/model.tar.gz
         image: 123456789012.dkr.ecr.us-east-2.amazonaws.com/xgboost:latest
   ```

3. Save the file, then use `kubectl` to apply your update as follows. You should see the status change from InService to ReconcilingEndpoint, then Updating.

   ```
   $ kubectl apply -f hosting.yaml
   hostingdeployment.sagemaker.aws.amazon.com/host-xgboost configured
   
   $ kubectl get hostingdeployments
   NAME           STATUS     SAGEMAKER-ENDPOINT-NAME
   host-xgboost   ReconcilingEndpoint host-xgboost-def0e83e0d5f11eaaa450a350abcdef
   
   $ kubectl get hostingdeployments
   NAME           STATUS     SAGEMAKER-ENDPOINT-NAME
   host-xgboost   Updating   host-xgboost-def0e83e0d5f11eaaa450a3507abcdef
   ```

SageMaker deploys a new set of instances with your models, switches traffic to use the new instances, and drains the old instances. As soon as this process begins, the status becomes Updating. After the update is complete, your endpoint becomes InService. This process takes approximately 10 minutes.

**Delete the HostingDeployment**

1. Use `kubectl` to delete a HostingDeployment with the following command:
Your output should look like the following:

```
hostingdeployment.sagemaker.aws.amazon.com "host-xgboost" deleted
```

2. To verify that the hosting deployment has been deleted, use the following command:

```
kubectl get hostingdeployments
No resources found.
```

Endpoints that have been deleted do not incur any charges for SageMaker resources.

**ProcessingJob operator**

ProcessingJob operators are used to launch Amazon SageMaker processing jobs. For more information on SageMaker processing jobs, see [CreateProcessingJob](#).

**Topics**

- Create a ProcessingJob Using a YAML File (p. 3360)
- List ProcessingJobs (p. 3361)
- Describe a ProcessingJob (p. 3362)
- Delete a ProcessingJob (p. 3363)

**Create a ProcessingJob Using a YAML File**

Follow these steps to create an Amazon SageMaker processing job by using a YAML file:

1. Download the `kmeans_preprocessing.py` pre-processing script.

```
wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/kmeans_preprocessing.py
```

2. In one of your Amazon Simple Storage Service (Amazon S3) buckets, create a `mnist_kmeans_example/processing_code` folder and upload the script to the folder.

3. Download the `kmeans-mnist-processingjob.yaml` file.

```
wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/kmeans-mnist-processingjob.yaml
```

4. Edit the YAML file to specify your `sagemaker-execution-role` and replace all instances of `my-bucket` with your S3 bucket.

```
... metadata:
  name: kmeans-mnist-processing
...
  roleArn: arn:aws:iam::<acct-id>:role/service-role/<sagemaker-execution-role>
...
  processingOutputConfig:
    outputs:
      ...
        s3Output:
```

3360
The `sagemaker-execution-role` must have permissions so that SageMaker can access your S3 bucket, Amazon CloudWatch, and other services on your behalf. For more information on creating an execution role, see SageMaker Roles.

5. Apply the YAML file using one of the following commands.

   For cluster-scoped installation:

   ```bash
   kubectl apply -f kmeans-mnist-processingjob.yaml
   ```

   For namespace-scoped installation:

   ```bash
   kubectl apply -f kmeans-mnist-processingjob.yaml -n <NAMESPACE>
   ```

**List ProcessingJobs**

Use one of the following commands to list all the jobs created using the ProcessingJob operator. `SAGEMAKER-JOB-NAME` comes from the metadata section of the YAML file.

For cluster-scoped installation:

```bash
kubectl get ProcessingJob kmeans-mnist-processing
```

For namespace-scoped installation:

```bash
kubectl get ProcessingJob -n <NAMESPACE> kmeans-mnist-processing
```

Your output should look similar to the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>CREATION-TIME</th>
<th>SAGEMAKER-JOB-NAME</th>
</tr>
</thead>
</table>

The output lists all jobs regardless of their status. To remove a job from the list, see Delete a Processing Job.

**ProcessingJob Status**

- **SynchronizingK8sJobWithSageMaker** – The job is first submitted to the cluster. The operator has received the request and is preparing to create the processing job.
- **Reconciling** – The operator is initializing or recovering from transient errors, along with others. If the processing job remains in this state, use the `kubectl describe` command to see the reason in the Additional field.
- **InProgress | Completed | Failed | Stopping | Stopped** – Status of the SageMaker processing job. For more information, see DescribeProcessingJob.
- **Error** – The operator cannot recover by reconciling.
Amazon SageMaker Developer Guide
SageMaker Operators for Kubernetes

Jobs that have completed, stopped, or failed do not incur further charges for SageMaker resources.

Describe a ProcessingJob
Use one of the following commands to get more details about a processing job. These commands are
typically used for debugging a problem or checking the parameters of a processing job.
For cluster-scoped installation:
kubectl describe processingjob kmeans-mnist-processing

For namespace-scoped installation:
kubectl describe processingjob kmeans-mnist-processing -n <NAMESPACE>

The output for your processing job should look similar to the following.
$ kubectl describe ProcessingJob kmeans-mnist-processing
Name:
kmeans-mnist-processing
Namespace:
default
Labels:
<none>
Annotations: kubectl.kubernetes.io/last-applied-configuration:
{"apiVersion":"sagemaker.aws.amazon.com/
v1","kind":"ProcessingJob","metadata":{"annotations":{},"name":"kmeans-mnistprocessing",...

Delete a ProcessingJob

When you delete a processing job, the SageMaker processing job is removed from Kubernetes but the job isn't deleted from SageMaker. If the job status in SageMaker is InProgress the job is stopped. Processing jobs that are stopped do not incur any charges for SageMaker resources. Use one of the following commands to delete a processing job.

For cluster-scoped installation:

```bash
kubectl delete processingjob kmeans-mnist-processing
```

For namespace-scoped installation:

```bash
kubectl delete processingjob kmeans-mnist-processing -n <NAMESPACE>
```

The output for your processing job should look similar to the following.

```bash
processingjob.sagemaker.aws.amazon.com "kmeans-mnist-processing" deleted
```

**Note**

SageMaker does not delete the processing job. Stopped jobs continue to show in the SageMaker console. The delete command takes a few minutes to clean up the resources from SageMaker.
HostingAutoscalingPolicy (HAP) Operator

The HostingAutoscalingPolicy (HAP) operator takes a list of resource IDs as input and applies the same policy to each of them. Each resource ID is a combination of an endpoint name and a variant name. The HAP operator performs two steps: it registers the resource IDs and then applies the scaling policy to each resource ID. Delete undoes both actions. You can apply the HAP to an existing SageMaker endpoint or you can create a new SageMaker endpoint using the HostingDeployment operator. You can read more about SageMaker autoscaling in the Application Autoscaling Policy documentation.

**Note**
In your kubectl commands, you can use the short form, hap, in place of hostingautoscalingpolicy.

**Topics**
- Create a HostingAutoscalingPolicy Using a YAML File (p. 3364)
- List HostingAutoscalingPolicies (p. 3366)
- Describe a HostingAutoscalingPolicy (p. 3367)
- Update a HostingAutoscalingPolicy (p. 3367)
- Delete a HostingAutoscalingPolicy (p. 3367)
- Update or Delete an Endpoint with a HostingAutoscalingPolicy (p. 3367)

Create a HostingAutoscalingPolicy Using a YAML File

Use a YAML file to create a HostingAutoscalingPolicy (HAP) that applies a predefined or custom metric to one or multiple SageMaker endpoints.

Amazon SageMaker requires specific values in order to apply autoscaling to your variant. If these values are not specified in the YAML spec, the HAP operator applies the following default values.

```yaml
# Do not change
Namespace                    = "sagemaker"
# Do not change
ScalableDimension            = "sagemaker:variant:DesiredInstanceCount"
# Only one supported
PolicyType                   = "TargetTrackingScaling"
# This is the default policy name but can be changed to apply a custom policy
DefaultAutoscalingPolicyName = "SageMakerEndpointInvocationScalingPolicy"
```

Use the following samples to create a HAP that applies a predefined or custom metric to one or multiple endpoints.

**Sample 1: Apply a Predefined Metric to a Single Endpoint Variant**

1. Download the sample YAML file for a predefined metric using the following command:

   ```bash
   wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/hap-predefined-metric.yaml
   ```

2. Edit the YAML file to specify your endpointName, variantName, and region.

3. Use one of the following commands to apply a predefined metric to a single resource ID (endpoint name and variant name combination).

   For cluster-scoped installation:

   ```bash
   kubectl apply -f hap-predefined-metric.yaml
   ```

   For namespace-scoped installation:
Sample 2: Apply a Custom Metric to a Single Endpoint Variant

1. Download the sample YAML file for a custom metric using the following command:

   ```bash
   wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/hap-custom-metric.yaml
   ```

2. Edit the YAML file to specify your `endpointName`, `variantName`, and `region`.

3. Use one of the following commands to apply a custom metric to a single resource ID (endpoint name and variant name combination) in place of the recommended `SageMakerVariantInvocationsPerInstance`.

   **Note**
   Amazon SageMaker does not check the validity of your YAML spec.

   For cluster-scoped installation:

   ```bash
   kubectl apply -f hap-custom-metric.yaml
   ```

   For namespace-scoped installation:

   ```bash
   kubectl apply -f hap-custom-metric.yaml -n <NAMESPACE>
   ```

Sample 3: Apply a Scaling Policy to Multiple Endpoints and Variants

You can use the HAP operator to apply the same scaling policy to multiple resource IDs. A separate `scaling_policy` request is created for each resource ID (endpoint name and variant name combination).

1. Download the sample YAML file for a predefined metric using the following command:

   ```bash
   wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/hap-predefined-metric.yaml
   ```

2. Edit the YAML file to specify your `region` and multiple `endpointName` and `variantName` values.

3. Use one of the following commands to apply a predefined metric to multiple resource IDs (endpoint name and variant name combinations).

   For cluster-scoped installation:

   ```bash
   kubectl apply -f hap-predefined-metric.yaml
   ```

   For namespace-scoped installation:

   ```bash
   kubectl apply -f hap-predefined-metric.yaml -n <NAMESPACE>
   ```

Considerations for Hosting Autoscaling Policies for Multiple Endpoints and Variants

The following considerations apply when you use multiple resource IDs:
If you apply a single policy across multiple resource IDs, one PolicyARN is created per resource ID. Five endpoints have five PolicyARNs. When you run the describe command on the policy, the responses show up as one job and include a single job status.

If you apply a custom metric to multiple resource IDs, the same dimension or value is used for all the resource ID (variant) values. For example, if you apply a customer metric for instances 1-5, and the endpoint variant dimension is mapped to variant 1, when variant 1 exceeds the metrics, all endpoints are scaled up or down.

The HAP operator supports updating the list of resource IDs. If you modify, add, or delete resource IDs to the spec, the autoscaling policy is removed from the previous list of variants and applied to the newly specified resource ID combinations. Use the describe command to list the resource IDs to which the policy is currently applied.

List HostingAutoscalingPolicies

Use one of the following commands to list all HostingAutoscalingPolicies (HAPs) created using the HAP operator.

For cluster-scoped installation:

```
kubectl get hap
```

For namespace-scoped installation:

```
kubectl get hap -n <NAMESPACE>
```

Your output should look similar to the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>CREATION-TIME</th>
</tr>
</thead>
<tbody>
<tr>
<td>hap-predefined</td>
<td>Created</td>
<td>2021-07-13T21:32:21Z</td>
</tr>
</tbody>
</table>

Use the following command to check the status of your HostingAutoscalingPolicy (HAP).

```
kubectl get hap <job-name>
```

One of the following values is returned:

- Reconciling – Certain types of errors show the status as Reconciling instead of Error. Some examples are server-side errors and endpoints in the Creating or Updating state. Check the Additional field in status or operator logs for more details.
- Created
- Error

To view the autoscaling endpoint to which you applied the policy

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the left side panel, expand Inference.
3. Choose Endpoints.
4. Select the name of the endpoint of interest.
5. Scroll to the Endpoint runtime settings section.
Describe a HostingAutoscalingPolicy

Use the following command to get more details about a HostingAutoscalingPolicy (HAP). These commands are typically used for debugging a problem or checking the resource IDs (endpoint name and variant name combinations) of a HAP.

```
kubectl describe hap <job-name>
```

Update a HostingAutoscalingPolicy

The HostingAutoscalingPolicy (HAP) operator supports updates. You can edit your YAML spec to change the values and then reapply the policy. The HAP operator deletes the existing policy and applies the new policy.

Delete a HostingAutoscalingPolicy

Use one of the following commands to delete a HostingAutoscalingPolicy (HAP) policy.

For cluster-scoped installation:

```
kubectl delete hap hap-predefined
```

For namespace-scoped installation:

```
kubectl delete hap hap-predefined -n <NAMESPACE>
```

This command deletes the scaling policy and deregisters the scaling target from Kubernetes. This command returns the following output:

```
hostingautoscalingpolicies.sagemaker.aws.amazon.com "hap-predefined" deleted
```

Update or Delete an Endpoint with a HostingAutoscalingPolicy

To update an endpoint that has a HostingAutoscalingPolicy (HAP), use the `kubectl delete` command to remove the HAP, update the endpoint, and then reapply the HAP.

To delete an endpoint that has a HAP, use the `kubectl delete` command to remove the HAP before you delete the endpoint.

Migrate resources to the new SageMaker Operators for Kubernetes

The new Amazon SageMaker Operators for Kubernetes uses AWS Controllers for Kubernetes (ACK) to train, tune, and deploy machine learning models with Amazon SageMaker. ACK is a framework for building Kubernetes custom controllers, where each controller communicates with an AWS service API. These controllers allow Kubernetes users to provision AWS resources like databases or message queues using the Kubernetes API. For a list of all ACK service controllers, see Services in the ACK documentation.

Note

The new SageMaker Operators for Kubernetes are not backwards compatible. Use the following steps to migrate your resources.

For more information, see the ACK documentation or the ACK SageMaker controller GitHub repository. For a list of supported SageMaker resources, refer to the ACK API Reference. To get started with hands-on examples, see Tutorials (p. 3370).
Prerequisites

To successfully migrate resources to the new SageMaker Operators for Kubernetes, you must:

2. If you are using *HostingAutoscalingPolicy* resources (p. 3369), install the new Application Auto Scaling Operator. See Setup in *Scale SageMaker Workloads with Application Auto Scaling* for step-by-step instructions. This step is optional if you are not using *HostingAutoscalingPolicy* resources.

If permissions are configured correctly, then the ACK SageMaker service controller can determine the specification and status of the AWS resource and reconcile the resource as if the ACK controller originally created it.

Adopt resources

The new SageMaker Operators for Kubernetes provide the ability to adopt resources that were not originally created by the ACK service controller. For more information, see *Adopt Existing AWS Resources* in the ACK documentation.

The following steps show how the new SageMaker Operators for Kubernetes can adopt an existing SageMaker endpoint. Save the following sample to a file named *adopt-endpoint-sample.yaml*.

```yaml
apiVersion: services.k8s.aws/v1alpha1
kind: AdoptedResource
metadata:
  name: adopt-endpoint-sample
spec:
  aws:
    # resource to adopt, not created by ACK
    nameOrID: xgboost-endpoint
  kubernetes:
    group: sagemaker.services.k8s.aws
    kind: Endpoint
    metadata:
      # target K8s CR name
      name: xgboost-endpoint

Submit the custom resource (CR) using `kubectl apply`:

```bash
kubectl apply -f adopt-endpoint-sample.yaml
```

Use `kubectl describe` to check the status conditions of your adopted resource.

```bash
kubectl describe adoptedresource adopt-endpoint-sample
```

Verify that the ACK.Adopted condition is `True`. The output should look similar to the following example:

```yaml
---
kind: AdoptedResource
metadata:
  annotations:
    kubectl.kubernetes.io/last-applied-configuration: |
      "apiVersion": "services.k8s.aws/v1alpha1",
      "kind": "AdoptedResource",
      "metadata": {
        "annotations": {},
        "name": "xgboost-endpoint",
        "namespace": "default"
      },
      "spec": {
        "aws": {"nameOrID": "xgboost-endpoint"},
        "kubernetes": {
          "group": "sagemaker.services.k8s.aws",
          "kind": "Endpoint",
          "metadata": {
            "name": "xgboost-endpoint"
          }
        }
      }
```
Check that your resource exists in your cluster:

```bash
cubectl describe endpoints.sagemaker xgboost-endpoint
```

**HostingAutoscalingPolicy resources**

The HostingAutoscalingPolicy (HAP) resource consists of multiple Application Auto Scaling resources: ScalableTarget and ScalingPolicy. When adopting a HAP resource with ACK, you need to first install the Application Auto Scaling controller. To adopt HAP resources, you need to adopt both ScalableTarget and ScalingPolicy resources. You can find the resource identifier for these resources in the status of the HostingAutoscalingPolicy resource (status.ResourceIDList).

**HostingDeployment resources**

The HostingDeployment resource consists of multiple SageMaker resources: Endpoint, EndpointConfig, and each Model. If you adopt a SageMaker endpoint in ACK, you need to adopt the Endpoint, EndpointConfig, and each Model separately. The Endpoint, EndpointConfig, and Model names can be found in status of the HostingDeployment resource (status.endpointName, status.endpointConfigName, and status.modelNames).

For a list of all supported SageMaker resources, refer to the [ACK API Reference](https://docs.aws.amazon.com/ckafka/latest/using/aws-controllers-k8s-sagemaker.html).

**Clean up old resources**

After the new SageMaker Operators for Kubernetes adopt your resources, it is time to uninstall old operators and clean up old resources.

**Step 1: Uninstall the old operator**

To uninstall the old operator, see Delete operators (p. 3339).

**Warning**

Uninstall the old operator before deleting any old resources.

**Step 2: Remove finalizers and delete old resources**

**Warning**

Before deleting old resources, be sure that you have uninstalled the old operator.
After uninstalling the old operator, you must explicitly remove the finalizers to delete old operator resources. The following sample script shows how to delete all training jobs managed by the old operator in a given namespace. You can use a similar pattern to delete additional resources once they are adopted by the new operator.

**Note**
You must use full resource names to get resources. For example, use `kubectl get trainingjobs.sagemaker.aws.amazon.com` instead of `kubectl get trainingjob`.

```
namespace=sagemaker_namespace
training_jobs=$(kubectl get trainingjobs.sagemaker.aws.amazon.com -n $namespace -ojson | jq -r '.items | .[] | .metadata.name')
for job in $training_jobs
do
echo "Deleting $job resource in $namespace namespace"
kubectl patch trainingjobs.sagemaker.aws.amazon.com $job -n $namespace -p '{"metadata": {"finalizers":null}}' --type=merge
kubectl delete trainingjobs.sagemaker.aws.amazon.com $job -n $namespace
done
```

**Tutorials**
For more in-depth guides on installing and using the new SageMaker Operator for Kubernetes, see the following tutorials:

- Machine Learning with the ACK SageMaker Controller
- Scale SageMaker Workloads with Application Auto Scaling

**SageMaker Components for Kubeflow Pipelines**

This document outlines how to use SageMaker Components for Kubeflow Pipelines (KFP). With these pipeline components, you can create and monitor native SageMaker training, tuning, endpoint deployment, and batch transform jobs from your Kubeflow Pipelines. By running Kubeflow Pipeline jobs on SageMaker, you move data processing and training jobs from the Kubernetes cluster to SageMaker's machine learning-optimized managed service. This document assumes prior knowledge of Kubernetes and Kubeflow.

**Contents**

- What is Kubeflow Pipelines? (p. 3370)
- Kubeflow Pipeline components (p. 3371)
- IAM permissions (p. 3372)
- Converting Pipelines to use SageMaker (p. 3373)
- Using SageMaker Components (p. 3373)

**What is Kubeflow Pipelines?**

Kubeflow Pipelines (KFP) is a platform for building and deploying portable, scalable machine learning (ML) workflows based on Docker containers. The Kubeflow Pipelines platform consists of the following:

- A user interface (UI) for managing and tracking experiments, jobs, and runs.
- An engine (Argo) for scheduling multi-step ML workflows.
- A AWS SDK for Python (Boto3) SDK for defining and manipulating pipelines and components.
• Notebooks for interacting with the system using the SDK.

A pipeline is a description of an ML workflow expressed as a directed acyclic graph as shown in the following diagram. Every step in the workflow is expressed as a Kubeflow Pipeline component, which is an AWS SDK for Python (Boto3) module.

If your data has been preprocessed, the standard pipeline can take a subset of the data and run hyperparameter optimization of your model. The pipeline then trains a model with the full dataset using the optimal hyperparameters. This model is used for both batch inference and endpoint creation.

For more information on Kubeflow Pipelines, see the Kubeflow Pipelines documentation.

### Kubeflow Pipeline components

A Kubeflow Pipeline component is a set of code used to execute one step of a Kubeflow pipeline. Components are represented by a AWS SDK for Python (Boto3) module built into a Docker image. These components make it fast and easy to write pipelines for experimentation and production environments without having to interact with the underlying Kubernetes infrastructure.

### SageMaker Components for Kubeflow Pipelines versions

SageMaker Components for Kubeflow Pipelines come in two versions. Each version leverages a different backend to create and manage resources on SageMaker.

- The SageMaker Components for Kubeflow Pipelines version 1 (v1.x or below) use Boto3 (AWS SDK for AWS SDK for Python (Boto3)) as backend.
- The version 2 (v2.0.0-alpha2 and above) of SageMaker Components for Kubeflow Pipelines use SageMaker Operator for Kubernetes (ACK).

AWS introduced ACK to facilitate a Kubernetes-native way of managing AWS Cloud resources. ACK includes a set of AWS service-specific controllers, one of which is the SageMaker controller. The SageMaker controller makes it easier for machine learning developers and data scientists using Kubernetes as their control plane to train, tune, and deploy machine learning (ML) models in SageMaker. For more information, see SageMaker Operators for Kubernetes

Both versions of the SageMaker Components for Kubeflow Pipelines are supported. However, the version 2 provides some additional advantages. In particular, it offers:

1. A consistent experience to manage your SageMaker resources from any application; whether you are using Kubeflow pipelines, or Kubernetes CLI (kubectl) or other Kubeflow applications such as Notebooks.
2. The flexibility to manage and monitor your SageMaker resources outside of the Kubeflow pipeline workflow.
3. Zero setup time to use the components if you deployed the full Kubeflow on AWS release since the SageMaker Operator is part of its deployment.

### What do SageMaker Components for Kubeflow Pipelines provide?

SageMaker Components for Kubeflow Pipelines offer an alternative to launching your compute-intensive jobs from SageMaker. The components integrate SageMaker with the portability and orchestration of Kubeflow Pipelines. Using the SageMaker Components for Kubeflow Pipelines (KFP), you can create and monitor your SageMaker resources as part of a Kubeflow Pipelines workflow. Each of the jobs in your pipelines runs on SageMaker instead of the local Kubernetes cluster. The job parameters, status, logs, and outputs from SageMaker are still accessible from the Kubeflow Pipelines UI.
The following SageMaker components have been created to integrate six key SageMaker features into your ML workflows. You can create a Kubeflow Pipeline built entirely using these components, or integrate individual components into your workflow as needed. Alternatively, you can find all SageMaker Components for Kubeflow Pipelines in GitHub.

There is no additional charge for using SageMaker Components for Kubeflow Pipelines. You incur charges for any SageMaker resources you use through these components.

Training components

Processing

The Processing component enables you to submit processing jobs to SageMaker directly from a Kubeflow Pipelines workflow. For more information, see SageMaker Processing Kubeflow Pipeline component version 1.

Training

The Training component allows you to submit SageMaker Training jobs directly from a Kubeflow Pipelines workflow. For more information, see SageMaker Training Kubeflow Pipelines component version 2. For information about Version 1 of the Training component see SageMaker Training Kubeflow Pipelines component version 1.

Hyperparameter Optimization

The Hyperparameter Optimization component enables you to submit hyperparameter tuning jobs to SageMaker directly from a Kubeflow Pipelines workflow. For more information, see SageMaker hyperparameter optimization Kubeflow Pipeline component version 1.

Inference components

Hosting Deploy

The Deploy component enables you to deploy a model in SageMaker Hosting from a Kubeflow Pipelines workflow. For more information, see SageMaker Hosting Services - Create Endpoint Kubeflow Pipeline component version 1.

Batch Transform component

The Batch Transform component enables you to run inference jobs for an entire dataset in SageMaker from a Kubeflow Pipelines workflow. For more information, see SageMaker Batch Transform Kubeflow Pipeline component version 1.

Ground Truth components

Ground Truth The Ground Truth component enables you to submit SageMaker Ground Truth labeling jobs directly from a Kubeflow Pipelines workflow. For more information, see SageMaker Ground Truth Kubeflow Pipelines component version 1.

Workteam

The Workteam component enables you to create SageMaker private workteam jobs directly from a Kubeflow Pipelines workflow. For more information, see SageMaker create private workteam Kubeflow Pipelines component version 1.

IAM permissions

Deploying Kubeflow Pipelines with SageMaker components requires the following three levels of IAM permissions:
• An IAM user/role to access your AWS account (your_credentials). Note: You don’t need this at all if
you already have access to KFP web UI and have your input data in Amazon S3, or if you already have
an Amazon Elastic Kubernetes Service (Amazon EKS) cluster with KFP.

You use this user/role from your gateway node, which can be your local machine or a remote
instance, to:
• Create an Amazon EKS cluster and install KFP
• Create IAM roles/users
• Create Amazon S3 buckets for your sample input data

The IAM user/role needs the following permissions:
• CloudWatchLogsFullAccess
• AWSCloudFormationFullAccess
• IAMFullAccess
• AmazonS3FullAccess
• AmazonEC2FullAccess
• AmazonEKSAdminPolicy (Create this policy using the schema from Amazon EKS Identity-Based
Policy Examples)

• An IAM role used by pipeline pods (kfp-example-pod-role) or the SageMaker Operator for Kubernetes
controller pod to access SageMaker. This permission is used to create and monitor SageMaker jobs.
Note: You can limit permissions to the KFP and controller pods by creating and attaching your own
custom policy.

The role needs the following permission:
• AmazonSageMakerFullAccess

• An IAM role used by SageMaker jobs to access resources such as Amazon S3 and Amazon ECR etc. (kfp-
example-sagemaker-execution-role).

Your SageMaker jobs use this role to:
• Access SageMaker resources
• Input Data from Amazon S3
• Store your output model to Amazon S3

The role needs the following permissions:
• AmazonSageMakerFullAccess
• AmazonS3FullAccess

These are all the IAM users/roles you need to run KFP components for SageMaker.

When you have run the components and have created the SageMaker endpoint, you also need a role with
the sagemaker:InvokeEndpoint permission to query inference endpoints.

Converting Pipelines to use SageMaker

You can convert an existing pipeline to use SageMaker by porting your generic AWS SDK for Python
(Boto3) processing containers and training containers. If you are using SageMaker for inference, you also
need to attach IAM permissions to your cluster and convert an artifact to a model.

Using SageMaker Components

In this tutorial, you run a pipeline using SageMaker Components for Kubeflow Pipelines to train a
classification model using Kmeans with the MNIST dataset. This workflow uses Kubeflow pipelines as the
orchestrator and SageMaker to execute each step of the workflow. For the full code for this and other
pipeline examples, see the Sample SageMaker Kubeflow Pipelines. For information on the components
used, see the KubeFlow Pipelines GitHub repository.
• Install Kubeflow Pipelines (p. 3374)
• Run Kubeflow Pipelines (p. 3381)

Install Kubeflow Pipelines

To use Kubeflow Pipelines (KFP), you need an Amazon Elastic Kubernetes Service (Amazon EKS) cluster and a gateway node to interact with that cluster. The following sections show the steps needed to set up these resources.

Topics
• Choose an installation option (p. 3374)
• Configure your pipeline permissions to access SageMaker (p. 3376)
• Access the KFP UI (p. 3378)

Choose an installation option

Kubeflow Pipelines offer two installation options. Select the option that applies to your use case:

1. Full Kubeflow on AWS Deployment (p. 3374)
   To use other Kubeflow components in addition to Kubeflow Pipelines, choose the full AWS Distribution of Kubeflow deployment.
2. Standalone Kubeflow Pipelines Deployment (p. 3374)
   To use the Kubeflow Pipelines without the other components of Kubeflow, install Kubeflow pipelines standalone.

Full Kubeflow on AWS Deployment

To install the full release of Kubeflow on AWS, follow one of the deployment guides

Standalone Kubeflow Pipelines Deployment

Set up a gateway node

A gateway node is used to create an Amazon EKS cluster and access the Kubeflow Pipelines UI. Use your local machine or an Amazon EC2 instance as your gateway node. If you want to use a new Amazon EC2 instance, create one with the latest Ubuntu 18.04 DLAMI version from the AWS console using the steps in Launching and Configuring a DLAMI.

Complete the following steps to set up your gateway node. Depending on your environment, you may have certain requirements already configured.

1. If you don't have an existing Amazon EKS cluster, create a user named your_credentials using the steps in Creating an IAM User in Your AWS Account. If you have an existing Amazon EKS cluster, use the credentials of the IAM role or user that has access to it.
2. Add the following permissions to your user using the steps in Changing Permissions for an IAM User:
   • CloudWatchLogsFullAccess
   • AWSCloudFormationFullAccess
   • IAMFullAccess
   • AmazonS3FullAccess
   • AmazonEC2FullAccess
   • AmazonEKSAdminPolicy (Create this policy using the schema from Amazon EKS Identity-Based Policy Examples)
3. Install the following on your gateway node to access the Amazon EKS cluster and KFP UI.
   - **AWS CLI.** If you are using an IAM user, configure your Access Key ID, Secret Access Key and preferred AWS Region by running: `aws configure`
   - **aws-iam-authenticator** version 0.1.31 and above
   - **eksctl** version above 0.15.
   - **kubectl** (The version needs to match your Kubernetes version within one minor version)

4. Install boto3.
   ```
   pip install boto3
   ```

### Set up an Amazon EKS cluster

Run the following steps from the command line of your gateway node to set up an Amazon EKS cluster:

1. If you do not have an existing Amazon EKS cluster, complete the following substeps. If you already have an Amazon EKS cluster, skip this step.
   a. Run the following from your command line to create an Amazon EKS cluster with version 1.17 or above. Replace `<your-cluster-name>` with any name for your cluster.
      ```
      eksctl create cluster --name <your-cluster-name> --region us-east-1 --auto-kubeconfig --timeout=50m --managed --nodes=1
      ```
   b. When cluster creation is complete, verify that you have access to the cluster using the following command.
      ```
      kubectl get nodes
      ```

2. Verify that the current kubectl context is the cluster you want to use with the following command. The current context is marked with an asterisk (*) in the output.
   ```
   kubectl config get-contexts
   ```
   ```
   CURRENT NAME     CLUSTER
   * <username>@<clusternname>.us-east-1.eksctl.io  <clusternname>.us-east-1.eksctl.io
   ```

3. If the desired cluster is not configured as your current default, update the default with the following command.
   ```
   aws eks update-kubeconfig --name <clusternname> --region us-east-1
   ```

### Install Kubeflow Pipelines

Run the following steps from the terminal of your gateway node to install Kubeflow Pipelines on your cluster.

1. Install all cert-manager components:
   ```
   kubectl apply -f https://github.com/cert-manager/cert-manager/releases/download/v1.9.1/cert-manager.yaml
   ```

2. Install the Kubeflow pipelines:
   ```
   export PIPELINE_VERSION=2.0.0-alpha.5
   ```
kubectl apply -k "github.com/kubeflow/pipelines/manifests/kustomize/env/cert-manager/cluster-scoped-resources?ref=$KFP_VERSION"

kubectl wait --for condition=established --timeout=60s crd/applications.app.k8s.io

kubectl apply -k "github.com/kubeflow/pipelines/manifests/kustomize/env/cert-manager/dev?ref=$KFP_VERSION"

3. Verify that the Kubeflow Pipelines service and other related resources are running.

```
kubectl -n kubeflow get all | grep pipeline
```

Your output should look like the following.

<table>
<thead>
<tr>
<th>Pod Name</th>
<th>Status</th>
<th>Age</th>
</tr>
</thead>
<tbody>
<tr>
<td>pod/ml-pipeline-6b88c67994-kdtjv</td>

</tbody>
</table>

**Configure your pipeline permissions to access SageMaker**

In this section, you create IAM users/roles and permissions to be used by Kubeflow Pipeline pods to access SageMaker services.

**Configuration for SageMaker components version 2**

To run SageMaker Components version 2 for Kubeflow Pipelines, you need to install the SageMaker Operator for Kubernetes and configure RBAC permissions for the Kubeflow Pipeline pods to create SageMaker custom resources in your Kubernetes cluster from the pipeline pods.
**Important**
Follow this section if you are using Kubeflow pipelines standalone deployment. These steps are preconfigured if you are using AWS distribution of Kubeflow version 1.6.0-aws-b1.0.0 or above.

   Follow the Setup section of [Machine Learning with ACK SageMaker Controller tutorial](#) to install the SageMaker Controller.

2. Configure RBAC permissions for the service account used by Kubeflow pipeline pods. In Kubeflow pipeline standalone deployment, the pipeline runs are executed in the namespace `kubeflow` using the pipeline-runner service account.

   a. Create a `RoleBinding` that grants service account access to manage sagemaker custom resources.

   ```
cat > manage_sagemaker_cr.yaml <<EOF
apiVersion: rbac.authorization.k8s.io/v1
kind: RoleBinding
metadata:
  name: manage-sagemaker-cr
  namespace: kubeflow
subjects:
- kind: ServiceAccount
  name: pipeline-runner
  namespace: kubeflow
roleRef:
  kind: ClusterRole
  name: ack-sagemaker-controller
  apiGroup: rbac.authorization.k8s.io
EOF

kubectl apply -f manage_sagemaker_cr.yaml
```

   b. Make sure that the rolebinding was created by running:

   ```
kubectl get rolebinding manage-sagemaker-cr -n kubeflow -o yaml
```

**Configuration for SageMaker components version 1**

To run SageMaker Components version 1 for Kubeflow Pipelines, the Kubeflow Pipeline pods need access to SageMaker.

**Important**
Follow this section if you are using full Kubeflow or standalone deployment.

To grant SageMaker access to the service account used by Kubeflow pipeline pods, follow those steps:
1. Export your cluster name (e.g., `my-cluster-name`) and cluster region (e.g., `us-east-1`).

```bash
export CLUSTER_NAME=my-cluster-name
export CLUSTER_REGION=us-east-1
```

2. Export the namespace and service account name according to your installation.

- For the full Kubeflow on AWS installation, export your profile namespace (e.g., `kubeflow-user-example-com`) and `default-editor` as the service account.

```bash
export NAMESPACE=kubeflow-user-example-com
export KUBEFLOW_PIPELINE_POD_SERVICE_ACCOUNT=default-editor
```

- For the standalone Pipelines deployment, export `kubeflow` as the namespace and `pipeline-runner` as the service account.

```bash
export NAMESPACE=kubeflow
export KUBEFLOW_PIPELINE_POD_SERVICE_ACCOUNT=pipeline-runner
```

3. Enable OIDC support on the Amazon EKS cluster with the following command.

```bash
eksctl utils associate-iam-oidc-provider --cluster ${CLUSTER_NAME} --region ${CLUSTER_REGION} --approve
```

4. Create a KFP execution role for the pods to access AWS services.

```bash
eksctl create iamserviceaccount
  --name ${KUBEFLOW_PIPELINE_POD_SERVICE_ACCOUNT}
  --namespace ${NAMESPACE} --cluster ${CLUSTER_NAME}
  --region ${CLUSTER_REGION}
  --attach-policy-arn arn:aws:iam::aws:policy/AmazonSageMakerFullAccess
  --attach-policy-arn arn:aws:iam::aws:policy/CloudWatchLogsFullAccess
  --override-existing-serviceaccounts
  --approve
```

Once you are finished configuring your pipeline permissions to access SageMaker Components version 1, follow the SageMaker components for Kubeflow pipelines guide on the Kubeflow on AWS documentation.

**Access the KFP UI**

The Kubeflow Pipelines UI is used for managing and tracking experiments, jobs, and runs on your cluster. For instructions on how to access the Kubeflow Pipelines UI from your gateway node, follow the steps that apply to your deployment option in this section.

**Full Kubeflow on AWS Deployment**

Follow the instructions on the Kubeflow on AWS website to connect to the Kubeflow dashboard and navigate to the pipelines tab.
Standalone Kubeflow Pipelines Deployment

Use port forwarding to access the Kubeflow Pipelines UI from your gateway node by following those steps.

Set up port forwarding to the KFP UI service

Run the following from the command line of your gateway node:

1. Verify that the KFP UI service is running using the following command:

```
kubectl -n kubeflow get service ml-pipeline-ui
```

<table>
<thead>
<tr>
<th>NAME</th>
<th>TYPE</th>
<th>CLUSTER-IP</th>
<th>EXTERNAL-IP</th>
<th>PORT(S)</th>
<th>AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>ml-pipeline-ui</td>
<td>ClusterIP</td>
<td>10.100.38.71</td>
<td>&lt;none&gt;</td>
<td>80/TCP</td>
<td>2d22h</td>
</tr>
</tbody>
</table>

2. Run the following command to set up port forwarding to the KFP UI service. This forwards the KFP UI to port 8080 on your gateway node and allows you to access the KFP UI from your browser.

```
kubectl port-forward -n kubeflow service/ml-pipeline-ui 8080:80
```

The port forward from your remote machine drops if there is no activity. Run this command again if your dashboard is unable to get logs or updates. If the commands return an error, ensure that there is no process already running on the port you are trying to use.

Access the KFP UI service

Your method of accessing the KFP UI depends on your gateway node type.

- Local machine as the gateway node
  1. Access the dashboard in your browser as follows:

```
http://localhost:8080
```

  2. Choose **Pipelines** to access the pipelines UI.

- Amazon EC2 instance as the gateway node
  1. You need to set up an SSH tunnel on your Amazon EC2 instance to access the Kubeflow dashboard from your local machine's browser.

     From a new terminal session in your local machine, run the following. Replace `<public-DNS-of-gateway-node>` with the IP address of your instance found on the Amazon EC2 console. You can also use the public DNS. Replace `<path_to_key>` with the path to the pem key used to access the gateway node.

```
public_DNS_address=<public-DNS-of-gateway-node>
key=<path_to_key>

on Ubuntu:
ssh -i $(key) -L 9000:localhost:8080 ubuntu@$public_DNS_address

or on Amazon Linux:
ssh -i $(key) -L 9000:localhost:8080 ec2-user@$public_DNS_address
```

  2. Access the dashboard in your browser.

```
http://localhost:9000
```
3. Choose **Pipelines** to access the KFP UI.

(Optional) Add access to additional IAM users or roles

If you use an intuitive IDE like Jupyter or want other people in your organization to use the cluster you set up, you can also give them access. The following steps run through this workflow using SageMaker notebooks. An SageMaker notebook instance is a fully managed Amazon EC2 compute instance that runs the Jupyter Notebook App. You use the notebook instance to create and manage Jupyter notebooks to create ML workflows. You can define, compile, deploy, and run your pipeline using the KFP AWS SDK for Python (Boto3) SDK or CLI. If you’re not using an SageMaker notebook to run Jupyter, you need to install the **AWS CLI** and the latest version of **kubectl**.

1. Follow the steps in Create an SageMaker Notebook Instance to create a SageMaker notebook instance if you do not already have one. Give the IAM role for this instance the **S3FullAccess** permission.

2. Amazon EKS clusters use IAM users and roles to control access to the cluster. The rules are implemented in a config map named `aws-auth`. Only the user/role that has access to the cluster will be able to edit this config map. Run the following from the command line of your gateway node to get the IAM role of the notebook instance you created. Replace `<instance-name>` with the name of your instance.

   ```bash
   aws sagemaker describe-notebook-instance --notebook-instance-name <instance-name> --region <region> --output text --query 'RoleArn'
   ```

   This command outputs the IAM role ARN in the `arn:aws:iam::<account-id>:role/<role-name>` format. Take note of this ARN.

3. Run the following to attach the policies the IAM role. Replace `<role-name>` with the `<role-name>` in your ARN.

   ```bash
   aws iam attach-role-policy --role-name <role-name> --policy-arn arn:aws:iam::aws:policy/AmazonSageMakerFullAccess
   aws iam attach-role-policy --role-name <role-name> --policy-arn arn:aws:iam::aws:policy/AmazonEKSWorkerNodePolicy
   aws iam attach-role-policy --role-name <role-name> --policy-arn arn:aws:iam::aws:policy/AmazonS3FullAccess
   ```

4. eksctl provides commands to read and edit the `aws-auth` config map. system:masters is one of the default user groups. You add the user to this group. The system:masters group has super user permissions to the cluster. You can also create a group with more restrictive permissions or you can bind permissions directly to users. Replace `<IAM-Role-arn>` with the ARN of the IAM role. `<your_username>` can be any unique username.

   ```bash
   eksctl create iamidentitymapping \
   --cluster <cluster-name> \
   --arn <IAM-Role-arn> \
   --group system:masters \
   --username <your-username> \
   --region <region>
   ```

5. Open the Jupyter notebook on your SageMaker instance and run the following to verify that it has access to the cluster.

   ```bash
   aws eks --region <region> update-kubeconfig --name <cluster-name>
   kubectl -n kubeflow get all | grep pipeline
   ```
Run Kubeflow Pipelines

Now that the setup of your gateway node and Amazon EKS cluster is complete, you can create your classification pipeline. To create your pipeline, you need to define and compile it. You then deploy it and use it to run workflows. You can define your pipeline in AWS SDK for Python (Boto3) and use the KFP dashboard, KFP CLI, or AWS SDK for Python (Boto3) SDK to compile, deploy, and run your workflows. The full code for the MNIST classification pipeline example is available in the Kubeflow Github repository. To use it, clone the example AWS SDK for Python (Boto3) files to your gateway node.

To run the classification pipeline example, follow the first section then continue with the steps that apply to your deployment option.

Create a SageMaker execution role

The kfp-example-sagemaker-execution-role IAM role is used by SageMaker jobs to access AWS resources. For more information, see the IAM Permissions section. You provide this role as an input parameter when running the pipeline.

Run the following to create the role. Note the ARN that is returned in your output.

```
SAGEMAKER_EXECUTION_ROLE_NAME=kfp-example-sagemaker-execution-role

aws iam create-role --role-name ${SAGEMAKER_EXECUTION_ROLE_NAME} --assume-role-policy-document "$TRUST"

aws iam attach-role-policy --role-name ${SAGEMAKER_EXECUTION_ROLE_NAME} --policy-arn arn:aws:iam::aws:policy/AmazonSageMakerFullAccess

aws iam attach-role-policy --role-name ${SAGEMAKER_EXECUTION_ROLE_NAME} --policy-arn arn:aws:iam::aws:policy/AmazonS3FullAccess

aws iam get-role --role-name ${SAGEMAKER_EXECUTION_ROLE_NAME} --output text --query 'Role.Arn'
```

Full Kubeflow on AWS Deployment

Follow the instructions of the SageMaker Training Pipeline tutorial for MNIST Classification with K-Means.

Standalone Kubeflow Pipelines Deployment

Prepare datasets

To run the pipelines, you need to upload the data extraction pre-processing script to an Amazon S3 bucket. This bucket and all resources for this example must be located in the us-east-1 Amazon Region. If you don’t have a bucket, create one using the steps in Creating a bucket.

From the mnist-kmeans-sagemaker folder of the Kubeflow repository you cloned on your gateway node, run the following command to upload the kmeans_preprocessing.py file to your Amazon S3 bucket. Change <bucket-name> to the name of the Amazon S3 bucket you created.

```
aws s3 cp mnist-kmeans-sagemaker/kmeans_preprocessing.py s3://<bucket-name>/mnist_kmeans_example/processing_code/kmeans_preprocessing.py
```

Compile and deploy your pipeline

After defining the pipeline in AWS SDK for Python (Boto3), you must compile the pipeline to an intermediate representation before you can submit it to the Kubeflow Pipelines service. The intermediate representation is a workflow specification in the form of a YAML file compressed into a tar.gz file. You need the KFP SDK to compile your pipeline.
Install KFP SDK

Run the following from the command line of your gateway node:

1. Install the KFP SDK following the instructions in the Kubeflow pipelines documentation.
2. Verify that the KFP SDK is installed with the following command:
   ```shell
   pip show kfp
   ```
3. Verify that `dsl-compile` has been installed correctly as follows:
   ```shell
   which dsl-compile
   ```

Compile your pipeline

You have three options to interact with Kubeflow Pipelines: KFP UI, KFP CLI, or the KFP SDK. The following sections illustrate the workflow using the KFP UI and CLI.

Complete the following from your gateway node to compile your pipeline.

1. Modify your AWS SDK for Python (Boto3) file with your Amazon S3 bucket name and IAM role ARN.
2. Use the `dsl-compile` command from the command line to compile your pipeline as follows.
   ```shell
   dsl-compile --py <path-to-python-file> --output <path-to-output>
   ```

Upload and run the pipeline using the KFP CLI

Complete the following steps from the command line of your gateway node. KFP organizes runs of your pipeline as experiments. You have the option to specify an experiment name. If you do not specify one, the run will be listed under Default experiment.

1. Upload your pipeline as follows:
   ```shell
   kfp pipeline upload --pipeline-name <pipeline-name> <path-to-output-tar.gz>
   ```
   Your output should look like the following. Take note of the ID.
   
   Pipeline 29c3ff21-49f5-4dfe-94f6-618c0e2420fe has been submitted
   Pipeline Details
   ------------------
   ID 29c3ff21-49f5-4dfe-94f6-618c0e2420fe
   Name sm-pipeline
   Description
   Uploaded at 2020-04-30T22:39:00+00:00
   ...
   ...

2. Create a run using the following command. The KFP CLI run command currently does not support specifying input parameters while creating the run. You need to update your parameters in the AWS SDK for Python (Boto3) pipeline file before compiling. Replace `<experiment-name>` and `<job-name>` with any names. Replace `<pipeline-id>` with the ID of your submitted pipeline. Replace `<your-role-arn>` with the ARN of kfp-example-pod-role. Replace `<your-bucket-name>` with the name of the Amazon S3 bucket you created.
You can also directly submit a run using the compiled pipeline package created as the output of the dsl-compile command.

```
kfp run submit --experiment-name <experiment-name> --run-name <job-name> --pipeline-id <pipeline-id> role_arn="<your-role-arn>" bucket_name="<your-bucket-name>"
```

Your output should look like the following:

```
Creating experiment aws.
Run 95084a2c-f18d-4b77-a9da-eba00bf01e63 is submitted
+--------------------------------------+--------+----------+---------------------------
<table>
<thead>
<tr>
<th>run id</th>
<th>name</th>
<th>status</th>
<th>created at</th>
</tr>
</thead>
</table>
+-------------------------+---------+----------+---------------------------|
| 95084a2c-f18d-4b77-a9da-eba00bf01e63 | sm-job  |          | 2020-04-30T20:36:41+00:00 |
+-------------------------+---------+----------+---------------------------|
```

3. Navigate to the UI to check the progress of the job.

### Upload and run the pipeline using the KFP UI

1. On the left panel, choose the **Pipelines** tab.
2. In the upper-right corner, choose **+UploadPipeline**.
3. Enter the pipeline name and description.
4. Choose **Upload a file** and enter the path to the tar.gz file you created using the CLI or with the AWS SDK for Python (Boto3) SDK.
5. On the left panel, choose the **Pipelines** tab.
6. Find the pipeline you created.
7. Choose **+CreateRun**.
8. Enter your input parameters.
9. Choose **Run**.

### Run predictions

Once your classification pipeline is deployed, you can run classification predictions against the endpoint that was created by the Deploy component. Use the KFP UI to check the output artifacts for `sagemaker-deploy-model-endpoint_name`. Download the .tgz file to extract the endpoint name or check the SageMaker console in the region you used.

### Configure permissions to run predictions

If you want to run predictions from your gateway node, skip this section.

1. To use any other machine to run predictions, assign the `sagemaker:InvokeEndpoint` permission to the IAM role or IAM user used by the client machine. This permission is used to run predictions.
2. On your gateway node, run the following to create a policy file:
3. Attach the policy to the client node's IAM role or IAM user.

4. If your client machine has an IAM role attached, run the following. Replace `<your-instance-IAM-role>` with the name of the client node's IAM role. Replace `<path-to-sagemaker-invoke-json>` with the path to the policy file you created.

```
aws iam put-role-policy --role-name <your-instance-IAM-role> --policy-name sagemaker-invoke-for-worker --policy-document file://<path-to-sagemaker-invoke-json>
```

5. If your client machine has IAM user credentials configured, run the following. Replace `<your_IAM_user_name>` with the name of the client node's IAM user. Replace `<path-to-sagemaker-invoke-json>` with the path to the policy file you created.

```
aws iam put-user-policy --user-name <your_IAM_user_name> --policy-name sagemaker-invoke-for-worker --policy-document file://<path-to-sagemaker-invoke-json>
```

### Run predictions

1. Create a AWS SDK for Python (Boto3) file from your client machine named `mnist-predictions.py` with the following content. Replace the `ENDPOINT_NAME` variable. This script loads the MNIST dataset, then creates a CSV from those digits and sends it to the endpoint for prediction. It then outputs the results.

```python
import boto3
import gzip
import io
import json
import numpy
import pickle

ENDPOINT_NAME='<endpoint-name>
region = boto3.Session().region_name

# S3 bucket where the original mnist data is downloaded and stored
downloaded_data_bucket = f"jumpstart-cache-prod-{region}"
downloaded_data_prefix = "1p-notebooks-datasets/mnist"

# Download the dataset
s3 = boto3.client("s3")
s3.download_file_object(downloaded_data_bucket, f"{downloaded_data_prefix}/mnist.pkl.gz", "mnist.pkl.gz")

# Load the dataset
with gzip.open('mnist.pkl.gz', 'rb') as f:
    train_set, valid_set, test_set = pickle.load(f, encoding='latin1')
```
# Simple function to create a csv from our numpy array

def np2csv(arr):
    csv = io.BytesIO()
    numpy.savetxt(csv, arr, delimiter=',', fmt='%g')
    return csv.getvalue().decode().rstrip()

runtime = boto3.Session(region).client('sagemaker-runtime')

payload = np2csv(train_set[0][30:31])

response = runtime.invoke_endpoint(EndpointName=ENDPOINT_NAME,
                                   ContentType='text/csv',
                                   Body=payload)

result = json.loads(response['Body'].read().decode())

print(result)

2. Run the AWS SDK for Python (Boto3) file as follows:

   python mnist-predictions.py

View results and logs

When the pipeline is running, you can choose any component to check execution details, such as inputs and outputs. This lists the names of created resources.

If the KFP request is successfully processed and an SageMaker job is created, the component logs in the KFP UI provide a link to the job created in SageMaker. The CloudWatch logs are also provided if the job is successfully created.

If you run too many pipeline jobs on the same cluster, you may see an error message that indicates you do not have enough pods available. To fix this, log in to your gateway node and delete the pods created by the pipelines you are not using as follows:

   kubectl get pods -n kubeflow
   kubectl delete pods -n kubeflow <name-of-pipeline-pod>

Cleanup

When you're finished with your pipeline, you need to clean up your resources.

1. From the KFP dashboard, terminate your pipeline runs if they do not exit properly by choosing Terminate.

2. If the Terminate option doesn't work, log in to your gateway node and manually terminate all the pods created by your pipeline run as follows:

   kubectl get pods -n kubeflow
   kubectl delete pods -n kubeflow <name-of-pipeline-pod>

3. Using your AWS account, log in to the SageMaker service. Manually stop all training, batch transform, and HPO jobs. Delete models, data buckets, and endpoints to avoid incurring any additional costs. Terminating the pipeline runs does not stop the jobs in SageMaker.

Amazon SageMaker Workflows FAQ

Use the following FAQ items to find answers to commonly asked questions about MLOps workflows.
Q. Do I need to use the SageMaker Python SDK to create a SageMaker pipeline?

No, the SageMaker Python SDK is not required to create a SageMaker pipeline. You can also use boto3 or AWS CloudFormation. Creating a pipeline requires a pipeline definition, which is a JSON object that defines each step of the pipeline. The SageMaker SDK offers a simple way to construct the pipeline definition, which you can use with any of the APIs previously mentioned to create the pipeline itself. Without using the SDK, users have to write the raw JSON definition to create the pipeline without any of the error checks provided by the SageMaker Python SDK. To see the schema for the pipeline JSON definition, see SageMaker Pipeline Definition JSON Schema. The following code sample shows an example of a SageMaker pipeline definition JSON object:

```json
{"Version": '2020-12-01',
'Metadata': {},
'Parameters': [{"Name": 'ProcessingInstanceType',
'Type': 'String',
'DefaultValue': 'ml.m5.xlarge'},
{"Name": 'ProcessingInstanceCount', 'Type': 'Integer', 'DefaultValue': 1},
{"Name": 'TrainingInstanceType',
'Type': 'String',
'DefaultValue': 'ml.m5.xlarge'},
{"Name": 'ModelApprovalStatus',
'Type': 'String',
'DefaultValue': 'PendingManualApproval'},
{"Name": 'ProcessedData',
'Type': 'String',
'DefaultValue': 'S3_URL'},
{"Name": 'InputDataUrl',
'Type': 'String',
'DefaultValue': 'S3_URL'},
'PipelineExperimentConfig': {'ExperimentName': {'Get': 'Execution.PipelineName'},
'TrialName': {'Get': 'Execution.PipelineExecutionId'}},
'Steps': [{"Name": 'ReadTrainDataFromFS',
'Type': 'Processing',
'Arguments': {'ProcessingResources': {'ClusterConfig': {'InstanceType': 'ml.m5.xlarge',
'InstanceCount': 2,
'VolumeSizeInGB': 30}},
'AppSpecification': {'ImageUri': 'IMAGE_URI',
'ContainerArguments': []},
'RoleArn': 'ROLE',
'ProcessingInputs': [],
'ProcessingOutputConfig': {'Outputs': []},
'StoppingCondition': {'MaxRuntimeInSeconds': 86400},
'CacheConfig': {'Enabled': True, 'ExpireAfter': '30d'}},
...
...
...}
```

Q. Why do I see a repack step in my SageMaker pipeline?

Model repacking happens when the pipeline needs to include a custom script in the compressed model file (model.tar.gz) to be uploaded to Amazon S3 and used to deploy a model to a SageMaker endpoint. When SageMaker pipeline trains a model and registers it to the model registry, it introduces a repack step if the trained model output from the training job needs to include a custom inference script. The repack step uncompressed the model, adds a new script, and recompresses the model. Running the pipeline adds the repack step as a training job.
Q. Can I use SageMaker Experiments with SageMaker Pipelines?

Yes. SageMaker Pipelines is natively integrated with SageMaker Experiments. You can use `PipelineExperimentConfig` when creating a pipeline and set your own SageMaker Experiment name. Each run of the pipeline creates a trial, and each step in the pipeline corresponds to a `TrialComponent` within the trial. If no trial name is specified in the experiment config, the pipeline execution ID is used as the trial name.

```python
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[...],
    steps=[...],
    sagemaker_session=sagemaker_session,
    pipeline_experiment_config=PipelineExperimentConfig(
        ExecutionVariables.PIPELINE_NAME,
        ExecutionVariables.PIPELINE_EXECUTION_ID
    )
)
```

Q. SageMaker Project templates have a model deploy repository that uses CloudFormation (CFN) to create an endpoint. Are there ways to deploy the model without using CloudFormation?

You can customize the deploy repository in the project template to deploy the model from the model registry any way you like. The template uses CloudFormation to create a real-time endpoint, as an example. You can update the deployment to use the SageMaker SDK, boto3, or any other API that can create endpoints instead of CFN. If you need to update the CodeBuild steps as part of the deployment pipeline, you can create a custom template.

Q. How do we pass the model file Amazon S3 URL from the train step to the model register step in a SageMaker pipeline at run time?

You can reference the model location as a property of the training step, as shown in the end-to-end example `CustomerChurn pipeline` in Github.

Q. If I am extending a prebuilt container to train an estimator or for a `ProcessingStep` on SageMaker Pipelines, is it necessary to copy the script to the container in the Dockerfile?

No, you can either copy the script to the container or pass it via the `entry_point` argument (of your estimator entity) or `code` argument (of your processor entity), as demonstrated in the following code sample.

```python
step_process = ProcessingStep(
    name="PreprocessAbaloneData",
    processor=sklearn_processor,
    inputs=[
        ProcessingInput(
            input_name='dataset',
            source=..., destination="/opt/ml/processing/code",
        )
    ],
    outputs=[
```

3387
Q. What's the recommended way to manage dependencies for different SageMaker Pipelines steps?

You can use a SageMaker Projects template to implement image-building CI/CD. With this template, you can automate the CI/CD of images that are built and pushed to Amazon ECR. Changes in the container files in your project's source control repositories initiate the ML pipeline and deploy the latest version for your container. For more information, see the blog Create Amazon SageMaker projects with image building CI/CD pipelines.

Q. How do I provide SageMaker Project access to specific user profiles in Amazon SageMaker Studio?

Since SageMaker Projects is backed by AWS Service Catalog, you must add each role that requires access to SageMaker Projects to the Amazon SageMaker Solutions and ML Ops products Portfolio in the service catalog. You can do this on the Groups, roles, and users tab, as shown in the following image. If each user profile in Studio has a different role, you should add each of those roles to the service catalog. You can also do this while creating a user profile in Studio.
Q. Where do I see the properties associated with each SageMaker pipeline step so that I can use them in subsequent steps?

Each step in the pipeline uses the underlying SageMaker APIs for the corresponding jobs. For example, TrainingStep invokes the CreateTrainingJob API and the step properties correspond to the response from DescribeTrainingJob. The response output can be found in the API reference link for DescribeTrainingJob. You can follow the same procedure to get the properties for TransformStep, ProcessingStep, TuningStep, and CreateModelStep. For more information about pipeline steps, see Pipeline Steps.

Q. What’s the best way to reproduce my model in SageMaker?

SageMaker’s Lineage Tracking service works in the backend to track all the metadata associated with your model training and deployment workflows. This includes your training jobs, datasets used, pipelines, endpoints, and the actual models. You can query the lineage service at any point to find the exact artifacts used to train a model. Using those artifacts, you can recreate the same ML workflow to reproduce the model as long as you have access to the exact dataset that was used. A trial component tracks the training job. This trial component has all the parameters used as part of the training job. If you don’t need to rerun the entire workflow, you can reproduce the training job to derive the same model.
Using Amazon Augmented AI for Human Review

When you use AI applications such as Amazon Rekognition, Amazon Textract, or your custom machine learning (ML) models, you can use Amazon Augmented AI to get human review of low-confidence predictions or random prediction samples.

What is Amazon Augmented AI?

Amazon Augmented AI (Amazon A2I) is a service that brings human review of ML predictions to all developers by removing the heavy lifting associated with building human review systems or managing large numbers of human reviewers.

Many ML applications require humans to review low-confidence predictions to ensure the results are correct. For example, extracting information from scanned mortgage application forms can require human review due to low-quality scans or poor handwriting. Building human review systems can be time-consuming and expensive because it involves implementing complex processes or workflows, writing custom software to manage review tasks and results, and managing large groups of reviewers.

Amazon A2I streamlines building and managing human reviews for ML applications. Amazon A2I provides built-in human review workflows for common ML use cases, such as content moderation and text extraction from documents. You can also create your own workflows for ML models built on SageMaker or any other tools. Using Amazon A2I, you can allow human reviewers to step in when a model is unable to make a high-confidence prediction or to audit its predictions on an ongoing basis.

Amazon A2I Use Case Examples

The following examples demonstrate how you can use Amazon A2I to integrate a human review loop into your ML application. For each of these examples, you can find a Jupyter Notebook that demonstrates that workflow in Use Cases and Examples Using Amazon A2I (p. 3411).

- **Use Amazon A2I with Amazon Textract** – Have humans review important key-value pairs in single-page documents or have Amazon Textract randomly sample and send documents from your dataset to humans for review.

- **Use Amazon A2I with Amazon Rekognition** – Have humans review unsafe images for explicit adult or violent content if Amazon Rekognition returns a low-confidence score, or have Amazon Rekognition randomly sample and send images from your dataset to humans for review.

- **Use Amazon A2I to review real-time ML inferences** – Use Amazon A2I to review real-time, low-confidence inferences made by a model deployed to a SageMaker hosted endpoint and incrementally train your model using Amazon A2I output data.

- **Use Amazon A2I with Amazon Comprehend** – Have humans review Amazon Comprehend inferences about text data such as sentiment analysis, text syntax, and entity detection.

- **Use Amazon A2I with Amazon Transcribe** – Have humans review Amazon Transcribe transcriptions of video or audio files. Use the results of transcription human review loops to create a custom vocabulary and improve future transcriptions of similar video or audio content.

- **Use Amazon A2I with Amazon Translate** – Have humans review low-confidence translations returned from Amazon Translate.
- **Use Amazon A2I to review tabular data** – Use Amazon A2I to integrate a human review loop into an ML application that uses tabular data.

---

**Core Components of Amazon A2I**

Review the following terms to familiarize yourself with the core components of Amazon A2I.

**Task Types**

The AI/ML workflow into which you integrate Amazon A2I defines an **Amazon A2I task type**.
Amazon A2I supports:

- **Two built-in task types**: Amazon Textract key-value pair extraction and Amazon Rekognition image moderation.

- **A custom task type**: Use a custom task type to integrate a human review loop into any machine learning workflow. You can use a custom task type to integrate Amazon A2I with other AWS services like Amazon Comprehend, Amazon Transcribe, and Amazon Translate, as well as your own custom machine learning workflows. To learn more, see Use Cases and Examples Using Amazon A2I (p. 3411).

Select a tab in the following table to see diagrams that illustrate how Amazon A2I works with each task type. Select the task type page using the links in the preceding list to learn more about that task type.

**Amazon Textract – Key-value pair extraction**

This image depicts the Amazon A2I built-in workflow with Amazon Textract. On the left, the resources that are required to create an Amazon Textract human review workflow are depicted: an Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Textract to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

**Amazon Rekognition – Image moderation**

This image depicts the Amazon A2I built-in workflow with Amazon Rekognition. On the left, the resources that are required to create an Amazon Rekognition human review workflow are depicted: an Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Rekognition to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.
Custom Task Type

The following image depicts the Amazon A2I custom workflow. A custom ML model is used to generate predictions. The client application filters these predictions using user-defined criteria and determines if a human review is required. If so, these predictions are sent to Amazon A2I for human review. Amazon A2I collects the results of human review in Amazon S3, which can access by the client application. If the filter determines that no human review is needed, predictions can be fed directly to the client application.

Human Review Workflow (Flow Definition)

You use a human review workflow to specify your human work team, to set up your worker UI using a worker task template, and to provide information about how workers should complete the review task.

For built-in task types, you also use the human review workflow to identify the conditions under which a human loop is initiated. For example, Amazon Rekognition can perform image content moderation using machine learning. You can use the human review workflow to specify that an image is sent to a human for content moderation review if Amazon Rekognition's confidence is too low.

You can use a human review workflow to create multiple human loops.
You can create a flow definition in the SageMaker console or with the SageMaker API. To learn more about both of these options, see Create a Human Review Workflow (p. 3419).

Work Team

A work team is a group of human workers to whom you send your human review tasks.

When you create a human review workflow, you specify a single work team.

Your work team can come from the Amazon Mechanical Turk workforce, a vendor-managed workforce, or your own private workforce. When you use the private workforce, you can create multiple work teams. Each work team can be used in multiple human review workflows. To learn how to create a workforce and work teams, see Create and Manage Workforces (p. 694).

Worker Task Template and Human Task UI

You use a worker task template to create a worker UI (a human task UI) for your human review tasks.

The human task UI displays your input data, such as documents or images, and instructions to workers. It also provides interactive tools that the worker uses to complete your tasks.

For built-in task types, you must use the Amazon A2I worker task template provided for that task type.

Human Loops

A human loop is used to create a single human review job. For each human review job, you can choose the number of workers that are sent a task to review a single data object. For example, if you set the number of workers per object to 3 for an image classification labeling job, three workers classify each input image. Increasing the number of workers per object can improve label accuracy.

A human loop is created using a human review workflow as follows:

- For built-in task types, the conditions specified in the human review workflow determine when the human loop is created.
- Human review tasks are sent to the work team specified in the human review workflow.
- The worker task template specified in the human review workflow is used to render the human task UI.

When do human loops get created?

When you use one of the built-in task types, the corresponding AWS service creates and starts a human loop on your behalf when the conditions specified in your human review workflow are met. For example:

- When you use Augmented AI with Amazon Textract, you can integrate Amazon A2I into a document review task using the API operation AnalyzeDocument. A human loop is created every time Amazon Textract returns inferences about key-value pairs that meet the conditions you specify in your human review workflow.
- When you use Augmented AI with Amazon Rekognition, you can integrate Amazon A2I into an image moderation task using the API operation DetectModerationLabels. A human loop is created every time Amazon Rekognition returns inferences about image content that meet the conditions you specify in your human review workflow.

When using a custom task type, you start a human loop using the Amazon Augmented AI Runtime API. When you call StartHumanLoop in your custom application, a task is sent to human reviewers.

To learn how to create and start a human loop, see Create and Start a Human Loop (p. 3438).
To generate these resources and create a human review workflow, Amazon A2I integrates multiple APIs, including the Amazon Augmented AI Runtime Model, the SageMaker APIs, and APIs associated with your task type. To learn more, see Use APIs in Amazon Augmented AI (p. 3474).

**Note**
AWS Region availability may differ when you use Augmented AI with other AWS services, such as Amazon Textract. Create Augmented AI resources in the same AWS Region that you use to interact with those AWS services. For AWS Region availability for all services, see the Region Table.

**Prerequisites to Using Augmented AI**

Amazon A2I uses resources in IAM, SageMaker, and Amazon S3 to create and run your human review workflows. You can create some of these resources in the Amazon A2I console when you create a human review workflow. To learn how, see Tutorial: Get Started in the Amazon A2I Console (p. 3395).

To use Amazon A2I, you need the following resources:

- One or more Amazon S3 buckets in the same AWS Region as the workflow for your input and output data. To create a bucket, follow the instructions in Create a Bucket in the Amazon Simple Storage Service Console User Guide.
- An IAM role with required permissions to create a human review workflow and an IAM user or role with permission to access Augmented AI. For more information, see Permissions and Security in Amazon Augmented AI (p. 3466).
- A public, private, or vendor workforce for your human review workflows. If you plan to use a private workforce, you need to set one up ahead of time in the same AWS Region as your Amazon A2I workflow. To learn more about these workforce types, see Create and Manage Workforces (p. 694).

**Important**
To learn about the compliance programs that cover Amazon Augmented AI at this time, see AWS Services in Scope by Compliance Program. If you use Amazon Augmented AI in conjunction with other AWS services (such as Amazon Rekognition and Amazon Textract), note that Amazon Augmented AI may not be in scope for the same compliance programs as those other services. You are responsible for how you use Amazon Augmented AI, including understanding how the service processes or stores customer data and any impact on the compliance of your data environment. You should discuss your workload objectives and goals with your AWS account team; they can help you evaluate whether the service is a good fit for your proposed use case and architecture.

**Tutorial: Get Started in the Amazon A2I Console**

The following tutorial shows you how to get started using Amazon A2I in the Amazon A2I console.

The tutorial gives you the option to use Augmented AI with Amazon Textract for document review or Amazon Rekognition for image content review.

**Prerequisites**

To get started using Amazon A2I, complete the following prerequisites.

- Create an Amazon S3 bucket in the same AWS Region as the workflow for your input and output data. For example, if you are using Amazon A2I with Amazon Textract in us-east-1, create your bucket in us-east-1. To create a bucket, follow the instructions in Create a Bucket in the Amazon Simple Storage Service Console User Guide.
- Do one of the following:
• If you want to complete the tutorial using Amazon Textract, download the sample document and place it in your Amazon S3 bucket.
• If you want to complete the tutorial using Amazon Rekognition, download this image and place it in your Amazon S3 bucket.

**Note**
The Amazon A2I console is embedded in the SageMaker console.

**Step 1: Create a Work Team**

First, create a work team in the Amazon A2I console and add yourself as a worker so that you can preview the worker review task.

**Important**
This tutorial uses a private work team. The Amazon A2I private workforce is configured in the Ground Truth area of the SageMaker console and is shared between Amazon A2I and Ground Truth.

**To create a private workforce using worker emails**

2. In the navigation pane, choose **Labeling workforces** under **Ground Truth**.
3. Choose **Private**, then choose **Create private team**.
4. Choose **Invite new workers by email**.
5. For this tutorial, enter your email and any others that you want to be able to preview the human task UI. You can paste or type a list of up to 50 email addresses, separated by commas, into the email addresses box.
6. Enter an organization name and contact email.
7. Optionally, choose an Amazon SNS topic to which to subscribe the team so workers are notified by email when new Ground Truth labeling jobs become available. Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to Amazon SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.
8. Choose **Create private team**.

If you add yourself to a private work team, you receive an email from no-reply@verificationemail.com with login information. Use the link in this email to reset your password and log in to your worker portal. This is where your human review tasks appear when you create a human loop.

**Step 2: Create a Human Review Workflow**

In this step, you create a human review workflow. Each human review workflow is created for a specific task type. This tutorial allows you to choose between the built-in task types: Amazon Rekognition and Amazon Textract.

**To create a human review workflow:**

1. Open the Augmented AI console at https://console.aws.amazon.com/a2i to access the **Human review workflows** page.
2. Select **Create human review workflow**.
3. In **Workflow settings**, enter a workflow **Name**, **S3 bucket**, and the **IAM role** that you created for this tutorial, with the AWS managed policy AmazonAugmentedAIIntegratedAPIAccess attached.
4. For **Task type**, select **Textract – Key-value pair extraction** or **Rekognition – Image moderation**.
5. Select the task type that you chose from the following table for instructions for that task type.

Amazon Textract – Key-value pair extraction

1. Select **Trigger a human review for specific form keys based on the form key confidence score or when specific form keys are missing**.

2. For **Key name**, enter **Mail Address**.

3. Set the identification confidence threshold between 0 and 99.

4. Set the qualification confidence threshold between 0 and 99.

5. Select **Trigger a human review for all form keys identified by Amazon Textract with confidence scores in a specific range**.

6. Set the identification confidence threshold between 0 and 90.

7. Set the qualification confidence threshold between 0 and 90.

This initiates a human review if Amazon Textract returns a confidence score that is less than 99 for **Mail Address** and its key, or if it returns a confidence score less than 90 for any key value pair detected in the document.

The following image shows the Amazon Textract form extraction - Conditions for invoking human review section of the Amazon A2I console. In the image, the check boxes for the two types of triggers explained in the proceeding paragraph are checked, and **Mail Address** is used as a **Key name** for the first trigger. The identification confidence threshold is defined using confidence scores for key-value pairs detect within the form and is set between 0 and 99. The qualification confidence threshold is defined using confidence scores for text contained within keys and values in a form and is set between 0 and 99.
1. Select **Trigger human review for labels identified by Amazon Rekognition based on label confidence score**.

2. Set the **Threshold** between 0 and 98.

This initiates a human review if Amazon Rekognition returns a confidence score that is less than 98 for an image moderation job.

The following image shows how you can select the **Trigger human review for labels identified by Amazon Rekognition based on label confidence score** option and enter a **Threshold** between 0 and 98 in the Amazon A2I console.
6. Under **Worker task template creation**, select **Create from a default template**.

7. Enter a **Template name**.

8. In **Task description** field, enter the following text:

   **Read the instructions carefully and complete the task.**

9. Under **Workers**, select **Private**.

10. Select the private team that you created.

11. Choose **Create**.

Once your human review workflow is created, it appears in the table on the **Human review workflows** page. When the **Status** is **Active**, copy and save the Workflow ARN. You need it for the next step.

### Step 3: Start a Human Loop

You must use an API operation to start a human loop. There are a variety of language-specific SDKs that you can use to interact with these API operations. To see documentation for each of these SDKs, refer to the **See Also** section in the API documentation, as shown in the following image.

For this tutorial, you use one of the following APIs:

- If you chose the Amazon Textract task type, you use the **AnalyzeDocument** operation.

- If you chose the Amazon Rekognition task type, you use the **DetectModerationLabels** operation.
You can interact with these APIs using a SageMaker notebook instance (recommended for new users) or the AWS Command Line Interface (AWS CLI). Choose one of the following to learn more about these options:

- To learn more about and set up a notebook instance, see Use Amazon SageMaker Notebook Instances (p. 291).
- To learn more about and get started using the AWS CLI, see What Is the AWS Command Line Interface? in the AWS Command Line Interface User Guide.

Select your task type in the following table to see example requests for Amazon Textract and Amazon Rekognition using the AWS SDK for Python (Boto3).

Amazon Textract – Key-value pair extraction

The following example uses the AWS SDK for Python (Boto3) to call `analyze_document` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the `analyze_document` documentation in the AWS SDK for Python (Boto) API Reference.

```python
response = client.analyze_document(
    Document={
        "S3Object": {
            "Bucket": "AWSDOC-EXAMPLE-BUCKET",
            "Name": "document-name.pdf"
        }
    },
    HumanLoopConfig={
        "HumanLoopName": "human-loop-name",
        "DataAttributes": {
            "ContentClassifiers": [
                "FreeOfPersonallyIdentifiableInformation",
                "FreeOfAdultContent"
            ]
        },
        "FeatureTypes": ["TABLES", "FORMS"]
    }
)
```

Amazon Rekognition – Image moderation

The following example uses the AWS SDK for Python (Boto3) to call `detect_moderation_labels` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the `detect_moderation_labels` documentation in the AWS SDK for Python (Boto) API Reference.

```python
response = client.detect_moderation_labels(
    Image={
        "S3Object": {
            "Bucket": "AWSDOC-EXAMPLE-BUCKET",
            "Name": "image-name.png"
        }
    },
    HumanLoopConfig={
        "HumanLoopName": "human-loop-name",
        "DataAttributes": {
            "ContentClassifiers": [
                "FreeOfPersonallyIdentifiableInformation",
                "FreeOfAdultContent"
            ]
        }
    }
)
```
Step 4: View Human Loop Status in Console

When you start a human loop, you can view its status in the Amazon A2I console.

To view your human loop status

1. Open the Augmented AI console at https://console.aws.amazon.com/a2i to access the Human review workflows page.
2. Select the human review workflow that you used to start your human loop.
3. In the Human loops section, you can see your human loop. View its status in the Status column.

Step 5: Download Output Data

Your output data is stored in the Amazon S3 bucket you specified when you created a human review workflow.

To view your Amazon A2I output data

1. Open the Amazon S3 console.
2. Select the Amazon S3 bucket you specified when you created your human review workflow in step 2 of this example.
3. Starting with the folder that is named after your human review workflow, navigate to your output data by selecting the folder with the following naming convention:

   s3://output-bucket-specified-in-human-review-workflow/human-review-workflow-name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json

4. Select output.json and choose Download.

Tutorial: Get Started Using the Amazon A2I API

This tutorial explains the API operations you can use to get started using Amazon A2I.

To use a Jupyter Notebook to run these operations, select a Jupyter Notebook from Use Cases and Examples Using Amazon A2I (p. 3411) and use Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook (p. 3413) to learn how to use it in a SageMaker notebook instance.

To learn more about the API operations you can use with Amazon A2I, see Use APIs in Amazon Augmented AI (p. 3474).

Create a Private Work Team

You can create a private work team and add yourself as a worker so that you can preview Amazon A2I.

If you are not familiar with Amazon Cognito, we recommend that you use the SageMaker console to create a private workforce and add yourself as a private worker. For instructions, see Step 1: Create a Work Team (p. 3396).

If you are familiar with Amazon Cognito, you can use the following instructions to create a private work team using the SageMaker API. After you create a work team, note the work team ARN (WorkteamArn).

To learn more about the private workforce and other available configurations, see Use a Private Workforce (p. 699).
Create a private workforce

If you have not created a private workforce, you can do so using an Amazon Cognito user pool. Make sure that you have added yourself to this user pool. You can create a private work team using the AWS SDK for Python (Boto3) `create_workforce` function. For other language-specific SDKs, refer to the list in `CreateWorkforce`.

```python
response = client.create_workforce(
    CognitoConfig={
        "UserPool": "Pool_ID",
        "ClientId": "app-client-id"
    },
    WorkforceName="workforce-name"
)
```

Create a private work team

After you have created a private workforce in the AWS Region to configure and start your human loop, you can create a private work team using the AWS SDK for Python (Boto3) `create_workteam` function. For other language-specific SDKs, refer to the list in `CreateWorkteam`.

```python
response = client.create_workteam(
    WorkteamName="work-team-name",
    WorkforceName="workforce-name",
    MemberDefinitions=[
        {
            "CognitoMemberDefinition": {
                "UserPool": "<aws-region>_ID",
                "UserGroup": "user-group",
                "ClientId": "app-client-id"
            },
        }
    ]
)
```

Access your work team ARN as follows:

```python
workteamArn = response["WorkteamArn"]
```

List private work teams in your account

If you have already created a private work team, you can list all work teams in a given AWS Region in your account using the AWS SDK for Python (Boto3) `list_workteams` function. For other language-specific SDKs, refer to the list in `ListWorkteams`.

```python
response = client.list_workteams()
```

If you have numerous work teams in your account, you may want to use `MaxResults`, `SortBy`, and `NameContains` to filter your results.

Create a Human Review Workflow

You can create a human review workflow using the Amazon A2I `CreateFlowDefinition` operation. Before you create your human review workflow, you need to create a human task UI. You can do this with the `CreateHumanTaskUi` operation.
If you are using Amazon A2I with the Amazon Textract or Amazon Rekognition integrations, you can specify activation conditions using a JSON.

**Create a Human Task UI**

If you are creating a human review workflow to be used with Amazon Textract or Amazon Rekognition integrations, you need to use and modify pre-made worker task template. For all custom integrations, you can use your own custom worker task template. Use the following table to learn how to create a human task UI using a worker task template for the two built-in integrations. Replace the template with your own to customize this request.

Amazon Textract – Key-value pair extraction

To learn more about this template, see Custom Template Example for Amazon Textract (p. 3449).

```html
template = r""
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.document.s3Object.bucket }}/
{{ task.input.aiServiceRequest.document.s3Object.name }}{% endcapture %}
<crowd-form>
  <crowd-textract-analyze-document
    src="{{ s3_uri | grant_read_access }}"
    initial-value="{{ task.input.selectedAiServiceResponse.blocks }}"
    header="Review the key-value pairs listed on the right and correct them if they
do\n't match the following document."
    no-key-edit=""
    no-geometry-edit=""
    keys="{{ task.input.humanLoopContext.importantFormKeys }}"
    block-types='["KEY_VALUE_SET"]'>
    <short-instructions header="Instructions">
    <p>Click on a key-value block to highlight the corresponding key-value pair in
    the document.</p>
    <p>If it is a valid key-value pair, review the content for the value. If the
    content is incorrect, correct it.</p>
    <p>The text of the value is incorrect, correct it.</p>
    <p>A wrong value is identified, correct it.</p>
    <p>If it is not a valid key-value relationship, choose No.</p>
    <p>If you can’t find the key in the document, choose Key not found.</p>
    <p>If the content of a field is empty, choose Value is blank.</p>
    <p>Key and value displayed next or below to each other.</p>
    <p>Key and value displayed in one line.</p>
    <p>Key and value displayed in two lines.</p>
  </short-instructions>
  </crowd-textract-analyze-document>
</crowd-form>
```
Amazon Rekognition – Image moderation

To learn more about this template, see Custom Template Example for Amazon Rekognition (p. 3451).

template = r""
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/{{ task.input.aiServiceRequest.image.s3Object.bucket }}/\n{{ task.input.aiServiceRequest.image.s3Object.name }}{% endcapture %}

<crowd-form>
<crowd-rekognition-detect-moderation-labels
  categories='[%
    {% for label in task.input.selectedAiServiceResponse.moderationLabels %}
    {
      name: "{{ label.name }}",
      parentName: "{{ label.parentName }}",
    },
    {% endfor %}
  ]'
  src="{{ s3_uri | grant_read_access }}"
  header="Review the image and choose all applicable categories."
>
  <short-instructions header="Instructions">
    <style>
      .instructions {
        white-space: pre-wrap;
      }
    </style>
    <p class="instructions">Review the image and choose all applicable categories. If no categories apply, choose None.</p>
  </short-instructions>
  <b>Nudity</b>
  Visuals depicting nude male or female person or persons

  <b>Partial Nudity</b>
  Visuals depicting covered up nudity, for example using hands or pose

  <b>Revealing Clothes</b>
  Visuals depicting revealing clothes and poses

  <b>Physical Violence</b>
  Visuals depicting violent physical assault, such as kicking or punching

  <b>Weapon Violence</b>
  Visuals depicting violence using weapons like firearms or blades, such as shooting

  <b>Weapons</b>
  Visuals depicting weapons like firearms and blades
</full-instructions>
</crowd-form>
Custom Integration

The following is an example template that can be used in a custom integration. This template is used in this notebook, demonstrating a custom integration with Amazon Comprehend.

```r
<crowd-rekognition-detect-moderation-labels>
</crowd-form>
```

Using the template specified above, you can create a template using the AWS SDK for Python (Boto3) `create_human_task_ui` function. For other language-specific SDKs, refer to the list in CreateHumanTaskUi.

```python
def create_template:
    template = r""
    <script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
    <crowd-form>
        <crowd-classifier
            name="sentiment"
            categories='["Positive", "Negative", "Neutral", "Mixed"]'
            initial-value="{{ task.input.initialValue }}"
            header="What sentiment does this text convey?"
        >
        <classification-target>
            {{ task.input.taskObject }}
        </classification-target>
        <full-instructions header="Sentiment Analysis Instructions">
            <p><strong>Positive</strong> sentiment include: joy, excitement, delight</p>
            <p><strong>Negative</strong> sentiment include: anger, sarcasm, anxiety</p>
            <p><strong>Neutral</strong>: neither positive or negative, such as stating a fact</p>
            <p><strong>Mixed</strong>: when the sentiment is mixed</p>
        </full-instructions>
        <short-instructions>
            Choose the primary sentiment that is expressed by the text.
        </short-instructions>
    </crowd-classifier>
""
```

This response element contains the human task UI ARN. Save this as follows:

```python
humanTaskUiArn = response['HumanTaskUiArn']
```

Create JSON to specify activation conditions

For Amazon Textract and Amazon Rekognition built-in integrations, you can save activation conditions in a JSON object and use this in your CreateFlowDefinition request.
Next, select a tab to see example activation conditions you can use for these built-in integrations. For additional information about activation condition options, see JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI (p. 3425).

Amazon Textract – Key-value pair extraction

This example specifies conditions for specific keys (such as Mail address) in the document. If Amazon Textract's confidence falls outside of the thresholds set here, the document is sent to a human for review, with the specific keys that initiated the human loop prompted to the worker.

```python
import json

humanLoopActivationConditions = json.dumps(
{
    "Conditions": [
        {
            "Or": [
                {
                    "ConditionType": "ImportantFormKeyConfidenceCheck",
                    "ConditionParameters": {
                        "ImportantFormKey": "Mail address",
                        "ImportantFormKeyAliases": ["Mail Address:","Mail address:"],
                        "KeyValueBlockConfidenceLessThan": 100,
                        "WordBlockConfidenceLessThan": 100
                    }
                },
                {
                    "ConditionType": "MissingImportantFormKey",
                    "ConditionParameters": {
                        "ImportantFormKey": "Mail address",
                        "ImportantFormKeyAliases": ["Mail Address:","Mail address:","Mailing Add:","Mailing Addresses"]
                    }
                }
            ],
            "ConditionType": "ImportantFormKeyConfidenceCheck",
            "ConditionParameters": {
                "ImportantFormKey": "Phone Number",
                "ImportantFormKeyAliases": ["Phone number:","Phone No.:"],
                "KeyValueBlockConfidenceLessThan": 100,
                "WordBlockConfidenceLessThan": 100
            }
        },
        {
            "ConditionType": "ImportantFormKeyConfidenceCheck",
            "ConditionParameters": {
                "ImportantFormKey": "*",
                "KeyValueBlockConfidenceLessThan": 100,
                "WordBlockConfidenceLessThan": 100
            }
        },
        {
            "ConditionType": "ImportantFormKeyConfidenceCheck",
            "ConditionParameters": {
                "ImportantFormKey": "*",
                "KeyValueBlockConfidenceGreaterThan": 0,
                "WordBlockConfidenceGreaterThan": 0
            }
        }
    ]
})
```
Amazon Rekognition – Image moderation

The human loop activation conditions used here are tailored towards Amazon Rekognition content moderation; they are based on the confidence thresholds for the Suggestive and Female Swimwear Or Underwear moderation labels.

```python
import json

humanLoopActivationConditions = json.dumps(
    {
        "Conditions": [
            {
                "Or": [
                    {
                        "ConditionType": "ModerationLabelConfidenceCheck",
                        "ConditionParameters": {
                            "ModerationLabelName": "Suggestive",
                            "ConfidenceLessThan": 98
                        }
                    },
                    {
                        "ConditionType": "ModerationLabelConfidenceCheck",
                        "ConditionParameters": {
                            "ModerationLabelName": "Female Swimwear Or Underwear",
                            "ConfidenceGreaterThan": 98
                        }
                    }
                ]
            }
        ]
    }
)
```

Create a human review workflow

This section gives an example of the `create_flow_definition` AWS SDK for Python (Boto3) request using the resources created in the previous sections. For other language-specific SDKs, refer to the list in `CreateFlowDefinition`. Use the tabs in the following table to see the requests to create a human review workflow for Amazon Textract and Amazon Rekognition built-in integrations.

**Amazon Textract – Key-value pair extraction**

If you use the built-in integration with Amazon Textract, you must specify "AWS/Textract/AnalyzeDocument/Forms/V1" for "AwsManagedHumanLoopRequestSource" in `HumanLoopRequestSource`.

```python
response = client.create_flow_definition(
    FlowDefinitionName="human-review-workflow-name",
    HumanLoopRequestSource={
        "AwsManagedHumanLoopRequestSource": "AWS/Textract/AnalyzeDocument/Forms/V1"
    },
    HumanLoopActivationConfig={
        "HumanLoopActivationConditionsConfig": {
            "HumanLoopActivationConditions": humanLoopActivationConditions
        }
    }
)
```
Amazon Sagemaker Developer Guide
Tutorial: Get Started Using the Amazon A2I API

Amazon Rekognition – Image moderation

If you use the built-in integration with Amazon Rekognition, you must specify "AWS/Rekognition/DetectModerationLabels/Image/V3" for "AwsManagedHumanLoopRequestSource" in HumanLoopRequestSource.

response = client.create_flow_definition(
    FlowDefinitionName="human-review-workflow-name",
    HumanLoopRequestSource={
        "AwsManagedHumanLoopRequestSource": "AWS/Rekognition/DetectModerationLabels/Image/V3"
    },
    HumanLoopActivationConfig={
        "HumanLoopActivationConditionsConfig": {
            "humanLoopActivationConditions": humanLoopActivationConditions
        }
    },
    HumanLoopConfig={
        "workteamArn": workteamArn,
        "humanTaskUiArn": humanTaskUiArn,
        "taskTitle": "Image content moderation",
        "taskDescription": "Review the image and instructions. Complete the task",
        "taskCount": 1,
        "TaskExpirationBehavior": "EXPIRE_TASK",
        "TaskAvailabilityLifetimeInSeconds": 43200,
        "TaskTimeLimitInSeconds": 3600,
        "TaskKeywords": [
            "content moderation",
        ],
    },
    OutputConfig={
        "S3OutputPath": "s3://DOC-EXAMPLE-BUCKET/prefix/",
    },
    RoleArn="arn:aws:iam::<account-number>:role/<role-name>",
    Tags=[
        {
            "Key": "string",
            "Value": "string"
        }
    ]
)
Custom Integration

If you use a custom integration, exclude the following parameters: HumanLoopRequestSource, HumanLoopActivationConfig.

```python
response = client.create_flow_definition(
    FlowDefinitionName="human-review-workflow-name",
    HumanLoopConfig={
        "WorkteamArn": workteamArn,
        "HumanTaskUiArn": humanTaskUiArn,
        "TaskTitle": "Image content moderation",
        "TaskDescription": "Review the image and instructions. Complete the task",
        "TaskCount": 1,
        "TaskAvailabilityLifetimeInSeconds": 43200,
        "TaskTimeLimitInSeconds": 3600,
        "TaskKeywords": ["content moderation"],
    },
    OutputConfig={
        "S3OutputPath": "s3://DOC-EXAMPLE-BUCKET/prefix/",
    },
    RoleArn="arn:aws:iam::<account-number>:role/<role-name>",
    Tags=[
        {"Key": "string",
         "Value": "string"
        },
    ]
)
```

After you create a human review workflow, you can retrieve the flow definition ARN from the response:

```python
humanReviewWorkflowArn = response["FlowDefinitionArn"]
```

Create a Human Loop

The API operation you use to start a human loop depends on the Amazon A2I integration you use.

- If you use the Amazon Textract built-in integration, you use the `AnalyzeDocument` operation.
- If you use the Amazon Rekognition built-in integration, you use the `DetectModerationLabels` operation.
- If you use a custom integration, you use the `StartHumanLoop` operation.

Select your task type in the following table to see example requests for Amazon Textract and Amazon Rekognition using the AWS SDK for Python (Boto3).

Amazon Textract – Key-value pair extraction

The following example uses the AWS SDK for Python (Boto3) to call `analyze_document` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes`
response = client.analyze_document(
    Document={"S3Object": {"Bucket": "AWSDOC-EXAMPLE-BUCKET", "Name": "document-name.pdf"},
                HumanLoopConfig={
            "HumanLoopName": "human-loop-name",
            "DataAttributes": {ContentClassifiers:
                                ["FreeOfPersonallyIdentifiableInformation"] | "FreeOfAdultContent")
                                }},
            FeatureTypes=["FORMS"]
)

Human loops are only created if Amazon Textract's confidence for document analysis task meets the activation conditions you specified in your human review workflow. You can check the response element to determine if a human loop has been created. To see everything included in this response, see HumanLoopActivationOutput.

if "HumanLoopArn" in analyzeDocumentResponse["HumanLoopActivationOutput"]:  
    # A human loop has been started!  
    print(f"A human loop has been started with ARN: {analyzeDocumentResponse["HumanLoopActivationOutput"]["HumanLoopArn"]}"

Amazon Rekognition – Image moderation

The following example uses the AWS SDK for Python (Boto3) to call detect_moderation_labels in us-west-2. Replace the italicized red text with your resources. Include the DataAttributes parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the detect_moderation_labels documentation in the AWS SDK for Python (Boto) API Reference.

response = client.detect_moderation_labels(
    Image={"S3Object": {"Bucket": "AWSDOC-EXAMPLE-BUCKET", "Name": "image-name.png"},
            HumanLoopConfig={
            "HumanLoopName": "human-loop-name",
            "DataAttributes": {ContentClassifiers:
                                ["FreeOfPersonallyIdentifiableInformation"] | "FreeOfAdultContent")
                                }},
            )

Human loops are only created if Amazon Rekognition's confidence for an image moderation task meets the activation conditions you specified in your human review workflow. You can check the response element to determine if a human loop has been created. To see everything included in this response, see HumanLoopActivationOutput.

if "HumanLoopArn" in response["HumanLoopActivationOutput"]:  
    # A human loop has been started!  
    print(f"A human loop has been started with ARN: {response["HumanLoopActivationOutput"]["HumanLoopArn"]}

3410
Custom Integration

The following example uses the AWS SDK for Python (Boto3) to call `start_human_loop` in `us-west-2`. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the `start_human_loop` documentation in the `AWS SDK for Python (Boto) API Reference`.

```python
response = client.start_human_loop(
    HumanLoopName= "human-loop-name",
    HumanLoopInput={"InputContent": inputContentJson},
    DataAttributes={"ContentClassifiers": ["FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent"]}
)
```

This example stores input content in the variable `inputContentJson`. Assume that the input content contains two elements: a text blurb and sentiment (such as Positive, Negative, or Neutral), and it is formatted as follows:

```python
inputContent = {
    "initialValue": sentiment,
    "taskObject": blurb
}
```

The keys `initialValue` and `taskObject` must correspond to the keys used in the liquid elements of the worker task template. Refer to the custom template in `Create a Human Task UI (p. 3403)` to see an example.

To create `inputContentJson`, do the following:

```python
import json
inputContentJson = json.dumps(inputContent)
```

A human loop starts each time you call `start_human_loop`. To check the status of your human loop, use `describe_human_loop`:

```python
human_loop_info = a2i.describe_human_loop(HumanLoopName="human-loop-name")
print(f"HumanLoop Status: {resp["HumanLoopStatus"]}")
print(f"HumanLoop Output Destination: {resp["HumanLoopOutput"]}")
```

Use Cases and Examples Using Amazon A2I

You can use Amazon Augmented AI to incorporate a human review into your workflow for built-in task types, Amazon Textract and Amazon Rekognition, or your own custom tasks using a custom task type.

When you create a human review workflow using one of the built-in task types, you can specify conditions, such as confidence thresholds, that initiate a human review. The service (Amazon Rekognition or Amazon Textract) creates a human loop on your behalf when these conditions are met and supplies your input data directly to Amazon A2I to send to human reviewers. To learn more about the built-in task types, use the following:
• Use Amazon Augmented AI with Amazon Textract (p. 3413)
• Use Amazon Augmented AI with Amazon Rekognition (p. 3416)

When you use a custom task type, you create and start a human loop using the Amazon A2I Runtime API. Use the custom task type to incorporate a human review workflow with other AWS services or your own custom ML application.

• For more details, see Use Amazon Augmented AI with Custom Task Types (p. 3417)

The following table outlines a variety of Amazon A2I use cases that you can explore using SageMaker Jupyter Notebooks. To get started with a Jupyter Notebook, use the instructions in Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook (p. 3413). For more examples, see this GitHub repository.

### Use Amazon Augmented AI with Amazon Textract

Amazon Textract enables you to add document text detection and analysis to your applications. Amazon Augmented AI (Amazon A2I) directly integrates with Amazon Textract's `AnalyzeDocument` API operation. You can use `AnalyzeDocument` to analyze a document for relationships between detected items. When you add an Amazon A2I human review loop to a `AnalyzeDocument` request, Amazon A2I monitors the Amazon Textract results and sends a document to one or more human workers for review.

### Use Amazon Augmented AI with Amazon Rekognition

### Use Amazon Augmented AI with Custom Task Types

### Topics

- Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook (p. 3413)
- Use Amazon Augmented AI with Amazon Textract (p. 3413)
- Use Amazon Augmented AI with Amazon Rekognition (p. 3416)
- Use Amazon Augmented AI with Custom Task Types (p. 3417)

### Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook

For an end-to-end example that demonstrates how to integrate an Amazon A2I human review loop into a machine learning workflow, you can use a Jupyter Notebook from this GitHub Repository in a SageMaker notebook instance.

**To use an Amazon A2I custom task type sample notebook in an Amazon SageMaker notebook instance:**

1. If you do not have an active SageMaker notebook instance, create one by following the instructions in *Step 1: Create an Amazon SageMaker Notebook Instance* (p. 74).
2. When your notebook instance is active, choose **Open JupyterLab** to the right of the notebook instance's name. It may take a few moments for JupyterLab to load.
3. Choose the ![git clone](https://github.com/) icon to clone a GitHub repository into your workspace.
4. Enter the `amazon-a2i-sample-jupyter-notebooks` repository HTTPS URL.
5. Choose **Clone**.
6. Open the notebook that you would like to run.
7. Follow the instructions in the notebook to configure your human review workflow and human loop and run the cells.
8. To avoid incurring unnecessary charges, when you are done with the demo, stop and delete your notebook instance in addition to any Amazon S3 buckets, IAM roles, and CloudWatch Events resources created during the walkthrough.
review when the conditions specified in your flow definition are met. For example, if you want a human to review a specific key like Full name: and their associated input values, you can create an activation condition that starts a human review any time the Full name: key is detected or when the inference confidence for that key falls within a range that you specify.

The following image depicts the Amazon A2I built-in workflow with Amazon Textract. On the left, the resources that are required to create an Amazon Textract human review workflow are depicted: an Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Textract to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

You can specify when Amazon Textract sends a task to a human worker for review when creating a human review workflow or flow definition by specifying activation conditions.

You can set the following activation conditions when using the Amazon Textract task type:

- Initiate a human review for specific form keys based on the form key confidence score.
- Initiate a human review when specific form keys are missing.
- Initiate human review for all form keys identified by Amazon Textract with confidence scores in a specified range.
- Randomly send a sample of forms to humans for review.

When your activation condition depends on form key confidence scores, you can use two types of prediction confidence to initiate human loops:

- **Identification confidence** – The confidence score for key-value pairs detected within a form.
- **Qualification confidence** – The confidence score for text contained within key and value in a form.

In the image in the following section, **Full Name: Jane Doe** is the key-value pair, **Full Name** is the key, and **Jane Doe** is the value.

You can set these activation conditions using the Amazon SageMaker console when you create a human review workflow, or by creating a JSON for human loop activation conditions and specifying this as input in the HumanLoopActivationConditions parameter of CreateFlowDefinition API operation.
learn how specify activation conditions in JSON format, see JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI (p. 3425) and Use Human Loop Activation Conditions JSON Schema with Amazon Textract (p. 3427).

**Note**
When using Augmented AI with Amazon Textract, create Augmented AI resources in the same AWS Region you use to call AnalyzeDocument.

**Get Started: Integrate a Human Review into an Amazon Textract Analyze Document Job**

To integrate a human review into an Amazon Textract text detection and analysis job, you need to create a flow definition, and then use the Amazon Textract API to integrate that flow definition into your workflow. To learn how to create a flow definition using the SageMaker console or Augmented AI API, see the following topics:

- Create a Human Review Workflow (Console) (p. 3420)
- Create a Human Review Workflow (API) (p. 3422)

After you've created your flow definition, see Using Augmented AI with Amazon Textract to learn how to integrate your flow definition into your Amazon Textract task.

**End-to-End Example Using Amazon Textract and Amazon A2I**

For an end-to-end example that demonstrates how to use Amazon Textract with Amazon A2I using the console, see Tutorial: Get Started in the Amazon A2I Console (p. 3395).

To learn how to use the Amazon A2I API to create and start a human review, you can use Amazon Augmented AI (Amazon A2I) integration with Amazon Textract's Analyze Document [Example] in a SageMaker Notebook instance. To get started, see Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook (p. 3413).

**A2I Textract Worker Console Preview**

When they're assigned a review task in an Amazon Textract workflow, workers might see a user interface similar to the following:
You can customize this interface in the SageMaker console when you create your human review definition, or by creating and using a custom template. To learn more, see Create and Manage Worker Task Templates (p. 3446).

Use Amazon Augmented AI with Amazon Rekognition

Amazon Rekognition makes it easy to add image analysis to your applications. The Amazon Rekognition DetectModerationLabels API operation is directly integrated with Amazon A2I so that you can easily create a human loop to review unsafe images, such as explicit adult or violent content. You can use DetectModerationLabels to configure a human loop using a flow definition ARN. This enables Amazon A2I to analyze predictions made by Amazon Rekognition and send results to a human for review to ensure they meet the conditions set in your flow definition.

The following image depicts the Amazon A2I built-in workflow with Amazon Rekognition. On the left, the resources that are required to create an Amazon Rekognition human review workflow are depicted: and Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Rekognition to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

You can set the following activation conditions when using the Amazon Rekognition task type:

- Initiate human review for labels identified by Amazon Rekognition based on the label confidence score.
- Randomly send a sample of images to humans for review.

You can set these activation conditions using the Amazon SageMaker console when you create a human review workflow, or by creating a JSON for human loop activation conditions and specifying this as input in the HumanLoopActivationConditions parameter of the CreateFlowDefinition API operation. To learn how specify activation conditions in JSON format, see JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI (p. 3425) and Use Human Loop Activation Conditions JSON Schema with Amazon Rekognition (p. 3433).

Note
When using Augmented AI with Amazon Rekognition, create Augmented AI resources in the same AWS Region you use to call DetectModerationLabels.
Get Started: Integrate a Human Review into an Amazon Rekognition Image Moderation Job

To integrate a human review into an Amazon Rekognition, see the following topics:

- Create a Human Review Workflow (Console) (p. 3420)
- Create a Human Review Workflow (API) (p. 3422)

After you've created your flow definition, see Using Augmented AI with Amazon Rekognition to learn how to integrate your flow definition into your Amazon Rekognition task.

End-to-end Demo Using Amazon Rekognition and Amazon A2I

For an end-to-end example that demonstrates how to use Amazon Rekognition with Amazon A2I using the console, see Tutorial: Get Started in the Amazon A2I Console (p. 3395).

To learn how to use the Amazon A2I API to create and start a human review, you can use Amazon Augmented AI (Amazon A2I) integration with Amazon Rekognition [Example] in a SageMaker notebook instance. To get started, see Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook (p. 3413).

A2I Rekognition Worker Console Preview

When they're assigned a review task in an Amazon Rekognition workflow, workers might see a user interface similar to the following:

You can customize this interface in the SageMaker console when you create your human review definition, or by creating and using a custom template. To learn more, see Create and Manage Worker Task Templates (p. 3446).

Use Amazon Augmented AI with Custom Task Types

You can use Amazon Augmented AI (Amazon A2I) to incorporate a human review (human loop) into any machine learning workflow using the custom task type. This options gives you the most flexibility to customize the conditions under which your data objects are sent to humans for review, as well as the look and feel of your worker user interface.
When you use a custom task type, you create a custom human review workflow and specify the conditions under which a data object is sent for human review directly in your application.

The following image depicts the Amazon A2I custom workflow. A custom ML model is used to generate predictions. The client application filters these predictions using user-defined criteria and determines if a human review is required. If so, these predictions are sent to Amazon A2I for human review. Amazon A2I collects the results of human review in Amazon S3, which can access by the client application. If the filter determines that no human review is needed, predictions can be fed directly to the client application.

Use the procedures on this page to learn how to integrate Amazon A2I into any machine learning workflow using the custom task type.

Create a human loop using a flow definition, integrate it into your application, and monitor the results

1. Complete the Amazon A2I Prerequisites to Using Augmented AI (p. 3395). Note the following:
   - The path to the Amazon Simple Storage Service (Amazon S3) bucket or buckets where you store your input and output data.
   - The Amazon Resource Name (ARN) of an AWS Identity and Access Management (IAM) role with required permissions attached.
   - (Optional) The ARN of your private workforce, if you plan to use one.

2. Using HTML elements, create a custom worker template which Amazon A2I uses to generate your worker task UI. To learn how to create a custom template, see Create Custom Worker Task Templates (p. 3448).

3. Use the custom worker template from step 2 to generate a worker task template in the Amazon SageMaker console. To learn how, see Create a Worker Task Template (p. 3447).

In the next step, you create a flow definition:

- If you want to create a flow definition using the SageMaker API, note the ARN of this worker task template for the next step.
- If you are creating a flow definition using the console, your template automatically appears in Worker task template section when you choose Create human review workflow.

4. When creating your flow definition, provide the path to your S3 buckets, your IAM role ARN, and your worker template.

- To learn how to create a flow definition using the SageMaker CreateFlowDefinition API, see Create a Human Review Workflow (API) (p. 3422).
Create a Human Review Workflow

Use an Amazon Augmented AI (Amazon A2I) human review workflow, or flow definition, to specify the following:

- For the Amazon Textract and Amazon Rekognition built-in task types, the conditions under which your human loop is called
- The workforce to which your tasks are sent
- The set of instructions that your workforce receives, which is called a worker task template
- The configuration of your worker tasks, including the number of workers that receive a task and time limits to complete tasks
- Where your output data is stored

You can create a human review workflow in the SageMaker console or using the SageMaker CreateFlowDefinition operation. You can build a worker task template using the console for Amazon Textract and Amazon Rekognition task types while creating your flow definition.

Important

Human loop activation conditions, which initiate the human loop—for example, confidence thresholds—aren’t available for Amazon A2I custom task types. When using the console to create a flow definition for a custom task type, you can’t specify activation conditions. When using the Amazon A2I API to create a flow definition for a custom task type, you can’t set the HumanLoopActivationConditions attribute of the HumanLoopActivationConditionsConfig parameter. To control when human reviews are initiated, specify conditions under which StartHumanLoop is called in your custom application. In this case, every StartHumanLoop invocation results in a human review. For more information, see Use Amazon Augmented AI with Custom Task Types (p. 3417).

Prerequisites

To create a human review workflow definition, you must have completed the prerequisites described in Prerequisites to Using Augmented AI (p. 3395).
Create a Human Review Workflow (Console)

Use this procedure to create a Amazon Augmented AI (Amazon A2I) human review workflow using the SageMaker console. If you are new to Amazon A2I, we recommend that you create a private work team using people in your organization, and use this work team's ARN when creating your flow definition. To learn how to set up a private workforce and create a work team, see Create a Private Workforce (Amazon SageMaker Console) (p. 700). If you have already set up a private workforce, see Create a Work Team Using the SageMaker Console (p. 704) to learn how to add a work team to that workforce.

If you are using Amazon A2I with one of the built-in task types, you can create worker instructions using a default worker task template provided by Augmented AI while creating a human review workflow in the console. To see samples of the default templates provided by Augmented AI, see the built-in task types in Use Cases and Examples Using Amazon A2I (p. 3411).

To create flow definition (console)

2. In the navigation pane, under the Augmented AI section, choose Human review workflows and then choose Create human review workflow.
3. In Overview, do the following:
   a. For Name, enter a unique workflow name. The name must be lowercase, unique within the AWS Region in your account, and can have up to 63 characters. Valid characters include: a-z, 0-9, and - (hyphen).
   b. For S3 location for output, enter the S3 bucket where you want to store the human review results. The bucket must be located in the same AWS Region as the workflow.
   c. For IAM role, choose the role that has the required permissions. If you choose a built-in task type and want to preview your worker template in the console, provide a role with the type of policy described in Enable Worker Task Template Previews (p. 3470) attached.
4. For Task type, choose the task type that you want the human worker to perform.
5. If you chose the Amazon Rekognition or Amazon Textract task type, specify the conditions that invoke human review.
   - For Amazon Rekognition image moderation tasks, choose an inference confidence score threshold interval that initiates human review.
   - For Amazon Textract tasks, you can initiate a human review when specific form keys are missing or when form key detection confidence is low. You can also initiate a human review if, after evaluating all of the form keys in the text, confidence is lower than your required threshold for
any form key. Two variables specify your confidence thresholds: **Identification confidence** and **Qualification confidence**. To learn more about these variables, see Use Amazon Augmented AI with Amazon Textract (p. 3413).

- For both task types, you can randomly send a percentage of data objects (images or forms) and their labels to humans for review.

6. **Configure and specify your worker task template:**

   a. If you are using the Amazon Rekognition or Amazon Textract task type:

      - In the **Create template** section:

        - To create instructions for your workers using the Amazon A2I default template for Amazon Rekognition and Amazon Textract task types, choose **Build from a default template**.
        - If you choose **Build from a default template**, create your instructions under **Worker task design**:
          - Provide a **Template name** that is unique in the AWS Region you are in.
          - In the **Instructions** section, provide detailed instructions on how to complete your task. To help workers achieve greater accuracy, provide good and bad examples.
          - (Optional) In **Additional instructions**, provide your workers with additional information and instructions.

          For information on creating effective instructions, see Creating Good Worker Instructions (p. 3455).

        - To select a custom template that you've created, choose it from the **Template** menu and provide a **Task description** to briefly describe the task for your workers. To learn how to create a custom template, see Create a Worker Task Template (p. 3447).

   b. If you are using the custom task type:

      - In the **Worker task template** section, select your template from the list. All of the templates that you have created in the SageMaker console appear in this list. To learn how to create a template for custom task types, see Create and Manage Worker Task Templates (p. 3446).

7. **(Optional) Preview your worker template:**

   For Amazon Rekognition and Amazon Textract task types, you have the option to choose **See a sample worker task** to preview your worker task UI.

   If you are creating a flow definition for a custom task type, you can preview your worker task UI using the **RenderUiTemplate** operation. For more information, see Preview a Worker Task Template (p. 3455).

8. For **Workers**, choose a workforce type.

9. Choose **Create**.

**Next Steps**

After you've created a human review workflow, it appears in the console under **Human review workflows**. To see your flow definition's Amazon Resource Name (ARN) and configuration details, choose the workflow by selecting its name.

If you are using a built-in task type, you can use the flow definition ARN to start a human loop using that AWS service's API (for example, the Amazon Textract API). For custom task types, you can use the ARN to start a human loop using the Amazon Augmented AI Runtime API. To learn more about both options, see Create and Start a Human Loop (p. 3438).
Create a Human Review Workflow (API)

To create a flow definition using the SageMaker API, you use the CreateFlowDefinition operation. After you complete the Prerequisites to Using Augmented AI (p. 3395), use the following procedure to learn how to use this API operation.

For an overview of the CreateFlowDefinition operation, and details about each parameter, see CreateFlowDefinition.

To create a flow definition (API)

1. For FlowDefinitionName, enter a unique name. The name must be unique within the AWS Region in your account, and can have up to 63 characters. Valid characters include: a-z, 0-9, and - (hyphen).
2. For RoleArn, enter the ARN of the role that you configured to grant access to your data sources.
3. For HumanLoopConfig, enter information about the workers and what they should see. For information about each parameter in HumanLoopConfig, see HumanLoopConfig.
4. (Optional) If you are using a built-in task type, provide conditions that initiate a human loop in HumanLoopActivationConfig. To learn how to create the input required for the HumanLoopActivationConfig parameter, see JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI (p. 3425). If you do not specify conditions here, when you provide a flow definition to the AWS service associated with a built-in task type (for example, Amazon Textract or Amazon Rekognition), that service sends every task to a human worker for review.

If you are using a custom task type, HumanLoopActivationConfig is disabled. To learn how to control when tasks are sent to human workers using a custom task type, see Use Amazon Augmented AI with Custom Task Types (p. 3417).

5. (Optional) If you are using a built-in task type, specify the integration source (for example, Amazon Rekognition or Amazon Textract) in the HumanLoopRequestSource parameter.
6. For OutputConfig, indicate where in Amazon Simple Storage Service (Amazon S3) to store the output of the human loop.
7. (Optional) Use Tags to enter key-value pairs to help you categorize and organize a flow definition. Each tag consists of a key and a value, both of which you define.

Amazon Textract – Key-value pair extraction

The following is an example of a request to create an Amazon Textract human review workflow (flow definition) using the AWS SDK for Python (Boto3). You must use 'AWS/Textract/AnalyzeDocument/Forms/V1' to create a Amazon Textract human loop. Only include PublicWorkforceTaskPrice if you are using the Mechanical Turk workforce.

```python
sagemaker_client = boto3.client('sagemaker', aws_region)
response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
    HumanLoopRequestSource={
        'AwsManagedHumanLoopRequestSource': 'AWS/Textract/AnalyzeDocument/Forms/V1'
    },
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig': {
            'HumanLoopActivationConditions': '{...}'
        }
    },
    HumanLoopConfig={
```
Amazon Rekognition – Image moderation

The following is an example of a request to create an Amazon Rekognition human review workflow (flow definition) using the AWS SDK for Python (Boto3). You must use 'AWS/Rekognition/DetectModerationLabels/Image/V3' to create an Amazon Rekognition flow definition. Only include PublicWorkforceTaskPrice if you are using the Mechanical Turk workforce.

```python
sagemaker_client = boto3.client('sagemaker', aws_region)
response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
    HumanLoopRequestSource={
        'AwsManagedHumanLoopRequestSource': 'AWS/Rekognition/DetectModerationLabels/Image/V3'
    },
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig': {
            'HumanLoopActivationConditions': ' [...]'
        }
    },
    HumanLoopConfig={
        'TaskTitle': 'Example task title',
        'TaskDescription': 'Example task description.',
        'TaskCount': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskKeywords': [
            'Keyword1', 'Keyword2'
        ],
        'PublicWorkforceTaskPrice': {
            'AmountInUsd': {
                'Dollars': 123,
                'Cents': 123,
                'TenthFractionsOfACent': 123
            }
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/',
        'KmsKeyId': '1234abcd-12ab-34cd-56ef-1234567890ab'
    },
    RoleArn='arn:aws:iam::aws_account_number:role/role_name',
    Tags=[
        {
            'Key': 'KeyName',
            'Value': 'ValueName'
        }
    ]
)
```

Custom Workflow

The following is an example of a request to create a human review workflow (flow definition) for a custom integration. To create this type of human review workflow, omit HumanLoopRequestSource from the flow definition request. You only need to include PublicWorkforceTaskPrice if you are using the Mechanical Turk workforce.

```python
sagemaker_client = boto3.client('sagemaker', aws_region)
response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig': {
            'HumanLoopActivationConditions': '{...}'
        }
    },
    HumanLoopConfig={
        'TaskTitle': 'Example task title',
        'TaskDescription': 'Example task description.',
        'TaskCount': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskKeywords': [
            'Keyword1', 'Keyword2'
        ],
        'PublicWorkforceTaskPrice': {
            'AmountInUsd': {
                'Dollars': 123,
                'Cents': 123,
                'TenthFractionsOfACent': 123
            }
        },
        'OutputConfig':{
            'S3OutputPath': 's3://bucket/path/',
            'KmsKeyId': '1234abcd-12ab-34cd-56ef-1234567890ab'
        },
        'RoleArn': 'arn:aws:iam::account_number:role/role_name',
        'Tags': [
            {
                'Key': 'KeyName',
                'Value': 'ValueName'
            }
        ]
    })
```

3424
Next Steps

The return value of a successful call of the CreateFlowDefinition API operation is a flow definition Amazon Resource Name (ARN).

If you are using a built-in task type, you can use the flow definition ARN to start a human loop using that AWS service's API (i.e. the Amazon Textract API). For custom task types, you can use the ARN to start a human loop using the Amazon Augmented AI Runtime API. To learn more about both of these options, see Create and Start a Human Loop (p. 3438).

JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI

The HumanLoopActivationConditions is an input parameter of the CreateFlowDefinition API. This parameter is a JSON-formatted string. The JSON models the conditions under which a human loop is created when those conditions are evaluated against the response from an integrating AI service API (such as Rekognition.DetectModerationLabels or Textract.AnalyzeDocument). This response is referred to as an inference. For example, Amazon Rekognition sends an inference of a moderation label with an associated confidence score. In this example, the inference is the model's best estimate of the appropriate label for an image. For Amazon Textract, inference is made on the association between blocks of text (key-value pairs), such as the association between Name: and Sue in a form as well as content within a block of text, or word block, such as 'Name'.

The following is the schema for the JSON. At the top level, the HumanLoopActivationConditions has a JSON array, Conditions. Each member of this array is an independent condition that, if evaluated to true, results in Amazon A2I creating a human loop. Each such independent condition can be a simple condition or a complex condition. A simple condition has the following attributes:

- **ConditionType**: This attribute identifies the type of condition. Each AWS AI service API that integrates with Amazon A2I defines its own set of allowed ConditionTypes.
- **Rekognition DetectModerationLabels** – This API supports the ModerationLabelConfidenceCheck and Sampling ConditionType values.
- **Textract AnalyzeDocument** – This API supports the ImportantFormKeyConfidenceCheck, MissingImportantFormKey, and Sampling ConditionType values.
- **ConditionParameters** – This is a JSON object that parameterizes the condition. The set of allowed attributes of this object is dependent on the value of the ConditionType. Each ConditionType defines its own set of ConditionParameters.

A member of the Conditions array can model a complex condition. This is accomplished by logically connecting simple conditions using the And and Or logical operators and nesting the underlying simple conditions. Up to two levels of nesting are supported.

```json
{
    "$schema": "http://json-schema.org/draft-07/schema#",
    "definitions": {
        "Condition": {
            "type": "object",
            "properties": {
                "ConditionType": {
                    "type": "string"
                }
            }
        }
    }
}
```
"ConditionParameters": { "type": "object" },
"required": [ "ConditionType" ]},
"OrConditionArray": { "type": "object", "properties": { "Or": { "type": "array", "minItems": 2, "items": { "$ref": "#/definitions/ComplexCondition" } } } },
"AndConditionArray": { "type": "object", "properties": { "And": { "type": "array", "minItems": 2, "items": { "$ref": "#/definitions/ComplexCondition" } } } } },
"ComplexCondition": { "anyOf": [ { "$ref": "#/definitions/Condition" }, { "$ref": "#/definitions/OrConditionArray" }, { "$ref": "#/definitions/AndConditionArray" } ] } },
"type": "object",
"properties": { "Conditions": { "type": "array", "items": { "$ref": "#/definitions/ComplexCondition" } } } }

**Note**

Human loop activation conditions aren't available for human review workflows that are integrated with custom task types. The `HumanLoopActivationConditions` parameter is disabled for custom task types.

**Topics**
• **Use Human Loop Activation Conditions JSON Schema with Amazon Textract** (p. 3427)
• **Use Human Loop Activation Conditions JSON Schema with Amazon Rekognition** (p. 3433)

## Use Human Loop Activation Conditions JSON Schema with Amazon Textract

When used with Amazon A2I, the AnalyzeDocument operation supports the following inputs in the `ConditionType` parameter:

- **ImportantFormKeyConfidenceCheck** – Use this condition to create a human loop when inference confidence is within a specified range for document form keys and word blocks. A form key is any word in a document that is associated with an input. The input is called a value. Together, form keys and values are referred to as key-value pairs. A word block refers to the words that Amazon Textract recognizes inside of a detected block of text. To learn more about Amazon Textract document blocks, see [Documents and Block Objects](#) in the Amazon Textract Developer Guide.

- **MissingImportantFormKey** – Use this condition to create a human loop when Amazon Textract did not identify the key or its associated aliases within the document.

- **Sampling** – Use this condition to specify a percentage of forms to send to humans for review, regardless of inference confidence scores. Use this condition to do the following:
  - Audit your ML model by randomly sampling all forms analyzed by your model and sending a specified percentage to humans for review.
  - Using the `ImportantFormKeyConfidenceCheck` condition, randomly sample a percentage of the inferences that met the conditions specified in `ImportantFormKeyConfidenceCheck` to start a human loop and send only the specified percentage to humans for review.

**Note**

If you send the same request to AnalyzeDocument multiple times, the result of Sampling does not change for the inference of that input. For example, if you make an AnalyzeDocument request once, and Sampling doesn't initiate a human loop, subsequent requests to AnalyzeDocument with the same configuration do not initiate a human loop.

### ImportantFormKeyConfidenceCheck Inputs and Results

The `ImportantFormKeyConfidenceCheck` ConditionType supports the following ConditionParameters:

- **ImportantFormKey** – A string representing a key in a key-value pair detected by Amazon Textract that needs to be reviewed by human workers. If the value of this parameter is the special catch-all value (*), then all keys are considered to be matched to the condition. You can use this to model the case where any key-value pair satisfying certain confidence thresholds needs human review.

- **ImportantFormKeyAliases** – An array that represents alternate spellings or logical equivalents for the important form key.

- **KeyValueBlockConfidenceEquals**
- **KeyValueBlockConfidenceLessThan**
- **KeyValueBlockConfidenceLessThanEquals**
- **KeyValueBlockConfidenceGreaterThan**
- **KeyValueBlockConfidenceGreaterThanEquals**

- **WordBlockConfidenceEquals**
- **WordBlockConfidenceLessThan**
- **WordBlockConfidenceLessThanEquals**
• **WordBlockConfidenceGreaterThan**
• **WordBlockConfidenceGreaterThanEquals**

When you use the **ImportantFormKeyConfidenceCheck** ConditionType, Amazon A2I sends the key-value block and word block inferences of the key-value blocks and associated aliases that you specified in **ImportantFormKey** and **ImportantFormKeyAliases** for human review.

When creating a flow definition, if you use the default worker task template that is provided in the **Human review workflows** section of the Amazon SageMaker console, key-value and block inferences sent for human review by this activation condition are included in the worker UI. If you use a custom worker task template, you need to include the **{{ task.input.selectedAiServiceResponse.blocks }}** element to include initial-value input data (inferences) from Amazon Textract. For an example of a custom template that uses this input element, see **Custom Template Example for Amazon Textract** (p. 3449).

**MissingImportantFormKey** Inputs and Results

The **MissingImportantFormKey** ConditionType supports the following ConditionParameters:

• **ImportantFormKey** – A string representing a key in a key-value pair detected by Amazon Textract that needs to be reviewed by human workers.
• **ImportantFormKeyAliases** – An array that represents alternate spellings or logical equivalents for the important form key.

When you use the **MissingImportantFormKey** ConditionType, if the key in **ImportantFormKey** or aliases in **ImportantFormKeyAliases** are not included in the Amazon Textract inference, that form is sent to human for review and no predicted key-value pairs are included. For example, if Amazon Textract only identified **Address** and **Phone** in a form, but was missing the **ImportantFormKey Name** (in the **MissingImportantFormKey** condition type) that form would be sent to humans for review without any of the form keys detected (Address and Phone).

If you use the default worker task template that is provided in the SageMaker console, a task is created asking workers to identify the key in **ImportantFormKey** and associated value. If you use a custom worker task template, you need to include the **<task.input.humanLoopContext>** custom HTML element to configure this task.

**Sampling Inputs and Results**

The **Sampling** ConditionType supports the **RandomSamplingPercentage** ConditionParameters. The input for **RandomSamplingPercentage** must be a real number between 0.01 and 100. This number represents the percentage of data that qualifies for a human review and is sent to humans for review. If you use the **Sampling** condition without any other conditions, this number represents the percentage of all resulting inferences made by the **AnalyzeDocument** operation from a single request that is sent to humans for review.

If you specify the **Sampling** condition without any other condition type, all key-value and block inferences are sent to workers for review.

When creating a flow definition, if you use the default worker task template that is provided in the **Human review workflows** section of the SageMaker console, all key-value and block inferences sent for human review by this activation condition are included in the worker UI. If you use a custom worker task template, you need to include the **{{ task.input.selectedAiServiceResponse.blocks }}** element to include initial-value input data (inferences) from Amazon Textract. For an example of a custom template that uses this input element, see **Custom Template Example for Amazon Textract** (p. 3449).
Examples

While only one condition needs to evaluate to true to initiate a human loop, Amazon A2I evaluates all conditions for each object analyzed by Amazon Textract. The human reviewers are asked to review the important form keys for all the conditions that evaluated to true.

Example 1: Detect important form keys with confidence scores in a specified range that initiate a human loop

The following example shows a HumanLoopActivationConditions JSON that initiates a human loop if any one of the following three conditions is met:

- The Amazon Textract AnalyzeDocument API returns a key-value pair whose key is one of Employee Name, Name, or EmployeeName, with the confidence of the key-value block being less than 60 and the confidences of each of the word blocks making up the key and value being less than 85.
- The Amazon Textract AnalyzeDocument API returns a key-value pair whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with the confidence of the key-value block being less than 65 and the confidences of each of the word blocks making up the key and value being less than 85.
- The Amazon Textract AnalyzeDocument API returns a key-value pair whose key is one of Gross Pay, GrossPay, or GrossAmount, with the confidence of the key-value block being less than 60 and the confidences of each of the word blocks making up the key and value being less than 85.

```json
{
    "Conditions": [
    {
        "ConditionType": "ImportantFormKeyConfidenceCheck",
        "ConditionParameters": {
            "ImportantFormKey": "Employee Name",
            "ImportantFormKeyAliases": [
                "Name",
                "EmployeeName"
            ],
            "KeyValueBlockConfidenceLessThan": 60,
            "WordBlockConfidenceLessThan": 85
        }
    },
    {
        "ConditionType": "ImportantFormKeyConfidenceCheck",
        "ConditionParameters": {
            "ImportantFormKey": "Pay Date",
            "ImportantFormKeyAliases": [
                "PayDate",
                "DateOfPay",
                "pay-date"
            ],
            "KeyValueBlockConfidenceLessThan": 65,
            "WordBlockConfidenceLessThan": 85
        }
    },
    {
        "ConditionType": "ImportantFormKeyConfidenceCheck",
        "ConditionParameters": {
            "ImportantFormKey": "Gross Pay",
            "ImportantFormKeyAliases": [
                "GrossPay",
                "GrossAmount"
            ],
            "KeyValueBlockConfidenceLessThan": 60,
            "WordBlockConfidenceLessThan": 85
        }
    }
}
```
Example 2: Use `ImportantFormKeyConfidenceCheck`  
In the following example, if Amazon Textract detects a key-value pair whose confidence for the key-value block is less than 60 and is less than 90 for any underlying word blocks, it creates a human loop. The human reviewers are asked to review all the form key-value pairs that matched the confidence value comparisons.

```json
{
  "Conditions": [
    {
      "ConditionType": "ImportantFormKeyConfidenceCheck",
      "ConditionParameters": {
        "ImportantFormKey": "*",
        "KeyValueBlockConfidenceLessThan": 60,
        "WordBlockConfidenceLessThan": 90
      }
    }
  ]
}
```

Example 3: Use Sampling  
In the following example, 5% of inferences resulting from an Amazon Textract `AnalyzeDocument` request are sent to human workers for review. All detected key-value pairs returned by Amazon Textract are sent to workers for review.

```json
{
  "Conditions": [
    {
      "ConditionType": "Sampling",
      "ConditionParameters": {
        "RandomSamplingPercentage": 5
      }
    }
  ]
}
```

Example 4: Use `MissingImportantFormKey`  
In the following example, if Mailing Address or its alias, Mailing Address:, is missing from keys detected by Amazon Textract, a human review is initiated. When using the default worker task template, the worker UI asks workers to identify the key Mailing Address or Mailing Address: and its associated value.

```json
{
  "ConditionType": "MissingImportantFormKey",
  "ConditionParameters": {
    "ImportantFormKey": "Mailing Address",
    "ImportantFormKeyAliases": ["Mailing Address:"]
  }
}
```

Example 5: Use Sampling and `ImportantFormKeyConfidenceCheck` with the And operator  
In this example, 5% of key-value pairs detected by Amazon Textract whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with the confidence of the key-value block less than 65 and the confidences of each of the word blocks making up the key and value less than 85, are sent to workers for review.

```json
{
  "ConditionType": "Sampling and ImportantFormKeyConfidenceCheck with the And operator",
  "ConditionParameters": {
    "ConditionType": "ImportantFormKeyConfidenceCheck",
    "ConditionParameters": {
      "ImportantFormKey": "Pay Date",
      "KeyValueBlockConfidenceLessThan": 65,
      "WordBlockConfidenceLessThan": 85
    }
  }
}
```
Example 6: Use Sampling and ImportantFormKeyConfidenceCheck with the And operator

Use this example to configure your human review workflow to always send low confidence inferences of a specified key-value pair for human review and sample high confidence inference of a key-value pair at a specified rate.

In the following example, a human review is initiated in one of the following ways:

- Key-value pairs detected whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with key-value and word block confidences less than 60, are sent for human review. Only the Pay Date form key (and its aliases) and associated values are sent to workers to review.
- 5% of key-value pairs detected whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with key-value and word block confidences greater than 90, are sent for human review. Only the Pay Date form key (and its aliases) and associated values are sent to workers to review.

```json
{
  "Conditions": [
    {
      "And": [
        {
          "ConditionType": "Sampling",
          "ConditionParameters": {
            "RandomSamplingPercentage": 5
          }
        },
        {
          "ConditionType": "ImportantFormKeyConfidenceCheck",
          "ConditionParameters": {
            "ImportantFormKey": "Pay Date",
            "ImportantFormKeyAliases": [
              "PayDate",
              "DateOfPay",
              "pay-date"
            ],
            "KeyValueBlockConfidenceLessThan": 65,
            "WordBlockConfidenceLessThan": 85
          }
        }
      ]
    }
  ]
}
```
"And": [
  {
    "ConditionType": "Sampling",
    "ConditionParameters": {
      "RandomSamplingPercentage": 5
    }
  },
  {
    "ConditionType": "ImportantFormKeyConfidenceCheck",
    "ConditionParameters": {
      "ImportantFormKey": "Pay Date",
      "ImportantFormKeyAliases": [
        "PayDate",
        "DateOfPay",
        "pay-date"
      ],
      "KeyValueBlockConfidenceLessThan": 90,
      "WordBlockConfidenceGreaterThan": 90
    }
  }
]

Example 7: Use Sampling and ImportantFormKeyConfidenceCheck with the Or operator

In the following example, the Amazon Textract AnalyzeDocument operation returns a key-value pair whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with the confidence of the key-value block less than 65 and the confidences of each of the word blocks making up the key and value less than 85. Additionally, 5% of all other forms initiate a human loop. For each form randomly chosen, all key-value pairs detected for that form are sent to humans for review.

{
  "Conditions": [
    "Or": [
      {
        "ConditionType": "Sampling",
        "ConditionParameters": {
          "RandomSamplingPercentage": 5
        }
      },
      {
        "ConditionType": "ImportantFormKeyConfidenceCheck",
        "ConditionParameters": {
          "ImportantFormKey": "Pay Date",
          "ImportantFormKeyAliases": [
            "PayDate",
            "DateOfPay",
            "pay-date"
          ],
          "KeyValueBlockConfidenceLessThan": 65,
          "WordBlockConfidenceGreaterThan": 85
        }
      }
    ]
  ]
}
Use Human Loop Activation Conditions JSON Schema with Amazon Rekognition

When used with Amazon A2I, the Amazon Rekognition DetectModerationLabels operation supports the following inputs in the ConditionType parameters:

- **ModerationLabelConfidenceCheck** – Use this condition type to create a human loop when inference confidence is low for one or more specified labels.
- **Sampling** – Use this condition to specify a percentage of all inferences to send to humans for review. Use this condition to do the following:
  - Audit your ML model by randomly sampling all of your model's inferences and sending a specified percentage to humans for review.
  - Using the ModerationLabelConfidenceCheck condition, randomly sample a percentage of the inferences that met the conditions specified in ModerationLabelConfidenceCheck to start a human loop and send only the specified percentage to humans for review.

**Note**

If you send the same request to DetectModerationLabels multiple times, the result of Sampling does not change for the inference of that input. For example, if you make a DetectModerationLabels request once, and Sampling does not initiate a human loop, subsequent requests to DetectModerationLabels with the same configuration don't initiate a human loop.

When creating a flow definition, if you use the default worker task template that is provided in the Human review workflows section of the Amazon SageMaker console, inferences sent for human review by these activation conditions are included in the worker UI when a worker opens your task. If you use a custom worker task template, you need to include the `<task.input.selectedAiServiceResponse.blocks>` custom HTML element to access these inferences. For an example of a custom template that uses this HTML element, see Custom Template Example for Amazon Rekognition (p. 3451).

**ModerationLabelConfidenceCheck Inputs**

For the ModerationLabelConfidenceCheck ConditionType, the following ConditionParameters are supported:

- **ModerationLabelName** – The exact (case-sensitive) name of a ModerationLabel detected by the Amazon Rekognition DetectModerationLabels operation. You can specify the special catch-all value (*) to denote any moderation label.
- **ConfidenceEquals**
- **ConfidenceLessThan**
- **ConfidenceLessThanEquals**
- **ConfidenceGreaterThan**
- **ConfidenceGreaterThanEquals**

When you use the ModerationLabelConfidenceCheck ConditionType, Amazon A2I sends label inferences for the labels that you specified in ModerationLabelName for human review.

**Sampling Inputs**

The Sampling ConditionType supports the RandomSamplingPercentage ConditionParameters. The input for the RandomSamplingPercentage parameter should be real number between 0.01 and
100. This number represents the percentage of inferences that qualifies for a human review that are sent to humans for review. If you use the Sampling condition without any other conditions, this number represents the percentage of all inferences that result from a single DetectModerationLabel request that are sent to humans for review.

**Examples**

**Example 1: Use ModerationLabelConfidenceCheck with the And operator**

The following example of a HumanLoopActivationConditions condition initiates a human loop when one or more of the following conditions are met:

- Amazon Rekognition detects the Graphic Male Nudity moderation label with a confidence between 90 and 99.
- Amazon Rekognition detects the Graphic Female Nudity moderation label with a confidence between 80 and 99.

Note the use of the Or and And logical operators to model this logic.

Although only one of the two conditions under the Or operator needs to evaluate to true for a human loop to be created, Amazon Augmented AI evaluates all conditions. Human reviewers are asked to review the moderation labels for all the conditions that evaluated to true.

```json
{
  "Conditions": [[
    "Or": [[
      "And": [[
        "ConditionType": "ModerationLabelConfidenceCheck",
        "ConditionParameters": {
          "ModerationLabelName": "Graphic Male Nudity",
          "ConfidenceLessThanEquals": 99
        }
      ],
      [[
        "ConditionType": "ModerationLabelConfidenceCheck",
        "ConditionParameters": {
          "ModerationLabelName": "Graphic Female Nudity",
          "ConfidenceLessThanEquals": 99
        }
      ]]
    ],
    "And": [[
      "ConditionType": "ModerationLabelConfidenceCheck",
      "ConditionParameters": {
        "ModerationLabelName": "Graphic Female Nudity",
        "ConfidenceGreaterThanEquals": 80
      }
    ]]
  ]]
}
```
Example 2: Use ModerationLabelConfidenceCheck with the catch-all value (*)

In the following example, if any moderation label with a confidence greater than or equal to 75 is detected, a human loop is initiated. Human reviewers are asked to review all moderation labels with confidence scores greater than or equal to 75.

```json
{
    "Conditions": [
        {
            "ConditionType": "ModerationLabelConfidenceCheck",
            "ConditionParameters": {
                "ModerationLabelName": "*",
                "ConfidenceGreaterThanEquals": 75
            }
        }
    ]
}
```

Example 3: Use Sampling

In the following example, 5% of Amazon Rekognition inferences from a DetectModerationLabels request are sent to human workers. When using the default worker task template provided in the SageMaker console, all moderation labels returned by Amazon Rekognition are sent to workers for review.

```json
{
    "Conditions": [
        {
            "ConditionType": "Sampling",
            "ConditionParameters": {
                "RandomSamplingPercentage": 5
            }
        }
    ]
}
```

Example 4: Use Sampling and ModerationLabelConfidenceCheck with the And operator

In this example, 5% of Amazon Rekognition inferences of the Graphic Male Nudity moderation label with a confidence greater than 50 are sent workers for review. When using the default worker task template provided in the SageMaker console, only the inferences of the Graphic Male Nudity label are sent to workers for review.

```json
{
    "Conditions": [
        {
            "And": [
                {
                    "ConditionType": "Sampling",
                    "ConditionParameters": {
                        "RandomSamplingPercentage": 5
                    }
                },
                {
                    "ConditionType": "ModerationLabelConfidenceCheck",
                    "ConditionParameters": {
                        "ModerationLabelName": "Graphic Male Nudity",
                        "ConfidenceGreaterThan": 50
                    }
                }
            ]
        }
    ]
}
```
Example 5: Use Sampling and ModerationLabelConfidenceCheck with the And operator

Use this example to configure your human review workflow to always send low-confidence inferences of a specified label for human review and sample high-confidence inferences of a label at a specified rate.

In the following example, a human review is initiated in one of the following ways:

- Inferences for the Graphic Male Nudity moderation label the with confidence scores less than 60 are always sent for human review. Only the Graphic Male Nudity label is sent to workers to review.
- 5% of all inferences for the Graphic Male Nudity moderation label the with confidence scores greater than 90 are sent for human review. Only the Graphic Male Nudity label is sent to workers to review.

```json
{
  "Conditions": [
    {
      "Or": [
        {
          "ConditionType": "ModerationLabelConfidenceCheck",
          "ConditionParameters": {
            "ModerationLabelName": "Graphic Male Nudity",
            "ConfidenceLessThan": 60
          }
        },
        {
          "And": [
            {
              "ConditionType": "Sampling",
              "ConditionParameters": {
                "RandomSamplingPercentage": 5
              }
            },
            {
              "ConditionType": "ModerationLabelConfidenceCheck",
              "ConditionParameters": {
                "ModerationLabelName": "Graphic Male Nudity",
                "ConfidenceGreaterThan": 90
              }
            }
          ]
        }
      ],
    }
  ]
}
```

Example 6: Use Sampling and ModerationLabelConfidenceCheck with the Or operator

In the following example, a human loop is created if the Amazon Rekognition inference response contains the 'Graphic Male Nudity' label with inference confidence greater than 50. Additionally, 5% of all other inferences initiate a human loop.

```json
{
  "Conditions": [
    {
      "Or": [
        {
          "ConditionType": "ModerationLabelConfidenceCheck",
          "ConditionParameters": {
            "ModerationLabelName": "Graphic Male Nudity",
            "ConfidenceGreaterThan": 50
          }
        },
        {
          "ConditionType": "Sampling",
          "ConditionParameters": {
            "RandomSamplingPercentage": 5
          }
        }
      ]
    }
  ]
}
```
Delete a Human Review Workflow

When you delete a human review workflow or you delete your AWS account while a human loop is in process, your human review workflow status changes to Deleting. Amazon A2I automatically stops and deletes all associated human loops if workers have not started tasks created by those human loops. If human workers are already working on a task, that task continues to be available until it is completed or expires. As long as workers are still working on a task, your human review workflow's status is Deleting. If these tasks are completed, the results are stored in the Amazon S3 bucket specified in your flow definition.

Deleting a flow definition does not remove any worker answers from your S3 bucket. If the tasks are completed, but you deleted your AWS account, the results are stored in the Augmented AI service bucket for 30 days and then permanently deleted.

After all human loops have been deleted, the human review workflow is permanently deleted. When a human review workflow has been deleted, you can reuse its name to create a new human review workflow.

You might want to delete a human review workflow for any of the following reasons:

• You have sent data to a set of human reviewers and you want to delete all non-started human loops because you do not want those workers to work on those tasks any longer.
• The worker task template used to generate your worker UI does not render correctly or is not functioning as expected.

After you delete a human review workflow, the following changes occur:

• The human review workflow no longer appears on the Human review workflows page in the Augmented AI area of the Amazon SageMaker console.
• When you use the human review workflow name as input to the API operations DescribeFlowDefinition or DeleteFlowDefinition, Augmented AI returns a ResourceNotFoundException error.
• When you use ListFlowDefinitions, deleted human review workflows aren’t included in the results.
• When you use the human review workflow ARN as input to the Augmented AI Runtime API operation ListHumanLoops, Augmented AI returns a ResourceNotFoundException.
Delete a Flow Definition Using the Console or the SageMaker API

You can delete a human review workflow on the **Human review workflows** page in the Augmented AI area of the SageMaker console or by using the SageMaker API.

Flow definitions can only be deleted if their status is **Active**.

**Delete a human review workflow (console)**

1. Navigate to the Augmented AI console at [https://console.aws.amazon.com/a2i/](https://console.aws.amazon.com/a2i/).
2. In the navigation pane, under the **Augmented AI** section, choose **Human review workflows**.
3. Select the hyperlinked name of the human review workflow that you want to delete.
4. On the **Summary** page of your human review workflow, choose **Delete**.
5. In the dialog box asking you to confirm that you want to delete your human review workflow, choose **Delete**.

You're automatically redirected to the **Human review workflows** page. While your human review workflow is being deleted, the status **Deleting** appears in the status column for that workflow. After it's deleted, it doesn't appear in the list of workflows on this page.

**Delete a human review workflow (API)**

You can delete a human review workflow (flow definition) using the SageMaker **DeleteFlowDefinition** API operation. This API operation is supported through the **AWS CLI** and a **variety of language specific SDKs**. The following table shows example requests using SDK for Python (Boto3) and the AWS CLI to delete the human review workflow, **example-flow-definition**.

**AWS SDK for Python (Boto3)**

The following request example uses the SDK for Python (Boto3) to delete the human review workflow. For more information, see **delete_flow_definition** in the [AWS SDK for Python (Boto) API Reference](https://boto3.amazonaws.com/v1/documentation/api/latest/reference/services/sagemaker.html#SageMaker.Client.delete_flow_definition).

```python
import boto3

sagemaker_client = boto3.client('sagemaker')
response = sagemaker_client.delete_flow_definition(FlowDefinitionName='example-flow-definition')
```

**AWS CLI**

The following request example uses the AWS CLI to delete the human review workflow. For more information, see **delete-flow-definition** in the [AWS CLI Command Reference](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/sagemaker/delete-flow-definition.html).

```
$ aws sagemaker delete-flow-definition --flow-definition-name 'example-flow-definition'
```

If the action is successful, Augmented AI sends back an HTTP 200 response with an empty HTTP body.

**Create and Start a Human Loop**

A **human loop** starts your human review workflow and sends data review tasks to human workers. When you use one of the Amazon A2I built-in task types, the corresponding AWS service creates and
starts a human loop on your behalf when the conditions specified in your flow definition are met. If no conditions are specified in your flow definition, a human loop is created for each object. When using Amazon A2I for a custom task, a human loop starts when your application calls \texttt{StartHumanLoop}.

Use the following instructions to configure a human loop with Amazon Rekognition or Amazon Textract built-in task types and custom task types.

**Prerequisites**

To create and start a human loop, you must attach the \texttt{AmazonAugmentedAIFullAccess} policy to the AWS Identity and Access Management (IAM) user or role that configures or starts the human loop. This is the identity that you use to configure the human loop using \texttt{HumanLoopConfig} for built-in task types. For custom task types, this is the identity that you use to call \texttt{StartHumanLoop}.

Additionally, when using a built-in task type, your IAM user or role must have permission to invoke API operations of the AWS service associated with your task type. For example, if you are using Amazon Rekognition with Augmented AI, you must attach permissions required to call \texttt{DetectModerationLabels}. For examples of identity-based policies you can use to grant these permissions, see \textit{Amazon Rekognition Identity-Based Policy Examples} and \textit{Amazon Textract Identity-Based Policy Examples}. You can also use the more general policy \texttt{AmazonAugmentedAIIntegratedAPIAccess} to grant these permissions. For more information, see \textit{Create an IAM User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations} (p. 3469).

To create and start a human loop, you need a flow definition ARN. To learn how to create a flow definition (or human review workflow), see \textit{Create a Human Review Workflow} (p. 3419).

**Important**

Amazon A2I requires all S3 buckets that contain human loop input image data to have a CORS policy attached. To learn more about this change, see \textit{CORS Permission Requirement} (p. 3467).

**Create and Start a Human Loop for a Built-in Task Type**

To start a human loop using a built-in task type, use the corresponding service's API to provide your input data and to configure the human loop. For Amazon Textract, you use the \texttt{AnalyzeDocument} API operation. For Amazon Rekognition, you use the \texttt{DetectModerationLabels} API operation. You can use the AWS CLI or a language-specific SDK to create requests using these API operations.

**Important**

When you create a human loop using a built-in task type, you can use \texttt{DataAttributes} to specify a set of \texttt{ContentClassifiers} related to the input provided to the \texttt{StartHumanLoop} operation. Use content classifiers to declare that your content is free of personally identifiable information or adult content.

To use Amazon Mechanical Turk, ensure your data is free of personally identifiable information, including protected health information under HIPAA. Include the \texttt{FreeOfPersonallyIdentifiableInformation} content classifier. If you do not use this content classifier, SageMaker does not send your task to Mechanical Turk. If your data is free of adult content, also include the \texttt{'FreeOfAdultContent'} classifier. If you do not use these content classifiers, SageMaker may restrict the Mechanical Turk workers that can view your task.

After you start your ML job using your built-in task type's AWS service API, Amazon A2I monitors the inference results of that service. For example, when running a job with Amazon Rekognition, Amazon A2I checks the inference confidence score for each image and compares it to the confidence thresholds specified in your flow definition. If the conditions to start a human review task are satisfied, or if you didn't specify conditions in your flow definition, a human review task is sent to workers.
Create an Amazon Textract Human Loop

Amazon A2I integrates with Amazon Textract so that you can configure and start a human loop using the Amazon Textract API. To send a document file to Amazon Textract for document analysis, you use the Amazon Textract AnalyzeDocument API operation. To add a human loop to this document analysis job, you must configure the parameter HumanLoopConfig.

When you configure your human loop, the flow definition you specify in FlowDefinitionArn of HumanLoopConfig must be located in the same AWS Region as the bucket identified in Bucket of the Document parameter.

The following table shows examples of how to use this operation with the AWS CLI and AWS SDK for Python (Boto3).

**AWS SDK for Python (Boto3)**

The following request example uses the SDK for Python (Boto3). For more information, see analyze_document in the AWS SDK for Python (Boto) API Reference.

```python
import boto3
textract = boto3.client('textract', aws_region)

response = textract.analyze_document(
    Document={'S3Object': {'Bucket': bucket_name, 'Name': document_name}},
    FeatureTypes=['TABLES', "FORMS"],
    HumanLoopConfig={
        'FlowDefinitionArn': 'arn:aws:sagemaker:',
        aws_region': aws_account_number:
flows-definition/flow_def_name',
        'HumanLoopName': human_loop_name',
        'DataAttributes': {'ContentClassifiers':
            ['FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent']}
    } )
```

**AWS CLI**

The following request example uses the AWS CLI. For more information, see analyze-document in the AWS CLI Command Reference.

```bash
$ aws textract analyze-document \
    --document '"S3Object":{"Bucket":"bucket_name","Name":"document_name"}}' \
    --human-loop-config
    HumanLoopName="human_loop_name",FlowDefinitionArn="arn:aws:sagemaker:',
    aws-region:aws_account_number:flow-definition/flow_def_name",DataAttributes={"ContentClassifiers=["FreeOfPersonallyIdentifiableInformation", "FreeOfAdultContent"]}" \
    --feature-types ['"TABLES", "FORMS"]'
```

```bash
$ aws textract analyze-document \
    --document '"S3Object":{"Bucket":"bucket_name","Name":"document_name"}}' \
    --human-loop-config
    '{"HumanLoopName":"human_loop_name","FlowDefinitionArn":arn:aws:sagemaker:',
    aws-region:aws_account_number:flow-definition/flow_def_name","DataAttributes": ["ContentClassifiers":
        ["FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent"]],"FeatureTypes": ['"TABLES", "FORMS"]'
```
After you run AnalyzeDocument with a human loop configured, Amazon A2I monitors the results from AnalyzeDocument and checks it against the flow definition’s activation conditions. If the Amazon Textract inference confidence score for one or more key-value pairs meets the conditions for review, Amazon A2I starts a human review loop and includes the HumanLoopActivationOutput object in the AnalyzeDocument response.

Create an Amazon Rekognition Human Loop

Amazon A2I integrates with Amazon Rekognition so that you can configure and start a human loop using the Amazon Rekognition API. To send images to Amazon Rekognition for content moderation, you use the Amazon Rekognition DetectModerationLabels API operation. To configure a human loop, set the HumanLoopConfig parameter when you configure DetectModerationLabels.

When you configure your human loop, the flow definition you specify in FlowDefinitionArn of HumanLoopConfig must be located in the same AWS Region as the S3 bucket identified in Bucket of the Image parameter.

The following table shows examples of how to use this operation with the AWS CLI and AWS SDK for Python (Boto3).

AWS SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3). For more information, see detect_moderation_labels in the AWS SDK for Python (Boto) API Reference.

```
import boto3
rekognition = boto3.client("rekognition", aws_region)
response = rekognition.detect_moderation_labels( \
  Image={'S3Object': {'Bucket': bucket_name, 'Name': image_name}}, \
  HumanLoopConfig={ \
    'HumanLoopName': human_loop_name, \
    'FlowDefinitionArn': \
    "arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name" \
    'DataAttributes': {'ContentClassifiers': ['FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent']} 
  })
```

AWS CLI

The following request example uses the AWS CLI. For more information, see detect-moderation-labels in the AWS CLI Command Reference.

```
$ aws rekognition detect-moderation-labels \
  --image "S3Object={Bucket='bucket_name',Name='image_name'}" \
  --human-loop-config HumanLoopName="human_loop_name",FlowDefinitionArn="arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name",DataAttributes='{"ContentClassifiers=['FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent']"'
```

```
$ aws rekognition detect-moderation-labels \
  --image "S3Object={Bucket='bucket_name',Name='image_name'}" \
  --human-loop-config "{"HumanLoopName": "human_loop_name", "FlowDefinitionArn": "arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name", "DataAttributes": {"ContentClassifiers": ["FreeOfPersonallyIdentifiableInformation", "FreeOfAdultContent"]}}"
```
After you run DetectModerationLabels with a human loop configured, Amazon A2I monitors the results from DetectModerationLabels and checks it against the flow definition's activation conditions. If the Amazon Rekognition inference confidence score for an image meets the conditions for review, Amazon A2I starts a human review loop and includes the response element HumanLoopActivationOutput in the DetectModerationLabels response.

Create and Start a Human Loop for a Custom Task Type

To configure a human loop for a custom human review task, use the StartHumanLoop operation within your application. This section provides an example of a human loop request using the AWS SDK for Python (Boto3) and the AWS Command Line Interface (AWS CLI). For documentation on other language-specific SDKs that support StartHumanLoop, use the See Also section of StartHumanLoop in the Amazon Augmented AI Runtime API documentation. Refer to Use Cases and Examples Using Amazon A2I (p. 3411) to see examples that demonstrate how to use Amazon A2I with a custom task type.

Prerequisites

To complete this procedure, you need:

- Input data formatted as a string representation of a JSON-formatted file
- The Amazon Resource Name (ARN) of your flow definition

To configure the human loop

1. For DataAttributes, specify a set of ContentClassifiers related to the input provided to the StartHumanLoop operation. Use content classifiers to declare that your content is free of personally identifiable information or adult content.

   To use Amazon Mechanical Turk, ensure your data is free of personally identifiable information, including protected health information under HIPAA, and include the FreeOfPersonallyIdentifiableInformation content classifier. If you do not use this content classifier, SageMaker does not send your task to Mechanical Turk. If your data is free of adult content, also include the 'FreeOfAdultContent' classifier. If you do not use these content classifiers, SageMaker may restrict the Mechanical Turk workers that can view your task.

2. For FlowDefinitionArn, enter the Amazon Resource Name (ARN) of your flow definition.

3. For HumanLoopInput, enter your input data as a string representation of a JSON-formatted file. Structure your input data and custom worker task template so that your input data is properly displayed to human workers when you start your human loop. See Preview a Worker Task Template (p. 3455) to learn how to preview your custom worker task template.

4. For HumanLoopName, enter a name for the human loop. The name must be unique within the Region in your account and can have up to 63 characters. Valid characters are a-z, 0-9, and - (hyphen).

To start a human loop

- To start a human loop, submit a request similar to the following examples using your preferred language-specific SDK.

AWS SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3). For more information, see Boto 3 Augmented AI Runtime in the AWS SDK for Python (Boto) API Reference.
import boto3

a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')

response = a2i_runtime_client.start_human_loop(
    HumanLoopName='human_loop_name',
    HumanLoopInput={
        'InputContent': '{"InputContent": "{\"prompt\":\"What is the answer?\"}\"}
    },
    DataAttributes={
        'ContentClassifiers': [
            'FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent',
        ]
    }
)

AWS CLI

The following request example uses the AWS CLI. For more information, see start-human-loop in the AWS CLI Command Reference.

```
$ aws sagemaker-a2i-runtime start-human-loop
    --flow-definition-arn 'arn:aws:sagemaker:aws-region:xyz:flow-definition/flow_def_name' \ 
    --human-loop-name 'human_loop_name' \ 
    --human-loop-input '{"InputContent": "{\"prompt\":\"What is the answer?\"}\"}' \ 
    --data-attributes ContentClassifiers='FreeOfPersonallyIdentifiableInformation', "FreeOfAdultContent"
```

When you successfully start a human loop by invoking StartHumanLoop directly, the response includes a HumanLoopARN and a HumanLoopActivationResults object which is set to NULL. You can use this the human loop name to monitor and manage your human loop.

**Next Steps:**

After starting a human loop, you can manage and monitor it with the Amazon Augmented AI Runtime API and Amazon CloudWatch Events. To learn more, see Monitor and Manage Your Human Loop (p. 3456).

**Delete a Human Loop**

When you delete a human loop, the status changes to Deleting. When the human loop is deleted, the associated human review task is no longer available to workers. You might want to delete a human loop in one of the following circumstances:

- The worker task template used to generate your worker user interface does not render correctly or is not functioning as expected.
- A single data object was accidentally sent to workers multiple times.
- You no longer need a data object reviewed by a human.

If the status of a human loop is InProgress, you must stop the human loop before deleting it. When you stop a human loop, the status changes to Stopping while it is being stopped. When the status changes to Stopped, you can delete the human loop.
If human workers are already working on a task when you stop the associated human loop, that task continues to be available until it is completed or expires. As long as workers are still working on a task, your human loop's status is Stopping. If these tasks are completed, the results are stored in the Amazon S3 bucket URI specified in your human review workflow. If the worker leaves the task without submitting work, it is stopped and the worker can't return to the task. If no worker has started working on the task, it is stopped immediately.

If you delete the AWS account used to create the human loop, it is stopped and deleted automatically.

**Human Loop Data Retention and Deletion**

When a human worker completes a human review task, the results are stored in the Amazon S3 output bucket you specified in the human review workflow used to create the human loop. Deleting or stopping a human loop does not remove any worker answers from your S3 bucket.

Additionally, Amazon A2I temporarily stores human loop input and output data internally for the following reasons:

- If you configure your human loops so that a single data object is sent to multiple workers for review, Amazon A2I does not write output data to your S3 bucket until all workers have completed the review task. Amazon A2I stores partial answers—answers from individual workers—internally so that it can write full results to your S3 bucket.
- If you report a low-quality human review result, Amazon A2I can investigate and respond to your issue.
- If you lose access to or delete the output S3 bucket specified in the human review workflow used to create a human loop, and the task has already been sent to one or more workers, Amazon A2I needs a place to temporarily store human review results.

Amazon A2I deletes this data internally 30 days after a human loop's status changes to one of the following: Deleted, Stopped, or Completed. In other words, data is deleted 30 days after the human loop has been completed, stopped, or deleted. Additionally, this data is deleted after 30 days if you close the AWS account used to create associated human loops.

**Stop and Delete a Flow Definition Using the Console or the Amazon A2I API**

You can stop and delete a human loop in the Augmented AI console or by using the SageMaker API. When the human loop has been deleted, the status changes to Deleted.

**Delete a human loop (console)**

1. Navigate to the Augmented AI console at https://console.aws.amazon.com/a2i/.
2. In the navigation pane, under the Augmented AI section, choose Human review workflows.
3. Choose the hyperlinked name of the human review workflow you used to create the human loop you want to delete.
4. In the Human loops section at the bottom of the page, select the human loop you want to stop and delete.
5. If the human loop status is Completed, Stopped, or Failed, select Delete.

   If the human loop Status is InProgress, select Stop. When the status changes to Stopped, select Delete.
Delete a human loop (API)

1. Check the status of your human loop using the Augmented AI Runtime API operation `DescribeHumanLoop`. See examples using this operation in the following table.

AWS SDK for Python (Boto3)

The following example uses the SDK for Python (Boto3) to describe the human loop named `example-human-loop`. For more information, see `describe_human_loop` in the AWS SDK for Python (Boto) API Reference.

```python
import boto3
a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
response = a2i_runtime_client.describe_human_loop(HumanLoopName='example-human-loop')
human_loop_status = response['HumanLoopStatus']
print(f'example-human-loop status is: {human_loop_status}')
```

AWS CLI

The following example uses the AWS CLI to describe the human loop named `example-human-loop`. For more information, see `describe-human-loop` in the AWS CLI Command Reference.

```bash
$ aws sagemaker-a2i-runtime describe-human-loop --human-loop-name 'example-human-loop'
```

2. If the flow definition status is Completed, Stopped, or Failed, delete the flow definition using the Augmented AI Runtime API operation `DeleteHumanLoop`.

AWS SDK for Python (Boto3)

The following example uses the SDK for Python (Boto3) to delete the human loop named `example-human-loop`. For more information, see `delete_human_loop` in the AWS SDK for Python (Boto) API Reference.

```python
import boto3
a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
response = a2i_runtime_client.delete_human_loop(HumanLoopName='example-human-loop')
```

AWS CLI

The following example uses the AWS CLI to delete the human loop named `example-human-loop`. For more information, see `delete-human-loop` in the AWS CLI Command Reference.

```bash
$ aws sagemaker-a2i-runtime delete-human-loop --human-loop-name 'example-human-loop'
```

If the human loop status is InProgress, stop the human loop using `StopHumanLoop` and then use `DeleteHumanLoop` to delete it.

AWS SDK for Python (Boto3)

The following example uses the SDK for Python (Boto3) to describe the human loop named `example-human-loop`. For more information, see `stop_human_loop` in the AWS SDK for Python (Boto) API Reference.

```python
import boto3
a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
response = a2i_runtime_client.stop_human_loop(HumanLoopName='example-human-loop')
```
**Create and Manage Worker Task Templates**

You can create a task user interface for your workers by creating a *worker task template*. A worker task template is an HTML file that is used to display your input data and instructions to help workers complete your task.

For Amazon Rekognition or Amazon Textract task types, you can customize a pre-made worker task template using a graphical user interface (GUI) and avoid interacting with HTML code. For this option, use the instructions in [Create a Human Review Workflow (Console) (p. 3420)](p.3420) to create a human review workflow and customize your worker task template in the Amazon SageMaker console. Once you create a template using these instructions, it appears on the worker task templates page of the Augmented AI console.

If you are creating a human review workflow for a custom task type, you must create a *custom worker task template* using HTML code. For more information, see [Create Custom Worker Task Templates (p. 3448)](p.3448).

If you create your template using HTML, you must use this template to generate an Amazon A2I human task UI Amazon Resource Name (ARN) in the Amazon A2I console. This ARN has the following format: arn:aws:sagemaker:<aws-region>:<aws-account-number>:human-task-ui/<template-name>. This ARN is associated with a worker task template resource that you can use in one or more human review workflows (flow definitions).

Generate a human task UI ARN using a worker task template by following the instructions found in [Create a Worker Task Template (p. 3447)](p.3447) or by using the CreateHumanTaskUi API operation.

**Topics**
- Create and Delete Worker Task Templates (p. 3446)
- Create Custom Worker Task Templates (p. 3448)
- Creating Good Worker Instructions (p. 3455)

---

**Create and Delete Worker Task Templates**

You can use a worker template to customize the interface and instructions that your workers see when working on your tasks. Use the instructions on this page to create a worker task template in the Augmented AI area of the Amazon SageMaker console. A starter template is provided for Amazon Textract and Amazon Rekognition tasks. To learn how to customize your template using HTML crowd elements, see [Create Custom Worker Task Templates (p. 3448)](p.3448).

When you create a worker template in the worker task templates page of the Augmented AI area of the SageMaker console, a worker task template ARN is generated. Use this ARN as the input to
Create and Delete Worker Task Templates

HumanTaskUiArn when you create a flow definition using the API operation `CreateFlowDefinition`. You can choose this template when creating a human review workflow on the human review workflows page of the console.

If you are creating a worker task template resource for an Amazon Textract or Amazon Rekognition task type, you can preview the worker UI that is generated from your template on the worker task templates console page. You must attach the policy described in Enable Worker Task Template Previews (p. 3470) to the IAM role that you use to preview the template.

Create a Worker Task Template

You can create a worker task template using the SageMaker console and using the SageMaker API operation `CreateHumanTaskUi`.

Create a worker task template (console)

1. Open the Amazon A2I console at https://console.aws.amazon.com/a2i/.
2. Under Amazon Augmented AI in the left navigation pane, choose Worker task templates.
3. Choose Create template.
4. In Template name, enter a unique name.
5. (Optional) Enter an IAM role that grants Amazon A2I the permissions necessary to call services on your behalf.
6. In Template type, choose a template type from the dropdown list. If you are creating a template for a Textract-form extraction or Rekognition-image moderation task, choose the appropriate option.
7. Enter your custom template elements as follows:
   - If you selected the Amazon Textract or Amazon Rekognition task template, the Template editor autopopulates with a default template that you can customize.
   - If you are using a custom template, enter your predefined template in the editor.
8. (Optional) To complete this step, you must provide an IAM role ARN with permission to read Amazon S3 objects that get rendered on your user interface in Step 5.

You can only preview your template if you are creating templates for Amazon Textract or Amazon Rekognition.

Choose See preview to preview the interface and instructions that workers see. This is an interactive preview. After you complete the sample task and choose Submit, you see the resulting output from the task that you just performed.

If you are creating a worker task template for a custom task type, you can preview your worker task UI using `RenderUiTemplate`. For more information, see Preview a Worker Task Template (p. 3455).

9. When you're satisfied with your template, choose Create.

After you've created your template, you can select that template when you create a human review workflow in the console. Your template also appears in the Amazon Augmented AI section of the SageMaker console under Worker task templates. Choose your template to view its ARN. Use this ARN when using the `CreateFlowDefinition` API operation.

Create a worker task template using a worker task template (API)

To generate a worker task template using the SageMaker API operation `CreateHumanTaskUi`, specify a name for your UI in `HumanTaskUiName` and input your HTML template in Content under UiTemplate. Find documentation on language-specific SDKs that support this API operation in the See Also section of the `CreateHumanTaskUi`.
Delete a Worker Task Template

Once you have created a worker task template, you can delete it using the SageMaker console or the SageMaker API operation `DeleteHumanTaskUi`.

When you delete a worker task template, you are not able to use human review workflows (flow definitions) created using that template to start human loops. Any human loops that have already been created using the worker task template that you delete continue to be processed until completion and are not impacted.

Delete a worker task template (console)

1. Open the Amazon A2I console at `https://console.aws.amazon.com/a2i/`.
2. Under Amazon Augmented AI in the left navigation pane, choose `Worker task templates`.
3. Select the template that you want to delete.
4. Select `Delete`.
5. A modal appears to confirm your choice. Select `Delete`.

Delete a worker task template (API)

To delete a worker task template using the SageMaker API operation `DeleteHumanTaskUi`, specify a name of your UI in `HumanTaskUiName`.

Create Custom Worker Task Templates

*Crowd HTML Elements* are web components that provide a number of task widgets and design elements that you can tailor to the question you want to ask. You can use these crowd elements to create a custom worker template and integrate it with an Amazon Augmented AI (Amazon A2I) human review workflow to customize the worker console and instructions.

For a list of all HTML crowd elements available to Amazon A2I users, see `Crowd HTML Elements Reference` (p. 720). For examples of templates, see the AWS GitHub repository, which contains over 60 sample custom task templates.

Develop Templates Locally

When in the console to test how your template processes incoming data, you can test the look and feel of your template's HTML and custom elements in your browser by adding the following code to the top of your HTML file.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
```

This loads the necessary code to render the custom HTML elements. Use this code if you want to develop your template's look and feel in your preferred editor instead of in the console.

This code won't parse your variables. You might want to replace them with sample content while developing locally.

Use External Assets

Amazon Augmented AI custom templates enable you to embed external scripts and style sheets. For example, the following header embeds a `text/css` style sheet name `stylesheet` located at `https://www.example.com/my-enhancement-styles.css` into the custom template.
Example

```html
<script src="https://www.example.com/my-enhancement-script.js"></script>
<link rel="stylesheet" type="text/css" href="https://www.example.com/my-enhancement-styles.css">
```

If you encounter errors, ensure that your originating server is sending the correct MIME type and encoding headers with the assets.

For example, the MIME and encoding type for remote scripts is `application/javascript;CHARSET=UTF-8`.

The MIME and encoding type for remote stylesheets is `text/css;CHARSET=UTF-8`.

### Track Your Variables

When building a custom template, you must add variables to it to represent the pieces of data that might change from task to task, or worker to worker. If you're starting with one of the sample templates, you need to make sure you're aware of the variables it already uses.

For example, for a custom template that integrates an Augmented AI human review loop with a Amazon Textract text review task, `{{ task.input.selectedAiServiceResponse.blocks }}` is used for initial-value input data. For Amazon Augmented AI (Amazon A2I) integration with Amazon Rekognition, `{{ task.input.selectedAiServiceResponse.moderationLabels }}` is used. For a custom task type, you need to determine the input parameter for your task type.

Use `{{ task.input.customInputValuesForStartHumanLoop }}` where you specify `customInputValuesForStartHumanLoop`.

### Custom Template Example for Amazon Textract

All custom templates begin and end with the `<crowd-form> </crowd-form>` elements. Like standard HTML `<form>` elements, all of your form code should go between these elements.

For an Amazon Textract document analysis task, use the `<crowd-textract-analyze-document>` element. It uses the following attributes:

- `src` – Specifies the URL of the image file to be annotated.
- `initialValue` – Sets initial values for attributes found in the worker UI.
- `blockTypes (required)` – Determines the kind of analysis that the workers can do. Only `KEY_VALUE_SET` is currently supported.
- `keys (required)` – Specifies new keys and the associated text value that the worker can add.
- `no-key-edit (required)` – Prevents the workers from editing the keys of annotations passed through `initialValue`.
- `no-geometry-edit` – Prevents workers from editing the polygons of annotations passed through `initialValue`.

For children of the `<crowd-textract-analyze-document>` element, you must have two Regions. You can use arbitrary HTML and CSS elements in these Regions.

- `<full-instructions>` – Instructions that are available from the View full instructions link in the tool. You can leave this blank, but we recommend that you provide complete instructions to get better results.
- `<short-instructions>` – A brief description of the task that appears in the tool's sidebar. You can leave this blank, but we recommend that you provide complete instructions to get better results.
An Amazon Textract template would look similar to the following.

**Example**

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/{{ task.input.aiServiceRequest.document.s3Object.bucket }}/{{ task.input.aiServiceRequest.document.s3Object.name }}{% endcapture %}

<crowd-form>
  <crowd-textract-analyze-document
    src="{{ s3_uri | grant_read_access }}"
    initial-value="{{ task.input.selectedAiServiceResponse.blocks }}"
    header="Review the key-value pairs listed on the right and correct them if they don't match the following document."
    no-key-edit
    no-geometry-edit
    keys="{{ task.input.humanLoopContext.importantFormKeys }}"
    block-types="'KEY_VALUE_SET'"
  >
    <short-instructions header="Instructions">
      <style>
        .instructions {
          white-space: pre-wrap;
        }
        .instructionsImage {
          display: inline-block;
          max-width: 100%;
        }
      </style>
      <p class='instructions'>Choose a key-value block to highlight the corresponding key-value pair in the document.

      If it is a valid key-value pair, review the content for the value. If the content is incorrect, correct it.
      The text of the value is incorrect, correct it.
      <img class='instructionsImage' src="https://example-site/correct-value-text.png" />
      A wrong value is identified, correct it.
      <img class='instructionsImage' src="https://example-site/correct-value.png" />
      If it is not a valid key-value relationship, choose No.
      <img class='instructionsImage' src="https://example-site/not-a-key-value-pair.png" />
      If you can't find the key in the document, choose Key not found.
      <img class='instructionsImage' src="https://example-site/key-is-not-found.png" />
      If the content of a field is empty, choose Value is blank.
      <img class='instructionsImage' src="https://example-site/value-is-blank.png" />
      <b>Examples</b>
      Key and value are often displayed next to or below each other.
      Key and value displayed in one line.
      <img class='instructionsImage' src="https://example-site/sample-key-value-pair-1.png" />
      Key and value displayed in two lines.
      <img class='instructionsImage' src="https://example-site/sample-key-value-pair-2.png" />
      If the content of the value has multiple lines, enter all the text without a line break. Include all value text even if it extends beyond the highlight box.
      <img class='instructionsImage' src="https://assets.crowd.aws/images/a2i-console/multiple-lines.png" /></p>
    </short-instructions>
  </crowd-textract-analyze-document>
</crowd-form>
```
Custom Template Example for Amazon Rekognition

All custom templates begin and end with the `<crowd-form>` elements. Like standard HTML `<form>` elements, all of your form code should go between these elements. For an Amazon Rekognition custom task template, use the `<crowd-rekognition-detect-moderation-labels>` element. This element supports the following attributes:

- **categories** – An array of strings or an array of objects where each object has a name field.
  - If the categories come in as objects, the following applies:
    - The displayed categories are the value of the name field.
    - The returned answer contains the full objects of any selected categories.
  - If the categories come in as strings, the following applies:
    - The returned answer is an array of all the strings that were selected.

- **exclusion-category** – By setting this attribute, you create a button underneath the categories in the UI. When a user selects the button, all categories are deselected and disabled. If the worker selects the button again, you re-enable users to choose categories. If the worker submits the task by selecting Submit after you select the button, that task returns an empty array.

For children of the `<crowd-rekognition-detect-moderation-labels>` element, you must have two Regions.

- **full-instructions** – Instructions that are available from the View full instructions link in the tool. You can leave this blank, but we recommend that you provide complete instructions to get better results.
- **short-instructions** – Brief description of the task that appears in the tool's sidebar. You can leave this blank, but we recommend that you provide complete instructions to get better results.

A template using these elements would look similar to the following.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.image.s3Object.bucket }}/
{{ task.input.aiServiceRequest.image.s3Object.name }}{% endcapture %}

<crowd-form>
  <crowd-rekognition-detect-moderation-labels
categories='[
    {% for label in task.input.selectedAiServiceResponse.moderationLabels %}
      { name: "{{ label.name }}",
        parentName: "{{ label.parentName }}",
      },
    {% endfor %}
  ]' src="{{ s3_uri | grant_read_access }}"
header="Review the image and choose all applicable categories."
  >
  <short-instructions header="Instructions">
    <style>
      .instructions {
        white-space: pre-wrap;
      }
    </style>
  </short-instructions>
</crowd-form>
```
Create Custom Worker Task Templates

Review the image and choose all applicable categories. If no categories apply, choose None.

- **Nudity**
  Visuals depicting nude male or female person or persons

- **Graphic Male Nudity**
  Visuals depicting full frontal male nudity, often close ups

- **Graphic Female Nudity**
  Visuals depicting full frontal female nudity, often close ups

- **Sexual Activity**
  Visuals depicting various types of explicit sexual activities and pornography

- **Illustrated Nudity or Sexual Activity**
  Visuals depicting animated or drawn sexual activity, nudity, or pornography

- **Adult Toys**
  Visuals depicting adult toys, often in a marketing context

- **Female Swimwear or Underwear**
  Visuals depicting female person wearing only swimwear or underwear

- **Male Swimwear Or Underwear**
  Visuals depicting male person wearing only swimwear or underwear

- **Partial Nudity**
  Visuals depicting covered up nudity, for example using hands or pose

- **Revealing Clothes**
  Visuals depicting revealing clothes and poses, such as deep cut dresses

- **Graphic Violence or Gore**
  Visuals depicting prominent blood or bloody injuries

- **Physical Violence**
  Visuals depicting violent physical assault, such as kicking or punching

- **Weapon Violence**
  Visuals depicting violence using weapons like firearms or blades, such as shooting

- **Weapons**
  Visuals depicting weapons like firearms and blades

- **Self Injury**
  Visuals depicting self-inflicted cutting on the body, typically in distinctive patterns using sharp objects

- **Emaciated Bodies**
  Visuals depicting extremely malnourished human bodies

- **Corpses**
  Visuals depicting human dead bodies

- **Hanging**
  Visuals depicting death by hanging
Add Automation with Liquid

The custom template system uses Liquid for automation. Liquid is an open-source inline markup language. For more information and documentation, see the Liquid homepage.

In Liquid, the text between single curly braces and percent symbols is an instruction or tag that performs an operation like control flow or iteration. Text between double curly braces is a variable or object that outputs its value. The following list includes two types of liquid tags that you may find useful to automate template input data processing. If you select one of the following tag-types, you are redirected to the Liquid documentation.

- Control flow: Includes programming logic operators like if/else, unless, and case/when.
- Iteration: Enables you to run blocks of code repeatedly using statements like for loops.

For example, the following code example demonstrates how you can use the Liquid for tag to create a for loop. This example loops through the moderationLabels returned from Amazon Rekognition and displays the moderationLabels attributes name and parentName for workers to review:

```liquid
{# for label in task.input.selectedAiServiceResponse.moderationLabels %}
    { name: &quot;{{ label.name }}&quot;, parentName: &quot;{{ label.parentName }}&quot; },
{# endfor %}
```

Use Variable Filters

In addition to the standard Liquid filters and actions, Amazon Augmented AI (Amazon A2I) offers additional filters. You apply filters by placing a pipe (|) character after the variable name, and then specifying a filter name. To chain filters, use the following format.

**Example**

```
{{ <content> | <filter> | <filter> }}
```

Autoescape and Explicit Escape

By default, inputs are HTML-escaped to prevent confusion between your variable text and HTML. You can explicitly add the escape filter to make it more obvious to someone reading the source of your template that escaping is being done.

escape_once

escape_once ensures that if you've already escaped your code, it doesn't get re-escaped again. For example, it ensures that &amp; doesn't become &amp;amp;.

skip_autoescape

skip_autoescape is useful when your content is meant to be used as HTML. For example, you might have a few paragraphs of text and some images in the full instructions for a bounding box.

**Note**

Use skip_autoescape sparingly. As a best practice for templates, avoid passing in functional code or markup with skip_autoescape unless you are absolutely sure that you have strict control over what's being passed. If you're passing user input, you could be opening your workers up to a cross-site scripting attack.
to_json

to_json encodes data that you provide to JavaScript Object Notation (JSON). If you provide an object, it serializes it.

grant_read_access

grant_read_access takes an Amazon Simple Storage Service (Amazon S3) URI and encodes it into an HTTPS URL with a short-lived access token for that resource. This makes it possible to display photo, audio, or video objects stored in S3 buckets that are not otherwise publicly accessible to workers.

Example Example of the to_json and grant_read_access filters

Input

| auto-escape: | {{ "Have you read 'James & the Giant Peach'?" }} |
| explicit escape: | {{ "Have you read 'James & the Giant Peach'?" | escape }} |
| explicit escape_once: | {{ "Have you read 'James & the Giant Peach'?" | escape_once }} |
| skip_autoescape: | {{ "Have you read 'James & the Giant Peach'?" | skip_autoescape }} |
| to_json: | {{ jsObject | to_json }} |
| grant_read_access: | {{ "s3://examplebucket/myphoto.png" | grant_read_access }} |

Example

Output

| auto-escape: | Have you read 'James & the Giant Peach'? |
| explicit escape: | Have you read 'James & the Giant Peach'? |
| explicit escape_once: | Have you read 'James & the Giant Peach'? |
| skip_autoescape: | Have you read 'James & the Giant Peach'? |
| to_json: | { "point_number": 8, "coords": [ 59, 76 ] } |
| grant_read_access: | https://s3.amazonaws.com/examplebucket/myphoto.png?access token and other params> |

Example Example of an automated classification template.

To automate this simple text classification sample, include the Liquid tag {{ task.input.source }}. This example uses the crowd-classifier (p. 734) element.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-classifier
    name="tweetFeeling"
    categories="["positive", "negative", "neutral", "cannot determine"]"
    header="Which term best describes this tweet?"
  >
    <classification-target>
      {{ task.input.source }}
    </classification-target>

    <full-instructions header="Analyzing a sentiment">
      Try to determine the feeling the author of the tweet is trying to express.
      If none seems to match, choose "other."
    </full-instructions>

    <short-instructions>
      Pick the term that best describes the sentiment of the tweet.
    </short-instructions>
```
Preview a Worker Task Template

To preview a custom worker task template, use the SageMaker RenderUiTemplate operation. You can use the RenderUiTemplate operation with the AWS CLI or your preferred AWS SDK. For documentation on the supported language specific SDKs for this API operation, see the See Also section of the RenderUiTemplate.

Prerequisites

To preview your worker task template, the AWS Identity and Access Management (IAM) role Amazon Resource Name (ARN), or RoleArn, that you use must have permission to access to the S3 objects that are used by the template. To learn how to configure your role or user see Enable Worker Task Template Previews (p. 3470).

To preview your worker task template using the RenderUiTemplate operation:

1. Provide a RoleArn of the role with required policies attached to preview your custom template.
2. In the Input parameter of Task, provide a JSON object that contains values for the variables defined in the template. These are the variables that are substituted for the task.input source variable. For example, if you define a task.input.text variable in your template, you can supply the variable in the JSON object as text: sample text.
3. In the Content parameter of UiTemplate, insert your template.

Once you've configured RenderUiTemplate, use your preferred SDK or the AWS CLI to submit a request to render your template. If your request was successful, the response includes RenderedContent, a Liquid template that renders the HTML for the worker UI.

Important
To preview your template, you need an IAM role with permissions to read Amazon S3 objects that get rendered on your user interface. For a sample policy that you can attach to your IAM role to grant these permissions, see Enable Worker Task Template Previews (p. 3470).

Creating Good Worker Instructions

Creating good instructions for your human review jobs improves your worker's accuracy in completing their task. You can modify the default instructions that are provided in the console when creating a human review workflow, or you can use the console to create a custom worker template and include your instructions in this template. The instructions are shown to the worker on the UI page where they complete their labeling task.

Create Good Worker Instructions

There are three kinds of instructions in the Amazon Augmented AI console:

- **Task Description** – The description should provide a succinct explanation of the task.
- **Instructions** – These instructions are shown on the same webpage where workers complete a task. These instructions should provide an easy reference to show the worker the correct way to complete the task.
- **Additional Instructions** – These instructions are shown in a dialog box that appears when a worker chooses View full instructions. We recommend that you provide detailed instructions for completing the task, and include several examples showing edge cases and other difficult situations for labeling objects.
Add Example Images to Your Instructions

Images provide useful examples for your workers. To add a publicly accessible image to your instructions, do the following:

1. Place the cursor where the image should go in the instructions editor.
2. Choose the image icon in the editor toolbar.
3. Enter the URL of your image.

If your instruction image is in an S3 bucket that isn't publicly accessible, do the following:

- For the image URL, enter: `{{ 'https://s3.amazonaws.com/your-bucket-name/image-file-name' | grant_read_access }}`.

This renders the image URL with a short-lived, one-time access code that's appended so the worker's browser can display it. A broken image icon is displayed in the instructions editor, but previewing the tool displays the image in the rendered preview. See `grant_read_access` (p. 3454) for more information about the `grant_read_access` element.

Monitor and Manage Your Human Loop

Once you've started a human review loop, you can check the results of tasks sent to the loop and manage it using the Amazon Augmented AI Runtime API. Additionally, Amazon A2I integrates with Amazon EventBridge (also known as Amazon CloudWatch Events) to alert you when a human review loop status changes to Completed, Failed, or Stopped. This event delivery is guaranteed at least once, which means all events created when human loops finish are successfully delivered to EventBridge.

Use the procedures below to learn how to use the Amazon A2I Runtime API to monitor and manage your human loops. See `Use Amazon CloudWatch Events in Amazon Augmented AI` (p. 3471) to learn how Amazon A2I integrates with Amazon EventBridge.

**To check your output data:**

1. Check the results of your human loop by calling the `DescribeHumanLoop` operation. The result of this API operation contains information about the reason for and outcome of the loop activation.
2. Check the output data from your human loop in Amazon Simple Storage Service (Amazon S3). In the path to the data, `YYYY/MM/DD/hh/mm/ss` represents the human loop creation date with year (YYYY), month (MM), and day (DD), and the creation time with hour (hh), minute (mm), and second (ss).

   s3://customer-output-bucket-specified-in-flow-definition/flow-definition-name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json

You can integrate this structure with AWS Glue or Amazon Athena to partition and analyze your output data. For more information, see `Managing Partitions for ETL Output in AWS Glue`.

To learn more about Amazon A2I output data format, see `Amazon A2I Output Data` (p. 3457).

**To stop and delete your human loop:**

1. Once a human loop has been started, you can stop your human loop by calling the `StopHumanLoop` operation using the `HumanLoopName`. If a human loop was successfully stopped, the server sends back an HTTP 200 response.
To delete a human loop for which the status equals Failed, Completed, or Stopped, use the `DeleteHumanLoop` operation.

**To list human loops:**

1. You can list all active human loops by calling the `ListHumanLoops` operation. You can filter human loops by the creation date of the loop using the `CreationTimeAfter` and `CreateTimeBefore` parameters.
2. If successful, `ListHumanLoops` returns `HumanLoopSummaries` and `NextToken` objects in the response element. `HumanLoopSummaries` contains information about a single human loop. For example, it lists a loop's status and, if applicable, its failure reason.

   Use the string returned in `NextToken` as an input in a subsequent call to `ListHumanLoops` to see the next page of human loops.

**Amazon A2I Output Data**

When your machine learning workflow sends Amazon A2I a data object, a human loop is created and human reviewers receive a task to review that data object. The output data from each human review task is stored in the Amazon Simple Storage Service (Amazon S3) output bucket you specify in your human review workflow. In the path to the data, `YYYY/MM/DD/hh/mm/ss` represents the human loop creation date with year (YYYY), month (MM), and day (DD), and the creation time with hour (hh), minute (mm), and second (ss).

![s3://customer-output-bucket-specified-in-flow-definition/flow-definition-name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json](image-url)

The content of your output data depends on the type of task type (built-in or custom) and the type of workforce you use. Your output data always includes the response from the human worker. Additionally, output data may include metadata about the human loop, the human reviewer (worker), and the data object.

Use the following sections to learn more about Amazon A2I output data format for different task types and workforces.

**Output Data From Built-In Task Types**

Amazon A2I built-in task types include Amazon Textract and Amazon Rekognition. In addition to human responses, the output data from one of these tasks includes details about the reason the human loop was created and information about the integrated service used to create the human loop. Use the following table to learn more about the output data schema for all built-in task types. The value for each of these parameters depends on the service you use with Amazon A2I. Refer to the second table in this section for more information about these service-specific values.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value Type</th>
<th>Example Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>awsManagedHumanLoopRequestSource</code></td>
<td>String</td>
<td><code>AWS/Rekognition/DetectModerationLabels/Image/V3</code> or <code>AWS/Textract/AnalyzeDocument/Forms/V1</code></td>
<td>The API operation and associated AWS services that requested that Amazon A2I create the human loop. This is the API operation you use to configure your human loop.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Value Type</td>

</tbody>
</table>
Select a tab on the following table to learn about the task type–specific parameters and see an example output-data code block for each of the built-in task types.

### Amazon Textract Task Type Output Data

When you use the Amazon Textract built-in integration, you see `'AWS/Textract/AnalyzeDocument/Forms/V1'` as the value for `awsManagedHumanLoopRequestSource` in your output data.

The `answerContent` parameter contains a Block object that includes human responses for all blocks sent to Amazon A2I.

The `aiServiceResponse` parameter also includes a Block object with Amazon Textract's response to the original request sent using to `AnalyzeDocument`.

To learn more about the parameters you see in the block object, refer to `Block` in the Amazon Textract Developer Guide.

The following is an example of the output data from an Amazon A2I human review of Amazon Textract document analysis inferences.

```json
{
  "awsManagedHumanLoopRequestSource": "AWS/Textract/AnalyzeDocument/Forms/V1",
  "humanAnswers": [
    {
      "answerContent": {
        "AWS/Textract/AnalyzeDocument/Forms/V1": {
          "blocks": [...]
        }
      },
      "submissionTime": "2020-09-28T19:17:59.880Z",

            "EvaluationResult": true
          },
          {
            "ConditionParameters": {
              "ImportantFormKey": "Mail address",
              "ImportantFormKeyAliases": [
                "Mail Address:"
              ]
            },
            "ConditionType": "ImportantFormKeyConfidenceCheck",
            "EvaluationResult": true
          }
        ]
      }
    ]
  }
}
When you use the Amazon Textract built-in integration, you see the string 'AWS/Rekognition/DetectModerationLabels/Image/V3' as the value for awsManagedHumanLoopRequestSource in your output data.

The answerContent parameter contains a moderationLabels object that contains human responses for all moderation labels sent to Amazon A2I.

The aiServiceResponse parameter also includes a moderationLabels object with Amazon Rekognition's response to the original request sent to DetectModerationLabels.

To learn more about the parameters you see in the block object, refer to ModerationLabel in the Amazon Rekognition Developer Guide.

The following is an example of the output data from an Amazon A2I human review of Amazon Rekognition image moderation inferences.

```json
{
    "awsManagedHumanLoopRequestSource": "AWS/Rekognition/DetectModerationLabels/Image/V3",
    "humanAnswers": [
        {
            "answerContent": {
                "AWS/Rekognition/DetectModerationLabels/Image/V3": {
                    "moderationLabels": ...
                }
            },
            "submissionTime": "2020-09-28T19:22:35.508Z",
            "workerId": "ef7294f850a3d9d1",
            "workerMetadata": {
                "identityData": {
                    "identityProviderType": "Cognito",
                    "sub": "c6aa8eb7-9944-42e9-a6b9-111122223333"
                }
            }
        }
    ],
    "humanLoopName": "human-loop-name",
    "inputContent": {
        "aiServiceRequest": {
            "humanLoopConfig": {
                ...
            }
        }
    }
}
```
Output Data From Custom Task Types

When you add Amazon A2I to a custom human review workflow, you see the following parameters in the output data returned from human review tasks.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flowDefinitionArn</td>
<td>String</td>
<td>The Amazon Resource Number (ARN) of the human review</td>
</tr>
<tr>
<td>humanLoopName</td>
<td></td>
<td></td>
</tr>
<tr>

<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>humanAnswers</td>
<td>List of JSON objects</td>
<td>A list of JSON objects that contain worker responses in answerContent. The value in this parameter is determined by the output received from your worker task template. If you are using a private workforce, worker metadata is included. To learn more, see Track Worker Activity (p. 3465).</td>
</tr>
<tr>
<td>humanLoopName</td>
<td>String</td>
<td>The name of the human loop.</td>
</tr>
<tr>
<td>inputContent</td>
<td>JSON Object</td>
<td>The input content sent to Amazon A2I in the request to StartHumanLoop.</td>
</tr>
</tbody>
</table>

The following is an example of output data from a custom integration with Amazon A2I and Amazon Transcribe. In this example, the inputContent consists of:

- A path to an .mp4 file in Amazon S3 and the video title
- The transcription returned from Amazon Transcribe (parsed from Amazon Transcribe output data)
- A start and end time used by the worker task template to clip the .mp4 file and show workers a relevant portion of the video

```json
{
    "humanAnswers": [
        {
            "answerContent": {
                "transcription": "use lambda to turn your notebook"
            },
            "submissionTime": "2020-06-18T17:08:26.246Z",
            "workerId": "ef7294f850a3d9d1",
            "workerMetadata": {
                "identityData": {
                    "identityProviderType": "Cognito",
                    "sub": "c6aa8eb7-9944-42e9-a6b9-111122223333"
                }
            }
        }
    ],
    "humanLoopName": "human-loop-name",
    "inputContent": {
        "audioPath": "s3://DOC-EXAMPLE-BUCKET1/a2i_transcribe_demo/Fully-Managed Notebook Instances with Amazon SageMaker - a Deep Dive.mp4",
        "end_time": 950.27,
        "original_words": "but definitely use Lambda to turn your ",
        "start_time": 948.51
    }
}
```
Track Worker Activity

Amazon A2I provides information that you can use to track individual workers in task output data. To identify the worker that worked on the human review task, use the following from the output data in Amazon S3:

- The `acceptanceTime` is the time that the worker accepted the task. The format of this date and time stamp is `YYYY-MM-DDTHH:MM:SS.mmmZ` for the year (YYYY), month (MM), day (DD), hour (HH), minute (MM), second (SS), and millisecond (mmm). The date and time are separated by a T.
- The `submissionTime` is the time that the worker submitted their annotations using the Submit button. The format of this date and time stamp is `YYYY-MM-DDTHH:MM:SS.mmmZ` for the year (YYYY), month (MM), day (DD), hour (HH), minute (MM), second (SS), and millisecond (mmm). The date and time are separated by a T.
- `timeSpentInSeconds` reports the total time, in seconds, that a worker actively worked on that task. This metric does not include time when a worker paused or took a break.
- The `workerId` is unique to each worker.
- If you use a private workforce, in workerMetadata, you see the following.
  - The `identityProviderType` is the service used to manage the private workforce.
  - The `issuer` is the Amazon Cognito user pool or OpenID Connect (OIDC) Identity Provider (IdP) issuer associated with the work team assigned to this human review task.
  - A unique sub identifier refers to the worker. If you create a workforce using Amazon Cognito, you can retrieve details about this worker (such as the name or user name) associated with this ID using Amazon Cognito. To learn how, see Managing and Searching for User Accounts in Amazon Cognito Developer Guide.

The following is an example of the output you may see if you use Amazon Cognito to create a private workforce. This is identified in the `identityProviderType`.

```json
"submissionTime": "2020-12-28T18:59:58.321Z",
"acceptanceTime": "2020-12-28T18:15:19.191Z",
"timeSpentInSeconds": 40.543,
"workerId": "a12b3cdefg4h5i67",
"workerMetadata": {
  "identityData": {
    "identityProviderType": "Cognito",
    "sub": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee"
  }
}
```

The following is an example of the output you may see if you use your own OIDC IdP to create a private workforce:

```json
"workerMetadata": {
  "identityData": {
    "identityProviderType": "Oidc",
    "issuer": "https://example-oidc-ipd.com/adfs",
    "sub": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee"
  }
}
```
Permissions and Security in Amazon Augmented AI

When using Amazon Augmented AI (Amazon A2I) to create a human review workflow for your ML/AI application, you create and configure resources in Amazon SageMaker such as a human workforce and worker task templates. To configure and start a human loop, you either integrate Amazon A2I with other AWS services such as Amazon Textract or Amazon Rekognition, or use the Amazon Augmented AI Runtime API. To create a human review workflow and start a human loop, you must attach certain policies to your AWS Identity and Access Management (IAM) role or user. Specifically:

• When you start a human loop using image input data on or after January 12th, 2020, you must add a CORS header policy to the Amazon S3 bucket that contains your input data. See CORS Permission Requirement (p. 3467) to learn more.

• When you create a flow definition, you need to provide a role that grants Amazon A2I permission to access Amazon S3 both for reading objects that are rendered in a human task UI and for writing the results of the human review. This role must also have a trust policy attached to give SageMaker permission to assume the role. This allows Amazon A2I to perform actions in accordance with permissions that you attach to the role. See Add Permissions to the IAM Role Used to Create a Flow Definition (p. 3467) for example policies that you can modify and attach to the role you use to create a flow definition. These are the policies that are attached to the IAM role that is created in the Human review workflows section of the Amazon A2I area of the SageMaker console.

• To create and start human loops, you either use an API operation from a built-in task type (such as DetectModerationLabel or AnalyzeDocument) or the Amazon A2I Runtime API operation StartHumanLoop in a custom ML application. You need to attach the AmazonAugmentedAIFullAccess managed policy to the IAM user that invokes these API operations to grant permission to these services to use Amazon A2I operations. To learn how, see Create an IAM User That Can Invoke Amazon A2I API Operations (p. 3469).

This policy does not grant permission to invoke the API operations of the AWS service associated with built-in task types. For example, AmazonAugmentedAIFullAccess does not grant permission to call the Amazon Rekognition DetectModerationLabel API operation or Amazon Textract AnalyzeDocument API operation. You can use the more general policy, AmazonAugmentedAIIntegratedAPIAccess, to grant these permissions. For more information, see Create an IAM User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations (p. 3469). This is a good option when you want to grant an IAM user broad permissions to use Amazon A2I and integrated AWS services' API operations.

If you want to configure more granular permissions, see Amazon Rekognition Identity-Based Policy Examples and Amazon Textract Identity-Based Policy Examples for identity-based policies you can use to grant permission to use these individual services.

• To preview your custom worker task UI template, you need an IAM role with permissions to read Amazon S3 objects that get rendered on your user interface. See a policy example in Enable Worker Task Template Previews (p. 3470).

Topics
• CORS Permission Requirement (p. 3467)
• Add Permissions to the IAM Role Used to Create a Flow Definition (p. 3467)
• Create an IAM User That Can Invoke Amazon A2I API Operations (p. 3469)
• Create an IAM User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations (p. 3469)
CORS Permission Requirement

Earlier in 2020, widely used browsers like Chrome and Firefox changed their default behavior for rotating images based on image metadata, referred to as **EXIF data**. Previously, images would always display in browsers exactly how they are stored on disk, which is typically unrotated. After the change, images now rotate according to a piece of image metadata called **orientation value**. This has important implications for the entire machine learning (ML) community. For example, if the EXIF orientation is not considered, applications that are used to annotate images may display images in unexpected orientations and result in incorrect labels.

Starting with Chrome 89, AWS can no longer automatically prevent the rotation of images because the web standards group W3C has decided that the ability to control rotation of images violates the web's Same-Origin Policy. Therefore, to ensure human workers annotate your input images in a predictable orientation when you submit requests to create a human loop, you must add a CORS header policy to the S3 buckets that contain your input images.

**Important**

If you do not add a CORS configuration to the S3 buckets that contains your input data, human review tasks for those input data objects fail.

You can add a CORS policy to an S3 bucket that contains input data in the Amazon S3 console. To set the required CORS headers on the S3 bucket that contains your input images in the S3 console, follow the directions detailed in How do I add cross-domain resource sharing with CORS?. Use the following CORS configuration code for the buckets that host your images. If you use the Amazon S3 console to add the policy to your bucket, you must use the JSON format.

**JSON**

```json
[
  "AllowedHeaders": [],
  "AllowedMethods": ["GET"],
  "AllowedOrigins": ["*"],
  "ExposedHeaders": []
]
```

**XML**

```xml
<CORSConfiguration>
  <CORSRule>
    <AllowedOrigin>*</AllowedOrigin>
    <AllowedMethod>GET</AllowedMethod>
  </CORSRule>
</CORSConfiguration>
```

**Add Permissions to the IAM Role Used to Create a Flow Definition**

To create a flow definition, attach the policies in this section to the role that you use when creating a human review workflow in the SageMaker console, or when using the CreateFlowDefinition API operation.
Add Permissions to the IAM Role
Used to Create a Flow Definition

• If you are using the console to create a human review workflow, enter the role Amazon Resource Name (ARN) in the IAM role field when creating a human review workflow in the console.

• When creating a flow definition using the API, attach these policies to the role that is passed to the RoleArn parameter of the CreateFlowDefinition operation.

When you create a human review workflow (flow definition), Amazon A2I invokes Amazon S3 to complete your task. To grant Amazon A2I permission to retrieve and store your files in your Amazon S3 bucket, create the following policy and attach it to your role. For example, if the images, documents, and other files that you are sending for human review are stored in an S3 bucket named my_input_bucket, and if you want the human reviews to be stored in a bucket named my_output_bucket, create the following policy.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": ["s3:GetObject"],
      "Resource": ["arn:aws:s3:::my_input_bucket/*"]
    },
    {
      "Effect": "Allow",
      "Action": ["s3:PutObject"],
      "Resource": ["arn:aws:s3:::my_output_bucket/*"]
    }
  ]
}
```

In addition, the IAM role must have the following trust policy to give SageMaker permission to assume the role. To learn more about IAM trust policies, see Resource-Based Policies section of Policies and Permissions in the AWS Identity and Access Management documentation.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "AllowSageMakerToAssumeRole",
      "Effect": "Allow",
      "Principal": {
        "Service": "sagemaker.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

For more information about creating and managing IAM roles and policies, see the following topics in the AWS Identity and Access Management User Guide:

• To create an IAM role, see Creating a Role to Delegate Permissions to an IAM User.
• To learn how to create IAM policies, see Creating IAM Policies.
Create an IAM User That Can Invoke Amazon A2I API Operations

To use Amazon A2I to create and start human loops for Amazon Rekognition, Amazon Textract, or the Amazon A2I runtime API, you must use an IAM user that has permissions to invoke Amazon A2I operations. To do this, use the IAM console to attach the `AmazonAugmentedAIFullAccess` managed policy to a new or existing IAM user.

This policy grants permission to an IAM user to invoke API operations from the SageMaker API for flow definition creation and management and the Amazon Augmented AI Runtime API for human loop creation and management. To learn more about these API operations, see Use APIs in Amazon Augmented AI.

`AmazonAugmentedAIFullAccess` does not grant permissions to use Amazon Rekognition or Amazon Textract API operations.

**Note**

You can also attach the `AmazonAugmentedAIFullAccess` policy to an IAM role that is used to create and start a human loop.

**To create the required IAM user**

2. Choose Users and choose an existing user, or create a new user by choosing Add user. To learn how to create a new user, see Creating an IAM User in Your AWS Account in the AWS Identity and Access Management User Guide.
   - If you chose to attach the policy to an existing user, choose Add permissions.
   - While creating a new user, follow the next step on the Set permissions page.
3. Choose Attach existing policies directly.
4. In the Search bar, enter AmazonAugmentedAIFullAccess and check the box next to that policy. To enable this IAM user to create a flow definition with the public work team, also attach the AmazonSageMakerMechanicalTurkAccess managed policy.
5. After attaching the policy or policies:
   a. If you are using an existing user, choose Next: Review, and then choose Add permissions.
   b. If you are creating a new user, choose Next: Tags and complete the process of creating your user.

For more information, see Adding and Removing IAM Identity Permissions in the AWS Identity and Access Management User Guide.

Create an IAM User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations

To create an IAM user that has permission to invoke the API operations used by the built-in task types (that is, DetectModerationLabels for Amazon Rekognition and AnalyzeDocument for Amazon...
To customize the interface and instructions that your workers see when working on your tasks, you create a worker task template. You can create the template using the `CreateHumanTaskUi` operation or the SageMaker console.

To preview your template, you need an IAM role with the following permissions to read Amazon S3 objects that get rendered on your user interface.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": ["s3:GetObject"],
      "Resource": ["arn:aws:s3:::my_input_bucket/*"]
    }
  ]
}
```
For Amazon Rekognition and Amazon Textract task types, you can preview your template using the Amazon Augmented AI section of the SageMaker console. For custom task types, you preview your template by invoking the `RenderUiTemplate` operation. To preview your template, follow the instructions for your task type:

- Amazon Rekognition and Amazon Textract task types – In the SageMaker console, use the role's Amazon Resource Name (ARN) in the procedure documented in Create a Worker Task Template (p. 3447).
- Custom task types – In the `RenderUiTemplate` operation, use the role's ARN in the `RoleArn` parameter.

**Using Amazon A2I with AWS KMS Encrypted Buckets**

If you specify an AWS Key Management Service (AWS KMS) customer managed key to encrypt output data in `OutputConfig` of CreateFlowDefinition, you must add an IAM policy similar to the following to that key. This policy gives the IAM execution role that you use to create your human loops permission to use this key to perform all of the actions listed in "Action". To learn more about these actions, see AWS KMS permissions in the AWS Key Management Service Developer Guide.

To use this policy, replace the IAM service-role ARN in "Principal" with the ARN of the execution role you use to create the human review workflow (flow definition). When you create a labeling job using CreateFlowDefinition, this is the ARN you specify for `RoleArn`. Note that you cannot provide a `KmsKeyId` when you create a flow definition in the console.

```json
{
   "Sid": "AllowUseOfKmsKey",
   "Effect": "Allow",
   "Principal": {
      "AWS": "arn:aws:iam::111122223333:role/service-role/example-role"
   },
   "Action": [
      "kms:Encrypt",
      "kms:Decrypt",
      "kms:ReEncrypt*",
      "kms:GenerateDataKey*",
      "kms:DescribeKey"
   ],
   "Resource": "**"
}
```

**Additional Permissions and Security Resources**

- the section called “Control Access to SageMaker Resources by Using Tags” (p. 3527).
- the section called “SageMaker Identity-Based Policies” (p. 3505)
- the section called “Control Creation of SageMaker Resources with Condition Keys” (p. 3518)
- the section called “Amazon SageMaker API Permissions Reference” (p. 3553)
- Security (p. 3493)

**Use Amazon CloudWatch Events in Amazon Augmented AI**

Amazon Augmented AI uses Amazon CloudWatch Events to alert you when a human review loop status changes to Completed, Failed, or Stopped. This event delivery is guaranteed at least once, which
means all events created when human loops finish are successfully delivered to CloudWatch Events (Amazon EventBridge). When a review loop changes to one of these states, Augmented AI sends an event to CloudWatch Events similar to the following.

```json
{
    "version":"0",
    "id":"12345678-1111-2222-3333-12345EXAMPLE",
    "detail-type":"SageMaker A2I HumanLoop Status Change",
    "source":"aws.sagemaker",
    "account":"111111111111",
    "time":"2019-11-14T17:49:25Z",
    "region":"us-east-1",
    "resources":[]
    "detail":{
        "creationTime":"2019-11-14T17:37:36.740Z",
        "failureCode":null,
        "failureReason":null,
        "flowDefinitionArn":"arn:aws:sagemaker:us-east-1:111111111111:flow-definition/flowdef-nov-12",
        "humanLoopName":"humanloop-nov-14-1",
        "humanLoopOutput":{
            "outputS3Uri":"s3://customer-output-bucket-specified-in-flow-definition/flowdef-nov-12/2019/11/14/17/37/36/humanloop-nov-14-1/output.json"
        },
        "humanLoopStatus":"Completed"
    }
}
```

The details in the JSON output include the following:

- **creationTime**: The timestamp when Augmented AI created the human loop.
- **failureCode**: A failure code denoting a specific type of failure.
- **failureReason**: The reason why a human loop has failed. The failure reason is only returned when the human review loop status is failed.
- **flowDefinitionArn**: The Amazon Resource Name (ARN) of the flow definition, or human review workflow.
- **humanLoopArn**: The Amazon Resource Name (ARN) of the human loop.
- **humanLoopName**: The name of the human loop.
- **humanLoopOutput**: An object containing information about the output of the human loop.
- **outputS3Uri**: The location of the Amazon S3 object where Augmented AI stores your human loop output.
Send Events from Your Human Loop to CloudWatch Events

The status of the human loop.

Send Events from Your Human Loop to CloudWatch Events

To configure a CloudWatch Events rule to get status updates, or events, for your Amazon A2I human loops, use the AWS Command Line Interface (AWS CLI) put-rule command. When using the put-rule command, specify the following to receive human loop statuses:

- "source": ["aws.sagemaker"]
- "detail-type": ["SageMaker A2I HumanLoop Status Change"]

To configure a CloudWatch Events rule to watch for all status changes, use the following command and replace the placeholder text. For example, replace "A2IHumanLoopStatusChanges" with a unique CloudWatch Events rule name and "arn:aws:iam::111122223333:role/MyRoleForThisRule" with the Amazon Resource Number (ARN) of an IAM role with an events.amazonaws.com trust policy attached. Replace region with the AWS Region in which you want to create the rule.

```bash
aws events put-rule --name "A2IHumanLoopStatusChanges"
   --event-pattern "{"source": ["aws.sagemaker"], "detail-type": ["SageMaker A2I HumanLoop Status Change"]}"
   --role-arn "arn:aws:iam::111122223333:role/MyRoleForThisRule"
   --region "region"
```

To learn more about the put-rule request, see Event Patterns in CloudWatch Events in the Amazon CloudWatch Events User Guide.

Set Up a Target to Process Events

To process events, you need to set up a target. For example, if you want to receive an email when a human loop status changes, use a procedure in Setting Up Amazon SNS Notifications in the Amazon CloudWatch User Guide to set up an Amazon SNS topic and subscribe your email to it. Once you have created a topic, you can use it to create a target.

To add a target to your CloudWatch Events rule

1. Open the CloudWatch console: https://console.aws.amazon.com/cloudwatch/home
2. In the navigation pane, choose Rules.
3. Choose the rule to which you want to add a target.
4. Choose Actions, and then choose Edit.
5. Under Targets, choose Add Target and choose the AWS service you want to act when a human loop status change event is detected.
6. Configure your target. For instructions, see the topic for configuring a target in the AWS documentation for that service.
7. Choose Configure details.
8. For Name, enter a name and, optionally, provide details about the purpose of the rule in Description.
9. Make sure that the check box next to State is selected so that your rule is listed as Enabled.
10. Choose Update rule.
Use Human Review Output

After you receive human review results, you can analyze the results and compare them to machine learning predictions. The JSON that is stored in the Amazon S3 bucket contains both the machine learning predictions and the human review results.

More Information

Automating Amazon SageMaker with Amazon EventBridge (p. 3681)

Use APIs in Amazon Augmented AI

You can create a human review workflow or a worker task template programmatically. The APIs you use depend on whether you are creating a Amazon Rekognition, Amazon Textract, or custom task type. This topic provides links to API reference documentation for each task type and programming task.

The following APIs can be used with Augmented AI:

Amazon Augmented AI

Use the Augmented AI API to start, stop, and delete human review loops. You can also list all human review loops and return information about human review loops in your account.

Learn more about human review loop APIs in the Amazon Augmented AI Runtime API Reference.

Amazon Rekognition

Use the `HumanLoopConfig` parameter of the `DetectModerationLabels` API to initiate a human review workflow using Amazon Rekognition.

Amazon SageMaker

Use the Amazon SageMaker API to create a `FlowDefinition`, also known as a human review workflow. You can also create a `HumanTaskUi` or worker task template.

For more information, see the `CreateFlowDefinition` or the `CreateHumanTaskUi` API documentation.

Amazon Textract

Use the `HumanLoopConfig` parameter of the `AnalyzeDocument` API to initiate a human review workflow using Amazon Textract.

Programmatic Tutorials

The following tutorials provide example code and step-by-step instructions for creating human review workflows and worker task templates programmatically.

- Tutorial: Get Started Using the Amazon A2I API (p. 3401)
- Create a Human Review Workflow (API) (p. 3422)
- Create and Start a Human Loop (p. 3438)
- Using Amazon Augmented AI with Amazon Rekognition in the Amazon Rekognition Developer Guide
- Using Amazon Augmented AI with Amazon Textract AnalyzeDocument in the Amazon Textract Developer Guide
Buy and Sell Amazon SageMaker Algorithms and Models in AWS Marketplace

Amazon SageMaker integrates with AWS Marketplace, enabling developers to charge other SageMaker users for the use of their algorithms and model packages. AWS Marketplace is a curated digital catalog that makes it easy for customers to find, buy, deploy, and manage third-party software and services that customers need to build solutions and run their businesses. AWS Marketplace includes thousands of software listings in popular categories, such as security, networking, storage, machine learning, business intelligence, database, and DevOps. It simplifies software licensing and procurement with flexible pricing options and multiple deployment methods.

For information, see AWS Marketplace Documentation.

Topics

- SageMaker Algorithms (p. 3475)
- SageMaker Model Packages (p. 3475)
- Sell Amazon SageMaker Algorithms and Model Packages (p. 3489)
- Find and Subscribe to Algorithms and Model Packages on AWS Marketplace (p. 3492)
- Use Algorithm and Model Package Resources (p. 3482)

SageMaker Algorithms

An algorithm enables you to perform end-to-end machine learning. It has two logical components: training and inference. Buyers can use the training component to create training jobs in SageMaker and build a machine learning model. SageMaker saves the model artifacts generated by the algorithm during training to an Amazon S3 bucket. For more information, see Train a Model with Amazon SageMaker (p. 9).

Buyers use the inference component with the model artifacts generated during a training job to create a deployable model in their SageMaker account. They can use the deployable model for real-time inference by using SageMaker hosting services. Or, they can get inferences for an entire dataset by running batch transform jobs. For more information, see Deploy a Model in Amazon SageMaker (p. 11).

SageMaker Model Packages

Buyers use a model package to build a deployable model in SageMaker. They can use the deployable model for real-time inference by using SageMaker hosting services. Or, they can get inferences for an entire dataset by running batch transform jobs. For more information, see Deploy a Model in Amazon SageMaker (p. 11). As a seller, you can build your model artifacts by training in SageMaker, or you can use your own model artifacts from a model that you trained outside of SageMaker. You can charge buyers for inference.
Use your own algorithms and models with the AWS Marketplace

The following sections show how to create algorithm and model package resources that you can use locally and publish to the AWS Marketplace.

Topics
- Create Algorithm and Model Package Resources (p. 3476)
- Use Algorithm and Model Package Resources (p. 3482)

Create Algorithm and Model Package Resources

After your training and/or inference code is packaged in Docker containers, create algorithm and model package resources that you can use in your Amazon SageMaker account and, optionally, publish on AWS Marketplace.

Topics
- Create an Algorithm Resource (p. 3476)
- Create a Model Package Resource (p. 3479)

Create an Algorithm Resource

To create an algorithm resource that you can use to run training jobs in Amazon SageMaker and publish on AWS Marketplace specify the following information:

- The Docker containers that contains the training and, optionally, inference code.
- The configuration of the input data that your algorithm expects for training.
- The hyperparameters that your algorithm supports.
- Metrics that your algorithm sends to Amazon CloudWatch during training jobs.
- The instance types that your algorithm supports for training and inference, and whether it supports distributed training across multiple instances.
- Validation profiles, which are training jobs that SageMaker uses to test your algorithm's training code and batch transform jobs that SageMaker runs to test your algorithm's inference code.

To ensure that buyers and sellers can be confident that products work in SageMaker, we require that you validate your algorithms before listing them on AWS Marketplace. You can list products in the AWS Marketplace only if validation succeeds. To validate your algorithms, SageMaker uses your validation profile and sample data to run the following validations tasks:

1. Create a training job in your account to verify that your training image works with SageMaker.
2. If you included inference code in your algorithm, create a model in your account using the algorithm's inference image and the model artifacts produced by the training job.
3. If you included inference code in your algorithm, create a transform job in your account using the model to verify that your inference image works with SageMaker.

When you list your product on AWS Marketplace, the inputs and outputs of this validation process persist as part of your product and are made available to your buyers. This helps buyers understand and evaluate the product before they buy it. For example, buyers can inspect the input data that you used, the outputs generated, and the logs and metrics emitted by your code. The more comprehensive your validation specification, the easier it is for customers to evaluate your product.
Note
In your validation profile, provide only data that you want to expose publicly.

Validation can take up to a few hours. To see the status of the jobs in your account, in the SageMaker console, see the Training jobs and Transform jobs pages. If validation fails, you can access the scan and validation reports from the SageMaker console. If any issues are found, you will have to create the algorithm again.

Note
To publish your algorithm on AWS Marketplace, at least one validation profile is required.

You can create an algorithm by using either the SageMaker console or the SageMaker API.

Topics
• Create an Algorithm Resource (Console) (p. 3477)
• Create an Algorithm Resource (API) (p. 3479)

Create an Algorithm Resource (Console)

To create an algorithm resource (console)
2. From the left menu, choose Training.
3. From the dropdown menu, choose Algorithms, then choose Create algorithm.
4. On the Training specifications page, provide the following information:
   a. For Algorithm name, type a name for your algorithm. The algorithm name must be unique in your account and in the AWS region. The name must have 1 to 64 characters. Valid characters are a-z, A-Z, 0-9, and - (hyphen).
   b. Type a description for your algorithm. This description appears in the SageMaker console and in the AWS Marketplace.
   c. For Training image, type the path in Amazon ECR where your training container is stored.
   d. For Support distributed training, Choose Yes if your algorithm supports training on multiple instances. Otherwise, choose No.
   e. For Support instance types for training, choose the instance types that your algorithm supports.
   f. For Channel specification, specify up to 8 channels of input data for your algorithm. For example, you might specify 3 input channels named train, validation, and test. For each channel, specify the following information:
      i. For Channel name, type a name for the channel. The name must have 1 to 64 characters. Valid characters are a-z, A-Z, 0-9, and - (hyphen).
      ii. To require the channel for your algorithm, choose Channel required.
      iii. Type a description for the channel.
      iv. For Supported input modes, choose Pipe mode if your algorithm supports streaming the input data, and File mode if your algorithm supports downloading the input data as a file. You can choose both.
      v. For Supported content types, type the MIME type that your algorithm expects for input data.
      vi. For Supported compression type, choose Gzip if your algorithm supports Gzip compression. Otherwise, choose None.
vii. Choose Add channel to add another data input channel, or choose Next if you are done adding channels.

5. On the Tuning specifications page, provide the following information:

a. For Hyperparameter specification, specify the hyperparameters that your algorithm supports by editing the JSON object. For each hyperparameter that your algorithm supports, construct a JSON block similar to the following:

```json
{
    "DefaultValue": "5",
    "Description": "The first hyperparameter",
    "IsRequired": true,
    "IsTunable": false,
    "Name": "intRange",
    "Range": {
        "IntegerParameterRangeSpecification": {
            "MaxValue": "10",
            "MinValue": "1"
        },
        "Type": "Integer"
    }
}
```

In the JSON, supply the following:

i. For DefaultValue, specify a default value for the hyperparameter, if there is one.

ii. For Description, specify a description for the hyperparameter.

iii. For IsRequired, specify whether the hyperparameter is required.

iv. For IsTunable, specify true if this hyperparameter can be tuned when a user runs a hyperparameter tuning job that uses this algorithm. For information, see Perform Automatic Model Tuning with SageMaker (p. 2436).

v. For Name, specify a name for the hyperparameter.

vi. For Range, specify one of the following:

- IntegerParameterRangeSpecification - the values of the hyperparameter are integers. Specify minimum and maximum values for the hyperparameter.
- ContinuousParameterRangeSpecification - the values of the hyperparameter are floating-point values. Specify minimum and maximum values for the hyperparameter.
- CategoricalParameterRangeSpecification - the values of the hyperparameter are categorical values. Specify a list of all of the possible values.

vii. For Type, specify Integer, Continuous, or Categorical. The value must correspond to the type of Range that you specified.

b. For Metric definitions, specify any training metrics that you want your algorithm to emit. SageMaker uses the regular expression that you specify to find the metrics by parsing the logs from your training container during training. Users can view these metrics when they run training jobs with your algorithm, and they can monitor and plot the metrics in Amazon CloudWatch. For information, see Monitor and Analyze Training Jobs Using Amazon CloudWatch Metrics (p. 2704). For each metric, provide the following information:

i. For Metric name, type a name for the metric.

ii. For Regex, type the regular expression that SageMaker uses to parse training logs so that it can find the metric value.

iii. For Objective metric support choose Yes if this metric can be used as the objective metric for a hyperparameter tuning job. For information, see Perform Automatic Model Tuning with SageMaker (p. 2436).
iv. Choose **Add metric** to add another metric, or choose **Next** if you are done adding metrics.

6. On the **Inference specifications** page, provide the following information if your algorithm supports inference:
   
a. For **Location of inference image**, type the path in Amazon ECR where your inference container is stored.
   
b. For **Container DNS host name**, type the name of a DNS host for your image.
   
c. For **Supported instance types for real-time inference**, choose the instance types that your algorithm supports for models deployed as hosted endpoints in SageMaker. For information, see *Deploy Models for Inference* (p. 2711).
   
d. For **Supported instance types for batch transform jobs**, choose the instance types that your algorithm supports for batch transform jobs. For information, see *Use Batch Transform* (p. 2955).
   
e. For **Supported content types**, type the type of input data that your algorithm expects for inference requests.
   
f. For **Supported response MIME types**, type the MIME types that your algorithm supports for inference responses.
   
g. Choose **Next**.

7. On the **Validation specifications** page, provide the following information:
   
a. For **Publish this algorithm on AWS Marketplace**, choose **Yes** to publish the algorithm on AWS Marketplace.
   
b. For **Validate this resource**, choose **Yes** if you want SageMaker to run training jobs and/or batch transform jobs that you specify to test the training and/or inference code of your algorithm.

   **Note**
   To publish your algorithm on AWS Marketplace, your algorithm must be validated.
   
c. For **IAM role**, choose an IAM role that has the required permissions to run training jobs and batch transform jobs in SageMaker, or choose **Create a new role** to allow SageMaker to create a role that has the AmazonSageMakerFullAccess managed policy attached. For information, see *SageMaker Roles* (p. 3536).
   
d. For **Validation profile**, specify the following:
      
      • A name for the validation profile.
      
      • A **Training job definition**. This is a JSON block that describes a training job. This is in the same format as the *TrainingJobDefinition* input parameter of the *CreateAlgorithm* API.
      
      • A **Transform job definition**. This is a JSON block that describes a batch transform job. This is in the same format as the *TransformJobDefinition* input parameter of the *CreateAlgorithm* API.
      
   e. Choose **Create algorithm**.

**Create an Algorithm Resource (API)**

To create an algorithm resource by using the SageMaker API, call the *CreateAlgorithm* API.

**Create a Model Package Resource**

To create a model package resource that you can use to create deployable models in Amazon SageMaker and publish on AWS Marketplace specify the following information:

• The Docker container that contains the inference code, or the algorithm resource that was used to train the model.
• The location of the model artifacts. Model artifacts can either be packaged in the same Docker container as the inference code or stored in Amazon S3.

• The instance types that your model package supports for both real-time inference and batch transform jobs.

• Validation profiles, which are batch transform jobs that SageMaker runs to test your model package's inference code.

Before listing model packages on AWS Marketplace, you must validate them. This ensures that buyers and sellers can be confident that products work in Amazon SageMaker. You can list products on AWS Marketplace only if validation succeeds.

The validation procedure uses your validation profile and sample data to run the following validations tasks:

1. Create a model in your account using the model package's inference image and the optional model artifacts that are stored in Amazon S3.

   Note
   A model package is specific to the region in which you create it. The S3 bucket where the model artifacts are stored must be in the same region where your created the model package.

2. Create a transform job in your account using the model to verify that your inference image works with SageMaker.

3. Create a validation profile.

   Note
   In your validation profile, provide only data that you want to expose publicly.

Validation can take up to a few hours. To see the status of the jobs in your account, in the SageMaker console, see the Transform jobs pages. If validation fails, you can access the scan and validation reports from the SageMaker console. After fixing issues, recreate the algorithm. When the status of the algorithm is COMPLETED, find it in the SageMaker console and start the listing process.

   Note
   To publish your model package on AWS Marketplace, at least one validation profile is required.

You can create an model package either by using the SageMaker console or by using the SageMaker API.

Topics

• Create a Model Package Resource (Console)  (p. 3480)
• Create a Model Package Resource (API)  (p. 3482)

Create a Model Package Resource (Console)

To create a model package in the SageMaker console:

2. From the left menu, choose Inference.
3. Choose Marketplace model packages, then choose Create marketplace model package.
4. On the Inference specifications page, provide the following information:

   a. For Model package name, type a name for your model package. The model package name must be unique in your account and in the AWS region. The name must have 1 to 64 characters. Valid characters are a-z, A-Z, 0-9, and - (hyphen).
b. Type a description for your model package. This description appears in the SageMaker console and in the AWS Marketplace.

c. For **Inference specification options**, choose **Provide the location of the inference image and model artifacts** to create a model package by using an inference container and model artifacts. Choose **Provide the algorithm used for training and its model artifacts** to create a model package from an algorithm resource that you created or subscribe to from AWS Marketplace.

d. If you chose **Provide the location of the inference image and model artifacts** for **Inference specification options**, provide the following information for **Container definition** and **Supported resources**:
   
i. For **Location of inference image**, type the path to the image that contains your inference code. The image must be stored as a Docker container in Amazon ECR.
   
   ii. For **Location of model data artifacts**, type the location in S3 where your model artifacts are stored.
   
   iii. For **Container DNS host name**, type the name of the DNS host to use for your container.
   
   iv. For **Supported instance types for real-time inference**, choose the instance types that your model package supports for real-time inference from SageMaker hosted endpoints.
   
   v. For **Supported instance types for batch transform jobs**, choose the instance types that your model package supports for batch transform jobs.
   
   vi. **Supported content types**, type the content types that your model package expects for inference requests.
   
   vii. For **Supported response MIME types**, type the MIME types that your model package uses to provide inferences.

e. If you chose **Provide the algorithm used for training and its model artifacts** for **Inference specification options**, provide the following information:
   
i. For **Algorithm ARN**, type the Amazon Resource Name (ARN) of the algorithm resource to use to create the model package.
   
   ii. For **Location of model data artifacts**, type the location in S3 where your model artifacts are stored.

f. Choose **Next**.

5. On the **Validation and scanning** page, provide the following information:
   
a. For **Publish this model package on AWS Marketplace**, choose **Yes** to publish the model package on AWS Marketplace.
   
b. For **Validate this resource**, choose **Yes** if you want SageMaker to run batch transform jobs that you specify to test the inference code of your model package.

   **Note**
   To publish your model package on AWS Marketplace, your model package must be validated.

   c. For **IAM role**, choose an IAM role that has the required permissions to run batch transform jobs in SageMaker, or choose **Create a new role** to allow SageMaker to create a role that has the AmazonSageMakerFullAccess managed policy attached. For information, see [SageMaker Roles](p. 3536).

   d. For **Validation profile**, specify the following:

   • A name for the validation profile.

   • **A Transform job definition**. This is a JSON block that describes a batch transform job. This is in the same format as the `TransformJobDefinition` input parameter of the `CreateAlgorithm` API.

6. Choose **Create marketplace model package**.
Create a Model Package Resource (API)

To create a model package by using the SageMaker API, call the `CreateModelPackage` API.

Use Algorithm and Model Package Resources

You can create algorithms and model packages as resources in your Amazon SageMaker account, and you can find and subscribe to algorithms and model packages on AWS Marketplace.

Use algorithms to:

- Run training jobs. For information, see Use an Algorithm to Run a Training Job (p. 3483).
- Run hyperparameter tuning jobs. For information, see Use an Algorithm to Run a Hyperparameter Tuning Job (p. 3485).
- Create model packages. After you use an algorithm resource to run a training job or a hyperparameter tuning job, you can use the model artifacts that these jobs output along with the algorithm to create a model package. For information, see Create a Model Package Resource (p. 3479).

**Note**
If you subscribe to an algorithm on AWS Marketplace, you must create a model package before you can use it to get inferences by creating hosted endpoint or running a batch transform job.
• Create models that you can use to get real-time inference or run batch transform jobs. For information, see Use a Model Package to Create a Model (p. 3488).
• Create hosted endpoints to get real-time inference. For information, see Deploy the Model to SageMaker Hosting Services (p. 85).
• Create batch transform jobs. For information, see (Optional) Make Prediction with Batch Transform (p. 86).

Topics
• Use an Algorithm to Run a Training Job (p. 3483)
• Use an Algorithm to Run a Hyperparameter Tuning Job (p. 3485)
• Use a Model Package to Create a Model (p. 3488)

Use an Algorithm to Run a Training Job

You can create an algorithm resource to create a training job by using the Amazon SageMaker console, the low-level Amazon SageMaker API, or the Amazon SageMaker Python SDK.

Topics
• Use an Algorithm to Run a Training Job (Console) (p. 3483)
• Use an Algorithm to Run a Training Job (API) (p. 3484)
• Use an Algorithm to Run a Training Job (Amazon SageMaker Python SDK) (p. 3484)

Use an Algorithm to Run a Training Job (Console)

To use an algorithm to run a training job (console)
2. Choose Algorithms.
3. Choose an algorithm that you created from the list on the My algorithms tab or choose an algorithm that you subscribed to on the AWS Marketplace subscriptions tab.
4. Choose Create training job.
   The algorithm you chose will automatically be selected.
5. On the Create training job page, provide the following information:
   a. For Job name, type a name for the training job.
   b. For IAM role, choose an IAM role that has the required permissions to run training jobs in SageMaker, or choose Create a new role to allow SageMaker to create a role that has the AmazonSageMakerFullAccess managed policy attached. For information, see SageMaker Roles (p. 3536).
   c. For Resource configuration, provide the following information:
      i. For Instance type, choose the instance type to use for training.
      ii. For Instance count, type the number of ML instances to use for the training job.
      iii. For Additional volume per instance (GB), type the size of the ML storage volume that you want to provision. ML storage volumes store model artifacts and incremental states.
      iv. For Encryption key, if you want Amazon SageMaker to use an AWS Key Management Service key to encrypt data in the ML storage volume attached to the training instance, specify the key.
      v. For Stopping condition, specify the maximum amount of time in seconds, minutes, hours, or days, that you want the training job to run.
d. For VPC, choose a Amazon VPC that you want to allow your training container to access. For more information, see Give SageMaker Training Jobs Access to Resources in Your Amazon VPC (p. 3648).

e. For Hyperparameters, specify the values of the hyperparameters to use for the training job.

f. For Input data configuration, specify the following values for each channel of input data to use for the training job. You can see what channels the algorithm you're using for training support, and the content type, supported compression type, and supported input modes for each channel, under Channel specification section of the Algorithm summary page for the algorithm.

i. For Channel name, type the name of the input channel.

ii. For Content type, type the content type of the data that the algorithm expects for the channel.

iii. For Compression type, choose the data compression type to use, if any.

iv. For Record wrapper, choose RecordIO if the algorithm expects data in the RecordIO format.

v. For S3 data type, S3 data distribution type, and S3 location, specify the appropriate values. For information about what these values mean, see S3DataSource.

vi. For Input mode, choose File to download the data from to the provisioned ML storage volume, and mount the directory to a Docker volume. Choose PipeTo stream data directly from Amazon S3 to the container.

vii. To add another input channel, choose Add channel. If you are finished adding input channels, choose Done.

g. For Output location, specify the following values:

i. For S3 output path, choose the S3 location where the training job stores output, such as model artifacts.

   Note
   You use the model artifacts stored at this location to create a model or model package from this training job.

ii. For Encryption key, if you want SageMaker to use a AWS KMS key to encrypt output data at rest in the S3 location.

h. For Tags, specify one or more tags to manage the training job. Each tag consists of a key and an optional value. Tag keys must be unique per resource.

i. Choose Create training job to run the training job.

Use an Algorithm to Run a Training Job (API)

To use an algorithm to run a training job by using the SageMaker API, specify either the name or the Amazon Resource Name (ARN) as the AlgorithmName field of the AlgorithmSpecification object that you pass to CreateTrainingJob. For information about training models in SageMaker, see Train a Model with Amazon SageMaker (p. 9).

Use an Algorithm to Run a Training Job (Amazon SageMaker Python SDK)

Use an algorithm that you created or subscribed to on AWS Marketplace to create a training job, create an AlgorithmEstimator object and specify either the Amazon Resource Name (ARN) or the name of the algorithm as the value of the algorithm_arn argument. Then call the fit method of the estimator. For example:

```python
from sagemaker import AlgorithmEstimator
data_path = os.path.join(DATA_DIR, 'marketplace', 'training')
```
Use an Algorithm to Run a Hyperparameter Tuning Job

A hyperparameter tuning job finds the best version of a model by running many training jobs on your dataset using the algorithm and ranges of hyperparameters that you specify. It then chooses the hyperparameter values that result in a model that performs the best, as measured by a metric that you choose. For more information, see Perform Automatic Model Tuning with SageMaker (p. 2436).

You can create use an algorithm resource to create a hyperparameter tuning job by using the Amazon SageMaker console, the low-level Amazon SageMaker API, or the Amazon SageMaker Python SDK.

Topics
- Use an Algorithm to Run a Hyperparameter Tuning Job (Console) (p. 3485)
- Use an Algorithm to Run a Hyperparameter Tuning Job (API) (p. 3487)
- Use an Algorithm to Run a Hyperparameter Tuning Job (Amazon SageMaker Python SDK) (p. 3487)

Use an Algorithm to Run a Hyperparameter Tuning Job (Console)

To use an algorithm to run a hyperparameter tuning job (console)

2. Choose Algorithms.
3. Choose an algorithm that you created from the list on the My algorithms tab or choose an algorithm that you subscribed to on the AWS Marketplace subscriptions tab.
4. Choose Create hyperparameter tuning job.

The algorithm you chose will automatically be selected.
5. On the Create hyperparameter tuning job page, provide the following information:
   a. For Warm start, choose Enable warm start to use the information from previous hyperparameter tuning jobs as a starting point for this hyperparameter tuning job. For more information, see Run a Warm Start Hyperparameter Tuning Job (p. 2459).
      i. Choose Identical data and algorithm if your input data is the same as the input data for the parent jobs of this hyperparameter tuning job, or choose Transfer learning to use additional or different input data for this hyperparameter tuning job.
      ii. For Parent hyperparameter tuning job(s), choose up to 5 hyperparameter tuning jobs to use as parents to this hyperparameter tuning job.
   b. For Hyperparameter tuning job name, type a name for the tuning job.
   c. For IAM role, choose an IAM role that has the required permissions to run hyperparameter tuning jobs in SageMaker, or choose Create a new role to allow SageMaker to create a role that has the AmazonSageMakerFullAccess managed policy attached. For information, see SageMaker Roles (p. 3536).
For VPC, choose a Amazon VPC that you want to allow the training jobs that the tuning job launches to access. For more information, see Give SageMaker Training Jobs Access to Resources in Your Amazon VPC (p. 3648).

e. Choose Next.

f. For Objective metric, choose the metric that the hyperparameter tuning job uses to determine the best combination of hyperparameters, and choose whether to minimize or maximize this metric. For more information, see View the Best Training Job (p. 2457).

g. For Hyperparameter configuration, choose ranges for the tunable hyperparameters that you want the tuning job to search, and set static values for hyperparameters that you want to remain constant in all training jobs that the hyperparameter tuning job launches. For more information, see Define Hyperparameter Ranges (p. 2440).

h. Choose Next.

i. For Input data configuration, specify the following values for each channel of input data to use for the hyperparameter tuning job. You can see what channels the algorithm you're using for hyperparameter tuning supports, and the content type, supported compression type, and supported input modes for each channel, under Channel specification section of the Algorithm summary page for the algorithm.

   i. For Channel name, type the name of the input channel.

   ii. For Content type, type the content type of the data that the algorithm expects for the channel.

   iii. For Compression type, choose the data compression type to use, if any.

   iv. For Record wrapper, choose RecordIO if the algorithm expects data in the RecordIO format.

   v. For S3 data type, S3 data distribution type, and S3 location, specify the appropriate values. For information about what these values mean, see S3DataSource.

   vi. For Input mode, choose File to download the data from to the provisioned ML storage volume, and mount the directory to a Docker volume. Choose PipeTo stream data directly from Amazon S3 to the container.

   vii. To add another input channel, choose Add channel. If you are finished adding input channels, choose Done.

j. For Output location, specify the following values:

   i. For S3 output path, choose the S3 location where the training jobs that this hyperparameter tuning job launches store output, such as model artifacts.

      **Note**
      
      You use the model artifacts stored at this location to create a model or model package from this hyperparameter tuning job.

   ii. For Encryption key, if you want SageMaker to use a AWS KMS key to encrypt output data at rest in the S3 location.

k. For Resource configuration, provide the following information:

   i. For Instance type, choose the instance type to use for each training job that the hyperparameter tuning job launches.

   ii. For Instance count, type the number of ML instances to use for each training job that the hyperparameter tuning job launches.

   iii. For Additional volume per instance (GB), type the size of the ML storage volume that you want to provision each training job that the hyperparameter tuning job launches. ML storage volumes store model artifacts and incremental states.

   iv. For Encryption key, if you want Amazon SageMaker to use an AWS Key Management Service key to encrypt data in the ML storage volume attached to the training instances, specify the key.
Use Algorithm and Model Package Resources

For **Resource limits**, provide the following information:

i. **For Maximum training jobs**, specify the maximum number of training jobs that you want the hyperparameter tuning job to launch. A hyperparameter tuning job can launch a maximum of 500 training jobs.

ii. **For Maximum parallel training jobs**, specify the maximum number of concurrent training jobs that the hyperparameter tuning job can launch. A hyperparameter tuning job can launch a maximum of 10 concurrent training jobs.

iii. **For Stopping condition**, specify the maximum amount of time in seconds, minutes, hours, or days, that you want each training job that the hyperparameter tuning job launches to run.

m. **For Tags**, specify one or more tags to manage the hyperparameter tuning job. Each tag consists of a key and an optional value. Tag keys must be unique per resource.

n. Choose **Create jobs** to run the hyperparameter tuning job.

### Use an Algorithm to Run a Hyperparameter Tuning Job (API)

To use an algorithm to run a hyperparameter tuning job by using the SageMaker API, specify either the name or the Amazon Resource Name (ARN) of the algorithm as the **AlgorithmName** field of the **AlgorithmSpecification** object that you pass to **CreateHyperParameterTuningJob**. For information about hyperparameter tuning in SageMaker, see [Perform Automatic Model Tuning with SageMaker](p. 2436).

### Use an Algorithm to Run a Hyperparameter Tuning Job (Amazon SageMaker Python SDK)

Use an algorithm that you created or subscribed to on AWS Marketplace to create a hyperparameter tuning job, create an **AlgorithmEstimator** object and specify either the Amazon Resource Name (ARN) or the name of the algorithm as the value of the **algorithm_arn** argument. Then initialize a **HyperparameterTuner** object with the **AlgorithmEstimator** you created as the value of the **estimator** argument. Finally, call the **fit** method of the **AlgorithmEstimator**. For example:

```python
from sagemaker import AlgorithmEstimator
from sagemaker.tuner import HyperparameterTuner

data_path = os.path.join(DATA_DIR, 'marketplace', 'training')
algo = AlgorithmEstimator(
    role='SageMakerRole',
    instance_count=1,
    instance_type='ml.c4.xlarge',
    sagemaker_session=sagemaker_session,
    base_job_name='test-marketplace')

train_input = algo.sagemaker_session.upload_data(
    path=data_path, key_prefix='integ-test-data/marketplace/train')

algo.set_hyperparameters(max_leaf_nodes=10)
tuner = HyperparameterTuner(estimator=algo, base_tuning_job_name='some-name',
                           objective_metric_name='validation:accuracy',
                           hyperparameter_ranges=hyperparameter_ranges,
                           max_jobs=2, max_parallel_jobs=2)

tuner.fit({'training': train_input}, include_cls_metadata=False)
tuner.wait()
```
Use a Model Package to Create a Model

Use a model package to create a deployable model that you can use to get real-time inferences by creating a hosted endpoint or to run batch transform jobs. You can create a deployable model from a model package by using the Amazon SageMaker console, the low-level SageMaker API, or the Amazon SageMaker Python SDK.

Topics

• Use a Model Package to Create a Model (Console) (p. 3488)
• Use a Model Package to Create a Model (API) (p. 3488)
• Use a Model Package to Create a Model (Amazon SageMaker Python SDK) (p. 3489)

Use a Model Package to Create a Model (Console)

To create a deployable model from a model package (console)

2. Choose Model packages.
3. Choose a model package that you created from the list on the My model packages tab or choose a model package that you subscribed to on the AWS Marketplace subscriptions tab.
4. Choose Create model.
5. For Model name, type a name for the model.
6. For IAM role, choose an IAM role that has the required permissions to call other services on your behalf, or choose Create a new role to allow SageMaker to create a role that has the AmazonSageMakerFullAccess managed policy attached. For information, see SageMaker Roles (p. 3536).
7. For VPC, choose a Amazon VPC that you want to allow the model to access. For more information, see Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC (p. 3650).
8. Leave the default values for Container input options and Choose model package.
9. For environment variables, provide the names and values of environment variables you want to pass to the model container.
10. For Tags, specify one or more tags to manage the model. Each tag consists of a key and an optional value. Tag keys must be unique per resource.
11. Choose Create model.

After you create a deployable model, you can use it to set up an endpoint for real-time inference or create a batch transform job to get inferences on entire datasets. For information about hosting endpoints in SageMaker, see Deploy Models for Inference.

Use a Model Package to Create a Model (API)

To use a model package to create a deployable model by using the SageMaker API, specify the name or the Amazon Resource Name (ARN) of the model package as the ModelPackageName field of the ContainerDefinition object that you pass to the CreateModel API.

After you create a deployable model, you can use it to set up an endpoint for real-time inference or create a batch transform job to get inferences on entire datasets. For information about hosted endpoints in SageMaker, see Deploy Models for Inference.
Use a Model Package to Create a Model (Amazon SageMaker Python SDK)

To use a model package to create a deployable model by using the SageMaker Python SDK, initialize a ModelPackage object, and pass the Amazon Resource Name (ARN) of the model package as the model_package_arn argument. For example:

```python
from sagemaker import ModelPackage
data = ModelPackage(role='SageMakerRole',
                     model_package_arn='training-job-scikit-decision-trees-1542660466-6f92',
                     sagemaker_session=sagemaker_session)
```

After you create a deployable model, you can use it to set up an endpoint for real-time inference or create a batch transform job to get inferences on entire datasets. For information about hosting endpoints in SageMaker, see Deploy Models for Inference.

Sell Amazon SageMaker Algorithms and Model Packages

Selling Amazon SageMaker algorithms and model packages is a three-step process:

1. Develop your algorithm or model, and package it in a Docker container. For information, see Develop Algorithms and Models in Amazon SageMaker (p. 3490).
2. Create an algorithm or model package resource in SageMaker. For information, see Create Algorithm and Model Package Resources (p. 3476).
3. Register as a seller on AWS Marketplace and list your algorithm or model package on AWS Marketplace. For information about registering as a seller, see Getting Started as a Seller in the User Guide for AWS Marketplace Providers. For information about listing and monetizing your algorithms and model packages, see Listing Algorithms and Model Packages in AWS Marketplace for Machine Learning in the User Guide for AWS Marketplace Providers.
Develop Algorithms and Models in Amazon SageMaker

Before you can create algorithm and model package resources to use in Amazon SageMaker or list on AWS Marketplace, you have to develop them and package them in Docker containers.

Note
When algorithms and model packages are created for listing on AWS Marketplace, SageMaker scans the containers for security vulnerabilities on supported operating systems. Only the following operating system versions are supported:

- Debian: 6.0, 7, 8, 9, 10
- CentOS: 5, 6, 7
- Oracle Linux: 5, 6, 7
- Alpine: 3.3, 3.4, 3.5
- Amazon Linux

Develop Algorithms in SageMaker

An algorithm should be packaged as a docker container and stored in Amazon ECR to use it in SageMaker. The Docker container contains the training code used to run training jobs and, optionally, the inference code used to get inferences from models trained by using the algorithm.

For information about developing algorithms in SageMaker and packaging them as containers, see Using Docker containers with SageMaker (p. 3149). For a complete example of how to create an algorithm container, see the sample notebook at https://sagemaker-examples.readthedocs.io/en/latest/advanced_functionality/scikitbring_your_own/scikitbring_your_own.html. You can also find the sample notebook in a SageMaker notebook instance. The notebook is in the Advanced Functionality section, and is named scikitbring_your_own.ipynb. For information about using the sample notebooks in a notebook instance, see Example Notebooks (p. 306).

Always thoroughly test your algorithms before you create algorithm resources to publish on AWS Marketplace.

Note
When a buyer subscribes to your containerized product, the Docker containers run in an isolated (internet-free) environment. When you create your containers, do not rely on making outgoing calls over the internet. Calls to AWS services are also not allowed.
Develop Models in SageMaker

A deployable model in SageMaker consists of inference code, model artifacts, an IAM role that is used to access resources, and other information required to deploy the model in SageMaker. Model artifacts are the results of training a model by using a machine learning algorithm. The inference code must be packaged in a Docker container and stored in Amazon ECR. You can either package the model artifacts in the same container as the inference code, or store them in Amazon S3.

You create a model by running a training job in SageMaker, or by training a machine learning algorithm outside of SageMaker. If you run a training job in SageMaker, the resulting model artifacts are available in the ModelArtifacts field in the response to a call to the DescribeTrainingJob operation. For information about how to develop a SageMaker model container, see Use Your Own Inference Code (p. 3191). For a complete example of how to create a model container from a model trained outside of SageMaker, see the sample notebook at https://sagemaker-examples.readthedocs.io/en/latest/advanced_functionality/xgboostbring_your_own_model/xgboostbring_your_own_model.html. You can also find the sample notebook in a SageMaker notebook instance. The notebook is in the Advanced Functionality section, and is named xgboostbring_your_own_model.ipynb. For information about using the sample notebooks in a notebook instance, see Example Notebooks (p. 306).

Always thoroughly test your models before you create model packages to publish on AWS Marketplace.

Note
When a buyer subscribes to your containerized product, the Docker containers run in an isolated (internet-free) environment. When you create your containers, do not rely on making outgoing calls over the internet. Calls to AWS services are also not allowed.

List Your Algorithm or Model Package on AWS Marketplace

After creating and validating your algorithm or model in Amazon SageMaker, list your product on AWS Marketplace. The listing process makes your products available in the AWS Marketplace and the SageMaker console.

To list products on AWS Marketplace, you must be a registered seller. To register, use the self-registration process from the AWS Marketplace Management Portal (AMMP). For information, see Getting Started as a Seller in the User Guide for AWS Marketplace Providers. When you start the product listing process from the Amazon SageMaker console, we check your seller registration status. If you have not registered, we direct you to do so.

To start the listing process, do one of the following:

- From the SageMaker console, choose the product, choose Actions, and choose Publish new ML Marketplace listing. This carries over your product reference, the Amazon Resource Name (ARN), and directs you to the AMMP to create the listing.
- Go to ML listing process, manually enter the Amazon Resource Name (ARN), and start your product listing. This process carries over the product metadata that you entered when creating the product in SageMaker. For an algorithm listing, the information includes the supported instance types and hyperparameters. In addition, you can enter a product description, promotional information, and support information as you would with other AWS Marketplace products.
Find and Subscribe to Algorithms and Model Packages on AWS Marketplace

With AWS Marketplace, you can browse and search for hundreds of machine learning algorithms and models in a broad range of categories, such as computer vision, natural language processing, speech recognition, text, data, voice, image, video analysis, fraud detection, predictive analysis, and more.

To find algorithms on AWS Marketplace

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. Choose Algorithms, then choose Find algorithms.

This takes you to the AWS Marketplace algorithms page. For information about finding and subscribing to algorithms on AWS Marketplace, see Machine Learning Products in the AWS Marketplace User Guide for AWS Consumers.

To find model packages on AWS Marketplace

2. Choose Model packages, then choose Find model packages.

This takes you to the AWS Marketplace model packages page. For information about finding and subscribing to model packages on AWS Marketplace, see Machine Learning Products in the AWS Marketplace User Guide for AWS Consumers.

Use Algorithms and Model Packages

For information about using algorithms and model packages that you subscribe to in SageMaker, see Use Algorithm and Model Package Resources (p. 3482).

Note
When you create a training job, inference endpoint, and batch transform job from an algorithm or model package that you subscribe to on AWS Marketplace, the training and inference containers do not have access to the internet. Because the containers do not have access to the internet, the seller of the algorithm or model package does not have access to your data.
Security in Amazon SageMaker

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the AWS compliance programs. To learn about the compliance programs that apply to Amazon SageMaker, see AWS Services in Scope by Compliance Program.

- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company’s requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using SageMaker. The following topics show you how to configure SageMaker to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your SageMaker resources.

**Topics**
- Access Control (p. 3493)
- Data Protection in Amazon SageMaker (p. 3495)
- Identity and Access Management for Amazon SageMaker (p. 3500)
- Logging and Monitoring (p. 3628)
- Compliance Validation for Amazon SageMaker (p. 3629)
- Resilience in Amazon SageMaker (p. 3629)
- Infrastructure Security in Amazon SageMaker (p. 3630)

Access Control

Amazon SageMaker Studio notebooks and SageMaker notebook instances differ in their runtime environments. The following topics describe how to control root access to these notebooks.

**Topics**
- Access control and SageMaker Studio notebooks (p. 3493)
- Control root access to a SageMaker notebook instance (p. 3495)

Access control and SageMaker Studio notebooks

Amazon SageMaker Studio uses filesystem and container permissions for access control and isolation of Studio users and notebooks. This is one of the major differences between Studio notebooks and SageMaker notebook instances. This topic describes how permissions are set up to avoid security threats, what SageMaker does by default, and how the customer can customize the permissions. For more information about Studio notebooks and their runtime environment, see Use Amazon SageMaker Studio Notebooks (p. 129).

**SageMaker app permissions**
A run-as user is a POSIX user/group which is used to run the JupyterServer app and KernelGateway apps inside the container.

The run-as user for the JupyterServer app is sagemaker-user (1000) by default. This user has sudo permissions to enable the installation of dependencies such as yum packages.

The run-as user for the KernelGateway apps is root (0) by default. This user is able to install dependencies using pip/apt-get/conda.

Due to user remapping, neither user is able to access resources or make changes to the host instance.

User remapping

SageMaker performs user-remapping to map a user inside the container to a user on the host instance outside the container. The range of user IDs (0 - 65535) in the container are mapped to non-privileged user IDs above 65535 on the instance. For example, sagemaker-user (1000) inside the container might map to user (200001) on the instance, where the number in parentheses is the user ID. If the customer creates a new user/group inside the container, it won't be privileged on the host instance regardless of the user/group ID. The root user of the container is also mapped to a non-privileged user on the instance. For more information, see Isolate containers with a user namespace.

Custom image permissions

Customers can bring their own custom SageMaker images. These images can specify a different run-as user/group to launch the KernelGateway app. The customer can implement fine grained permission control inside the image, for example, to disable root access or perform other actions. The same user remapping applies here. For more information, see Bring your own SageMaker image (p. 152).

Container isolation

Docker keeps a list of default capabilities that the container can use. SageMaker doesn't add additional capabilities. SageMaker adds specific route rules to block requests to Amazon EFS and the instance metadata service (IMDS) from the container. Customers can't change these route rules from the container. For more information, see Runtime privilege and Linux capabilities.

App metadata access

Metadata used by running apps are mounted to the container with read-only permission. Customers aren't able to modify this metadata from the container. For the available metadata, see Get Notebook and App Metadata (p. 139).

User isolation on EFS

When you onboard to Studio, SageMaker creates an Amazon Elastic File System (EFS) volume for your domain that is shared by all Studio users in the domain. Each user gets their own private home directory on the EFS volume. This home directory is used to store the user's notebooks, Git repositories, and other data. To prevent other users in the domain from accessing the user's data, SageMaker creates a globally unique user ID for the user's profile and applies it as a POSIX user/group ID for the user's home directory.

EBS access

An Amazon Elastic Block Store (Amazon EBS) volume is attached to the host instance and shared across all images. It's used for the root volume of the notebooks and stores temporary data that's generated inside the container. The storage isn't persisted when the instance running the notebooks is deleted. The root user inside the container can't access the EBS volume.

IMDS access

Due to security concerns, access to the Amazon Elastic Compute Cloud (Amazon EC2) Instance Metadata Service (IMDS) is unavailable in SageMaker Studio. For more information on IMDS, see Instance metadata and user data.
Control root access to a SageMaker notebook instance

By default, when you create a notebook instance, users that log into that notebook instance have root access. Data science is an iterative process that might require the data scientist to test and use different software tools and packages, so many notebook instance users need to have root access to be able to install these tools and packages. Because users with root access have administrator privileges, users can access and edit all files on a notebook instance with root access enabled.

If you don't want users to have root access to a notebook instance, when you call CreateNotebookInstance or UpdateNotebookInstance operations, set the RootAccess field to Disabled. You can also disable root access for users when you create or update a notebook instance in the Amazon SageMaker console. For information, see Step 1: Create an Amazon SageMaker Notebook Instance (p. 74).

Note
Lifecycle configurations need root access to be able to set up a notebook instance. Because of this, lifecycle configurations associated with a notebook instance always run with root access even if you disable root access for users.

Note
For security reasons, Rootless Docker is installed on root-disabled notebook instances instead of regular Docker. For more information, see Run the Docker daemon as a non-root user (Rootless mode)

Data Protection in Amazon SageMaker

The AWS shared responsibility model applies to data protection in Amazon SageMaker. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. This content includes the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the Data Privacy FAQ. For information about data protection in Europe, see the AWS Shared Responsibility Model and GDPR blog post on the AWS Security Blog.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual user accounts with AWS Identity and Access Management (IAM). That way each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We recommend TLS 1.2 or later.
- Set up API and user activity logging with AWS CloudTrail.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing personal data that is stored in Amazon S3.
- If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-2.

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form fields such as a Name field. This includes when you work with Amazon SageMaker or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form fields used for names may be used for billing or
diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Topics
- Protect Data at Rest Using Encryption (p. 3496)
- Protecting Data in Transit with Encryption (p. 3497)
- Key Management (p. 3500)
- Internetwork Traffic Privacy (p. 3500)

Protect Data at Rest Using Encryption

To protect your Amazon SageMaker Studio notebooks and SageMaker notebook instances, along with your model-building data and model artifacts, SageMaker encrypts the notebooks, as well as output from Training and Batch Transform jobs. SageMaker encrypts these by default using the AWS Managed Key for Amazon S3. This AWS Managed Key for Amazon S3 cannot be shared for cross-account access. For cross-account access, specify your customer managed key while creating SageMaker resources so that it can be shared for cross-account access. For more information on AWS KMS, see What is AWS Key Management Service?

Topics
- Studio notebooks (p. 3496)
- Notebook instances, SageMaker jobs, and Endpoints (p. 3496)

Studio notebooks

In Amazon SageMaker Studio, your SageMaker Studio notebooks and data can be stored in the following locations:

- An S3 bucket – When you onboard to Studio and enable shareable notebook resources, SageMaker shares notebook snapshots and metadata in an Amazon Simple Storage Service (Amazon S3) bucket.
- An EFS volume – When you onboard to Studio, SageMaker attaches an Amazon Elastic File System (Amazon EFS) volume to your domain for storing your Studio notebooks and data files. The EFS volume persists after the domain is deleted.
- An EBS volume – When you open a notebook in Studio, an Amazon Elastic Block Store (Amazon EBS) is attached to the instance that the notebook runs on. The EBS volume persists for the duration of the instance.

SageMaker uses the AWS Key Management Service (AWS KMS) to encrypt the S3 bucket and both volumes. By default, it uses an AWS managed key. For more control, you can specify your own customer managed key when you onboard to Studio or through the SageMaker API. For more information, see Onboard to Amazon SageMaker Domain (p. 35) and CreateDomain.

In the CreateDomain API, you use the S3KmsKeyId parameter to specify the customer managed key for shareable notebooks. You use the KmsKeyId parameter to specify the customer managed key for the EFS and EBS volumes. The same customer managed key is used for both volumes. The customer managed key for shareable notebooks can be the same customer managed key as used for the volumes or a different customer managed key.

Notebook instances, SageMaker jobs, and Endpoints

To encrypt the machine learning (ML) storage volume that is attached to notebooks, processing jobs, training jobs, hyperparameter tuning jobs, batch transform jobs, and endpoints, you can pass a AWS KMS
key to SageMaker. If you don't specify a KMS key, SageMaker encrypts storage volumes with a transient key and discards it immediately after encrypting the storage volume. For notebook instances, if you don't specify a KMS key, SageMaker encrypts both OS volumes and ML data volumes with a system-managed KMS key.

You can use an AWS managed AWS KMS key to encrypt all instance OS volumes. You can encrypt all ML data volumes for all SageMaker instances with a AWS KMS key that you specify. ML storage volumes are mounted as follows:

- Notebooks - `/home/ec2-user/SageMaker`
- Processing - `/opt/ml/processing` and `/tmp/`
- Training - `/opt/ml/` and `/tmp/`
- Batch - `/opt/ml/` and `/tmp/`
- Endpoints - `/opt/ml/` and `/tmp/`

Processing, batch transform, and training job containers and their storage are ephemeral in nature. When the job completes, output is uploaded to Amazon S3 using AWS KMS encryption with an optional AWS KMS key that you specify and the instance is torn down. If a AWS KMS Key is not provided in the job request, the output is encrypted by default using your AWS Managed Key for Amazon S3.

**Note**
The key policy for an AWS Managed Key for Amazon S3 cannot be edited, so cross-account permissions cannot be granted for these key policies. If the output Amazon S3 bucket for the request is from another account, specify your own AWS KMS Customer Key in the job request and ensure that the job's execution role has permissions to encrypt data with it.

**Important**
Sensitive data that needs to be encrypted with a KMS key for compliance reasons should be stored in the ML storage volume or in Amazon S3, both of which can be encrypted using a KMS key you specify.

When you open a notebook instance, SageMaker saves it and any files associated with it in the SageMaker folder in the ML storage volume by default. When you stop a notebook instance, SageMaker creates a snapshot of the ML storage volume. Any customizations to the operating system of the stopped instance, such as installed custom libraries or operating system level settings, are lost. Consider using a lifecycle configuration to automate customizations of the default notebook instance. When you terminate an instance, the snapshot and the ML storage volume are deleted. Any data that you need to persist beyond the lifespan of the notebook instance should be transferred to an Amazon S3 bucket.

**Note**
Certain Nitro-based SageMaker instances include local storage, depending on the instance type. Local storage volumes are encrypted using a hardware module on the instance. You can't use a KMS key on an instance type with local storage. For a list of instance types that support local instance storage, see [Instance Store Volumes](#). For more information about storage volumes on Nitro-based instances, see [Amazon EBS and NVMe on Linux Instances](#). For more information about local instance storage encryption, see [SSD Instance Store Volumes](#).

## Protecting Data in Transit with Encryption

All internetwork data in transit supports TLS 1.2 encryption.

With Amazon SageMaker, machine learning (ML) model artifacts and other system artifacts are encrypted in transit and at rest. Requests to the SageMaker API and console are made over a secure (SSL) connection. You pass AWS Identity and Access Management roles to SageMaker to provide permissions to access resources on your behalf for training and deployment. Use encrypted Amazon S3 buckets for model artifacts and data, and to pass an AWS KMS key to SageMaker instances to encrypt the attached ML storage volumes.
Some intranetwork data in transit (inside the service platform) is unencrypted. This includes:

- Command and control communications between the service control plane and training job instances (not customer data).
- Communications between nodes in distributed processing jobs (intranetwork).
- Communications between nodes in distributed training jobs (intranetwork).

There are no inter-node communications for batch processing.

You can choose to encrypt communication between nodes in a training cluster.

**Note**
For use cases in the healthcare sector, the best practice for security is to encrypt communication between the nodes.

For information about how to encrypt communication, see the next topic at Protect Communications Between ML Compute Instances in a Distributed Training Job (p. 3498).

**Note**
Encrypting inter-container traffic can increase training time, especially if you use distributed deep learning algorithms. For affected algorithms, this additional level of security also increases cost. The training time for most SageMaker built-in algorithms, such as XGBoost, DeepAR, and linear learner, typically aren't affected.

FIPS validated endpoints are available for the SageMaker API and request router for hosted models (runtime). For information about FIPS compliant endpoints, see Federal Information Processing Standard (FIPS) 140-2.

**Protect Communications with RStudio on Amazon SageMaker**

RStudio on Amazon SageMaker provides encryption for all communications that involve SageMaker components. However, the previous version did not support encryption between the RStudioServerPro and RSession apps.

RStudio released version 2022.02.2-485.pro2 in April 2022. This version supports encryption between RStudioServerPro and RSession apps to enable end-to-end encryption. The version upgrade, however, is not completely backward compatible. As a result, you must update all of your RStudioServerPro and RSession apps. For information about how to update your apps, see Upgrade the RStudio Version (p. 184).

**Protect Communications Between ML Compute Instances in a Distributed Training Job**

By default, Amazon SageMaker runs training jobs in an Amazon Virtual Private Cloud (Amazon VPC) to help keep your data secure. You can add another level of security to protect your training containers and data by configuring a private VPC. Distributed ML frameworks and algorithms usually transmit information that is directly related to the model, such as weights, not the training dataset. When performing distributed training, you can further protect data that is transmitted between instances. This can help you to comply with regulatory requirements. To do this, use inter-container traffic encryption.

**Note**
For use cases in the healthcare sector, the best practice for security is to encrypt communication between the nodes.

Enabling inter-container traffic encryption can increase training time, especially if you are using distributed deep learning algorithms. Enabling inter-container traffic encryption doesn't affect training jobs with a single compute instance. However, for training jobs with several compute instances, the effect
on training time depends on the amount of communication between compute instances. For affected algorithms, adding this additional level of security also increases cost. The training time for most SageMaker built-in algorithms, such as XGBoost, DeepAR, and linear learner, typically aren't affected.

You can enable inter-container traffic encryption for training jobs or hyperparameter tuning jobs. You can use SageMaker APIs or console to enable inter-container traffic encryption.

For information about running training jobs in a private VPC, see Give SageMaker Training Jobs Access to Resources in Your Amazon VPC (p. 3648).

Enable Inter-container Traffic Encryption (API)

Before enabling inter-container traffic encryption on training or hyperparameter tuning jobs with APIs, add inbound and outbound rules to your private VPC's security group.

To enable inter-container traffic encryption (API)

1. Add the following inbound and outbound rules in the security group for your private VPC:

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port Range</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>UDP</td>
<td>500</td>
<td>Self Security Group ID</td>
</tr>
<tr>
<td>ESP 50</td>
<td>N/A</td>
<td>Self Security Group ID</td>
</tr>
</tbody>
</table>

2. When you send a request to the CreateTrainingJob or CreateHyperParameterTuningJob API, specify True for the EnableInterContainerTrafficEncryption parameter.

Note
For the ESP 50 protocol, the AWS Security Group Console might display the port range as "All". However, Amazon EC2 ignores the specified port range because it is not applicable for the ESP 50 IP protocol.

Enable Inter-container Traffic Encryption (Console)

Enable Inter-container Traffic Encryption in a Training Job

To enable inter-container traffic encryption in a training job

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the navigation pane, choose Training, then choose Training jobs.
3. Choose Create training job.
4. Under Network, choose a VPC. You can use the default VPC or one that you have created.
5. Choose Enable inter-container traffic encryption.

After you enable inter-container traffic encryption, finish creating the training job. For more information, see Step 4: Train a Model (p. 81).

Enable Inter-container Traffic Encryption in a Hyperparameter Tuning Job

To enable inter-container traffic encryption in a hyperparameter tuning job

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the navigation pane, choose Training, then choose Hyperparameter tuning jobs.
3. Choose Create hyperparameter tuning job.
4. Under **Network**, choose a **VPC**. You can use the default VPC or one that you created.
5. Choose **Enable inter-container traffic encryption**.

After enabling inter-container traffic encryption, finish creating the hyperparameter tuning job. For more information, see **Configure and Launch a Hyperparameter Tuning Job** (p. 2450).

## Key Management

Customers can specify AWS KMS keys, including bring your own keys (BYOK), to use for envelope encryption with Amazon S3 input/output buckets and machine learning (ML) Amazon EBS volumes. ML volumes for notebook instances and for processing, training, and hosted model Docker containers can be optionally encrypted by using AWS KMS customer-owned keys. All instance OS volumes are encrypted with an AWS-managed AWS KMS key.

**Note**

Certain Nitro-based instances include local storage, dependent on the instance type. Local storage volumes are encrypted using a hardware module on the instance. You can't request a **VolumeKmsKeyId** when using an instance type with local storage. For a list of instance types that support local instance storage, see [Instance Store Volumes](#). For more information about local instance storage encryption, see [SSD Instance Store Volumes](#). For more information about storage volumes on nitro-based instances, see [Amazon EBS and NVMe on Linux Instances](#).

For information about AWS KMS keys see [What is AWS Key Management Service?](#) in the [AWS Key Management Service Developer Guide](#).

## Internetwork Traffic Privacy

This topic describes how Amazon SageMaker secures connections from the service to other locations.

Internetwork communications support TLS 1.2 encryption between all components and clients.

Instances can be connected to Customer VPC, providing access to S3 VPC endpoints or customer repositories. Internet egress can be managed through this interface by the customer if service platform internet egress is disabled for notebooks. For training and hosting, egress through the service platform is not available when connected to the customer’s VPC.

By default, API calls made to published endpoints traverse the public network to the request router. SageMaker supports Amazon Virtual Private Cloud interface endpoints powered by AWS PrivateLink for private connectivity between the customer’s VPC and the request router to access hosted model endpoints. For information about Amazon VPC, see [Connect to SageMaker Through a VPC Interface Endpoint](#).

## Identity and Access Management for Amazon SageMaker

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be **authenticated** (signed in) and **authorized** (have permissions) to use SageMaker resources. IAM is an AWS service that you can use with no additional charge.

**Topics**

- Audience (p. 3501)
Audience

How you use AWS Identity and Access Management (IAM) differs, depending on the work that you do in SageMaker.

Service user – If you use the SageMaker service to do your job, then your administrator provides you with the credentials and permissions that you need. As you use more SageMaker features to do your work, you might need additional permissions. Understanding how access is managed can help you request the right permissions from your administrator. If you cannot access a feature in SageMaker, see Troubleshooting Amazon SageMaker Identity and Access (p. 3626).

Service administrator – If you're in charge of SageMaker resources at your company, you probably have full access to SageMaker. It's your job to determine which SageMaker features and resources your service users should access. You must then submit requests to your IAM administrator to change the permissions of your service users. Review the information on this page to understand the basic concepts of IAM. To learn more about how your company can use IAM with SageMaker, see How Amazon SageMaker Works with IAM (p. 3505).

IAM administrator – If you're an IAM administrator, you might want to learn details about how you can write policies to manage access to SageMaker. To view example SageMaker identity-based policies that you can use in IAM, see Amazon SageMaker Identity-Based Policy Examples (p. 3507).

Authenticating with Identities

Authentication is how you sign in to AWS using your identity credentials. You must be authenticated (signed in to AWS) as the AWS account root user, as an IAM user, or by assuming an IAM role.

You can sign in to AWS as a federated identity by using credentials provided through an identity source. AWS IAM Identity Center (successor to AWS Single Sign-On) (IAM Identity Center) users, your company's single sign-on authentication, and your Google or Facebook credentials are examples of federated identities. When you sign in as a federated identity, your administrator previously set up identity federation using IAM roles. When you access AWS by using federation, you are indirectly assuming a role.

Depending on the type of user you are, you can sign in to the AWS Management Console or the AWS access portal. For more information about signing in to AWS, see How to sign in to your AWS account in the AWS Sign-In User Guide.

If you access AWS programmatically, AWS provides a software development kit (SDK) and a command line interface (CLI) to cryptographically sign your requests using your credentials. If you don't use AWS tools, you must sign requests yourself. For more information about using the recommended method to sign requests yourself, see Signature Version 4 signing process in the AWS General Reference.

Regardless of the authentication method that you use, you might be required to provide additional security information. For example, AWS recommends that you use multi-factor authentication (MFA)
to increase the security of your account. To learn more, see Multi-factor authentication in the AWS IAM Identity Center (successor to AWS Single Sign-On) User Guide and Using multi-factor authentication (MFA) in AWS in the IAM User Guide.

AWS account root user

When you create an AWS account, you begin with one sign-in identity that has complete access to all AWS services and resources in the account. This identity is called the AWS account root user and is accessed by signing in with the email address and password that you used to create the account. We strongly recommend that you do not use the root user for your everyday tasks. Safeguard your root user credentials and use them to perform the tasks that only the root user can perform. For the complete list of tasks that require you to sign in as the root user, see Tasks that require root user credentials in the AWS General Reference.

IAM Users and Groups

An IAM user is an identity within your AWS account that has specific permissions for a single person or application. Where possible, we recommend relying on temporary credentials instead of creating IAM users who have long-term credentials such as passwords and access keys. However, if you have specific use cases that require long-term credentials with IAM users, we recommend that you rotate access keys. For more information, see Rotate access keys regularly for use cases that require long-term credentials in the IAM User Guide.

An IAM group is an identity that specifies a collection of IAM users. You can't sign in as a group. You can use groups to specify permissions for multiple users at a time. Groups make permissions easier to manage for large sets of users. For example, you could have a group named IAMAdmins and give that group permissions to administer IAM resources.

Users are different from roles. A user is uniquely associated with one person or application, but a role is intended to be assumable by anyone who needs it. Users have permanent long-term credentials, but roles provide temporary credentials. To learn more, see When to create an IAM user (instead of a role) in the IAM User Guide.

IAM Roles

An IAM role is an identity within your AWS account that has specific permissions. It is similar to an IAM user, but is not associated with a specific person. You can temporarily assume an IAM role in the AWS Management Console by switching roles. You can assume a role by calling an AWS CLI or AWS API operation or by using a custom URL. For more information about methods for using roles, see Using IAM roles in the IAM User Guide.

IAM roles with temporary credentials are useful in the following situations:

- **Federated user access** – To assign permissions to a federated identity, you create a role and define permissions for the role. When a federated identity authenticates, the identity is associated with the role and is granted the permissions that are defined by the role. For information about roles for federation, see Creating a role for a third-party Identity Provider in the IAM User Guide. If you use IAM Identity Center, you configure a permission set. To control what your identities can access after they authenticate, IAM Identity Center correlates the permission set to a role in IAM. For information about permissions sets, see Permission sets in the AWS IAM Identity Center (successor to AWS Single Sign-On) User Guide.

- **Temporary IAM user permissions** – An IAM user or role can assume an IAM role to temporarily take on different permissions for a specific task.

- **Cross-account access** – You can use an IAM role to allow someone (a trusted principal) in a different account to access resources in your account. Roles are the primary way to grant cross-account access. However, with some AWS services, you can attach a policy directly to a resource (instead of using a role
as a proxy). To learn the difference between roles and resource-based policies for cross-account access, see How IAM roles differ from resource-based policies in the IAM User Guide.

- **Cross-service access** – Some AWS services use features in other AWS services. For example, when you make a call in a service, it’s common for that service to run applications in Amazon EC2 or store objects in Amazon S3. A service might do this using the calling principal’s permissions, using a service role, or using a service-linked role.

- **Principal permissions** – When you use an IAM user or role to perform actions in AWS, you are considered a principal. Policies grant permissions to a principal. When you use some services, you might perform an action that then triggers another action in a different service. In this case, you must have permissions to perform both actions. To see whether an action requires additional dependent actions in a policy, see Actions, Resources, and Condition Keys for Amazon SageMaker in the Service Authorization Reference.

- **Service role** – A service role is an IAM role that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see Creating a role to delegate permissions to an AWS service in the IAM User Guide.

- **Service-linked role** – A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your IAM account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.

- **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an EC2 instance and making AWS CLI or AWS API requests. This is preferable to storing access keys within the EC2 instance. To assign an AWS role to an EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the EC2 instance to get temporary credentials. For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the IAM User Guide.

To learn whether to use IAM roles or IAM users, see When to create an IAM role (instead of a user) in the IAM User Guide.

## Managing Access Using Policies

You control access in AWS by creating policies and attaching them to AWS identities or resources. A policy is an object in AWS that, when associated with an identity or resource, defines their permissions. AWS evaluates these policies when a principal (user, root user, or role session) makes a request. Permissions in the policies determine whether the request is allowed or denied. Most policies are stored in AWS as JSON documents. For more information about the structure and contents of JSON policy documents, see Overview of JSON policies in the IAM User Guide.

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

Every IAM entity (user or role) starts with no permissions. By default, users can do nothing, not even change their own password. To give a user permission to do something, an administrator must attach a permissions policy to a user. Or the administrator can add the user to a group that has the intended permissions. When an administrator gives permissions to a group, all users in that group are granted those permissions.

IAM policies define permissions for an action regardless of the method that you use to perform the operation. For example, suppose that you have a policy that allows the iam:GetRole action. A user with that policy can get role information from the AWS Management Console, the AWS CLI, or the AWS API.

### Identity-Based Policies

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform,
Identity-based policies can be further categorized as inline policies or managed policies. Inline policies are embedded directly into a single user, group, or role. Managed policies are standalone policies that you can attach to multiple users, groups, and roles in your AWS account. Managed policies include AWS managed policies and customer managed policies. To learn how to choose between a managed policy or an inline policy, see Choosing between managed policies and inline policies in the IAM User Guide.

Resource-Based Policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM role trust policies and Amazon S3 bucket policies. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must specify a principal in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

Resource-based policies are inline policies that are located in that service. You can't use AWS managed policies from IAM in a resource-based policy.

Access Control Lists (ACLs)

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

Amazon S3, AWS WAF, and Amazon VPC are examples of services that support ACLs. To learn more about ACLs, see Access control list (ACL) overview in the Amazon Simple Storage Service Developer Guide.

Other Policy Types

AWS supports additional, less-common policy types. These policy types can set the maximum permissions granted to you by the more common policy types.

- **Permissions boundaries** – A permissions boundary is an advanced feature in which you set the maximum permissions that an identity-based policy can grant to an IAM entity (IAM user or role). You can set a permissions boundary for an entity. The resulting permissions are the intersection of entity's identity-based policies and its permissions boundaries. Resource-based policies that specify the user or role in the Principal field are not limited by the permissions boundary. An explicit deny in any of these policies overrides the allow. For more information about permissions boundaries, see Permissions boundaries for IAM entities in the IAM User Guide.

- **Service control policies (SCPs)** – SCPs are JSON policies that specify the maximum permissions for an organization or organizational unit (OU) in AWS Organizations. AWS Organizations is a service for grouping and centrally managing multiple AWS accounts that your business owns. If you enable all features in an organization, then you can apply service control policies (SCPs) to any or all of your accounts. The SCP limits permissions for entities in member accounts, including each AWS account root user. For more information about Organizations and SCPs, see How SCPs work in the AWS Organizations User Guide.

- **Session policies** – Session policies are advanced policies that you pass as a parameter when you programmatically create a temporary session for a role or federated user. The resulting session's permissions are the intersection of the user or role's identity-based policies and the session policies. Permissions can also come from a resource-based policy. An explicit deny in any of these policies overrides the allow. For more information, see Session policies in the IAM User Guide.
Multiple Policy Types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see Policy evaluation logic in the IAM User Guide.

How Amazon SageMaker Works with IAM

Before you use IAM to manage access to SageMaker, you should understand what IAM features are available to use with SageMaker. To get a high-level view of how SageMaker and other AWS services work with IAM, see AWS Services That Work with IAM in the IAM User Guide.

Topics

- SageMaker Identity-Based Policies (p. 3505)

SageMaker Identity-Based Policies

With IAM identity-based policies, you can specify allowed or denied actions and resources as well as the conditions under which actions are allowed or denied. SageMaker supports specific actions, resources, and condition keys. To learn about all of the elements that you use in a JSON policy, see IAM JSON Policy Elements Reference in the IAM User Guide.

Actions

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

The Action element of a JSON policy describes the actions that you can use to allow or deny access in a policy. Policy actions usually have the same name as the associated AWS API operation. There are some exceptions, such as permission-only actions that don't have a matching API operation. There are also some operations that require multiple actions in a policy. These additional actions are called dependent actions.

Include actions in a policy to grant permissions to perform the associated operation.

Policy actions in SageMaker use the following prefix before the action: sagemaker:. For example, to grant someone permission to run a SageMaker training job with the SageMaker CreateTrainingJob API operation, you include the sagemaker:CreateTrainingJob action in their policy. Policy statements must include either an Action or NotAction element. SageMaker defines its own set of actions that describe tasks that you can perform with this service.

To specify multiple actions in a single statement, separate them with commas as follows:

```
"Action": [
    "sagemaker:action1",
    "sagemaker:action2"
]
```

You can specify multiple actions using wildcards (*). For example, to specify all actions that begin with the word Describe, include the following action:

```
"Action": "sagemaker:Describe*"
```

To see a list of SageMaker actions, see Actions, resources, and condition keys for Amazon SageMaker in the Service Authorization Reference.
Resources

SageMaker does not support specifying resource ARNs in a policy.

Condition Keys

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

The Condition element (or Condition block) lets you specify conditions in which a statement is in effect. The Condition element is optional. You can create conditional expressions that use condition operators, such as equals or less than, to match the condition in the policy with values in the request.

If you specify multiple Condition elements in a statement, or multiple keys in a single Condition element, AWS evaluates them using a logical AND operation. If you specify multiple values for a single condition key, AWS evaluates the condition using a logical OR operation. All of the conditions must be met before the statement's permissions are granted.

You can also use placeholder variables when you specify conditions. For example, you can grant an IAM user permission to access a resource only if it is tagged with their IAM user name. For more information, see IAM policy elements: variables and tags in the IAM User Guide.

AWS supports global condition keys and service-specific condition keys. To see all AWS global condition keys, see AWS global condition context keys in the IAM User Guide.

SageMaker defines its own set of condition keys and also supports using some global condition keys. To see all AWS global condition keys, see AWS Global Condition Context Keys in the IAM User Guide.

SageMaker supports a number of service-specific condition keys that you can use for fine-grained access control for the following operations:

- CreateProcessingJob
- CreateTrainingJob
- CreateModel
- CreateEndpointConfig
- CreateTransformJob
- CreateHyperParameterTuningJob
- CreateLabelingJob
- CreateNotebookInstance
- UpdateNotebookInstance

To see a list of SageMaker condition keys, see Condition keys for Amazon SageMaker in the IAM User Guide. To learn with which actions and resources you can use a condition key, see Actions defined by Amazon SageMaker.

For examples of using SageMaker condition keys, see the following: Control Creation of SageMaker Resources with Condition Keys (p. 3518).

Examples

To view examples of SageMaker identity-based policies, see Amazon SageMaker Identity-Based Policy Examples (p. 3507).
Amazon SageMaker Developer Guide
Identity-Based Policy Examples

SageMaker Resource-Based Policies

SageMaker does not support resource-based policies.

Authorization Based on SageMaker Tags

You can attach tags to SageMaker resources or pass tags in a request to SageMaker. To control access based on tags, you provide tag information in the condition element of a policy using the sagemaker:ResourceTag/key-name, aws:RequestTag/key-name, or aws:TagKeys condition keys. For more information about tagging SageMaker resources, see Control Access to SageMaker Resources by Using Tags (p. 3527).

To view an example identity-based policy for limiting access to a resource based on the tags on that resource, see Control Access to SageMaker Resources by Using Tags (p. 3527).

SageMaker IAM Roles

An IAM role is an entity within your AWS account that has specific permissions.

Using Temporary Credentials with SageMaker

You can use temporary credentials to sign in with federation, assume an IAM role, or to assume a cross-account role. You obtain temporary security credentials by calling AWS STS API operations such as AssumeRole or GetFederationToken.

SageMaker supports using temporary credentials.

Service-Linked Roles

SageMaker partially supports service-linked roles. Service-linked roles are currently available for SageMaker Studio and SageMaker training jobs.

Service Roles

This feature allows a service to assume a service role on your behalf. This role allows the service to access resources in other services to complete an action on your behalf. Service roles appear in your IAM account and are owned by the account. This means that an IAM administrator can change the permissions for this role. However, doing so might break the functionality of the service.

SageMaker supports service roles.

Choosing an IAM Role in SageMaker

When you create a notebook instance, processing job, training job, hosted endpoint, or batch transform job resource in SageMaker, you must choose a role to allow SageMaker to access SageMaker on your behalf. If you have previously created a service role or service-linked role, then SageMaker provides you with a list of roles to choose from. It’s important to choose a role that allows access to the AWS operations and resources you need. For more information, see SageMaker Roles (p. 3536).

Amazon SageMaker Identity-Based Policy Examples

By default, IAM users and roles don’t have permission to create or modify SageMaker resources. They also can’t perform tasks using the AWS Management Console, AWS CLI, or AWS API. An IAM administrator must create IAM policies that grant users and roles permission to perform specific API operations on the specified resources they need. The administrator must then attach those policies to the IAM users or groups that require those permissions. To learn how to attach policies to an IAM user or group, see Adding and Removing IAM Identity Permissions in the IAM User Guide.

To learn how to create an IAM identity-based policy using these example JSON policy documents, see Creating Policies on the JSON Tab in the IAM User Guide.

3507
Policy Best Practices

Identity-based policies determine whether someone can create, access, or delete SageMaker resources in your account. These actions can incur costs for your AWS account. When you create or edit identity-based policies, follow these guidelines and recommendations:

- **Get started with AWS managed policies and move toward least-privilege permissions** – To get started granting permissions to your users and workloads, use the AWS managed policies that grant permissions for many common use cases. They are available in your AWS account. We recommend that you reduce permissions further by defining AWS customer managed policies that are specific to your use cases. For more information, see AWS managed policies or AWS managed policies for job functions in the IAM User Guide.

- **Apply least-privilege permissions** – When you set permissions with IAM policies, grant only the permissions required to perform a task. You do this by defining the actions that can be taken on specific resources under specific conditions, also known as least-privilege permissions. For more information about using IAM to apply permissions, see Policies and permissions in IAM in the IAM User Guide.

- **Use conditions in IAM policies to further restrict access** – You can add a condition to your policies to limit access to actions and resources. For example, you can write a policy condition to specify that all requests must be sent using SSL. You can also use conditions to grant access to service actions if they are used through a specific AWS service, such as AWS CloudFormation. For more information, see IAM JSON policy elements: Condition in the IAM User Guide.

- **Use IAM Access Analyzer to validate your IAM policies to ensure secure and functional permissions** – IAM Access Analyzer validates new and existing policies so that the policies adhere to the IAM policy language (JSON) and IAM best practices. IAM Access Analyzer provides more than 100 policy checks and actionable recommendations to help you author secure and functional policies. For more information, see IAM Access Analyzer policy validation in the IAM User Guide.

- **Require multi-factor authentication (MFA)** – If you have a scenario that requires IAM users or root users in your account, turn on MFA for additional security. To require MFA when API operations are called, add MFA conditions to your policies. For more information, see Configuring MFA-protected API access in the IAM User Guide.

For more information about best practices in IAM, see Security best practices in IAM in the IAM User Guide.

Using the SageMaker Console

To access the Amazon SageMaker console, you must have a minimum set of permissions. These permissions must allow you to list and view details about the SageMaker resources in your AWS account. If you create an identity-based policy that is more restrictive than the minimum required permissions, the console won’t function as intended for entities (IAM users or roles) with that policy.
To ensure that those entities can still use the SageMaker console, also attach the following AWS managed policy to the entities. For more information, see Adding Permissions to a User in the IAM User Guide:

You don't need to allow minimum console permissions for users that are making calls only to the AWS CLI or the AWS API. Instead, allow access to only the actions that match the API operation that you're trying to perform.

Topics

- Permissions Required to Use the Amazon SageMaker Console (p. 3509)
- Permissions Required to Use the Amazon SageMaker Ground Truth Console (p. 3510)
- Permissions Required to Use the Amazon Augmented AI (Preview) Console (p. 3511)

Permissions Required to Use the Amazon SageMaker Console

The permissions reference table lists the Amazon SageMaker API operations and shows the required permissions for each operation. For more information about Amazon SageMaker API operations, see Amazon SageMaker API Permissions: Actions, Permissions, and Resources Reference (p. 3553).

To use the Amazon SageMaker console, you need to grant permissions for additional actions. Specifically, the console needs permissions that allow the ec2 actions to display subnets, VPCs, and security groups. Optionally, the console needs permission to create execution roles for tasks such as CreateNotebook, CreateTrainingJob, and CreateModel. Grant these permissions with the following permissions policy:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "SageMakerApis",
            "Effect": "Allow",
            "Action": ["sagemaker:*"],
            "Resource": "*"
        },
        {
            "Sid": "VpcConfigurationForCreateForms",
            "Effect": "Allow",
            "Action": ["ec2:DescribeVpcs", "ec2:DescribeSubnets", "ec2:DescribeSecurityGroups"],
            "Resource": "*"
        },
        {
            "Sid": "KmsKeysForCreateForms",
            "Effect": "Allow",
            "Action": ["kms:DescribeKey", "kms:ListAliases"],
            "Resource": "*"
        },
        {
            "Sid": "AccessAwsMarketplaceSubscriptions",
            "Effect": "Allow",
            "Action": ["aws-marketplace:ViewSubscriptions"
```
Permissions Required to Use the Amazon SageMaker Ground Truth Console

To use the Amazon SageMaker Ground Truth console, you need to grant permissions for additional resources. Specifically, the console needs permissions for the AWS Marketplace to view subscriptions, Amazon Cognito operations to manage your private workforce, Amazon S3 actions for access to your input and output files, and AWS Lambda actions to list and invoke functions. Grant these permissions with the following permissions policy:

```json
{
  "Version": "2012-10-17",
  "Statement": [  
    {
      "Effect": "Allow",
      "Action": [
        "codecommit:BatchGetRepositories",
        "codecommit:CreateRepository",
        "codecommit:GetRepository",
        "codecommit:ListRepositories",
        "codecommit:ListBranches",
        "secretsmanager:CreateSecret",
        "secretsmanager:DescribeSecret",
        "secretsmanager:ListSecrets"
      ],
      "Resource": "*"
    },
    {
      "Sid": "ListAndCreateExecutionRoles",
      "Effect": "Allow",
      "Action": [
        "iam:ListRoles",
        "iam:CreateRole",
        "iam:CreatePolicy",
        "iam:AttachRolePolicy"
      ],
      "Resource": "*"
    },
    {
      "Sid": "DescribeECRMetaData",
      "Effect": "Allow",
      "Action": [  
        "ecr:Describe*"
      ],
      "Resource": "*"
    },
    {
      "Sid": "PassRoleForExecutionRoles",
      "Effect": "Allow",
      "Action": [
        "iam:PassRole"
      ],
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "iam:PassedToService": "sagemaker.amazonaws.com"
        }
      }
    }
  ]
}
```
Identity-Based Policy Examples

```
{

  ],
  "Resource": "*"
}
```

Permissions Required to Use the Amazon Augmented AI (Preview) Console

To use the Augmented AI console, you need to grant permissions for additional resources. Grant these permissions with the following permissions policy:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "sagemaker:*Algorithm",
        "sagemaker:*Algorithms",
        "sagemaker:*App",
        "sagemaker:*Apps",
        "sagemaker:*AutoMLJob",
        "sagemaker:*AutoMLJobs",
        "sagemaker:*CodeRepositories",
        "sagemaker:*CodeRepository"
      ],
      "Resource": "*"
    }
  ]
}
```

Allow Users to View Their Own Permissions

This example shows how you might create a policy that allows IAM users to view the inline and managed policies that are attached to their user identity. This policy includes permissions to complete this action on the console or programmatically using the AWS CLI or AWS API.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "ViewOwnUserInfo",
         "Effect": "Allow",
         "Action": [
            "iam:GetUserPolicy",
            "iam:ListGroupsForUser",
            "iam:ListAttachedUserPolicies",
            "iam:GetUserPolicy",
            "iam:GetUser"
         ],
         "Resource": ["arn:aws:iam::*:user/${aws:username}"],
      },
      {
         "Sid": "NavigateInConsole",
         "Effect": "Allow",
         "Action": [
            "iam:GetGroupPolicy",
            "iam:GetPolicyVersion",
            "iam:GetPolicy",
            "iam:ListAttachedGroupPolicies",
            "iam:ListGroupPolicies",
            "iam:ListPolicyVersions",
            "iam:ListPolicies",
            "iam:ListUsers"
         ],
         "Resource": "*
      }
   ]
}
```
Control Creation of SageMaker Resources with Condition Keys

Control fine-grained access to allow the creation of SageMaker resources by using SageMaker-specific condition keys. For information about using condition keys in IAM policies, see IAM JSON Policy Elements: Condition in the IAM User Guide.

The condition keys, along with related API actions, and links to relevant documentation are listed in Condition Keys for SageMaker in the IAM User Guide.

The following examples show how to use the SageMaker condition keys to control access.

Topics
• Control Access to SageMaker Resources by Using File System Condition Keys (p. 3518)
• Restrict Training to a Specific VPC (p. 3520)
• Restrict Access to Workforce Types for Ground Truth Labeling Jobs and Amazon A2I Human Review Workflows (p. 3520)
• Enforce Encryption of Input Data (p. 3522)
• Enforce Encryption of Notebook Instance Storage Volume (p. 3522)
• Enforce Network Isolation for Training Jobs (p. 3523)
• Enforce a Specific Instance Type for Training Jobs (p. 3523)
• Enforce a Specific EI Accelerator for Training Jobs (p. 3523)
• Enforce Disabling Internet Access and Root Access for Creating Notebook Instances (p. 3524)

Control Access to SageMaker Resources by Using File System Condition Keys

SageMaker training provides a secure infrastructure for the training algorithm to run in, but for some cases you may want increased defense in depth. For example, you minimize the risk of running untrusted code in your algorithm, or you have specific security mandates in your organization. For these scenarios, you can use the service-specific condition keys in the Condition element of an IAM policy to scope down the user to specific file systems, directories, access modes (read-write, read-only) and security groups.

Topics
• Restrict an IAM User to Specific Directories and Access Modes (p. 3518)
• Restrict an IAM User to a Specific File System (p. 3519)

Restrict an IAM User to Specific Directories and Access Modes

The policy below restricts an IAM user to the /sagemaker/xgboost-dm/train and /sagemaker/xgboost-dm/validation directories of an EFS file system to ro (read-only) AccessMode:

Note
When a directory is allowed, all of its subdirectories are also accessible by the training algorithm. POSIX permissions are ignored.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AccessToElasticFileSystem",
            "Effect": "Allow",
            "Action": ["sagemaker:CreateTrainingJob",
```

3518
Restrict an IAM User to a Specific File System

To prevent a malicious algorithm using a user space client from accessing any file system directly in your account, you can restrict networking traffic by allowing ingress from a specific security group. In the following example, the IAM user can only use the specified security group to access the file system:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AccessToLustreFileSystem",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateTrainingJob",
                "sagemaker:CreateHyperParameterTuningJob"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "sagemaker:FileSystemId": "fs-12345678",
                    "sagemaker:FileSystemAccessMode": "ro",
                    "sagemaker:FileSystemType": "FSxLustre",
                    "sagemaker:FileSystemDirectoryPath": "/fsx/sagemaker/xgboost/train"
                },
                "ForAllValues:StringEquals": {
                    "sagemaker:VpcSecurityGroupIds": [
                        "sg-12345678"
                    ]
                }
            }
        }
    ]
}
```
Although the above example can restrict an algorithm to a specific file system, it does not prevent an algorithm from accessing any directory within that file system using the user space client. To mitigate this, you can:

- Ensure that the file system only contains data that you trust your IAM users to access
- Create an IAM role that restricts your IAM users to launching training jobs with algorithms from approved ECR repositories

For more information on how to use roles with SageMaker, see SageMaker Roles.

**Restrict Training to a Specific VPC**

Restrict an AWS user to creating training jobs from within a Amazon VPC. When a training job is created within a VPC, you can use VPC flow logs to monitor all traffic to and from the training cluster. For information about using VPC flow logs, see VPC Flow Logs in the Amazon Virtual Private Cloud User Guide.

The following policy enforces that a training job is created by an IAM user calling CreateTrainingJob from within a VPC:

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "AllowFromVpc",
         "Effect": "Allow",
         "Action": [
            "sagemaker:CreateTrainingJob",
            "sagemaker:CreateHyperParameterTuningJob"
         ],
         "Resource": "*",
         "Condition": {
            "ForAllValues:StringEquals": {
               "sagemaker:VpcSubnets": ["subnet-a1234"],
               "sagemaker:VpcSecurityGroupIds": ["sg12345", "sg-67890"]
            },
            "Null": {
               "sagemaker:VpcSubnets": "false",
               "sagemaker:VpcSecurityGroupIds": "false"
            }
         }
      }
   ]
}
```

**Restrict Access to Workforce Types for Ground Truth Labeling Jobs and Amazon A2I Human Review Workflows**

Amazon SageMaker Ground Truth and Amazon Augmented AI work teams fall into one of three workforce types: public (with Amazon Mechanical Turk), private, and vendor. To restrict IAM user access to a specific work team using one of these types or the work team ARN, use the `sagemaker:WorkteamType` and/or the `sagemaker:WorkteamArn` condition keys.

For the `sagemaker:WorkteamType` condition key, use string condition operators. For the `sagemaker:WorkteamArn` condition key, use Amazon Resource Name (ARN) condition operators. If the user attempts to create a labeling job with a restricted work team, SageMaker returns an access denied error.
The policies below demonstrate different ways to use the `sagemaker:WorkteamType` and `sagemaker:WorkteamArn` condition keys with appropriate condition operators and valid condition values.

The following example uses the `sagemaker:WorkteamType` condition key with the `StringEquals` condition operator to restrict access to a public work team. It accepts condition values in the following format: `workforcetype-crowd`, where `workforcetype` can equal public, private, or vendor.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "RestrictWorkteamType",
            "Effect": "Deny",
            "Action": "sagemaker:CreateLabelingJob",
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "sagemaker:WorkteamType": "public-crowd"
                }
            }
        }
    ]
}
```

The following policies show how to restrict access to a public work team using the `sagemaker:WorkteamArn` condition key. The first shows how to use it with a valid IAM regex-variant of the work team ARN and the `ArnLike` condition operator. The second shows how to use it with the `ArnEquals` condition operator and the work team ARN.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "RestrictWorkteamType",
            "Effect": "Deny",
            "Action": "sagemaker:CreateLabelingJob",
            "Resource": "*",
            "Condition": {
                "ArnLike": {
                    "sagemaker:WorkteamArn": "arn:aws:sagemaker:*::*:workteam/public-crowd/*"
                }
            }
        }
    ]
}
```

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "RestrictWorkteamType",
            "Effect": "Deny",
            "Action": "sagemaker:CreateLabelingJob",
            "Resource": "*",
            "Condition": {
                "ArnEquals": {
                }
            }
        }
    ]
}
```
Enforce Encryption of Input Data

The following policy restricts an IAM user to specify an AWS KMS key to encrypt input data when creating training, hyperparameter tuning, and labeling jobs by using the `sagemaker:VolumeKmsKey` condition key:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "EnforceEncryption",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateTrainingJob",
                "sagemaker:CreateHyperParameterTuningJob",
                "sagemaker:CreateLabelingJob",
                "sagemaker:CreateFlowDefinition"
            ],
            "Resource": "*",
            "Condition": {
                "ArnEquals": {
                    "sagemaker:VolumeKmsKey": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"
                }
            }
        }
    ]
}
```

Enforce Encryption of Notebook Instance Storage Volume

The following policy restricts an IAM user to specify an AWS KMS key to encrypt the attached storage volume when creating or updating a notebook instance by using the `sagemaker:VolumeKmsKey` condition key:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "EnforceEncryption",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateNotebookInstance"
            ],
            "Resource": "*",
            "Condition": {
                "ArnLike": {
                    "sagemaker:VolumeKmsKey": "*key/volume-kms-key-12345"
                }
            }
        }
    ]
}
```
Enforce Network Isolation for Training Jobs

The following policy restricts an IAM user to enable network isolation when creating training jobs by using the sagemaker:NetworkIsolation condition key:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "EnforceIsolation",
      "Effect": "Allow",
      "Action": [
        "sagemaker:CreateTrainingJob",
        "sagemaker:CreateHyperParameterTuningJob"
      ],
      "Resource": "*",
      "Condition": {
        "Bool": {
          "sagemaker:NetworkIsolation": "true"
        }
      }
    }
  ]
}
```

Enforce a Specific Instance Type for Training Jobs

The following policy restricts an IAM user to use a specific instance type when creating training jobs by using the sagemaker:InstanceTypes condition key:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "EnforceInstanceType",
      "Effect": "Allow",
      "Action": [
        "sagemaker:CreateTrainingJob",
        "sagemaker:CreateHyperParameterTuningJob"
      ],
      "Resource": "*",
      "Condition": {
        "ForAllValues:StringLike": {
          "sagemaker:InstanceTypes": ["ml.c5.*"]
        }
      }
    }
  ]
}
```

Enforce a Specific EI Accelerator for Training Jobs

The following policy restricts an IAM user to use a specific elastic inference (EI) accelerator, if an accelerator is provided, when creating or updating notebook instances and when creating endpoint configurations by using the sagemaker:AcceleratorTypes condition key:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
    }
  ]
}
```
Enforce Disabling Internet Access and Root Access for Creating Notebook Instances

You can disable both internet access and root access to notebook instances to help make them more secure. For information about controlling root access to a notebook instance, see Control root access to a SageMaker notebook instance (p. 3495). For information about disabling internet access for a notebook instance, see Connect a Notebook Instance in a VPC to External Resources (p. 3633).

The following policy requires an IAM user to disable network access when creating instance, and disable root access when creating or updating a notebook instance.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "LockDownCreateNotebookInstance",
      "Effect": "Allow",
      "Action": [
        "sagemaker:CreateNotebookInstance"
      ],
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "sagemaker:DirectInternetAccess": "Disabled",
          "sagemaker:RootAccess": "Disabled"
        },
        "Null": {
          "sagemaker:VpcSubnets": "false",
          "sagemaker:VpcSecurityGroupIds": "false"
        }
      }
    }
  
    {
      "Sid": "LockDownUpdateNotebookInstance",
      "Effect": "Allow",
      "Action": [
        "sagemaker:UpdateNotebookInstance"
      ],
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "sagemaker:RootAccess": "Disabled"
        }
      }
    }
  
  }
}
```
Control Access to the SageMaker API by Using Identity-based Policies

To control access to SageMaker API calls and calls to SageMaker hosted endpoints, use identity-based IAM policies.

Topics

- Restrict Access to SageMaker API and Runtime to Calls from Within Your VPC (p. 3525)

Restrict Access to SageMaker API and Runtime to Calls from Within Your VPC

If you set up an interface endpoint in your VPC, individuals outside the VPC can still connect to the SageMaker API and runtime over the internet unless you attach an IAM policy that restricts access to calls coming from within the VPC to all users and groups that have access to your SageMaker resources. For information about creating a VPC interface endpoint for the SageMaker API and runtime, see Connect to SageMaker Through a VPC Interface Endpoint (p. 3635).

Important

If you apply an IAM policy similar to one of the following, users can't access the specified SageMaker APIs through the console.

To restrict access to only connections made from within your VPC, create an AWS Identity and Access Management policy that restricts access to only calls that come from within your VPC. Then add that policy to every AWS Identity and Access Management user, group, or role used to access the SageMaker API or runtime.

Note

This policy allows connections only to callers within a subnet where you created an interface endpoint.

```json
{
  "Id": "api-example-1",
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "EnableAPIAccess",
      "Effect": "Allow",
      "Action": [
        "sagemaker:*"
      ],
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "aws:SourceVpc": "vpc-11bbaaa"
        }
      }
    }
  ]
}
```

If you want to restrict access to the API to only calls made using the interface endpoint, use the `aws:SourceVpce` condition key instead of `aws:SourceVpc`:

```json
{
  "Id": "api-example-1",
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "EnableAPIAccess",
      "Effect": "Allow",
      "Action": [
        "sagemaker:*"
      ],
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "aws:SourceVpce": "vpc-11bbaaa"
        }
      }
    }
  ]
}
```
Identity-Based Policy Examples

Limit Access to SageMaker API and Runtime Calls by IP Address

To allow access to SageMaker API calls and runtime invocations only from IP addresses in a list that you specify, attach an IAM policy that denies access to the API unless the call comes from an IP address in the list to every AWS Identity and Access Management user, group, or role used to access the API or runtime. For information about creating IAM policies, see Creating IAM Policies in the AWS Identity and Access Management User Guide. To specify the list of IP addresses that you want to have access to the API call, use the IpAddress condition operator and the aws:SourceIp condition context key. For information about IAM condition operators, see IAM JSON Policy Elements: Condition Operators in the AWS Identity and Access Management User Guide. For information about IAM condition context keys, see AWS Global Condition Context Keys.

For example, the following policy allows access to the CreateTrainingJob only from IP addresses in the ranges 192.0.2.0-192.0.2.255 and 203.0.113.0-203.0.113.255:

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": "sagemaker:CreateTrainingJob",
         "Resource": "*",
         "Condition": {
            "IpAddress": {
               "aws:SourceIp": [
                  "192.0.2.0/24",
                  "203.0.113.0/24"
               ]
            }
         }
      }
   ]
}
```

Limit Access to a Notebook Instance by IP Address

To allow access to a notebook instance only from IP addresses in a list that you specify, attach an IAM policy that denies access to CreatePresignedNotebookInstanceUrl unless the call comes from an
IP address in the list to every AWS Identity and Access Management user, group, or role used to access the notebook instance. For information about creating IAM policies, see Creating IAM Policies in the AWS Identity and Access Management User Guide. To specify the list of IP addresses that you want to have access to the notebook instance, use the IpAddress condition operator and the aws:SourceIP condition context key. For information about IAM condition operators, see IAM JSON Policy Elements: Condition Operators in the AWS Identity and Access Management User Guide. For information about IAM condition context keys, see AWS Global Condition Context Keys.

For example, the following policy allows access to a notebook instance only from IP addresses in the ranges `192.0.2.0-192.0.2.255` and `203.0.113.0-203.0.113.255`:

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": "sagemaker:CreatePresignedNotebookInstanceUrl",
         "Resource": "*",
         "Condition": {
            "IpAddress": {
               "aws:SourceIp": [
                  "192.0.2.0/24",
                  "192.0.2.0/24",
                  "203.0.113.0/24"
               ]
            }
         }
      }
   ]
}
```

The policy restricts access to both the call to CreatePresignedNotebookInstanceUrl and to the URL that the call returns. The policy also restricts access to opening a notebook instance in the console and is enforced for every HTTP request and WebSocket frame that attempts to connect to the notebook instance.

**Note**

Using this method to filter by IP address is incompatible when connecting to SageMaker through a VPC interface endpoint. For information about restricting access to a notebook instance when connecting through a VPC interface endpoint, see Connect to a Notebook Instance Through a VPC Interface Endpoint (p. 3641).

### Control Access to SageMaker Resources by Using Tags

Control access to groups of SageMaker resources by attaching tags to the resources and specifying ResourceTag conditions in IAM policies.

**Note**

Tag-based policies don't work to restrict the following API calls:

- DeleteImageVersion
- DescribeImageVersion
- ListAlgorithms
- ListCodeRepositories
- ListCompilationJobs
- ListEndpointConfigs
- ListEndpoints
- ListFlowDefinitions
For example, suppose you've defined two different IAM groups, named DevTeam1 and DevTeam2, in your AWS account. Suppose also that you've created 10 notebook instances, 5 of which are used for one project, and 5 of which are used for a second project. You want to allow members of DevTeam1 to make API calls on notebook instances used for the first project, and members of DevTeam2 to make API calls on notebook instances used for the second project.

To control access to API calls (example)

1. Add a tag with the key Project and value A to the notebook instances used for the first project. For information about adding tags to SageMaker resources, see AddTags.
2. Add a tag with the key Project and value B to the notebook instances used for the second project.
3. Create an IAM policy with a ResourceTag condition that denies access to the notebook instances used for the second project, and attach that policy to DevTeam1. The following is an example of a policy that denies all API calls on any notebook instance that has a tag with a key of Project and a value of B:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "sagemaker:*",
            "Resource": "*"
        },
        {
            "Effect": "Deny",
            "Action": "sagemaker:*",
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "sagemaker:ResourceTag/Project": "B"
                }
            }
        },
        {
            "Effect": "Deny",
            "Action": [ "sagemaker:AddTags",
```
4. Create an IAM policy with a `ResourceTag` condition that denies access to the notebook instances used for the first project, and attach that policy to DevTeam2. The following is an example of a policy that denies all API calls on any notebook instance that has a tag with a key of `Project` and a value of `A`:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "sagemaker:*",
            "Resource": "*"
        },
        {
            "Effect": "Deny",
            "Action": "sagemaker:*",
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "sagemaker:ResourceTag/Project": "A"
                }
            }
        },
        {
            "Effect": "Deny",
            "Action": [
                "sagemaker:AddTags",
                "sagemaker:DeleteTags"
            ],
            "Resource": "*"
        }
    ]
}
```

**Require the Presence or Absence of Tags for API Calls**

Require the presence or absence of specific tags or specific tag values by using `RequestTag` condition keys in an IAM policy. For example, if you want to require that every endpoint created by any member of an IAM group to be created with a tag with the key `environment` and value `dev`, create a policy as follows:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "sagemaker:CreateEndpoint",
            "Resource": "arn:aws:sagemaker:*:*:endpoint/**",
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/environment": "dev"
                }
            }
        }
    ]
}
```
Cross-Service Confused Deputy Prevention

The confused deputy problem is a security issue where an entity that doesn't have permission to perform an action can coerce a more-privileged entity to perform the action. In AWS, cross-service impersonation can result in the confused deputy problem. Cross-service impersonation can occur when one service (the calling service) calls another service (the called service). The calling service can be manipulated to use its permissions to act on another customer's resources in a way it should not otherwise have permission to access. To prevent this, AWS provides tools that help you protect your data for all services with service principals that have been given access to resources in your account.

Read on for general guidance or navigate to an example for a specific SageMaker feature:

- SageMaker Processing Jobs (p. 3534)
- SageMaker Studio (p. 3535)
- SageMaker Training Jobs (p. 3535)

Limit Permissions With Global Condition Keys

We recommend using the `aws:SourceArn` and `aws:SourceAccount` global condition keys in resource policies to limit the permissions to the resource that Amazon SageMaker gives another service. If you use both global condition keys and the `aws:SourceArn` value contains the account ID, the `aws:SourceAccount` value and the account in the `aws:SourceArn` value must use the same account ID when used in the same policy statement. Use `aws:SourceArn` if you want only one resource to be associated with the cross-service access. Use `aws:SourceAccount` if you want to allow any resource in that account to be associated with the cross-service use.

The most effective way to protect against the confused deputy problem is to use the `aws:SourceArn` global condition key with the full ARN of the resource. If you don't know the full ARN of the resource or if you are specifying multiple resources, use the `aws:SourceArn` global condition key with wildcards (*) for the unknown portions of the ARN. For example, `arn:aws:sagemaker:*:123456789012:*`.

The following example shows how you can use the `aws:SourceArn` and `aws:SourceAccount` global condition keys in SageMaker to prevent the confused deputy problem.

```json
{
    "Version": "2012-10-17",
    "Statement": {
        "Sid": "ConfusedDeputyPreventionExamplePolicy",
        "Effect": "Allow",
```
The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Edge Manager created by account number `123456789012` in the `us-west-2` Region.

```json
{
  "Version": "2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Principal": { "Service": "sagemaker.amazonaws.com" },
    "Action": "sts:AssumeRole",
    "Condition": {
      "ArnLike": {
        "aws:SourceArn": "arn:partition:sagemaker:region:123456789012:*"
      }
    }
  }
}
```

You can replace the `aws:SourceArn` in this template with the full ARN of one specific packaging job to further limit permissions.

### SageMaker Images

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Images. Use this template with either `Image` or `ImageVersion`. This example uses an `ImageVersion` record ARN with the account number `123456789012`. Note that because the account number is part of the `aws:SourceArn` value, you do not need to specify an `aws:SourceAccount` value.

```json
{
  "Version": "2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Principal": { "Service": "sagemaker.amazonaws.com" },
    "Action": "sts:AssumeRole",
    "Condition": {
      "ArnLike": {
      }
    }
  }
}
```
Do not replace the `aws:SourceArn` in this template with the full ARN of a specific image or image version. The ARN must be in the format provided above and specify either image or image-version. The partition placeholder should designate either an AWS commercial partition (`aws`) or an AWS in China partition (`aws-cn`), depending on where the image or image version is running. Similarly, the region placeholder in the ARN can be any valid Region where SageMaker images are available.

**SageMaker Inference**

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker real-time, serverless, and asynchronous inference. Note that because the account number is part of the `aws:SourceArn` value, you do not need to specify an `aws:SourceAccount` value.

```json
{
  "Version": "2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Principal": { "Service": "sagemaker.amazonaws.com" },
    "Action": "sts:AssumeRole",
    "Condition": {
      "ArnLike": {
      }
    }
  }
}
```

Do not replace the `aws:SourceArn` in this template with the full ARN of a specific model or endpoint. The ARN must be in the format provided above. The asterisk in the ARN template does not stand for wildcard and should not be changed.

**SageMaker Batch Transform Jobs**

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker batch transform jobs created by account number `123456789012` in the `us-west-2` Region. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": { "Service": "sagemaker.amazonaws.com" },
      "Action": "sts:AssumeRole",
      "Condition": {
        "ArnLike": {
        }
      }
    }
  ]
}
```
You can replace the `aws:SourceArn` in this template with the full ARN of one specific batch transform job to further limit permissions.

### SageMaker Marketplace

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Marketplace resources created by account number 123456789012 in the us-west-2 Region. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "sagemaker.amazonaws.com"
            },
            "Action": "sts:AssumeRole",
            "Condition": {
                "ArnLike": {
                    "aws:SourceArn": "arn:aws:sagemaker:us-west-2:123456789012:*"
                }
            }
        }
    ]
}
```

Do not replace the `aws:SourceArn` in this template with the full ARN of a specific algorithm or model package. The ARN must be in the format provided above. The asterisk in the ARN template does stand for wildcard and covers all training jobs, models, and batch transform jobs from validation steps, as well as algorithm and model packages published to SageMaker Marketplace.

### SageMaker Neo

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Neo compilation jobs created by account number 123456789012 in the us-west-2 Region. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "sagemaker.amazonaws.com"
            },
            "Action": "sts:AssumeRole",
            "Condition": {
                "ArnLike": {
                }
            }
        }
    ]
}
```

You can replace the `aws:SourceArn` in this template with the full ARN of one specific compilation job to further limit permissions.
SageMaker Pipelines

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Pipelines using pipeline execution records from one or more pipelines. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "sagemaker.amazonaws.com"
            },
            "Action": "sts:AssumeRole",
            "Condition": {
                "ArnLike": {
                    "aws:SourceArn": "arn:aws:sagemaker:region:123456789012:pipeline/mypipeline/*"
                }
            }
        }
    ]
}
```

Do not replace the `aws:SourceArn` in this template with the full ARN of a specific pipeline execution. The ARN must be in the format provided above. The `partition` placeholder should designate either an AWS commercial partition (aws) or an AWS in China partition (aws-cn), depending on where the pipeline is running. Similarly, the `region` placeholder in the ARN can be any valid Region where SageMaker Pipelines is available.

The asterisk in the ARN template does stand for wildcard and covers all pipeline executions of a pipeline named `mypipeline`. If you want to allow the `AssumeRole` permissions for all pipelines in account `123456789012` rather than one specific pipeline, then the `aws:SourceArn` would be `arn:aws:sagemaker:*:123456789012:pipeline/*`.

SageMaker Processing Jobs

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker processing jobs created by account number `123456789012` in the `us-west-2` Region. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "sagemaker.amazonaws.com"
            },
            "Action": "sts:AssumeRole",
            "Condition": {
                " ArnLike": {
                }
            }
        }
    ]
}
```
You can replace the `aws:SourceArn` in this template with the full ARN of one specific processing job to further limit permissions.

**SageMaker Studio**

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Studio created by account number 123456789012 in the `us-west-2` Region. Note that because the account number is part of the `aws:SourceArn` value, you do not need to specify an `aws:SourceAccount` value.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "sagemaker.amazonaws.com"
            },
            "Action": "sts:AssumeRole",
            "Condition": {
                "ArnLike": {
                    "aws:SourceArn": "arn:aws:sagemaker:us-west-2:123456789012:*"
                }
            }
        }
    ]
}
```

Do not replace the `aws:SourceArn` in this template with the full ARN of a specific Studio application, user profile, or domain. The ARN must be in the format provided in the previous example. The asterisk in the ARN template does not stand for wildcard and should not be changed.

**SageMaker Training Jobs**

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker training jobs created by account number 123456789012 in the `us-west-2` Region. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "sagemaker.amazonaws.com"
            },
            "Action": "sts:AssumeRole",
            "Condition": {
                "ArnLike": {
                }
            }
        }
    ]
}
```
You can replace the `aws:SourceArn` in this template with the full ARN of one specific training job to further limit permissions.

Next Up

For more information on managing execution roles, see SageMaker Roles.

**SageMaker Roles**

As a managed service, Amazon SageMaker performs operations on your behalf on the AWS hardware that is managed by SageMaker. SageMaker can perform only operations that the user permits.

A SageMaker user can grant these permissions with an IAM role (referred to as an execution role).

To create and use a locally available execution role, you can use the following procedures.

**Get execution role**

You can find the IAM execution role in the following ways:

**From the notebook**

When you run a notebook within SageMaker (from the SageMaker console or SageMaker Studio) you can access the execution role with the following code:

```python
sagemaker_session = sagemaker.Session()
role = sagemaker.get_execution_role()
```

**Note**

The execution role is available only when running a notebook within SageMaker. If you run `get_execution_role` in a notebook not on SageMaker, expect a "region" error.

**From the SageMaker console**

Under Notebook > Notebook instances, select the notebook. The ARN is given in the Permissions and encryption section.

**Create execution role**

Use the following procedure to create an execution role with the IAM managed policy, `AmazonSageMakerFullAccess`, attached. If your use case requires more granular permissions, use other sections on this page to create an execution role that meets your business needs.

**Important**

The IAM managed policy, `AmazonSageMakerFullAccess`, used in the following procedure only grants the execution role permission to perform certain Amazon S3 actions on buckets or objects with SageMaker, Sagemaker, sagemaker, or aws-glue in the name. To learn how to add an additional policy to an execution role to grant it access to other Amazon S3 buckets and objects, see Add Additional Amazon S3 Permissions to a SageMaker Execution Role (p. 3537).

**To create a new role**

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. Select Roles and then select Create role.
4. Select Next: Permissions.
5. The IAM managed policy, `AmazonSageMakerFullAccess` is automatically attached to this role. To see the permissions included in this policy, select the sideways arrow next to the policy name. Select Next: Tags.
6. (Optional) Add tags and select **Next: Review**.
7. Give the role a name in the text field under **Role name** and select **Create role**.
8. On the **Roles** section of the IAM console, select the role you just created. If needed, use the text box to search for the role using the role name you entered in step 7.
9. On the role summary page, make note of the ARN.

With a known ARN for your role, you can programmatically check the role when running the notebook locally or on SageMaker. Replace `RoleName` with your known ARN:

```python
try:
    role = sagemaker.get_execution_role()
except ValueError:
    iam = boto3.client('iam')
    role = iam.get_role(RoleName='AmazonSageMaker-ExecutionRole-20201200T100000')['Role']['Arn']
```

### Add Additional Amazon S3 Permissions to a SageMaker Execution Role

When you use a SageMaker feature with resources in Amazon S3, such as input data, the execution role you specify in your request (for example `CreateTrainingJob`) is used to access these resources.

If you attach the IAM managed policy, `AmazonSageMakerFullAccess`, to an execution role, that role has permission to perform certain Amazon S3 actions on buckets or objects with `SageMaker`, `Sagemaker`, `sagemaker`, or `aws-glue` in the name. It also has permission to perform the following actions on any Amazon S3 resource:

- `s3:CreateBucket`
- `s3:GetBucketLocation`
- `s3:ListBucket`
- `s3:ListAllMyBuckets`
- `s3:GetBucketCors`
- `s3:PutBucketCors`

To give an execution role permissions to access one or more specific buckets in Amazon S3, you can attach a policy similar to the following to the role. This policy grants an IAM role permission to perform all actions that `AmazonSageMakerFullAccess` allows but restricts this access to the buckets `DOC-EXAMPLE-BUCKET1` and `DOC-EXAMPLE-BUCKET2`. Refer to the security documentation for the specific SageMaker feature you are using to learn more about the Amazon S3 permissions required for that feature.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:PutObject",
                "s3:DeleteObject",
                "s3:AbortMultipartUpload"
            ],
            "Resource": [
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET1/*",
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET2/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
```
Passing Roles

Actions like passing a role between services are a common function within SageMaker. You can find more details on Actions, Resources, and Condition Keys for SageMaker in the IAM User Guide.

You pass the role (iam:PassRole) when making these API calls: CreateAutoMLJob, CreateCompilationJob, CreateDomain, CreateFlowDefinition, CreateHyperParameterTuningJob, CreateImage, CreateLabelingJob, CreateModel, CreateMonitoringSchedule, CreateNotebookInstance, CreateProcessingJob, CreateTrainingJob, CreateUserProfile, RenderUiTemplate, and UpdateImage.

You attach the following trust policy to the IAM role which grants SageMaker principal permissions to assume the role, and is the same for all of the execution roles:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "sagemaker.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

The permissions that you need to grant to the role vary depending on the API that you call. The following sections explain these permissions.

**Note**

Instead of managing permissions by crafting a permission policy, you can use the AWS-managed AmazonSageMakerFullAccess permission policy. The permissions in this policy are fairly broad, to allow for any actions you might want to perform in SageMaker. For a listing of the policy including information about the reasons for adding many of the permissions, see AWS managed policy: AmazonSageMakerFullAccess (p. 3572). If you prefer to create custom policies and manage permissions to scope the permissions only to the actions you need to perform with the execution role, see the following topics.
Important
If you’re running into issues, see Troubleshooting Amazon SageMaker Identity and Access (p. 3626).

For more information about IAM roles, see IAM Roles in the IAM User Guide.

Topics
- CreateAutoMLJob API: Execution Role Permissions (p. 3539)
- CreateDomain API: Execution Role Permissions (p. 3540)
- CreateImage and UpdateImage APIs: Execution Role Permissions (p. 3541)
- CreateNotebookInstance API: Execution Role Permissions (p. 3542)
- CreateHyperParameterTuningJob API: Execution Role Permissions (p. 3545)
- CreateProcessingJob API: Execution Role Permissions (p. 3547)
- CreateTrainingJob API: Execution Role Permissions (p. 3549)
- CreateModel API: Execution Role Permissions (p. 3552)

CreateAutoMLJob API: Execution Role Permissions

For an execution role that you can pass in a CreateAutoMLJob API request, you can attach the following minimum permission policy to the role:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "iam:PassRole",
        "sagemaker:DescribeEndpointConfig",
        "sagemaker:DescribeModel",
        "sagemaker:InvokeEndpoint",
        "sagemaker:ListTags",
        "sagemaker:DescribeEndpoint",
        "sagemaker:CreateModel",
        "sagemaker:CreateEndpointConfig",
        "sagemaker:CreateEndpoint",
        "sagemaker:DeleteModel",
        "sagemaker:DeleteEndpointConfig",
        "sagemaker:DeleteEndpoint",
        "cloudwatch:PutMetricData",
        "logs:CreateLogStream",
        "logs:PutLogEvents",
        "logs:CreateLogGroup",
        "logs:DescribeLogStreams",
        "s3:GetObject",
        "s3:PutObject",
        "s3:ListBucket",
        "ecr:GetAuthorizationToken",
```
"ecr:BatchCheckLayerAvailability",
"ecr:GetDownloadUrlForLayer",
"ecr:BatchGetImage"
],
"Resource": "*"
}
}

If you specify a private VPC for your AutoML job, add the following permissions:

[
   "Effect": "Allow",
   "Action": [
      "ec2:CreateNetworkInterface",
      "ec2:CreateNetworkInterfacePermission",
      "ec2:DeleteNetworkInterface",
      "ec2:DeleteNetworkInterfacePermission",
      "ec2:DescribeNetworkInterfaces",
      "ec2:DescribeVpcs",
      "ec2:DescribeDhcpOptions",
      "ec2:DescribeSubnets",
      "ec2:DescribeSecurityGroups"
   ]
]

If your input is encrypted using server-side encryption with an AWS KMS–managed key (SSE-KMS), add the following permissions:

[
   "Effect": "Allow",
   "Action": ["kms:Decrypt"
]
]

If you specify a KMS key in the output configuration of your AutoML job, add the following permissions:

[
   "Effect": "Allow",
   "Action": ["kms:Encrypt"
]
]

If you specify a volume KMS key in the resource configuration of your AutoML job, add the following permissions:

[
   "Effect": "Allow",
   "Action": ["kms:CreateGrant"
]
]

CreateDomain API: Execution Role Permissions

The execution role for domains with IAM Identity Center and the user/execution role for IAM domains need the following permissions when you pass an AWS KMS customer managed key as the KmsKeyId in the CreateDomain API request. The permissions are enforced during the CreateApp API call.
For an execution role that you can pass in the CreateDomain API request, you can attach the following permission policy to the role:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "kms:CreateGrant",
                "kms:DescribeKey"
            ],
            "Resource": "arn:aws:kms:region:account-id:key/kms-key-id"
        }
    ]
}
```

Alternatively, if the permissions are specified in a KMS policy, you can attach the following policy to the role:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Allow use of the key",
            "Effect": "Allow",
            "Principal": {
                "AWS": [
                    "arn:aws:iam::account-id:role/ExecutionRole"
                ]
            },
            "Action": [
                "kms:CreateGrant",
                "kms:DescribeKey"
            ],
            "Resource": "*"
        }
    ]
}
```

CreateImage and UpdateImage APIs: Execution Role Permissions

For an execution role that you can pass in a CreateImage or UpdateImage API request, you can attach the following permission policy to the role:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ecr:BatchGetImage",
                "ecr:GetDownloadUrlForLayer"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "iam:PassRole"
            ],
            "Resource": "*"
        }
    ]
}
```
CreateNotebookInstance API: Execution Role Permissions

The permissions that you grant to the execution role for calling the CreateNotebookInstance API depend on what you plan to do with the notebook instance. If you plan to use it to invoke SageMaker APIs and pass the same role when calling the CreateTrainingJob and CreateModel APIs, attach the following permissions policy to the role:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "sagemaker:*",
        "ecr:GetAuthorizationToken",
        "ecr:GetDownloadUrlForLayer",
        "ecr:BatchGetImage",
        "ecr:BatchCheckLayerAvailability",
        "ecr:SetRepositoryPolicy",
        "ecr:CompleteLayerUpload",
        "ecr:BatchDeleteImage",
        "ecr:UploadLayerPart",
        "ecr:DeleteRepositoryPolicy",
        "ecr:InitiateLayerUpload",
        "ecr:DeleteRepository",
        "ecr:PutImage",
        "ecr:CreateRepository",
        "cloudwatch:PutMetricData",
        "cloudwatch:GetMetricData",
        "cloudwatch:GetMetricStatistics",
        "cloudwatch:ListMetrics",
        "logs:CreateLogGroup",
        "logs:CreateLogStream",
        "logs:DescribeLogStreams",
        "logs:PutLogEvents",
        "logs:GetLogEvents",
        "s3:CreateBucket",
        "s3:ListBucket",
        "s3:GetBucketLocation",
        "s3:GetObject",
        "s3:PutObject",
        "s3:DeleteObject",
        "robomaker:CreateSimulationApplication",
        "robomaker:DescribeSimulationApplication",
        "robomaker:DeleteSimulationApplication",
        "robomaker:CreateSimulationJob",
        "robomaker:DescribeSimulationJob",
        "robomaker:CancelSimulationJob",
        "ec2:CreateVpcEndpoint",
        "ec2:DescribeRouteTables",
        "elasticfilesystem:DescribeMountTargets"
      ],
      "Resource": "*"
    }
  ]
}
```
To tighten the permissions, limit them to specific Amazon S3 and Amazon ECR resources, by restricting "Resource": "**", as follows:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "sagemaker:*",
        "ecr:GetAuthorizationToken",
        "cloudwatch:PutMetricData",
        "logs:CreateLogGroup",
        "logs:CreateLogStream",
        "logs:DescribeLogStreams",
        "logs:PutLogEvents",
        "logs:GetLogEvents"
      ],
      "Resource": "**"
    },
    {
      "Effect": "Allow",
      "Action": [
        "iam:PassRole"
      ],
      "Resource": "**",
      "Condition": {
        "StringEquals": {
          "iam:PassedToService": "sagemaker.amazonaws.com"
        }
      }
    },
    {
      "Effect": "Allow",
      "Action": [
        "s3:ListBucket"
      ],
      "Resource": "**"
    }
  ]
}
```
If you plan to access other resources, such as Amazon DynamoDB or Amazon Relational Database Service, add the relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- Scope the `s3:ListBucket` permission to the specific bucket that you specify as `InputDataConfig.DataSource.S3DataSource.S3Uri` in a CreateTrainingJob request.
- Scope `s3:GetObject`, `s3:PutObject`, and `s3:DeleteObject` permissions as follows:
  - Scope to the following values that you specify in a CreateTrainingJob request:
    
    ```
    InputDataConfig.DataSource.S3DataSource.S3Uri
    OutputDataConfig.S3OutputPath
    ```
  - Scope to the following values that you specify in a CreateModel request:
    
    ```
    PrimaryContainer.ModelDataUrl
    SuplementalContainers.ModelDataUrl
    ```
- Scope ecr permissions as follows:
  - Scope to the `AlgorithmSpecification.TrainingImage` value that you specify in a CreateTrainingJob request.
  - Scope to the `PrimaryContainer.Image` value that you specify in a CreateModel request.

The `cloudwatch` and `logs` actions are applicable for `*` resources. For more information, see [CloudWatch Resources and Operations](https://docs.aws.amazon.com/AmazonCloudWatch/latest/monitoring/cloudwatch-events-resource-based-policy.html) in the Amazon CloudWatch User Guide.
CreateHyperParameterTuningJob API: Execution Role Permissions

For an execution role that you can pass in a CreateHyperParameterTuningJob API request, you can attach the following permission policy to the role:

```
{
   "Version": "2012-10-17",
   "Statement": [
       {
           "Effect": "Allow",
           "Action": [
               "cloudwatch:PutMetricData",
               "logs:CreateLogStream",
               "logs:PutLogEvents",
               "logs:CreateLogGroup",
               "logs:DescribeLogStreams",
               "s3:GetObject",
               "s3:PutObject",
               "s3:ListBucket",
               "ecr:GetAuthorizationToken",
               "ecr:BatchCheckLayerAvailability",
               "ecr:GetDownloadUrlForLayer",
               "ecr:BatchGetImage"
           ],
           "Resource": "*"
       }]
}
```

Instead of specifying "Resource": "*", you could scope these permissions to specific Amazon S3 and Amazon ECR resources:

```
{
   "Version": "2012-10-17",
   "Statement": [
       {
           "Effect": "Allow",
           "Action": [
               "cloudwatch:PutMetricData",
               "logs:CreateLogStream",
               "logs:PutLogEvents",
               "logs:CreateLogGroup",
               "logs:DescribeLogStreams",
               "ecr:GetAuthorizationToken"
           ],
           "Resource": "*"
       },
       {
           "Effect": "Allow",
           "Action": [
               "s3:ListBucket"
           ],
           "Resource": [
               "arn:aws:s3:::inputbucket"
           ]
       },
       {
           "Effect": "Allow",
           "Action": [
               "s3:GetObject",
               "s3:PutObject"
           ],
           "Resource": "*"
       }
   ]
}
```
If the training container associated with the hyperparameter tuning job needs to access other data sources, such as DynamoDB or Amazon RDS resources, add relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- Scope the `s3:ListBucket` permission to a specific bucket that you specify as the `InputDataConfig.DataSource.S3DataSource.S3Uri` in a `CreateTrainingJob` request.
- Scope the `s3:GetObject` and `s3:PutObject` permissions to the following objects that you specify in the input and output data configuration in a `CreateHyperParameterTuningJob` request:
  - `InputDataConfig.DataSource.S3DataSource.S3Uri`
  - `OutputDataConfig.S3OutputPath`
- Scope Amazon ECR permissions to the registry path (AlgorithmSpecification.TrainingImage) that you specify in a `CreateHyperParameterTuningJob` request.

The `cloudwatch` and `logs` actions are applicable for `*` resources. For more information, see CloudWatch Resources and Operations in the Amazon CloudWatch User Guide.

If you specify a private VPC for your hyperparameter tuning job, add the following permissions:

```json
{
  "Effect": "Allow",
  "Action": [
    "ec2:CreateNetworkInterface",
    "ec2:CreateNetworkInterfacePermission",
    "ec2:DeleteNetworkInterface",
    "ec2:DeleteNetworkInterfacePermission",
    "ec2:DescribeNetworkInterfaces",
    "ec2:DescribeVpcs",
    "ec2:DescribeDhcpOptions",
    "ec2:DescribeSubnets",
    "ec2:DescribeSecurityGroups"
  ]
}
```

If your input is encrypted using server-side encryption with an AWS KMS–managed key (SSE-KMS), add the following permissions:

```json
{
  "Effect": "Allow",
  "Action": [
    "kms:Encrypt",
    "kms:Decrypt",
    "kms:GenerateDataKey",
    "kms:ReEncrypt`
```
If you specify a KMS key in the output configuration of your hyperparameter tuning job, add the following permissions:

```
{
  "Effect": "Allow",
  "Action": [
    "kms:Decrypt"
  ]
}
```

If you specify a volume KMS key in the resource configuration of your hyperparameter tuning job, add the following permissions:

```
{
  "Effect": "Allow",
  "Action": [
    "kms:Encrypt"
  ]
}
```

### CreateProcessingJob API: Execution Role Permissions

For an execution role that you can pass in a CreateProcessingJob API request, you can attach the following permission policy to the role:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "cloudwatch:PutMetricData",
        "logs:CreateLogStream",
        "logs:PutLogEvents",
        "logs:CreateLogGroup",
        "logs:DescribeLogStreams",
        "s3:GetObject",
        "s3:PutObject",
        "s3:ListBucket",
        "ecr:GetAuthorizationToken",
        "ecr:BatchCheckLayerAvailability",
        "ecr:GetDownloadUrlForLayer",
        "ecr:GetDownloadUrlForLayer",
        "ecr:GetDownloadUrlForLayer"
      ],
      "Resource": "*"
    }
  ]
}
```

Instead of specifying "Resource": "*", you could scope these permissions to specific Amazon S3 and Amazon ECR resources:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "cloudwatch:PutMetricData",
        "logs:CreateLogStream",
        "logs:PutLogEvents",
        "logs:CreateLogGroup",
        "logs:DescribeLogStreams",
        "s3:GetObject",
        "s3:PutObject",
        "s3:ListBucket",
        "ecr:GetAuthorizationToken",
        "ecr:BatchCheckLayerAvailability",
        "ecr:GetDownloadUrlForLayer",
        "ecr:GetDownloadUrlForLayer"
      ],
      "Resource": "*"
    }
  ]
}
```
"Statement": [

    {
        "Effect": "Allow",
        "Action": [
            "cloudwatch:PutMetricData",
            "logs:CreateLogStream",
            "logs:PutLogEvents",
            "logs:CreateLogGroup",
            "logs:DescribeLogStreams",
            "ecr:GetAuthorizationToken"
        ],
        "Resource": "*"
    },

    {
        "Effect": "Allow",
        "Action": [
            "s3:ListBucket"
        ],
        "Resource": [
            "arn:aws:s3:::inputbucket"
        ]
    },

    {
        "Effect": "Allow",
        "Action": [
            "s3:GetObject",
            "s3:PutObject"
        ],
        "Resource": [
            "arn:aws:s3:::inputbucket/object",
            "arn:aws:s3:::outputbucket/path"
        ]
    },

    {
        "Effect": "Allow",
        "Action": [
            "ecr:BatchCheckLayerAvailability",
            "ecr:GetDownloadUrlForLayer",
            "ecr:BatchGetImage"
        ],
        "Resource": "arn:aws:ecr:region::repository/my-repo"
    }
]

If CreateProcessingJob.AppSpecification.ImageUri needs to access other data sources, such as DynamoDB or Amazon RDS resources, add relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- **Scope the s3:ListBucket permission to a specific bucket that you specify as the ProcessingInputs in a CreateProcessingJob request.**
- **Scope the s3:GetObject and s3:PutObject permissions to the objects that will be downloaded or uploaded in the ProcessingInputs and ProcessingOutputConfig in a CreateProcessingJob request.**
- **Scope Amazon ECR permissions to the registry path (AppSpecification.ImageUri) that you specify in a CreateProcessingJob request.**

The cloudwatch and logs actions are applicable for "*" resources. For more information, see CloudWatch Resources and Operations in the Amazon CloudWatch User Guide.

If you specify a private VPC for your processing job, add the following permissions:
If your input is encrypted using server-side encryption with an AWS KMS–managed key (SSE-KMS), add the following permissions:

```
{
  "Effect": "Allow",
  "Action": [
    "kms:Decrypt"
  ]
}
```

If you specify a KMS key in the output configuration of your processing job, add the following permissions:

```
{
  "Effect": "Allow",
  "Action": [
    "kms:Encrypt"
  ]
}
```

If you specify a volume KMS key in the resource configuration of your processing job, add the following permissions:

```
{
  "Effect": "Allow",
  "Action": [
    "kms:CreateGrant"
  ]
}
```

**CreateTrainingJob API: Execution Role Permissions**

For an execution role that you can pass in a CreateTrainingJob API request, you can attach the following permission policy to the role:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "cloudwatch:PutMetricData",
        "logs:CreateLogStream",
        "logs:PutLogEvents",
```
Instead of specifying "Resource": "*", you could scope these permissions to specific Amazon S3 and Amazon ECR resources:

```json
{  
"Version": "2012-10-17",  
"Statement": [  
{    
"Effect": "Allow",    
"Action": [      
"cloudwatch:PutMetricData",      
"logs:CreateLogStream",      
"logs:PutLogEvents",      
"logs:CreateLogGroup",      
"logs:DescribeLogStreams",      
"ecr:GetAuthorizationToken"    
],    
"Resource": "*"
  },  
{    
"Effect": "Allow",    
"Action": [      
"s3:ListBucket"
],    
"Resource": [      
"arn:aws:s3:::inputbucket"
    ]
  },  
{    
"Effect": "Allow",    
"Action": [      
"s3:GetObject",      
"s3:PutObject"
],    
"Resource": [      
"arn:aws:s3:::inputbucket/object",      
"arn:aws:s3:::outputbucket/path"
    ]
  },  
{    
"Effect": "Allow",    
"Action": [      
"ecr:BatchCheckLayerAvailability",      
"ecr:GetDownloadUrlForLayer",      
"ecr:BatchGetImage"
],    
"Resource": "arn:aws:ecr::region::repository/my-repo"
  }
]}
```
If `CreateTrainingJob.AlgorithmSpecifications.TrainingImage` needs to access other data sources, such as DynamoDB or Amazon RDS resources, add relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- Scope the `s3:ListBucket` permission to a specific bucket that you specify as the `InputDataConfig.DataSource.S3DataSource.S3Uri` in a `CreateTrainingJob` request.
- Scope the `s3:GetObject` and `s3:PutObject` permissions to the following objects that you specify in the input and output data configuration in a `CreateTrainingJob` request:
  - `InputDataConfig.DataSource.S3DataSource.S3Uri`
  - `OutputDataConfig.S3OutputPath`
- Scope Amazon ECR permissions to the registry path (`AlgorithmSpecification.TrainingImage`) that you specify in a `CreateTrainingJob` request.

The `cloudwatch` and `logs` actions are applicable for ")" resources. For more information, see CloudWatch Resources and Operations in the Amazon CloudWatch User Guide.

If you specify a private VPC for your training job, add the following permissions:

```
{
  "Effect": "Allow",
  "Action": [
    "ec2:CreateNetworkInterface",
    "ec2:CreateNetworkInterfacePermission",
    "ec2:DeleteNetworkInterface",
    "ec2:DeleteNetworkInterfacePermission",
    "ec2:DescribeNetworkInterfaces",
    "ec2:DescribeVpcs",
    "ec2:DescribeDhcpOptions",
    "ec2:DescribeSubnets",
    "ec2:DescribeSecurityGroups"
  ]
}
```

If your input is encrypted using server-side encryption with an AWS KMS–managed key (SSE-KMS), add the following permissions:

```
{
  "Effect": "Allow",
  "Action": [
    "kms:Decrypt"
  ]
}
```

If you specify a KMS key in the output configuration of your training job, add the following permissions:

```
{
  "Effect": "Allow",
  "Action": [
    "kms:Encrypt"
  ]
}
```

If you specify a volume KMS key in the resource configuration of your training job, add the following permissions:

```
{
}
```
CreateModel API: Execution Role Permissions

For an execution role that you can pass in a CreateModel API request, you can attach the following permission policy to the role:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": ["kms:CreateGrant"]
    }
  ]
}
```

Instead of specifying "Resource": "*", you can scope these permissions to specific Amazon S3 and Amazon ECR resources:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": ["cloudwatch:PutMetricData",
                  "logs:CreateLogStream",
                  "logs:PutLogEvents",
                  "logs:CreateLogGroup",
                  "logs:DescribeLogStreams",
                  "s3:GetObject",
                  "s3:ListBucket",
                  "ecr:GetAuthorizationToken",
                  "ecr:BatchCheckLayerAvailability",
                  "ecr:GetDownloadUrlForLayer",
                  "ecr:BatchGetImage"
                ],
      "Resource": "*
    }
  ]
}
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": ["s3:GetObject"
                ],
      "Resource": ["arn:aws:s3:::inputbucket/object"
                ]
    }
  ]
}
```

"Effect": "Allow",
"Action": [
  "kms:CreateGrant"
]
}
If `CreateModel.PrimaryContainer.Image` need to access other data sources, such as Amazon DynamoDB or Amazon RDS resources, add relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- **•** Scope S3 permissions to objects that you specify in the `PrimaryContainer.ModelDataUrl` in a `CreateModel` request.
- **•** Scope Amazon ECR permissions to a specific registry path that you specify as the `PrimaryContainer.Image` and `SecondaryContainer.Image` in a `CreateModel` request.

The `cloudwatch` and `logs` actions are applicable for "*" resources. For more information, see [CloudWatch Resources and Operations](https://docs.aws.amazon.com/AmazonCloudWatch/latest/monitoring/cloudwatch-resource-summary.html) in the Amazon CloudWatch User Guide.

If you specify a private VPC for your model, add the following permissions:

```json
{
  "Effect": "Allow",
  "Action": [
    "ec2:CreateNetworkInterface",
    "ec2:CreateNetworkInterfacePermission",
    "ec2:DeleteNetworkInterface",
    "ec2:DeleteNetworkInterfacePermission",
    "ec2:DescribeNetworkInterfaces",
    "ec2:DescribeVpcs",
    "ec2:DescribeDhcpOptions",
    "ec2:DescribeSubnets",
    "ec2:DescribeSecurityGroups"
  ]
}
```

### Amazon SageMaker API Permissions: Actions, Permissions, and Resources Reference

When you are setting up access control and writing a permissions policy that you can attach to an IAM identity (an identity-based policy), use the following as a reference. The each Amazon SageMaker API operation, the corresponding actions for which you can grant permissions to perform the action, and the AWS resource for which you can grant the permissions. You specify the actions in the policy's `Action` field, and you specify the resource value in the policy's `Resource` field.

**Note**

Except for the ListTags API, resource-level restrictions are not available on List- calls. Any user calling a List- API will see all resources of that type in the account.

To express conditions in your Amazon SageMaker policies, you can use AWS-wide condition keys. For a complete list of AWS-wide keys, see [Available Keys](https://docs.aws.amazon.com/IAM/latest/UserGuide/reference_policies_elements_condition-keys.html) in the IAM User Guide.
### Amazon SageMaker API Operations and Required Permissions for Actions

Required Permissions (API Action): sagemaker:UpdateNotebookInstance, iam:PassRole
AWS Managed Policies for Amazon SageMaker

To add permissions to users, groups, and roles, it is easier to use AWS managed policies than to write policies yourself. It takes time and expertise to create IAM customer managed policies that provide your team with only the permissions they need. To get started quickly, you can use our AWS managed policies. These policies cover common use cases and are available in your AWS account. For more information about AWS managed policies, see AWS managed policies in the IAM User Guide.

AWS services maintain and update AWS managed policies. You can't change the permissions in AWS managed policies. Services occasionally add additional permissions to an AWS managed policy to support new features. This type of update affects all identities (users, groups, and roles) to which the policy is attached. Services are most likely to update an AWS managed policy when a new feature is launched or when new operations become available. Services do not remove permissions from an AWS managed policy, so policy updates won't break your existing permissions.

Additionally, AWS supports managed policies for job functions that span multiple services. For example, the ReadOnlyAccess AWS managed policy provides read-only access to all AWS services and resources. When a service launches a new feature, AWS adds read-only permissions for new operations and resources. For a list and descriptions of job function policies, see AWS managed policies for job functions in the IAM User Guide.

Important
We recommend that you use the most restricted policy that allows you to perform your use case.

The following AWS managed policies, which you can attach to users in your account, are specific to Amazon SageMaker:

- **AmazonSageMakerFullAccess** – Grants full access to Amazon SageMaker resources and the supported operations. This does not provide unrestricted Amazon S3 access, but supports buckets and objects with specific sagemaker tags. This policy allows all IAM roles to be passed to Amazon SageMaker, but only allows IAM roles with “AmazonSageMaker” in them to be passed to the AWS Glue, AWS Step Functions, and AWS RoboMaker services.

- **AmazonSageMakerReadOnly** – Grants read-only access to Amazon SageMaker resources.

The following AWS managed policies can be attached to users in your account but are not recommended:

- **AdministratorAccess** – Grants all actions for all AWS services and for all resources in the account.
- **DataScientist** – Grants a wide range of permissions to cover most of the use cases (primarily for analytics and business intelligence) encountered by data scientists.

You can review these permissions policies by signing in to the IAM console and searching for them.

You can also create your own custom IAM policies to allow permissions for Amazon SageMaker actions and resources as you need them. You can attach these custom policies to the IAM users or groups that require them.

Topics

---

3571
• AWS managed policy: AmazonSageMakerFullAccess (p. 3572)
• AWS managed policy: AmazonSageMakerReadOnly (p. 3581)
• AWS managed policies for Amazon SageMaker Canvas (p. 3582)
• AWS Managed Policies for Amazon SageMaker Ground Truth (p. 3586)
• AWS Managed Policies for SageMaker Pipelines (p. 3591)
• AWS Managed Policies for SageMaker projects and JumpStart (p. 3593)
• SageMaker Updates to AWS Managed Policies (p. 3626)

**AWS managed policy: AmazonSageMakerFullAccess**

This policy grants administrative permissions that allow a principal full access to all Amazon SageMaker resources and operations. The policy also provides select access to related services. This policy allows all IAM roles to be passed to Amazon SageMaker, but only allows IAM roles with "AmazonSageMaker" in them to be passed to the AWS Glue, AWS Step Functions, and AWS RoboMaker services. This policy does not include permissions to create an Amazon SageMaker domain. For information on the policy needed to create a domain, see Create an IAM Administrator User and Group (p. 34).

**Permissions details**

This policy includes the following permissions.

- **application-autoscaling** – Allows principals to automatically scale a SageMaker real-time inference endpoint.
- **athena** – Allows principals to query a list of data catalogs, databases, and table metadata from Amazon Athena.
- **aws-marketplace** – Allows principals to view AWS AI Marketplace subscriptions. You need this if you want to access SageMaker software subscribed in AWS Marketplace.
- **cloudformation** – Allows principals to get AWS CloudFormation templates for using SageMaker JumpStart solutions and Pipelines. SageMaker JumpStart creates resources necessary to run end-to-end machine learning solutions that tie SageMaker to other AWS services. SageMaker Pipelines creates new projects that are backed by AWS Service Catalog.
- **cloudwatch** – Allows principals to post CloudWatch metrics, interact with alarms, and upload logs to CloudWatch Logs in your account.
- **codebuild** – Allows principals to store AWS CodeBuild artifacts for SageMaker Pipeline and Projects.
- **codecommit** – Needed for AWS CodeCommit integration with SageMaker notebook instances.
- **cognito-idp** – Needed for Amazon SageMaker Ground Truth to define private workforce and work teams.
- **ec2** – Needed for SageMaker to manage Amazon EC2 resources and network interfaces when you specify an Amazon VPC for your SageMaker jobs, models, endpoints, and notebook instances.
- **ecr** – Needed to pull and store Docker artifacts for Amazon SageMaker Studio (custom images), training, processing, batch inference, and inference endpoints. This is also required to use your own container in SageMaker. Additional permissions for SageMaker JumpStart solutions are required to create and remove custom images on behalf of users.
- **elastic-inference** – Allows principals to connect to Amazon Elastic Inference for using SageMaker notebook instances and endpoints.
- **elasticfilesystem** – Allows principals to access Amazon Elastic File System. This is needed for SageMaker to use data sources in Amazon Elastic File System for training machine learning models.
- **fsx** – Allows principals to access Amazon FSx. This is needed for SageMaker to use data sources in Amazon FSx for training machine learning models.
- **glue** – Needed for inference pipeline pre-processing from within SageMaker notebook instances.
• groundtruthlabeling – Needed for Ground Truth labeling jobs. The groundtruthlabeling endpoint is accessed by the Ground Truth console.
• iam – Needed to give the SageMaker console access to available IAM roles and create service-linked roles.
• kms – Needed to give the SageMaker console access to available AWS KMS keys and retrieve them for any specified AWS KMS aliases in jobs and endpoints.
• lambda – Allows principals to invoke and get a list of AWS Lambda functions.
• logs – Needed to allow SageMaker jobs and endpoints to publish log streams.
• redshift – Allows principals to access Amazon Redshift cluster credentials.
• redshift-data – Allows principals to use data from Amazon Redshift to run, describe, and cancel statements; get statement results; and list schemas and tables.
• robomaker – Allows principals to have full access to create, get descriptions, and delete AWS RoboMaker simulation applications and jobs. This is also needed to run reinforcement learning examples on notebook instances.
• s3 – Allows principals to have full access to Amazon S3 resources pertaining to SageMaker, but not all of Amazon S3.
• sagemaker – Allows principals to list tags on Amazon SageMaker user profiles.
• secretsmanager – Allows principals to have full access to AWS Secrets Manager. The principals can securely encrypt, store, and retrieve credentials for databases and other services. This is also needed for SageMaker notebook instances with SageMaker code repositories that use GitHub.
• servicecatalog – Allows principals to use AWS Service Catalog. The principals can create, get a list of, update, or terminate provisioned products, such as servers, databases, websites, or applications deployed using AWS resources. This is needed for SageMaker JumpStart and Projects to find and read service catalog products and launch AWS resources in user accounts.
• sns – Allows principals to get a list of Amazon SNS topics. This is needed for endpoints with Async Inference enabled for notifying users that their inference has completed.
• states – Needed for SageMaker JumpStart and Pipelines to use a service catalog to create step function resources.
• tag – Needed for SageMaker Pipelines to render in Studio. Studio needs resources tagged with particular sagemaker:project-id tag-key. This requires the tag:GetResources permission.

AWS managed policy: AmazonSageMakerReadOnly

This policy grants read-only access to Amazon SageMaker through the AWS Management Console and SDK.

Permissions details

This policy includes the following permissions.

- application-autoscaling – Allows users to browse descriptions of scalable SageMaker real-time inference endpoints.
- aws-marketplace – Allows users to view AWS AI Marketplace subscriptions.
- cloudwatch – Allows users to receive CloudWatch alarms.
- cognito-idp – Needed for Amazon SageMaker Ground Truth to browse descriptions and lists of private workforce and work teams.
- ecr – Needed to read Docker artifacts for training and inference.

AWS managed policies for Amazon SageMaker Canvas

These AWS managed policies add permissions required to use SageMaker Canvas. The policies are available in your AWS account and are used by execution roles created from the SageMaker console.

Topics
- AWS managed policy: AmazonSageMakerCanvasFullAccess (p. 3582)
- AWS managed policy: AmazonSageMakerCanvasForecastAccess (p. 3586)
- Amazon SageMaker updates to Amazon SageMaker Canvas managed policies (p. 3586)

AWS managed policy: AmazonSageMakerCanvasFullAccess

This policy grants permissions that allow full access to Amazon SageMaker Canvas through the AWS Management Console and SDK. The policy also provides select access to related services (for example, Amazon Simple Storage Service (Amazon S3), AWS Identity and Access Management (IAM), Amazon Virtual Private Cloud (Amazon VPC), Amazon Elastic Container Registry (Amazon ECR), Amazon CloudWatch Logs, Amazon Redshift, AWS Secrets Manager, and Amazon Forecast).

Permissions details

This AWS managed policy includes the following permissions.

- **sagemaker** – Allows principals to create and host SageMaker models. These resources are limited to those whose name includes "Canvas", "canvas", or "model-compilation-".
- **ec2** – Allows principals to create Amazon VPC endpoints.
- **ecr** – Allows principals to get information about a container image.
- **iam** – Allows principals to pass an IAM role to Amazon SageMaker and Amazon Forecast.
- **logs** – Allows principals to publish logs from training jobs and endpoints.
- **s3** – Allows principals to add and retrieve objects from Amazon S3 buckets. These objects are limited to those whose name includes "SageMaker", "Sagemaker", or "sagemaker".
- **secretsmanager** – Allows principals to store customer credentials to connect to a Snowflake database using Secrets Manager.
- **redshift-data** – Allows principals to run queries on Amazon Redshift.
- **forecast** – Allows principals to use Amazon Forecast.

AWS managed policy: AmazonSageMakerCanvasForecastAccess

This policy grants permissions commonly needed to use SageMaker Canvas with Amazon Forecast.

Permissions details

This AWS managed policy includes the following permissions.

- s3 – Allows principals to add and retrieve objects from Amazon S3 buckets. These objects are limited to those whose case-insensitive name starts with "sagemaker-".

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [

AWS Managed Policies for Amazon SageMaker Ground Truth

These AWS managed policies add permissions required to use SageMaker Ground Truth. The policies are available in your AWS account and are used by execution roles created from the SageMaker console.

Topics
• AWS managed policy: AmazonSageMakerGroundTruthExecution (p. 3587)
• AWS managed policy: GroundTruthSyntheticConsoleFullAccess (p. 3589)
• AWS managed policy: GroundTruthSyntheticConsoleReadOnlyAccess (p. 3590)
• Amazon SageMaker updates to SageMaker Ground Truth managed policies (p. 3590)

**AWS managed policy: AmazonSageMakerGroundTruthExecution**

This AWS managed policy grants permissions commonly needed to use SageMaker Ground Truth.

**Permissions details**

This policy includes the following permissions.

- **lambda** – Allows principals to invoke Lambda functions whose name includes "sagemaker" (case-insensitive), "GtRecipe", or "LabelingFunction".
- **s3** – Allows principals to add and retrieve objects from Amazon S3 buckets. These objects are limited to those whose case-insensitive name contains "groundtruth" or "sagemaker", or are tagged with "SageMaker".
- **cloudwatch** – Allows principals to post CloudWatch metrics.
- **logs** – Allows principals to create and access log streams, and post log events.
- **sqs** – Allows principals to create Amazon SQS queues, and send and receive Amazon SQS messages. These permissions are limited to queues whose name includes "GroundTruth".
- **sns** – Allows principals to subscribe to and publish messages to Amazon SNS topics whose case-insensitive name contains "groundtruth" or "sagemaker".
- **ec2** – Allows principals to create, describe, and delete Amazon VPC endpoints whose VPC endpoint service name contains "sagemaker-task-resources" or "labeling".

```json
{
  "Version": "2012-10-17",

    ],
    "Condition": {
        "StringEquals": {
            "sns:Protocol": "sqs"}  
}  
}
This AWS managed policy grants permissions needed to use most features of the SageMaker Ground Truth synthetic data console. The policy is available in your AWS account. In order to use all features of the console, users must add "s3:GetObject" permissions to allow SageMaker Ground Truth synthetic data console to display data from their S3 buckets. This can be done by attaching the AmazonS3ReadOnlyAccess managed policy to their role or by adding "s3:GetObject" for specific S3 resources to their role.

Permissions details

This policy includes the following permissions.
• s3 – Allows the retrieval of objects from Amazon S3 buckets to display data in the console.
• sagemaker-groundtruth-synthetic – Allows the console to call SageMaker Ground Truth synthetic data APIs.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "sagemaker-groundtruth-synthetic:*",
            "s3:ListBucket"
         ],
         "Resource": "*"
      }
   ]
}
```

**AWS managed policy: GroundTruthSyntheticConsoleReadOnlyAccess**

This AWS managed policy grants read-only access to SageMaker Ground Truth synthetic data via the AWS Management Console. In order to use all features of the console, users must add "s3:GetObject" permissions to allow SageMaker Ground Truth synthetic data console to display data from their S3 buckets. This can be done by attaching the AmazonS3ReadOnlyAccess managed policy to their role or by adding "s3:GetObject" for specific S3 resources to their role.

**Permissions details**

This policy includes the following permissions.

• s3 – Allows the retrieval of objects from Amazon S3 buckets to display data in the console.
• sagemaker-groundtruth-synthetic – Allows the console to call SageMaker Ground Truth synthetic data ReadOnly APIs.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "sagemaker-groundtruth-synthetic:List*",
            "sagemaker-groundtruth-synthetic:Get*",
            "s3:ListBucket"
         ],
         "Resource": "*"
      }
   ]
}
```

**Amazon SageMaker updates to SageMaker Ground Truth managed policies**

AWS Managed Policies for SageMaker Pipelines

These AWS managed policies add permissions required to use SageMaker Pipelines. The policies are available in your AWS account and are used by execution roles created from the SageMaker console.

Topics

- AWS managed policy: AmazonSageMakerPipelinesIntegrations (p. 3591)
- Amazon SageMaker updates to SageMaker Pipelines managed policies (p. 3593)

AWS managed policy: AmazonSageMakerPipelinesIntegrations

This AWS managed policy grants permissions commonly needed to use Callback steps and Lambda steps in SageMaker Pipelines. The policy is added to the AmazonSageMaker-ExecutionRole that is created when you onboard to Amazon SageMaker Studio. The policy can be attached to any role used for authoring or executing a pipeline.

This policy grants appropriate AWS Lambda, Amazon Simple Queue Service (Amazon SQS), Amazon EventBridge, and IAM permissions needed when building pipelines that invoke Lambda functions or include callback steps, which can be used for manual approval steps or running custom workloads.

The Amazon SQS permissions allow you to create the Amazon SQS queue needed for receiving callback messages, and also to send messages to that queue.

The Lambda permissions allow you to create, read, update, and delete the Lambda functions used in the pipeline steps, and also to invoke those Lambda functions.

This policy grants the Amazon EMR permissions needed to run a pipelines Amazon EMR step.

Permissions details

This policy includes the following permissions.

- elasticmapreduce – Read, add, and cancel steps in a running Amazon EMR cluster.
- events – Read, create, update, and add targets to an EventBridge rule named SageMakerPipelineExecutionEMRStepStatusUpdateRule.
- **iam** – Pass an IAM role to the AWS Lambda service.
- **lambda** – Create, read, update, delete, and invoke Lambda functions. These permissions are limited to functions whose name includes “sagemaker”.
- **sqs** – Create an Amazon SQS queue; send an Amazon SQS message. These permissions are limited to queues whose name includes “sagemaker”.

AWS Managed Policies for SageMaker projects and JumpStart

These AWS managed policies add permissions to use built-in Amazon SageMaker project templates and JumpStart solutions. The policies are available in your AWS account and are used by execution roles created from the SageMaker console.

SageMaker projects and JumpStart use AWS Service Catalog to provision AWS resources in customers' accounts. Some created resources need to assume an execution role. For example, if AWS Service Catalog creates a CodePipeline pipeline on behalf of a customer for a SageMaker machine learning CI/CD project, then that pipeline requires an IAM role.

The **AmazonSageMakerServiceCatalogProductsLaunchRole** role has the permissions required to launch the SageMaker portfolio of products from AWS Service Catalog. The **AmazonSageMakerServiceCatalogProductsUseRole** role has the permissions required to use the SageMaker portfolio of products from AWS Service Catalog. The **AmazonSageMakerServiceCatalogProductsLaunchRole** role passes an **AmazonSageMakerServiceCatalogProductsUseRole** role to the provisioned AWS Service Catalog product resources.

AWS managed policy: AmazonSageMakerAdmin-ServiceCatalogProductsServiceRolePolicy

This service role policy is used by the AWS Service Catalog service to provision products from the Amazon SageMaker portfolio. The policy grants permissions to a set of related AWS services including AWS CodePipeline, AWS CodeBuild, AWS CodeCommit, AWS Glue, AWS CloudFormation, and others.

The AmazonSageMakerAdmin-ServiceCatalogProductsServiceRolePolicy policy is intended to be used by the AmazonSageMakerServiceCatalogProductsLaunchRole role created from the SageMaker console. The policy adds permissions to provision AWS resources for SageMaker projects and JumpStart using AWS Service Catalog to a customer's account.

Permissions details

This policy includes the following permissions.

- **apigateway** – Allows the role to call API Gateway endpoints that are tagged with sagemaker:launch-source.
- **cloudformation** – Allows AWS Service Catalog to create, update and delete CloudFormation stacks.
- **codebuild** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to create, update and delete CodeBuild projects.
- **codecommit** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to create, update and delete CodeCommit repositories.
- **codepipeline** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to create, update and delete CodePipelines.
- **codestar-connections** – Allows the role to pass AWS CodeStar connections.
- **cognito-idp** – Allows the role to create, update, and delete groups and user pools. Also allows tagging resources.
- **ecr** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to create and delete Amazon ECR repositories. Also allows tagging resources.
- **events** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to create and delete EventBridge rules. Used for tying together the various components of the CICD pipeline.
- **firehose** – Allows the role to interact with Kinesis Data Firehose streams.
- **iam** – Allows the role to interact with AWS Glue.
- **lambda** – Allows the role to pass roles prepended with AmazonSageMakerServiceCatalog. This is needed when Projects provisions a AWS Service Catalog product, as a role needs to be passed to AWS Service Catalog.
- **lambda** – Allows the role to interact with AWS Lambda. Also allows tagging resources.
• logs – Allows the role to create, delete and access log streams.
• s3 – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to access Amazon S3 buckets where the Project template code is stored.
• sagemaker – Allows the role to interact with various SageMaker services. This is done both in CloudFormation during template provisioning, as well as in CodeBuild during CICD pipeline execution. Also allows tagging the following resources: endpoints, endpoint configurations, models, pipelines, projects, and model packages.
• states – Allows the role to create, delete, and update Step Functions prepended with sagemaker.

AWS managed policy:
AmazonSageMakerServiceCatalogProductsApiGatewayServiceRolePolicy

This policy is used by Amazon API Gateway within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by API Gateway that require a role.

Permissions details

This policy includes the following permissions.

- **logs** – Create and read CloudWatch Logs groups, streams, and events; update events; describe various resources.
These permissions are limited to resources whose log group prefix starts with "aws/apigateway/".

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "logs:CreateLogDelivery",
        "logs:CreateLogGroup",
        "logs:CreateLogStream",
        "logs:DeleteLogDelivery",

      ],
      "Resource": "arn:aws:logs:*:*:log-group:/aws/apigateway/*"
    }
  ]
}
```

**AWS managed policy:**

**AmazonSageMakerServiceCatalogProductsCloudformationServiceRolePolicy**

This policy is used by AWS CloudFormation within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by AWS CloudFormation that require a role.

**Permissions details**

This policy includes the following permissions.

- **sagemaker** – Allow access to various SageMaker resources excluding domains, user-profiles, apps, and flow definitions.
- **iam** – Pass the AmazonSageMakerServiceCatalogProductsCodeBuildRole and AmazonSageMakerServiceCatalogProductsExecutionRole roles.

```json

AWS managed policy:
AmazonSageMakerServiceCatalogProductsCodeBuildServiceRolePolicy

This policy is used by AWS CodeBuild within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by CodeBuild that require a role.

Permissions details

This policy includes the following permissions.

- **sagemaker** – Allow access to various SageMaker resources.
- **codecommit** – Upload CodeCommit archives to CodeBuild pipelines, get upload status, and cancel uploads; get branch and commit information. These permissions are limited to resources whose name starts with "sagemaker-".
- **ecr** – Create Amazon ECR repositories and container images; upload image layers. These permissions are limited to repositories whose name starts with "sagemaker-".
- **s3** – Create, read, and list Amazon S3 buckets. These permissions are limited to buckets whose name starts with "sagemaker-".

**AWS managed policy:**

AmazonSageMakerServiceCatalogProductsCodePipelineServiceRolePolicy

This policy is used by AWS CodePipeline within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by CodePipeline that require a role.

**Permissions details**

This policy includes the following permissions.

- **cloudformation** – Create, read, delete, and update CloudFormation stacks; create, read, delete, and execute change sets; set stack policy. These permissions are limited to resources whose name starts with "sagemaker-".
- **s3** – Create, read, list, and delete Amazon S3 buckets; add, read, and delete objects from the buckets; read and set the CORS configuration; read the access control list (ACL); and read the AWS Region the bucket resides in.

  These permissions are limited to buckets whose name starts with "sagemaker-" or "aws-glue-".
- **iam** – Pass the AmazonSageMakerServiceCatalogProductsCloudformationRole role.
- **codebuild** – Get CodeBuild build information and start builds. These permissions are limited to project and build resources whose name starts with "sagemaker-".
- **codecommit** – Upload CodeCommit archives to CodeBuild pipelines, get upload status, and cancel uploads; get branch and commit information.

      ],
      "Resource": [
        "arn:aws:s3:::sagemaker-*"
      ]
    }]
}
AWS managed policy:
AmazonSageMakerServiceCatalogProductsEventsServiceRolePolicy

This policy is used by Amazon EventBridge within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by EventBridge that require a role.

Permissions details

This policy includes the following permissions.

- codepipeline – Start a CodeBuild execution. These permissions are limited to pipelines whose name starts with "sagemaker-".
AWS managed policy:
AmazonSageMakerServiceCatalogProductsFirehoseServiceRolePolicy

This policy is used by Amazon Kinesis Data Firehose within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by Kinesis Data Firehose that require a role.

Permissions details

This policy includes the following permissions.

• firehose – Send Kinesis Data Firehose records. These permissions are limited to resources whose delivery stream name starts with "sagemaker-".

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",

        "firehose:PutRecord",
        "firehose:PutRecordBatch"
      ],
      "Resource": "arn:aws:firehose:*:*:deliverystream/sagemaker-*"
    }
  ]
}
```

AWS managed policy:
AmazonSageMakerServiceCatalogProductsGlueServiceRolePolicy

This policy is used by AWS Glue within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by Glue that require a role.

Permissions details

This policy includes the following permissions.

• glue – Create, read, and delete AWS Glue partitions, tables, and table versions. These permissions are limited to those resources whose name starts with "sagemaker-". Create and read AWS Glue databases. These permissions are limited to databases whose name is "default", "global_temp", or starts with "sagemaker-". Get user defined functions.

• s3 – Create, read, list, and delete Amazon S3 buckets; add, read, and delete objects from the buckets; read and set the CORS configuration; read the access control list (ACL), and read the AWS Region the bucket resides in. These permissions are limited to buckets whose name starts with "sagemaker-" or "aws-glue-".

• logs – Create, read, and delete CloudWatch Logs log group, streams, and deliveries; and create a resource policy. These permissions are limited to resources whose name prefix starts with "aws/glue/".

AWS managed policy:  
AmazonSageMakerServiceCatalogProductsLambdaServiceRolePolicy

This policy is used by AWS Lambda within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by Lambda that require a role.

Permissions details

This policy includes the following permissions.

- **sagemaker** – Allow access to various SageMaker resources.
- **ecr** – Create and delete Amazon ECR repositories; create, read, and delete container images; upload image layers. These permissions are limited to repositories whose name starts with "sagemaker-".
- **events** – Create, read, and delete Amazon EventBridge rules; and create and remove targets. These permissions are limited to rules whose name starts with "sagemaker-".
- **s3** – Create, read, list, and delete Amazon S3 buckets; add, read, and delete objects from the buckets; read and set the CORS configuration; read the access control list (ACL), and read the AWS Region the bucket resides in.
  
  These permissions are limited to buckets whose name starts with "sagemaker-" or "aws-glue-".
- **iam** – Pass the AmazonSageMakerServiceCatalogProductsExecutionRole role.
- **logs** – Create, read, and delete CloudWatch Logs log group, streams, and deliveries; and create a resource policy.
  
  These permissions are limited to resources whose name prefix starts with "aws/lambda/".

### Troubleshooting Amazon SageMaker Identity and Access

Use the following information to help you diagnose and fix common issues that you might encounter when working with SageMaker and IAM.

**Topics**
I Am Not Authorized to Perform an Action in SageMaker

If the AWS Management Console tells you that you're not authorized to perform an action, then you must contact your administrator for assistance. Your administrator is the person that provided you with your user name and password.

The following example error occurs when the mateojackson IAM user tries to use the console to view details about a training job but does not have sagemaker:sagemaker:DescribeTrainingJob permissions.

User: arn:aws:iam::123456789012:user/mateojackson is not authorized to perform: sagemaker:DescribeTrainingJob on resource: my-example-widget

In this case, Mateo asks his administrator to update his policies to allow him to access the TrainingJob resource using the sagemaker:DescribeTrainingJob action.

I Am Not Authorized to Perform iam:PassRole

If you receive an error that you're not authorized to perform the iam:PassRole action, your policies must be updated to allow you to pass a role to SageMaker.

Some AWS services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named marymajor tries to use the console to perform an action in SageMaker. However, the action requires the service to have permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.

User: arn:aws:iam::123456789012:user/marymajor is not authorized to perform: iam:PassRole

In this case, Mary's policies must be updated to allow her to perform the iam:PassRole action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

I Want to View My Access Keys

After you create your IAM user access keys, you can view your access key ID at any time. However, you can't view your secret access key again. If you lose your secret key, you must create a new access key pair.

Access keys consist of two parts: an access key ID (for example, AKIAIOSFODNN7EXAMPLE) and a secret access key (for example, wJalrXUttnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY). Like a user name and password, you must use both the access key ID and secret access key together to authenticate your requests. Manage your access keys as securely as you do your user name and password.

Important
Do not provide your access keys to a third party, even to help find your canonical user ID. By doing this, you might give someone permanent access to your account.
When you create an access key pair, you are prompted to save the access key ID and secret access key in a secure location. The secret access key is available only at the time you create it. If you lose your secret access key, you must add new access keys to your IAM user. You can have a maximum of two access keys. If you already have two, you must delete one key pair before creating a new one. To view instructions, see Managing access keys in the IAM User Guide.

I'm an Administrator and Want to Allow Others to Access SageMaker

To allow others to access SageMaker, you must create an IAM entity (user or role) for the person or application that needs access. They will use the credentials for that entity to access AWS. You must then attach a policy to the entity that grants them the correct permissions in SageMaker.

To get started right away, see Creating your first IAM delegated user and group in the IAM User Guide.

I Want to Allow People Outside of My AWS Account to Access My SageMaker Resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether SageMaker supports these features, see How Amazon SageMaker Works with IAM (p. 3505).
- To learn how to provide access to your resources across AWS accounts that you own, see Providing access to an IAM user in another AWS account that you own in the IAM User Guide.
- To learn how to provide access to your resources to third-party AWS accounts, see Providing access to AWS accounts owned by third parties in the IAM User Guide.
- To learn how to provide access through identity federation, see Providing access to externally authenticated users (identity federation) in the IAM User Guide.
- To learn the difference between using roles and resource-based policies for cross-account access, see How IAM roles differ from resource-based policies in the IAM User Guide.

Logging and Monitoring

You can monitor Amazon SageMaker using Amazon CloudWatch, which collects raw data and processes it into readable, near real-time metrics. These statistics are kept for 15 months, so that you can access historical information and gain a better perspective on how your web application or service is performing. You can also set alarms that watch for certain thresholds and send notifications or take actions when those thresholds are met. For more information, see Monitor Amazon SageMaker with Amazon CloudWatch (p. 3663).

Amazon CloudWatch Logs enables you to monitor, store, and access your log files from Amazon EC2 instances, AWS CloudTrail, and other sources. You can collect and track metrics, create customized dashboards, and set alarms that notify you or take actions when a specified metric reaches a threshold that you specify. CloudWatch Logs can monitor information in the log files and notify you when certain thresholds are met. You can also archive your log data in highly durable storage. For more information, see Log Amazon SageMaker Events with Amazon CloudWatch (p. 3675).
Compliance Validation for Amazon SageMaker

Third-party auditors assess the security and compliance of Amazon SageMaker as part of multiple AWS compliance programs. These include SOC, PCI, FedRAMP, HIPAA, and others.

For a list of AWS services in scope of specific compliance programs, see AWS Services in Scope by Compliance Program. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact.

Your compliance responsibility when using Amazon SageMaker is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- **Security and Compliance Quick Start Guides** – These deployment guides discuss architectural considerations and provide steps for deploying security- and compliance-focused baseline environments on AWS.
- **Architecting for HIPAA Security and Compliance Whitepaper** – This whitepaper describes how companies can use AWS to create HIPAA-compliant applications.
- **AWS Compliance Resources** – This collection of workbooks and guides might apply to your industry and location.
- **AWS Config** – This AWS service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- **AWS Security Hub** – This AWS service provides a comprehensive view of your security state within AWS that helps you check your compliance with security industry standards and best practices.

Resilience in Amazon SageMaker

The AWS global infrastructure is built around AWS Regions and Availability Zones. AWS Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between Availability Zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see AWS Global Infrastructure.

In addition to the AWS global infrastructure, Amazon SageMaker offers several features to help support your data resiliency and backup needs.
Infrastructure Security in Amazon SageMaker

As a managed service, Amazon SageMaker is protected by the AWS global network security procedures that are described in the Amazon Web Services: Overview of Security Processes whitepaper.

You use AWS published API calls to access Amazon SageMaker through the network. Clients must support Transport Layer Security (TLS) 1.0 or later. We recommend TLS 1.2 or later. Clients must also support cipher suites with perfect forward secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the AWS Security Token Service (AWS STS) to generate temporary security credentials to sign requests.

- Give SageMaker Access to Resources in your Amazon VPC (p. 3644)

SageMaker Scans AWS Marketplace Training and Inference Containers for Security Vulnerabilities

To meet our security requirements, algorithms and model packages listed in AWS Marketplace are scanned for Common Vulnerabilities and Exposures (CVE). CVE is a list of publicly known information about security vulnerability and exposure. The National Vulnerability Database (NVD) provides CVE details such as severity, impact rating, and fix information. Both CVE and NVD are available for public consumption and free for security tools and services to use. For more information, see http://cve.mitre.org/about/faqs.html#what_is_cve.

Connect to Resources From Within a VPC

Amazon SageMaker Studio and SageMaker notebook instances allow direct internet access by default. This allows you to download popular packages and notebooks, customize your development environment, and work efficiently. However, this could provide an additional avenue for unauthorized access to your data. For example, if you install malicious code on your computer in the form of a publicly available notebook or a publicly available source code library, it could access your data. You can choose to restrict which traffic can access the internet by launching your Amazon SageMaker Studio and SageMaker notebook instances in a Amazon Virtual Private Cloud (Amazon VPC) of your choosing.

An Amazon Virtual Private Cloud is a virtual network dedicated to your AWS account. With an Amazon VPC, you can control the network access and internet connectivity of your Amazon SageMaker Studio and notebook instances. You can disable direct internet access to add an additional layer of security.

The following topics describe how to connect your SageMaker Studio instances and notebook instances to resources in a VPC.

Topics
Connect SageMaker Studio Notebooks in a VPC to External Resources

The following topic gives information on how to connect Studio Notebooks in a VPC to external resources.

Default communication with the internet

By default, SageMaker Studio provides a network interface that allows communication with the internet through a VPC managed by SageMaker. Traffic to AWS services like Amazon S3 and CloudWatch goes through an internet gateway, as does traffic that accesses the SageMaker API and SageMaker runtime. Traffic between the domain and your Amazon EFS volume goes through the VPC that you specified when you onboarded to Studio or called the CreateDomain API. The following diagram shows the default configuration.

VPC only communication with the internet

To prevent SageMaker from providing internet access to your Studio notebooks, you can disable internet access by specifying the VPC only network access type when you onboard to Studio or call the CreateDomain API. As a result, you won't be able to run a Studio notebook unless your VPC has an interface endpoint to the SageMaker API and runtime, or a NAT gateway with internet access, and your security groups allow outbound connections. The following diagram shows a configuration for using VPC-only mode.
Requirements to use VPC only mode

When you choose *VpcOnly*, follow these steps:

1. Ensure your subnets have the required number of IP addresses needed. The expected number of IP addresses needed per user can vary based on use case. We recommend between 2 and 4 IP addresses per user. The total IP address capacity for a Studio domain is the sum of available IP addresses for each subnet provided when the domain is created. Ensure that your estimated IP address usage does not exceed the capacity supported by the number of subnets you provide. Additionally, using subnets distributed across many availability zones can aid in IP address availability. For more information, see [VPC and subnet sizing for IPv4](#).

   **Note**
   You can configure only subnets with a default tenancy VPC in which your instance runs on shared hardware. For more information on the tenancy attribute for VPCs, see [Dedicated Instances](#).

2. Set up one or more security groups with inbound and outbound rules that together allow the following traffic:
   - **NFS traffic over TCP on port 2049** between the domain and the Amazon EFS volume.
   - **TCP traffic within the security group.** This is required for connectivity between the JupyterServer app and the KernelGateway apps. You must allow access to at least ports in the range 8192–65535.

3. If you want to allow internet access, you must use a **NAT gateway** with access to the internet, for example through an internet gateway.

4. If you don’t want to allow internet access, create interface VPC endpoints (AWS PrivateLink) to allow Studio to access the following services with the corresponding service names. You must also associate the security groups for your VPC with these endpoints.
   - **SageMaker API**: `com.amazonaws.us-east-1.sagemaker.api`
   - **SageMaker runtime**: `com.amazonaws.us-east-1.sagemaker.runtime`. This is required to run Studio notebooks and to train and host models.
   - **Amazon S3**: `com.amazonaws.us-east-1.s3`
   - To use SageMaker Projects: `com.amazonaws.us-east-1.servicecatalog`.
   - Any other AWS services you require.
Note
For a customer working within VPC mode, company firewalls can cause connection issues with SageMaker Studio or between JupyterServer and the KernelGateway. Make the following checks if you encounter one of these issues when using SageMaker Studio from behind a firewall.

- Check that the Studio URL is in your networks allowlist.
- Check that the websocket connections are not blocked. Jupyter uses websocket under the hood. If the KernelGateway application is InService, JupyterServer may not be able to connect to the KernelGateway. You should see this problem when opening System Terminal as well.

For more information
- Securing Amazon SageMaker Studio connectivity using a private VPC.
- Security groups for your VPC
- Connect to SageMaker Through a VPC Interface Endpoint (p. 3635)
- VPC with public and private subnets (NAT)

Connect a Notebook Instance in a VPC to External Resources

The following topic gives information on how to connect your notebook instance in a VPC to external resources.

Default communication with the internet

When your notebook allows direct internet access, SageMaker provides a network interface that allows the notebook to communicate with the internet through a VPC managed by SageMaker. Traffic within your VPC’s CIDR goes through elastic network interface created in your VPC. All the other traffic goes through the network interface created by SageMaker, which is essentially through the public internet. Traffic to gateway VPC endpoints like Amazon S3 and DynamoDB goes through the public internet, while traffic to interface VPC interface endpoints still goes through your VPC. If you want to use gateway VPC endpoints, you might want to disable direct internet access.

VPC communication with the internet

To disable direct internet access, you can specify a VPC for your notebook instance. By doing so, you prevent SageMaker from providing internet access to your notebook instance. As a result, the notebook instance can’t train or host models unless your VPC has an interface endpoint (AWS PrivateLink) or a NAT gateway and your security groups allow outbound connections.

For information about creating a VPC interface endpoint to use AWS PrivateLink for your notebook instance, see Connect to a Notebook Instance Through a VPC Interface Endpoint (p. 3641). For information about setting up a NAT gateway for your VPC, see VPC with Public and Private Subnets (NAT) in the Amazon Virtual Private Cloud User Guide. For information about security groups, see Security Groups for Your VPC. For more information about networking configurations in each networking mode and configuring network on premise, see Understanding Amazon SageMaker notebook instance networking configurations and advanced routing options.

Security and Shared Notebook Instances

A SageMaker notebook instance is designed to work best for an individual user. It is designed to give data scientists and other users the most power for managing their development environment.

A notebook instance user has root access for installing packages and other pertinent software. We recommend that you exercise judgement when granting individuals access to notebook instances that are attached to a VPC that contains sensitive information. For example, you might grant a user access to a notebook instance with an IAM policy, as shown in the following example:
Run Training and Inference Containers in Internet-Free Mode

SageMaker training and deployed inference containers are internet-enabled by default. This allows containers to access external services and resources on the public internet as part of your training and inference workloads. However, this could provide an avenue for unauthorized access to your data. For example, a malicious user or code that you accidentally install on the container (in the form of a publicly available source code library) could access your data and transfer it to a remote host.

If you use an Amazon VPC by specifying a value for the VpcConfig parameter when you call CreateTrainingJob, CreateHyperParameterTuningJob, or CreateModel, you can protect your data and resources by managing security groups and restricting internet access from your VPC. However, this comes at the cost of additional network configuration, and has the risk of configuring your network incorrectly. If you do not want SageMaker to provide external network access to your training or inference containers, you can enable network isolation.

Network Isolation

You can enable network isolation when you create your training job or model by setting the value of the EnableNetworkIsolation parameter to True when you call CreateTrainingJob, CreateHyperParameterTuningJob, or CreateModel.

Note
Network isolation is required to run training jobs and models using resources from AWS Marketplace.

If you enable network isolation, the containers can't make any outbound network calls, even to other AWS services such as Amazon S3. Additionally, no AWS credentials are made available to the container runtime environment. In the case of a training job with multiple instances, network inbound and outbound traffic is limited to the peers of each training container. SageMaker still performs download and upload operations against Amazon S3 using your SageMaker execution role in isolation from the training or inference container.

The following managed SageMaker containers do not support network isolation because they require access to Amazon S3:

- Chainer
- SageMaker Reinforcement Learning

Network isolation with a VPC

Network isolation can be used in conjunction with a VPC. In this scenario, the download and upload of customer data and model artifacts are routed through your VPC subnet. However, the training and
inference containers themselves continue to be isolated from the network, and do not have access to any resource within your VPC or on the internet.

Connect to SageMaker Through a VPC Interface Endpoint

You can connect directly to the SageMaker API or to the SageMaker Runtime through an interface endpoint in your Virtual Private Cloud (VPC) instead of connecting over the internet. When you use a VPC interface endpoint, communication between your VPC and the SageMaker API or Runtime is conducted entirely and securely within the AWS network.

The SageMaker API and Runtime support Amazon Virtual Private Cloud (Amazon VPC) interface endpoints that are powered by AWS PrivateLink. Each VPC endpoint is represented by one or more Elastic Network Interfaces with private IP addresses in your VPC subnets.

The VPC interface endpoint connects your VPC directly to the SageMaker API or Runtime without an internet gateway, NAT device, VPN connection, or AWS Direct Connect connection. The instances in your VPC don't need public IP addresses to communicate with the SageMaker API or Runtime.

You can create an interface endpoint to connect to SageMaker or to SageMaker Runtime with either the AWS console or AWS Command Line Interface (AWS CLI) commands. For instructions, see Creating an Interface Endpoint.

After you have created a VPC endpoint, you can use the following example CLI commands that use the endpoint-url parameter to specify interface endpoints to the SageMaker API or Runtime:

```bash
aws sagemaker list-notebook-instances --endpoint-url VPC_Endpoint_ID.api.sagemaker.Region.vpce.amazonaws.com
aws sagemaker list-training-jobs --endpoint-url VPC_Endpoint_ID.api.sagemaker.Region.vpce.amazonaws.com
aws sagemaker-runtime invoke-endpoint --endpoint-url VPC_Endpoint_ID.runtime.sagemaker.Region.vpce.amazonaws.com --endpoint-name Endpoint_Name --body "Endpoint_Body" --content-type "Content_Type" "Output_File"
```

If you enable private DNS hostnames for your VPC endpoint, you don't need to specify the endpoint URL. The SageMaker API DNS hostname that the CLI and SageMaker SDK use by default (https://api.sagemaker.Region.amazonaws.com) resolves to your VPC endpoint. Similarly, the SageMaker Runtime DNS hostname that the CLI and SageMaker Runtime SDK use by default (https://runtime.sagemaker.Region.amazonaws.com) resolves to your VPC endpoint.

The SageMaker API and Runtime support VPC endpoints in all AWS Regions where both Amazon VPC and SageMaker are available. SageMaker supports making calls to all of its Operations inside your VPC. The result AuthorizedUrl from the CreatePresignedNotebookInstanceUrl is not supported by AWS PrivateLink. For information about how to enable AWS PrivateLink for the authorized URL that users use to connect to a notebook instance, see Connect to a Notebook Instance Through a VPC Interface Endpoint (p. 3641).

To learn more about AWS PrivateLink, see the AWS PrivateLink documentation. Refer to PrivateLink Pricing for the price of VPC endpoints. To learn more about VPC and endpoints, see Amazon VPC. For information about how to use identity-based AWS Identity and Access Management policies to restrict access to the SageMaker API and runtime, see Control Access to the SageMaker API by Using Identity-based Policies (p. 3525).
Create a VPC Endpoint Policy for SageMaker

You can create a policy for Amazon VPC endpoints for SageMaker to specify the following:

- The principal that can perform actions.
- The actions that can be performed.
- The resources on which actions can be performed.

For more information, see Controlling Access to Services with VPC Endpoints in the Amazon VPC User Guide.

**Note**

VPC endpoint policies aren't supported for Federal Information Processing Standard (FIPS) SageMaker runtime endpoints for `runtime_InvokeEndpoint`.

The following example VPC endpoint policy specifies that all users who have access to the VPC interface endpoint are allowed to invoke the SageMaker hosted endpoint named `myEndpoint`.

```json
{
  "Statement": [
    {
      "Action": "sagemaker:InvokeEndpoint",
      "Effect": "Allow",
      "Principal": "*"
    }
  ]
}
```

In this example, the following are denied:

- Other SageMaker API actions, such as `sagemaker:CreateEndpoint` and `sagemaker:CreateTrainingJob`.
- Invoking SageMaker hosted endpoints other than `myEndpoint`.

**Note**

In this example, users can still take other SageMaker API actions from outside the VPC. For information about how to restrict API calls to those from within the VPC, see Control Access to the SageMaker API by Using Identity-based Policies (p. 3525).

Create a VPC Endpoint Policy for Amazon SageMaker Feature Store

To create a VPC Endpoint for Amazon SageMaker Feature Store, use the following endpoint template, substituting your `VPC_Endpoint_ID.api` and `Region`:

`VPC_Endpoint_ID.api.featurestore-runtime.sagemaker.Region.vpce.amazonaws.com`

Connect to SageMaker Studio Through an Interface VPC Endpoint

You can connect to Amazon SageMaker Studio from your Amazon Virtual Private Cloud (Amazon VPC) through an interface endpoint in your VPC instead of connecting over the internet. When you use an
interface VPC endpoint (interface endpoint), communication between your VPC and Studio is conducted entirely and securely within the AWS network.

SageMaker Studio supports interface endpoints that are powered by AWS PrivateLink. Each interface endpoint is represented by one or more Elastic network interfaces with private IP addresses in your VPC subnets.

Studio supports interface endpoints in all AWS Regions where both Amazon SageMaker and Amazon VPC are available.

Topics
- Create a VPC Endpoint (p. 3637)
- Create a VPC Endpoint Policy for SageMaker Studio (p. 3637)
- Allow Access Only from Within Your VPC (p. 3638)

Create a VPC Endpoint

You can create an interface endpoint to connect to Studio with either the AWS console or the AWS Command Line Interface (AWS CLI). For instructions, see Creating an interface endpoint. Make sure that you create interface endpoints for all of the subnets in your VPC from which you want to connect to Studio.

When you create an interface endpoint, ensure that the security groups on your endpoint allow inbound access for HTTPS traffic from the security groups associated with SageMaker Studio. For more information, see Control access to services with VPC endpoints.

Note
In addition to creating an interface endpoint to connect to SageMaker Studio, create an interface endpoint to connect to the Amazon SageMaker API. When users call CreatePresignedDomainUrl to get the URL to connect to Studio, that call goes through the interface endpoint used to connect to the SageMaker API.

When you create the interface endpoint, specify aws.sagemaker.Region.studio as the service name. After you create the interface endpoint, enable private DNS for your endpoint. When you connect to SageMaker Studio from within the VPC using the SageMaker API, the AWS CLI, or the console, you connect through the interface endpoint instead of the public internet. You also need to set up a custom DNS with private hosted zones for the Amazon VPC endpoint so SageMaker Studio can access the SageMaker API using the api.sagemaker.$region.amazonaws.com endpoint rather than using the VPC endpoint URL. For instructions on setting up a private hosted zone, see Working with private hosted zones.

Create a VPC Endpoint Policy for SageMaker Studio

You can attach an Amazon VPC endpoint policy to the interface VPC endpoints that you use to connect to SageMaker Studio. The endpoint policy controls access to Studio. You can specify the following:

- The principal that can perform actions.
- The actions that can be performed.
- The resources on which actions can be performed.

To use a VPC endpoint with SageMaker Studio, your endpoint policy must allow the CreateApp operation on the KernelGateway app type. This allows traffic that is routed to through the VPC endpoint to call the CreateApp API. The following example VPC endpoint policy shows how to allow the CreateApp operation.

```
"Statement": [  
  
  
  
  ]
}

For more information, see Controlling access to services with VPC endpoints.

The following example of a VPC endpoint policy specifies that all users that have access to the endpoint are allowed to access the user profiles in the SageMaker Studio domain with the specified domain ID. Access to other domains is denied.

```
{
  "Statement": [
    
    
    
  ]
}
```

Allow Access Only from Within Your VPC

Users outside your VPC can connect to SageMaker Studio over the internet even if you set up an interface endpoint in your VPC.

To allow access to only connections made from within your VPC, create an AWS Identity and Access Management (IAM) policy to that effect. Add that policy to every IAM user, group, or role used to access Studio. This feature is only supported in IAM mode, and is not supported in IAM Identity Center mode. The following examples demonstrate how to create such policies.

**Important**
If you apply an IAM policy similar to one of the following examples, users can't access SageMaker Studio or the specified SageMaker APIs through the SageMaker console. To access Studio, users must use a presigned URL or call the SageMaker APIs directly.

**Example 1: Allow connections only within the subnet of an interface endpoint**

The following policy allows connections only to callers within the subnet where you created the interface endpoint.

```
{
  "Id": "sagemaker-studio-example-1",
  "Version": "2012-10-17",
  "Statement": [
    
    
    
    ]
}
```
Example 2: Allow connections only through interface endpoints using `aws:sourceVpce`

The following policy allows connections only to those made through the interface endpoints specified by the `aws:sourceVpce` condition key. For example, the first interface endpoint could allow access through the SageMaker Studio Control Panel. The second interface endpoint could allow access through the SageMaker API.

```json
{
"Id": "sagemaker-studio-example-2",
"Version": "2012-10-17",
"Statement": [
{
 "Sid": "Enable SageMaker Studio Access",
 "Effect": "Allow",
 "Action": [
 "sagemaker:CreatePresignedDomainUrl",
 "sagemaker:DescribeUserProfile"
 ],
 "Resource": "*",
 "Condition": {
 "ForAnyValue:StringEquals": {
 "aws:sourceVpce": [
 "vpce-111bbccc",
 "vpce-111bbddd"
 ]
 }
 }
]
}
```

This policy includes the `DescribeUserProfile` action. Typically you call `DescribeUserProfile` to make sure that the status of the user profile is `InService` before you try to connect to the domain. For example:

```bash
aws sagemaker describe-user-profile \
   --domain-id domain-id \
   --user-profile-name profile-name
```

Response:

```json
{
 "DomainId": "domain-id",
 "UserProfileName": "profile-name",
 "HomeEfsFileSystemUid": "200001",
 "Status": "InService",
 "LastModifiedTime": 1605418785.555,
 "CreationTime": 1605418477.297
}
```

```bash
aws sagemaker create-presigned-domain-url
```
Connect to SageMaker Through a VPC Interface Endpoint

---

**Response:**

```
{
  "AuthorizedUrl": "https://domain-id.studio.us-west-2.sagemaker.aws/auth?token=AuthToken"
}
```

For both of these calls, if you are using a version of the AWS SDK that was released before August 13, 2018, you must specify the endpoint URL in the call. For example, the following example shows a call to `create-presigned-domain-url`:

```
aws sagemaker create-presigned-domain-url
   --domain-id domain-id \ 
   --user-profile-name profile-name \ 
   --endpoint-url vpc-endpoint-id.api.sagemaker.Region.vpce.amazonaws.com
```

**Example 3: Allow connections from IP addresses using `aws:SourceIp`**

The following policy allows connections only from the specified range of IP addresses using the `aws:SourceIp` condition key.

```
{
  "Id": "sagemaker-studio-example-3",
  "Version": "2012-10-17",
  "Statement": [ 
    { 
      "Sid": "Enable SageMaker Studio Access",
      "Effect": "Allow",
      "Action": [ 
        "sagemaker:CreatePresignedDomainUrl",
        "sagemaker:DescribeUserProfile"
      ],
      "Resource": "*",
      "Condition": { 
        "IpAddress": { 
          "aws:SourceIp": [ 
            "192.0.2.0/24",
            "203.0.113.0/24"
          ]
        }
      }
    }
  ]
}
```

**Example 4: Allow connections from IP addresses through an interface endpoint using `aws:VpcSourceIp`**

If you are accessing SageMaker Studio through an interface endpoint, you can use the `aws:VpcSourceIp` condition key to allow connections only from the specified range of IP addresses within the subnet where you created the interface endpoint as shown in the following policy:

```
{
  "Id": "sagemaker-studio-example-4",
  "Version": "2012-10-17",
  "Statement": [ 
    { 
      "Sid": "Enable SageMaker Studio Access",
      "Effect": "Allow",
      "Action": [ 
        "sagemaker:CreatePresignedDomainUrl",
        "sagemaker:DescribeUserProfile"
      ],
      "Resource": "*",
      "Condition": { 
        "IpAddress": { 
          "aws:SourceIp": [ 
            "192.0.2.0/24",
            "203.0.113.0/24"
          ]
        } 
      }
    }
  ]
}
```
Connect to a Notebook Instance Through a VPC Interface Endpoint

You can connect to your notebook instance from your VPC through an interface endpoint in your Virtual Private Cloud (VPC) instead of connecting over the public internet. When you use a VPC interface endpoint, communication between your VPC and the notebook instance is conducted entirely and securely within the AWS network.

SageMaker notebook instances support Amazon Virtual Private Cloud (Amazon VPC) interface endpoints that are powered by AWS PrivateLink. Each VPC endpoint is represented by one or more Elastic Network Interfaces with private IP addresses in your VPC subnets.

Note
Before you create an interface VPC endpoint to connect to a notebook instance, create an interface VPC endpoint to connect to the SageMaker API. That way, when users call CreatePresignedNotebookInstanceUrl to get the URL to connect to the notebook instance, that call also goes through the interface VPC endpoint. For information, see Connect to SageMaker Through a VPC Interface Endpoint (p. 3635).

You can create an interface endpoint to connect to your notebook instance with either the AWS console or AWS Command Line Interface (AWS CLI) commands. For instructions, see Creating an Interface Endpoint. Make sure that you create an interface endpoint for all of the subnets in your VPC from which you want to connect to the notebook instance.

When you create the interface endpoint, specify aws.sagemaker.region.notebook as the service name. After you create a VPC endpoint, enable private DNS for your VPC endpoint. Anyone using the SageMaker API, the AWS CLI, or the console to connect to the notebook instance from within the VPC connects to the notebook instance through the VPC endpoint instead of the public internet.

SageMaker notebook instances support VPC endpoints in all AWS Regions where both Amazon VPC and SageMaker are available.

Topics
- Connect Your Private Network to Your VPC (p. 3642)
- Create a VPC Endpoint Policy for SageMaker Notebook Instances (p. 3642)
- Restrict Access to Connections from Within Your VPC (p. 3642)
Connect Your Private Network to Your VPC

To connect to your notebook instance through your VPC, you either have to connect from an instance that is inside the VPC, or connect your private network to your VPC by using an AWS Virtual Private Network (AWS VPN) or AWS Direct Connect. For information about AWS VPN, see VPN Connections in the Amazon Virtual Private Cloud User Guide. For information about AWS Direct Connect, see Creating a Connection in the AWS Direct Connect User Guide.

Create a VPC Endpoint Policy for SageMaker Notebook Instances

You can create a policy for Amazon VPC endpoints for SageMaker notebook instances to specify the following:

- The principal that can perform actions.
- The actions that can be performed.
- The resources on which actions can be performed.

For more information, see Controlling Access to Services with VPC Endpoints in the Amazon VPC User Guide.

The following example of a VPC endpoint policy specifies that all users that have access to the endpoint are allowed to access the notebook instance named myNotebookInstance.

```
{
  "Statement": [
    {
      "Action": "sagemaker:CreatePresignedNotebookInstanceUrl",
      "Effect": "Allow",
      "Principal": "*"
    }
  ]
}
```

Access to other notebook instances is denied.

Restrict Access to Connections from Within Your VPC

Even if you set up an interface endpoint in your VPC, individuals outside the VPC can connect to the notebook instance over the internet.

Important

If you apply an IAM policy similar to one of the following, users can't access the specified SageMaker APIs or the notebook instance through the console.

To restrict access to only connections made from within your VPC, create an AWS Identity and Access Management policy that restricts access to only calls that come from within your VPC. Then add that policy to every AWS Identity and Access Management user, group, or role used to access the notebook instance.

Note

This policy allows connections only to callers within a subnet where you created an interface endpoint.

```
{
  "Id": "notebook-example-1",
  "Version": "2012-10-17",
  "Statement": [
```
Connect to SageMaker Through a VPC Interface Endpoint

If you want to restrict access to the notebook instance to only connections made using the interface endpoint, use the `aws:SourceVpce` condition key instead of `aws:SourceVpc`:

```json
{
  "Id": "notebook-example-1",
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "Enable Notebook Access",
      "Effect": "Allow",
      "Action": [
        "sagemaker:CreatePresignedNotebookInstanceUrl",
        "sagemaker:DescribeNotebookInstance"
      ],
      "Resource": "*",
      "Condition": {
        "ForAnyValue:StringEquals": {
          "aws:SourceVpce": [
            "vpce-111bbccc",
            "vpce-111bbddd"
          ]
        }
      }
    }
  ]
}
```

Both of these policy examples assume that you have also created an interface endpoint for the SageMaker API. For more information, see Connect to SageMaker Through a VPC Interface Endpoint (p. 3635). In the second example, one of the values for `aws:SourceVpce` is the ID of the interface endpoint for the notebook instance. The other is the ID of the interface endpoint for the SageMaker API.

The policy examples here include `DescribeNotebookInstance`, because typically you would call `DescribeNotebookInstance` to make sure that the `NotebookInstanceStatus` is `InService` before you try to connect to it. For example:

```bash
aws sagemaker describe-notebook-instance
  --notebook-instance-name myNotebookInstance
```

```json
{
  "NotebookInstanceArn":
```
"NotebookInstanceName": "myNotebookInstance",
"NotebookInstanceStatus": "InService",
"Url": "mynotebookinstance.notebook.us-west-2.sagemaker.aws",
"InstanceType": "ml.m4.xlarge",
"RoleArn": "arn:aws:iam::1234567890ab:role/service-role/AmazonSageMaker-
ExecutionRole-12345678T123456",
"LastModifiedTime": 1540334777.501,
"CreationTime": 1523050674.078,
"DirectInternetAccess": "Disabled"
}

aws sagemaker create-presigned-notebook-instance-url --notebook-instance-name
myNotebookInstance

{
  "AuthorizedUrl": "https://mynotebookinstance.notebook.us-west-2.sagemaker.aws?
authToken=AuthToken"
}

**Note**
The presigned url generated can be used from anywhere on the internet.

For both of these calls, if you did not enable private DNS hostnames for your VPC endpoint, or if you
are using a version of the AWS SDK that was released before August 13, 2018, you must specify the
endpoint URL in the call. For example, the call to create-presigned-notebook-instance-url is:

```bash
aws sagemaker create-presigned-notebook-instance-url
--notebook-instance-name myNotebookInstance
--endpoint-url VPC_Endpoint_ID.api.sagemaker.Region.vpce.amazonaws.com
```

**Connect Your Private Network to Your VPC**

To call the SageMaker API and runtime through your VPC, you have to connect from an instance that is
inside the VPC or connect your private network to your VPC by using an AWS Virtual Private Network
(AWS VPN) or AWS Direct Connect. For information about AWS VPN, see **VPN Connections** in the Amazon
Virtual Private Cloud User Guide. For information about AWS Direct Connect, see **Creating a Connection** in
the AWS Direct Connect User Guide.

**Give SageMaker Access to Resources in your Amazon VPC**

SageMaker runs the following job types in an Amazon Virtual Private Cloud by default.

- Processing
- Training
- Model hosting
- Batch transform
- Amazon SageMaker Clarify
- SageMaker Compilation

However, containers for these jobs access AWS resources—such as the Amazon Simple Storage Service
(Amazon S3) buckets where you store training data and model artifacts—over the internet.

To control access to your data and job containers, we recommend that you create a private VPC
and configure it so that they aren't accessible over the internet. For information about creating and
configuring a VPC, see Getting Started With Amazon VPC in the Amazon VPC User Guide. Using a VPC helps to protect your job containers and data because you can configure your VPC so that it is not connected to the internet. Using a VPC also allows you to monitor all network traffic in and out of your job containers by using VPC flow logs. For more information, see VPC Flow Logs in the Amazon VPC User Guide.

You specify your private VPC configuration when you create jobs by specifying subnets and security groups. When you specify the subnets and security groups, SageMaker creates elastic network interfaces that are associated with your security groups in one of the subnets. Network interfaces allow your job containers to connect to resources in your VPC. For information about network interfaces, see Elastic Network Interfaces in the Amazon VPC User Guide.

**Topics**
- Give SageMaker Processing Jobs Access to Resources in Your Amazon VPC (p. 3645)
- Give SageMaker Training Jobs Access to Resources in Your Amazon VPC (p. 3648)
- Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC (p. 3650)
- Give Batch Transform Jobs Access to Resources in Your Amazon VPC (p. 3653)
- Give Amazon SageMaker Clarify Jobs Access to Resources in Your Amazon VPC (p. 3656)
- Give SageMaker Compilation Jobs Access to Resources in Your Amazon VPC (p. 3659)

**Give SageMaker Processing Jobs Access to Resources in Your Amazon VPC**

To control access to your data and processing jobs, we recommend that you create a private Amazon VPC and configure it so that your jobs aren't accessible over the public internet. For information about creating and configuring a VPC, see Getting Started With Amazon VPC in the Amazon VPC User Guide. Using a VPC helps to protect your processing containers and data because you can configure your VPC so that it is not connected to the internet. Using a VPC also allows you to monitor all network traffic in and out of your processing containers by using VPC flow logs. For more information, see VPC Flow Logs in the Amazon VPC User Guide.

This document explains how to add Amazon VPC configurations for processing jobs.

**Configure a Processing Job for Amazon VPC Access**

To specify subnets and security groups in your private VPC, use the NetworkConfig.VpcConfig request parameter of the CreateProcessingJob API, or provide this information when you create a processing job in the SageMaker console. SageMaker uses this information to create network interfaces and attach them to your processing containers. The network interfaces provide your processing containers with a network connection within your VPC that is not connected to the internet. They also enable your processing job to connect to resources in your private VPC.

The following is an example of the VpcConfig parameter that you include in your call to CreateProcessingJob:

```json
VpcConfig: {
    "Subnets": [
        "subnet-0123456789abcdef0",
        "subnet-0123456789abcdef1",
        "subnet-0123456789abcdef2"
    ],
    "SecurityGroupIds": [
        "sg-0123456789abcdef0"
    ]
}
```
Configure Your Private VPC for SageMaker Processing

When configuring the private VPC for your SageMaker processing jobs, use the following guidelines. For information about setting up a VPC, see Working with VPCs and Subnets in the Amazon VPC User Guide.

Topics

• Ensure That Subnets Have Enough IP Addresses (p. 3646)
• Create an Amazon S3 VPC Endpoint (p. 3646)
• Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3646)
• Configure Route Tables (p. 3647)
• Configure the VPC Security Group (p. 3647)
• Connect to Resources Outside Your VPC (p. 3647)

Ensure That Subnets Have Enough IP Addresses

Your VPC subnets should have at least two private IP addresses for each instance in a processing job. For more information, see VPC and Subnet Sizing for IPv4 in the Amazon VPC User Guide.

Create an Amazon S3 VPC Endpoint

If you configure your VPC so that processing containers don't have access to the internet, they can't connect to the Amazon S3 buckets that contain your data unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your processing containers to access the buckets where you store your data. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see Endpoints for Amazon S3.

To create an S3 VPC endpoint:

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose Endpoints, then choose Create Endpoint
3. For Service Name, choose com.amazonaws.region.s3, where region is the name of the region where your VPC resides.
4. For VPC, choose the VPC you want to use for this endpoint.
5. For Configure route tables, select the route tables to be used by the endpoint. The VPC service automatically adds a route to each route table you select that points any S3 traffic to the new endpoint.
6. For Policy, choose Full Access to allow full access to the S3 service by any user or service within the VPC. Choose Custom to restrict access further. For information, see Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3646).

Use a Custom Endpoint Policy to Restrict Access to S3

The default endpoint policy allows full access to S3 for any user or service in your VPC. To further restrict access to S3, create a custom endpoint policy. For more information, see Using Endpoint Policies for Amazon S3. You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see Using Amazon S3 Bucket Policies.

Restrict Package Installation on the Processing Container

The default endpoint policy allows users to install packages from the Amazon Linux and Amazon Linux 2 repositories on the processing container. If you don't want users to install packages from that repository, create a custom endpoint policy that explicitly denies access to the Amazon Linux and Amazon Linux 2 repositories. The following is an example of a policy that denies access to these repositories:
Give SageMaker Access to Resources in your Amazon VPC

```json
{
  "Statement": [
    {
      "Sid": "AmazonLinuxAMIRepositoryAccess",
      "Principal": "*",
      "Action": [
        "s3:GetObject"
      ],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::packages.*.amazonaws.com/*",
        "arn:aws:s3:::repo.*.amazonaws.com/*"
      ]
    }
  ]
}
{
  "Statement": [
    {
      "Sid": "AmazonLinux2AMIRepositoryAccess",
      "Principal": "*",
      "Action": [
        "s3:GetObject"
      ],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::amazonlinux.*.amazonaws.com/*"
      ]
    }
  ]
}
```

Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, http://s3-aws-region.amazonaws.com/MyBucket) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your processing jobs resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see Routing for Gateway Endpoints in the Amazon VPC User Guide.

Configure the VPC Security Group

In distributed processing, you must allow communication between the different containers in the same processing job. To do that, configure a rule for your security group that allows inbound connections between members of the same security group. For more information, see Security Group Rules.

Connect to Resources Outside Your VPC

If you configure your VPC so that it doesn't have internet access, processing jobs that use that VPC do not have access to resources outside your VPC. If your processing job needs access to resources outside your VPC, provide access with one of the following options:

- If your processing job needs access to an AWS service that supports interface VPC endpoints, create an endpoint to connect to that service. For a list of services that support interface endpoints, see VPC Endpoints in the Amazon VPC User Guide. For information about creating an interface VPC endpoint, see Interface VPC Endpoints (AWS PrivateLink) in the Amazon VPC User Guide.

- If your processing job needs access to an AWS service that doesn't support interface VPC endpoints or to a resource outside of AWS, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see Scenario 2: VPC with Public and Private Subnets (NAT) in the Amazon Virtual Private Cloud User Guide.
Give SageMaker Training Jobs Access to Resources in Your Amazon VPC

**Note**
For training jobs, you can configure only subnets with a default tenancy VPC in which your instance runs on shared hardware. For more information on the tenancy attribute for VPCs, see [Dedicated Instances](#).

**Configure a Training Job for Amazon VPC Access**

To specify subnets and security groups in your private VPC, use the `VpcConfig` request parameter of the `CreateTrainingJob` API, or provide this information when you create a training job in the SageMaker console. SageMaker uses this information to create network interfaces and attach them to your training containers. The network interfaces provide your training containers with a network connection within your VPC that is not connected to the internet. They also enable your training job to connect to resources in your private VPC.

The following is an example of the `VpcConfig` parameter that you include in your call to `CreateTrainingJob`:

```
VpcConfig: {
  "Subnets": [
    "subnet-0123456789abcdef0",
    "subnet-0123456789abcdef1",
    "subnet-0123456789abcdef2"
  ],
  "SecurityGroupIds": [
    "sg-0123456789abcdef0"
  ]
}
```

**Configure Your Private VPC for SageMaker Training**

When configuring the private VPC for your SageMaker training jobs, use the following guidelines. For information about setting up a VPC, see [Working with VPCs and Subnets](#) in the Amazon VPC User Guide.

**Topics**
- Ensure That Subnets Have Enough IP Addresses (p. 3648)
- Create an Amazon S3 VPC Endpoint (p. 3648)
- Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3649)
- Configure Route Tables (p. 3650)
- Configure the VPC Security Group (p. 3650)
- Connect to Resources Outside Your VPC (p. 3650)

**Ensure That Subnets Have Enough IP Addresses**

Your VPC subnets should have at least two private IP addresses for each instance in a training job. For more information, see [VPC and Subnet Sizing for IPv4](#) in the Amazon VPC User Guide.

**Create an Amazon S3 VPC Endpoint**

If you configure your VPC so that training containers don't have access to the internet, they can't connect to the Amazon S3 buckets that contain your training data unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your training containers to access the buckets where you store your data and model artifacts. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see [Endpoints for Amazon S3](#).
To create an S3 VPC endpoint:

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose Endpoints, then choose Create Endpoint.
3. For Service Name, search for com.amazonaws.region.s3, where region is the name of the region where your VPC resides.
4. Choose the Gateway type.
5. For VPC, choose the VPC you want to use for this endpoint.
6. For Configure route tables, select the route tables to be used by the endpoint. The VPC service automatically adds a route to each route table you select that points any S3 traffic to the new endpoint.
7. For Policy, choose Full Access to allow full access to the S3 service by any user or service within the VPC. Choose Custom to restrict access further. For information, see Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3649).

Use a Custom Endpoint Policy to Restrict Access to S3

The default endpoint policy allows full access to S3 for any user or service in your VPC. To further restrict access to S3, create a custom endpoint policy. For more information, see Using Endpoint Policies for Amazon S3. You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see Using Amazon S3 Bucket Policies.

Restrict Package Installation on the Training Container

The default endpoint policy allows users to install packages from the Amazon Linux and Amazon Linux 2 repositories on the training container. If you don't want users to install packages from that repository, create a custom endpoint policy that explicitly denies access to the Amazon Linux and Amazon Linux 2 repositories. The following is an example of a policy that denies access to these repositories:

```json
{
  "Statement": [
    {
      "Sid": "AmazonLinuxAMIRepositoryAccess",
      "Principal": "*",
      "Action": [
        "s3:GetObject"
      ],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::packages.*.amazonaws.com/*",
        "arn:aws:s3:::repo.*.amazonaws.com/*"
      ]
    }
  ]
}

{
  "Statement": [
    {
      "Sid": "AmazonLinux2AMIRepositoryAccess",
      "Principal": "*",
      "Action": [
        "s3:GetObject"
      ],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::amazonlinux.*.amazonaws.com/*"
      ]
    }
  ]
}
```
Give SageMaker Access to Resources in your Amazon VPC

Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, http://s3-aws-region.amazonaws.com/MyBucket) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your training jobs resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see Routing for Gateway Endpoints in the Amazon VPC User Guide.

Configure the VPC Security Group

In distributed training, you must allow communication between the different containers in the same training job. To do that, configure a rule for your security group that allows inbound connections between members of the same security group. For EFA-enabled instances, ensure that both inbound and outbound connections allow all traffic from the same security group. For information, see Security Group Rules in the Amazon Virtual Private Cloud User Guide.

Connect to Resources Outside Your VPC

If you configure your VPC so that it doesn't have internet access, training jobs that use that VPC do not have access to resources outside your VPC. If your training job needs access to resources outside your VPC, provide access with one of the following options:

- If your training job needs access to an AWS service that supports interface VPC endpoints, create an endpoint to connect to that service. For a list of services that support interface endpoints, see VPC Endpoints in the Amazon Virtual Private Cloud User Guide. For information about creating an interface VPC endpoint, see Interface VPC Endpoints (AWS PrivateLink) in the Amazon Virtual Private Cloud User Guide.
- If your training job needs access to an AWS service that doesn't support interface VPC endpoints or to a resource outside of AWS, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see Scenario 2: VPC with Public and Private Subnets (NAT) in the Amazon Virtual Private Cloud User Guide.

Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC

Configure a Model for Amazon VPC Access

To specify subnets and security groups in your private VPC, use the VpcConfig request parameter of the CreateModel API, or provide this information when you create a model in the SageMaker console. SageMaker uses this information to create network interfaces and attach them to your model containers. The network interfaces provide your model containers with a network connection within your VPC that is not connected to the internet. They also enable your model to connect to resources in your private VPC.

**Note**
You must create at least two subnets in different availability zones in your private VPC, even if you have only one hosting instance.

The following is an example of the VpcConfig parameter that you include in your call to CreateModel:

```json
VpcConfig: {
    "Subnets": [
        "subnet-0123456789abcdef0",
        "subnet-0123456789abcdef1",
        "subnet-0123456789abcdef2"
    ],
}
```
"SecurityGroupIds": [
  "sg-0123456789abcdef0"
]
}

## Configure Your Private VPC for SageMaker Hosting

When configuring the private VPC for your SageMaker models, use the following guidelines. For information about setting up a VPC, see [Working with VPCs and Subnets](https://docs.aws.amazon.com/vpc/userguide) in the *Amazon VPC User Guide*.

### Topics
- **Ensure That Subnets Have Enough IP Addresses** (p. 3651)
- **Create an Amazon S3 VPC Endpoint** (p. 3651)
- **Use a Custom Endpoint Policy to Restrict Access to Amazon S3** (p. 3651)
- **Add Permissions for Endpoint Access for Containers Running in a VPC to Custom IAM Policies** (p. 3652)
- **Configure Route Tables** (p. 3653)
- **Connect to Resources Outside Your VPC** (p. 3653)

### Ensure That Subnets Have Enough IP Addresses

Your VPC subnets should have at least two private IP addresses for each model instance. For more information, see [VPC and Subnet Sizing for IPv4](https://docs.aws.amazon.com/vpc/userguide) in the *Amazon VPC User Guide*.

### Create an Amazon S3 VPC Endpoint

If you configure your VPC so that model containers don't have access to the internet, they can't connect to the Amazon S3 buckets that contain your data unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your model containers to access the buckets where you store your data and model artifacts. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see [Endpoints for Amazon S3](https://docs.aws.amazon.com/s3/v2/endpoint_overview).

**To create an Amazon S3 VPC endpoint:**

1. Open the Amazon VPC console at [https://console.aws.amazon.com/vpc/](https://console.aws.amazon.com/vpc/).
2. In the navigation pane, choose **Endpoints**, then choose **Create Endpoint**.
3. For **Service Name**, choose com.amazonaws.region.s3, where *region* is the name of the AWS Region where your VPC resides.
4. For **VPC**, choose the VPC that you want to use for this endpoint.
5. For **Configure route tables**, choose the route tables for the endpoint to use. The VPC service automatically adds a route to each route table that you choose that points Amazon S3 traffic to the new endpoint.
6. For **Policy**, choose **Full Access** to allow full access to the Amazon S3 service by any user or service within the VPC. To restrict access further, choose **Custom**. For more information, see [Use a Custom Endpoint Policy to Restrict Access to Amazon S3](https://docs.aws.amazon.com/s3/v2/endpoint_overview) (p. 3651).

### Use a Custom Endpoint Policy to Restrict Access to Amazon S3

The default endpoint policy allows full access to Amazon Simple Storage Service (Amazon S3) for any user or service in your VPC. To further restrict access to Amazon S3, create a custom endpoint policy. For more information, see [Using Endpoint Policies for Amazon S3](https://docs.aws.amazon.com/s3/v2/endpoint_overview).

You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see [Using Amazon S3 Bucket Policies](https://docs.aws.amazon.com/s3/v2/endpoint_overview).
Restrict Package Installation on the Model Container with a Custom Endpoint Policy

The default endpoint policy allows users to install packages from the Amazon Linux and Amazon Linux 2 repositories on the model container. If you don't want users to install packages from those repositories, create a custom endpoint policy that explicitly denies access to the Amazon Linux and Amazon Linux 2 repositories. The following is an example of a policy that denies access to these repositories:

```json
{
    "Statement": [
        {
            "Sid": "AmazonLinuxAMIRepositoryAccess",
            "Principal": "*",
            "Action": ["s3:GetObject"],
            "Effect": "Deny",
            "Resource": ["arn:aws:s3:::packages.*.amazonaws.com/*", "arn:aws:s3:::repo.*.amazonaws.com/*"]
        }
    ]
}
{
    "Statement": [
        {
            "Sid": "AmazonLinux2AMIRepositoryAccess",
            "Principal": "*",
            "Action": ["s3:GetObject"],
            "Effect": "Deny",
            "Resource": ["arn:aws:s3:::amazonlinux.*.amazonaws.com/*"]
        }
    ]
}
```

Add Permissions for Endpoint Access for Containers Running in a VPC to Custom IAM Policies

The SageMakerFullAccess managed policy includes the permissions that you need to use models configured for Amazon VPC access with an endpoint. These permissions allow SageMaker to create an elastic network interface and attach it to model containers running in a VPC. If you use your own IAM policy, you must add the following permissions to that policy to use models configured for VPC access.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
        ]
    ]
}
```
For more information about the SageMakerFullAccess managed policy, see AWS managed policy: AmazonSageMakerFullAccess (p. 3572).

Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, http://s3-aws-region.amazonaws.com/MyBucket) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your models resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see Routing for Gateway Endpoints in the Amazon VPC User Guide.

Connect to Resources Outside Your VPC

If you configure your VPC so that it doesn't have internet access, models that use that VPC do not have access to resources outside your VPC. If your model needs access to resources outside your VPC, provide access with one of the following options:

- If your model needs access to an AWS service that supports interface VPC endpoints, create an endpoint to connect to that service. For a list of services that support interface endpoints, see VPC Endpoints in the Amazon VPC User Guide. For information about creating an interface VPC endpoint, see Interface VPC Endpoints (AWS PrivateLink) in the Amazon VPC User Guide.

- If your model needs access to an AWS service that doesn't support interface VPC endpoints or to a resource outside of AWS, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see Scenario 2: VPC with Public and Private Subnets (NAT) in the Amazon Virtual Private Cloud User Guide.

Give Batch Transform Jobs Access to Resources in Your Amazon VPC

To control access to your data and batch transform jobs, we recommend that you create a private Amazon VPC and configure it so that your jobs aren't accessible over the public internet. You specify your private VPC configuration when you create a model by specifying subnets and security groups. You then specify the same model when you create a batch transform job. When you specify the subnets and security groups, SageMaker creates elastic network interfaces that are associated with your security groups in one of the subnets. Network interfaces allow your model containers to connect to resources in your VPC. For information about network interfaces, see Elastic Network Interfaces in the Amazon VPC User Guide.

This document explains how to add Amazon VPC configurations for batch transform jobs.

Configure a Batch Transform Job for Amazon VPC Access

To specify subnets and security groups in your private VPC, use the VpcConfig request parameter of the CreateModel API, or provide this information when you create a model in the SageMaker console. Then specify the same model in the ModelName request parameter of the CreateTransformJob API, or in the Model name field when you create a transform job in the SageMaker console. SageMaker uses this information to create network interfaces and attach them to your model containers. The network interfaces provide your model containers with a network connection within your VPC that is not connected to the internet. They also enable your transform job to connect to resources in your private VPC.

The following is an example of the VpcConfig parameter that you include in your call to CreateModel:
If you are creating a model using the CreateModel API operation, the IAM execution role that you use to create your model must include the permissions described in CreateModel API: Execution Role Permissions (p. 3552), including the following permissions required for a private VPC.

When creating a model in the console, if you select Create a new role in the Model Settings section, the AmazonSageMakerFullAccess policy used to create the role already contains these permissions. If you select Enter a custom IAM role ARN or Use existing role, the role ARN that you specify must have an execution policy attached with the following permissions.

```json
{
   "Effect": "Allow",
   "Action": [
      "ec2:CreateNetworkInterface",
      "ec2:DeleteNetworkInterface",
      "ec2:DescribeNetworkInterfaces",
      "ec2:DescribeVpcs",
      "ec2:DescribeDhcpOptions",
      "ec2:DescribeSecurityGroups"
   ]
}
```

### Configure Your Private VPC for SageMaker Batch Transform

When configuring the private VPC for your SageMaker batch transform jobs, use the following guidelines. For information about setting up a VPC, see Working with VPCs and Subnets in the Amazon VPC User Guide.

**Topics**

- Ensure That Subnets Have Enough IP Addresses (p. 3654)
- Create an Amazon S3 VPC Endpoint (p. 3654)
- Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3655)
- Configure Route Tables (p. 3656)
- Configure the VPC Security Group (p. 3656)
- Connect to Resources Outside Your VPC (p. 3656)

**Ensure That Subnets Have Enough IP Addresses**

Your VPC subnets should have at least two private IP addresses for each instance in a transform job. For more information, see VPC and Subnet Sizing for IPv4 in the Amazon VPC User Guide.

**Create an Amazon S3 VPC Endpoint**

If you configure your VPC so that model containers don't have access to the internet, they can't connect to the Amazon S3 buckets that contain your data unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your model containers to access the buckets where you store your data.
data and model artifacts. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see Endpoints for Amazon S3.

To create an S3 VPC endpoint:

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose Endpoints, then choose Create Endpoint.
3. For Service Name, choose com.amazonaws.region.s3, where region is the name of the region where your VPC resides.
4. For VPC, choose the VPC you want to use for this endpoint.
5. For Configure route tables, select the route tables to be used by the endpoint. The VPC service automatically adds a route to each route table you select that points any S3 traffic to the new endpoint.
6. For Policy, choose Full Access to allow full access to the S3 service by any user or service within the VPC. Choose Custom to restrict access further. For information, see Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3655).

Use a Custom Endpoint Policy to Restrict Access to S3

The default endpoint policy allows full access to S3 for any user or service in your VPC. To further restrict access to S3, create a custom endpoint policy. For more information, see Using Endpoint Policies for Amazon S3. You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see Using Amazon S3 Bucket Policies.

Restrict Package Installation on the Model Container

The default endpoint policy allows users to install packages from the Amazon Linux and Amazon Linux 2 repositories on the training container. If you don't want users to install packages from that repository, create a custom endpoint policy that explicitly denies access to the Amazon Linux and Amazon Linux 2 repositories. The following is an example of a policy that denies access to these repositories:

```
{
  "Statement": [
    {
      "Sid": "AmazonLinuxAMIRepositoryAccess",
      "Principal": "*",
      "Action": [
        "s3:GetObject"
      ],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::packages.*.amazonaws.com/*",
        "arn:aws:s3:::repo.*.amazonaws.com/*"
      ]
    }
  ]
}
{
  "Statement": [
    {
      "Sid": "AmazonLinux2AMIRepositoryAccess",
      "Principal": "*",
      "Action": [
        "s3:GetObject"
      ],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::amazonlinux.*.amazonaws.com/*"
      ]
    }
  ]
}
```

3655
Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, http://s3-aws-region.amazonaws.com/MyBucket) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your batch transform jobs resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see Routing for Gateway Endpoints in the Amazon VPC User Guide.

Configure the VPC Security Group

In distributed batch transform, you must allow communication between the different containers in the same batch transform job. To do that, configure a rule for your security group that allows inbound and outbound connections between members of the same security group. Members of the same security group should be able to communicate with each other across all ports. For more information, see Security Group Rules.

Connect to Resources Outside Your VPC

If you configure your VPC so that it doesn't have internet access, batch transform jobs that use that VPC do not have access to resources outside your VPC. If your batch transform job needs access to resources outside your VPC, provide access with one of the following options:

- If your batch transform job needs access to an AWS service that supports interface VPC endpoints, create an endpoint to connect to that service. For a list of services that support interface endpoints, see VPC Endpoints in the Amazon VPC User Guide. For information about creating an interface VPC endpoint, see Interface VPC Endpoints (AWS PrivateLink) in the Amazon VPC User Guide.
- If your batch transform job needs access to an AWS service that doesn't support interface VPC endpoints or to a resource outside of AWS, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see Scenario 2: VPC with Public and Private Subnets (NAT) in the Amazon Virtual Private Cloud User Guide.

Give Amazon SageMaker Clarify Jobs Access to Resources in Your Amazon VPC

To control access to your data and SageMaker Clarify jobs, we recommend that you create a private Amazon VPC and configure it so that your jobs aren't accessible over the public internet. For information about creating and configuring an Amazon VPC for processing jobs, see Give SageMaker Processing Jobs Access to Resources in Your Amazon VPC.

This document explains how to add additional Amazon VPC configurations that meet the requirements for SageMaker Clarify jobs.

Topics

- Configure a SageMaker Clarify Job for Amazon VPC Access (p. 3656)
- Configure Your Private Amazon VPC for SageMaker Clarify jobs (p. 3658)

Configure a SageMaker Clarify Job for Amazon VPC Access

You need to specify subnets and security groups when configuring your private Amazon VPC for SageMaker Clarify jobs and to enable the job to get inferences from the SageMaker model when computing post-training bias metrics and feature contributions that help explain model predictions.
SageMaker Developer Guide

Give SageMaker Access to Resources in your Amazon VPC

Topics

- SageMaker Clarify Job Amazon VPC Subnets and Security Groups (p. 3657)
- Configure a Model Amazon VPC for Inference (p. 3657)

SageMaker Clarify Job Amazon VPC Subnets and Security Groups

Subnets and security groups in your private Amazon VPC can be assigned to a SageMaker Clarify job in various ways, depending on how you create the job.

- **SageMaker console:** Provide this information when you create the job in the SageMaker Dashboard. From the Processing menu, choose Processing jobs, then choose Create processing job. Select the VPC option in the Network panel and provide the subnets and security groups using the drop-down lists. Make sure network isolation option provided in this panel is set to disabled.

- **SageMaker API:** Use the NetworkConfig.VpcConfig request parameter of the CreateProcessingJob API, as shown in the following example:

  ```json
  "NetworkConfig": {
    "VpcConfig": {
      "Subnets": [
        "subnet-0123456789abcdef0",
        "subnet-0123456789abcdef1",
        "subnet-0123456789abcdef2"
      ],
      "SecurityGroupIds": [
        "sg-0123456789abcdef0"
      ]
    }
  }
  ```

- **SageMaker Python SDK:** Use the NetworkConfig parameter of the SageMakerClarifyProcessor API or Processor API, as shown in the following example:

  ```python
  from sagemaker.network import NetworkConfig
  network_config = NetworkConfig(
    subnets=[
      "subnet-0123456789abcdef0",
      "subnet-0123456789abcdef1",
      "subnet-0123456789abcdef2",
    ],
    security_group_ids=[
      "sg-0123456789abcdef0",
    ],
  )
  ```

SageMaker uses the information to create network interfaces and attach them to the SageMaker Clarify job. The network interfaces provide a SageMaker Clarify job with a network connection within your Amazon VPC that is not connected to the public internet. They also enable the SageMaker Clarify job to connect to resources in your private Amazon VPC.

Configure a Model Amazon VPC for Inference

In order to compute post-training bias metrics and explainability, the SageMaker Clarify job needs to get inferences from the SageMaker model that is specified by the model_name parameter of the analysis configuration for the SageMaker Clarify processing job. Alternatively, if you use the SageMakerClarifyProcessor API in the SageMaker Python SDK, the job needs to get the model_name specified by the ModelConfig class. To accomplish this, the SageMaker Clarify job creates an ephemeral endpoint with the model, known as a shadow endpoint, and then applies the Amazon VPC configuration of the model to the shadow endpoint.

3657
**Note**
The network isolation option of both the SageMaker Clarify job and the model must be disabled (by default the option is disabled) so that the SageMaker Clarify job can communicate with the shadow endpoint.

To specify subnets and security groups in your private Amazon VPC to the SageMaker model, use the VpcConfig request parameter of the CreateModel API or provide this information when you create the model using the SageMaker dashboard in the console. The following is an example of the VpcConfig parameter that you include in your call to CreateModel:

```json
"VpcConfig": {
  "Subnets": ["subnet-0123456789abcdef0", "subnet-0123456789abcdef1", "subnet-0123456789abcdef2"],
  "SecurityGroupIds": ["sg-0123456789abcdef0"]
}
```

You can specify the number of instances of the shadow endpoint to launch with the initial_instance_count parameter of the analysis configuration for the SageMaker Clarify processing job. Alternatively, if you use the SageMakerClarifyProcessor API in the SageMaker Python SDK, the job needs to get the instance_count specified by the ModelConfig class.

**Note**
Even if you only request one instance when creating the shadow endpoint, you need at least two subnets in the model's ModelConfig in distinct availability zones. Otherwise the shadow endpoint creation fails with the following error:

```
ClientError: Error hosting endpoint sagemaker-clarify-endpoint-XXX: Failed. Reason: Unable to locate at least 2 availability zone(s) with the requested instance type YYY that overlap with SageMaker subnets.
```

If your model requires model files in Amazon S3, then the model Amazon VPC needs to have an Amazon S3 VPC endpoint. For more information about creating and configuring an Amazon VPC for SageMaker models, see [Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC](p. 3650).

### Configure Your Private Amazon VPC for SageMaker Clarify jobs

In general, you can follow the steps in [Configure Your Private VPC for SageMaker Processing](p. 3650) to configure your private Amazon VPC for SageMaker Clarify jobs. Here are some highlights and special requirements for SageMaker Clarify jobs.

**Topics**

- [Connect to Resources Outside Your Amazon VPC](p. 3658)
- [Configure the Amazon VPC Security Group](p. 3659)

### Connect to Resources Outside Your Amazon VPC

If you configure your Amazon VPC so that it does not have public internet access, then some additional setup is required to grant SageMaker Clarify jobs access to resources and services outside of your Amazon VPC. For example, an Amazon S3 VPC endpoint is required because a SageMaker Clarify job needs to load a dataset from an S3 bucket as well as save the analysis results to an S3 bucket. For more information, see [Create an Amazon S3 VPC Endpoint](p. 3650) for the creation guide. In addition, if a SageMaker Clarify job needs to get inferences from the shadow endpoint, then it needs to call several more AWS services.
Create an Amazon SageMaker API service VPC endpoint: The SageMaker Clarify job needs to call the Amazon SageMaker API service to manipulate the shadow endpoint, or to describe a SageMaker model for Amazon VPC validation. You can follow the guidance provided in the Securing all Amazon SageMaker API calls with AWS PrivateLink blog to create an Amazon SageMaker API VPC endpoint that allows the SageMaker Clarify job to make the service calls. Note that the service name of Amazon SageMaker API service is com.amazonaws.region.sagemaker.api, where region is the name of the Region where your Amazon VPC resides.

Create an Amazon SageMaker Runtime VPC Endpoint: The SageMaker Clarify job needs to call the Amazon SageMaker runtime service, which routes the invocations to the shadow endpoint. The setup steps are similar to those for the Amazon SageMaker API service. Note that the service name of Amazon SageMaker Runtime service is com.amazonaws.region.sagemaker.runtime, where region is the name of the Region where your Amazon VPC resides.

Configure the Amazon VPC Security Group

SageMaker Clarify jobs support distributed processing when two or more processing instances are specified in one of the following ways:

- **SageMaker console**: The Instance count is specified in the Resource configuration part of the Job settings panel on the Create processing job page.
- **SageMaker API**: The InstanceCount is specified when you create the job with the CreateProcessingJob API.
- **SageMaker Python SDK**: The instance_count is specified when using the SageMakerClarifyProcessor API or the Processor API.

In distributed processing, you must allow communication between the different instances in the same processing job. To do that, configure a rule for your security group that allows inbound connections between members of the same security group. For information, see Security group rules.

Give SageMaker Compilation Jobs Access to Resources in Your Amazon VPC

Note
For compilation jobs, you can configure only subnets with a default tenancy VPC in which your job runs on shared hardware. For more information on the tenancy attribute for VPCs, see Dedicated Instances.

Configure a Compilation Job for Amazon VPC Access

To specify subnets and security groups in your private VPC, use the VpcConfig request parameter of the CreateCompilationJob API, or provide this information when you create a compilation job in the SageMaker console. SageMaker Neo uses this information to create network interfaces and attach them to your compilation jobs. The network interfaces provide compilation jobs with a network connection within your VPC that is not connected to the internet. They also enable your compilation job to connect to resources in your private VPC. The following is an example of the VpcConfig parameter that you include in your call to CreateCompilationJob:

```json
VpcConfig: {"Subnets": [
  "subnet-0123456789abcdef0",
  "subnet-0123456789abcdef1",
  "subnet-0123456789abcdef2"
],
  "SecurityGroupIds": ["sg-0123456789abcdef0"]
}
```
Configure Your Private VPC for SageMaker Compilation

When configuring the private VPC for your SageMaker compilation jobs, use the following guidelines. For information about setting up a VPC, see Working with VPCs and Subnets in the Amazon VPC User Guide.

Topics

- Ensure That Subnets Have Enough IP Addresses (p. 3660)
- Create an Amazon S3 VPC Endpoint (p. 3660)
- Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3660)
- Configure Route Tables (p. 3661)
- Configure the VPC Security Group (p. 3662)

Ensure That Subnets Have Enough IP Addresses

Your VPC subnets should have at least two private IP addresses for each instance in a compilation job. For more information, see VPC and Subnet Sizing for IPv4 in the Amazon VPC User Guide.

Create an Amazon S3 VPC Endpoint

If you configure your VPC to block access to the internet, SageMaker Neo can’t connect to the Amazon S3 buckets that contain your models unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your SageMaker Neo compilation jobs to access the buckets where you store your data and model artifacts. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see Endpoints for Amazon S3.

To create an S3 VPC endpoint:

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose Endpoints, then choose Create Endpoint
3. For Service Name, search for com.amazonaws.region.s3, where region is the name of the region where your VPC resides.
4. Choose the Gateway type.
5. For VPC, choose the VPC you want to use for this endpoint.
6. For Configure route tables, select the route tables to be used by the endpoint. The VPC service automatically adds a route to each route table you select that points any S3 traffic to the new endpoint.
7. For Policy, choose Full Access to allow full access to the S3 service by any user or service within the VPC. Choose Custom to restrict access further. For information, see Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3649).

Use a Custom Endpoint Policy to Restrict Access to S3

The default endpoint policy allows full access to S3 for any user or service in your VPC. To further restrict access to S3, create a custom endpoint policy. For more information, see Using Endpoint Policies for Amazon S3. You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see Using Amazon S3 Bucket Policies. The following is a sample customized policy:

```json

```
Give SageMaker Access to Resources in your Amazon VPC

Add Permissions for Compilation Job Running in a Amazon VPC to Custom IAM Policies

The SageMakerFullAccess managed policy includes the permissions that you need to use models configured for Amazon VPC access with an endpoint. These permissions allow SageMaker Neo to create an elastic network interface and attach it to compilation job running in a Amazon VPC. If you use your own IAM policy, you must add the following permissions to that policy to use models configured for Amazon VPC access.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ec2:DescribeVpcEndpoints",
        "ec2:DescribeDhcpOptions",
        "ec2:DescribeVpcs",
        "ec2:DescribeSubnets",
        "ec2:DescribeSecurityGroups",
        "ec2:DescribeNetworkInterfaces",
        "ec2:DeleteNetworkInterfacePermission",
        "ec2:DeleteNetworkInterface",
        "ec2:CreateNetworkInterfacePermission",
        "ec2:CreateNetworkInterface",
        "ec2:ModifyNetworkInterfaceAttribute"
      ],
      "Resource": "*
    }
  ]
}
```

For more information about the SageMakerFullAccess managed policy, see AWS managed policy: AmazonSageMakerFullAccess (p. 3572).

Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, http://s3-aws-region.amazonaws.com/MyBucket) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your compilation jobs resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see Routing for Gateway Endpoints in the Amazon VPC User Guide.
Configure the VPC Security Group

In your security group for the compilation job, you must allow outbound communication to your Amazon S3 Amazon VPC endpoints and the subnet CIDR ranges used for the compilation job. For information, see Security Group Rules and Control access to services with Amazon VPC endpoints.
Monitor Amazon SageMaker

Monitoring is an important part of maintaining the reliability, availability, and performance of SageMaker and your other AWS solutions. AWS provides the following monitoring tools to watch SageMaker, report when something is wrong, and take automatic actions when appropriate:

- **Amazon CloudWatch** monitors your AWS resources and the applications that you run on AWS in real time. You can collect and track metrics, create customized dashboards, and set alarms that notify you or take actions when a specified metric reaches a threshold that you specify. For example, you can have CloudWatch track CPU usage or other metrics of your Amazon EC2 instances and automatically launch new instances when needed. For more information, see the [Amazon CloudWatch User Guide](#).

- **Amazon CloudWatch Logs** enables you to monitor, store, and access your log files from EC2 instances, AWS CloudTrail, and other sources. CloudWatch Logs can monitor information in the log files and notify you when certain thresholds are met. You can also archive your log data in highly durable storage. For more information, see the [Amazon CloudWatch Logs User Guide](#).

- **AWS CloudTrail** captures API calls and related events made by or on behalf of your AWS account and delivers the log files to an Amazon S3 bucket that you specify. You can identify which users and accounts called AWS, the source IP address from which the calls were made, and when the calls occurred. For more information, see the [AWS CloudTrail User Guide](#).

- **CloudWatch Events** delivers a near real-time stream of system events that describe changes in AWS resources. Create CloudWatch Events rules react to a status change in a SageMaker training, hyperparameter tuning, or batch transform job

Topics

- Monitor Amazon SageMaker with Amazon CloudWatch (p. 3663)
- Log Amazon SageMaker Events with Amazon CloudWatch (p. 3675)
- Log Amazon SageMaker API Calls with AWS CloudTrail (p. 3676)
- Monitoring user resource access from Amazon SageMaker Studio (p. 3679)
- Automating Amazon SageMaker with Amazon EventBridge (p. 3681)

Monitor Amazon SageMaker with Amazon CloudWatch

You can monitor Amazon SageMaker using Amazon CloudWatch, which collects raw data and processes it into readable, near real-time metrics. These statistics are kept for 15 months, so that you can access historical information and gain a better perspective on how your web application or service is performing. However, the Amazon CloudWatch console limits the search to metrics that were updated in the last 2 weeks. This limitation ensures that the most current jobs are shown in your namespace. To graph metrics without using a search, specify its exact name in the source view. You can also set alarms that watch for certain thresholds, and send notifications or take actions when those thresholds are met. For more information, see the [Amazon CloudWatch User Guide](#).

SageMaker Metrics and Dimensions

- SageMaker Endpoint Invocation Metrics (p. 3664)
- SageMaker Multi-Model Endpoint Metrics (p. 3665)
- SageMaker Jobs and Endpoint Metrics (p. 3667)
- SageMaker Ground Truth Metrics (p. 3670)
SageMaker Endpoint Invocation Metrics

The AWS/SageMaker namespace includes the following request metrics from calls to `InvokeEndpoint`. Metrics are available at a 1-minute frequency.

For information about how long CloudWatch metrics are retained for, see `GetMetricStatistics` in the Amazon CloudWatch API Reference.

### Endpoint Invocation Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invocation4XXErrors</td>
<td>The number of <code>InvokeEndpoint</code> requests where the model returned a 4xx HTTP response code. For each 4xx response, 1 is sent; otherwise, 0 is sent.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum</td>
</tr>
<tr>
<td>Invocation5XXErrors</td>
<td>The number of <code>InvokeEndpoint</code> requests where the model returned a 5xx HTTP response code. For each 5xx response, 1 is sent; otherwise, 0 is sent.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum</td>
</tr>
<tr>
<td>Invocations</td>
<td>The number of <code>InvokeEndpoint</code> requests sent to a model endpoint.</td>

<td>To get the total number of requests sent to a model endpoint, use the Sum statistic.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Sum</td>
</tr>
<tr>
<td>InvocationsPerInstance</td>
<td>The number of invocations sent to a model, normalized by <code>InstanceCount</code> in each ProductionVariant. 1/<code>numberOfInstances</code> is sent as the value on each request, where <code>numberOfInstances</code> is the number of active instances for the ProductionVariant behind the endpoint at the time of the request.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Sum</td>
</tr>
<tr>
<td>ModelLatency</td>
<td>The interval of time taken by a model to respond as viewed from SageMaker. This interval includes the local communication times taken to send the request and to fetch the response from the container of a model and the time taken to complete the inference in the container.</td>
</tr>
<tr>
<td></td>
<td>Units: Microseconds</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum, Min, Max, Sample Count</td>
</tr>
</tbody>
</table>
| OverheadLatency      | The interval of time added to the time taken to respond to a client request by SageMaker overheads. This interval is measured from the time SageMaker
Multi-Model Endpoint Metrics

### Metric Description

**Metric**: ModelLatency

- **Description**: The interval of time that an invocation request has waited for the target model to be downloaded, or loaded, or both in order to perform inference.

- **Units**: Microseconds

- **Valid statistics**: Average, Sum, Min, Max, Sample Count

**Metric**: ModelSetupTime

- **Description**: The time it takes to launch new compute resources for a serverless endpoint.

- **Units**: Microseconds

- **Valid statistics**: Average, Min, Max, Sample Count, Percentiles

**Dimensions for Endpoint Invocation Metrics**

SageMaker Jobs and Endpoint Metrics

The /aws/sagemaker/ProcessingJobs, /aws/sagemaker/TrainingJobs, /aws/sagemaker/TransformJobs, and /aws/sagemaker/Endpoints namespaces include the following metrics for the training jobs and endpoint instances.

Metrics are available at a 1-minute frequency.

**Note**
Amazon CloudWatch supports high-resolution custom metrics and its finest resolution is 1 second. However, the finer the resolution, the shorter the lifespan of the CloudWatch metrics. For the 1-second frequency resolution, the CloudWatch metrics are available for 3 hours. For more information about the resolution and the lifespan of the CloudWatch metrics, see GetMetricStatistics in the Amazon CloudWatch API Reference.

**Tip**
If you want to profile your training job with a finer resolution down to 100-millisecond (0.1 second) granularity and store the training metrics indefinitely in Amazon S3 for custom analysis at any time, consider using Amazon SageMaker Debugger. SageMaker Debugger provides built-in rules to automatically detect common training issues; it detects hardware resource utilization issues (such as CPU, GPU, and I/O bottlenecks) and non-converging model issues (such as overfit, vanishing gradients, and exploding tensors). SageMaker Debugger also provides visualizations through Studio and its profiling report. To explore the Debugger visualizations, see SageMaker Debugger Insights Dashboard Walkthrough, Debugger Profiling Report Walkthrough, and Analyze Data Using the SMDebug Client Library.

Processing Job, Training Job, Batch Transform Job, and Endpoint Instance Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>

### SageMaker Ground Truth Metrics

**Ground Truth Metrics**

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
</table>
| **ActiveWorkers** | A single active worker on a private work team submitted, released, or declined a task. To get the total number of active workers, use the Sum statistic. Ground Truth attempts to deliver each individual ActiveWorkers event once. If this delivery is unsuccessful, this metric may not report the total number of active workers.  
Units: None  
Valid statistics: Sum, Sample Count |
| **DatasetObjectsAutoAnnotated** | The number of dataset objects auto-annotated in a labeling job. This metric is only emitted when automated labeling is enabled. To view the labeling job progress, use the Max metric.  
Units: None  
Valid statistics: Max |
| **DatasetObjectsHumanAnnotated** | The number of dataset objects annotated by a human in a labeling job. To view the labeling job progress, use the Max metric.  
Units: None  
Valid statistics: Max |
| **DatasetObjectsLabelingFailed** | The number of dataset objects that failed labeling in a labeling job. To view the labeling job progress, use the Max metric.  
Units: None  
Valid statistics: Max |
| **JobsFailed** | A single labeling job failed. To get the total number of labeling jobs that failed, use the Sum statistic.  
Units: None  
Valid statistics: Sum, Sample Count |
| **JobsSucceeded** | A single labeling job succeeded. To get the total number of labeling jobs that succeeded, use the Sum statistic.  
Units: None |
<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JobsStopped</td>
<td>A single labeling job was stopped. To get the total number of labeling jobs that were stopped, use the Sum statistic.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Sum, Sample Count</td>
</tr>
<tr>
<td>TasksAccepted</td>
<td>A single task was accepted by a worker. To get the total number of tasks accepted by workers, use the Sum statistic. Ground Truth attempts to deliver each individual TaskAccepted event once. If this delivery is unsuccessful, this metric may not report the total number of tasks accepted.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Sum, Sample Count</td>
</tr>
<tr>
<td>TasksDeclined</td>
<td>A single task was declined by a worker. To get the total number of tasks declined by workers, use the Sum statistic. Ground Truth attempts to deliver each individual TasksDeclined event once. If this delivery is unsuccessful, this metric may not report the total number of tasks declined.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Sum, Sample Count</td>
</tr>
<tr>
<td>TasksReturned</td>
<td>A single task was returned. To get the total number of tasks returned, use the Sum statistic. Ground Truth attempts to deliver each individual TasksReturned event once. If this delivery is unsuccessful, this metric may not report the total number of tasks returned.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Sum, Sample Count</td>
</tr>
<tr>
<td>TasksSubmitted</td>
<td>A single task was submitted/completed by a private worker. To get the total number of tasks submitted by workers, use the Sum statistic. Ground Truth attempts to deliver each individual TasksSubmitted event once. If this delivery is unsuccessful, this metric may not report the total number of tasks submitted.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Sum, Sample Count</td>
</tr>
<tr>
<td>TimeSpent</td>
<td>Time spent on a task completed by a private worker. This metric does not include time when a worker paused or took a break. Ground Truth attempts to deliver each TimeSpent event once. If this delivery is unsuccessful, this metric may not report the total amount of time spent.</td>
</tr>
<tr>

**SageMaker Pipelines Metrics**

The AWS/Sagemaker/ModelBuildingPipeline namespace includes the following metrics for pipeline executions.

Two categories of Pipelines execution metrics are available:

- **Execution Metrics across All Pipelines** – Account level pipeline execution metrics (for all pipelines in the current account)
• **Execution Metrics by Pipeline** – Pipeline execution metrics per pipeline

Metrics are available at a 1-minute frequency.

**Pipelines Execution Metrics**

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ExecutionStarted</td>
<td>The number of pipeline executions that started.</td>
</tr>
<tr>
<td></td>
<td>Units: Count</td>

**Log Amazon SageMaker Events with Amazon CloudWatch**

To help you debug your compilation jobs, processing jobs, training jobs, endpoints, transform jobs, notebook instances, and notebook instance lifecycle configurations, anything an algorithm container, a model container, or a notebook instance lifecycle configuration sends to `stdout` or `stderr` is also sent to Amazon CloudWatch Logs. In addition to debugging, you can use these for progress analysis.

**Logs**

The following table lists all of the logs provided by Amazon SageMaker.

<table>
<thead>
<tr>
<th>Log Group Name</th>
<th>Log Stream Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>/aws/sagemaker/CompilationJobs</td>
<td>[compilation-job-name]</td>
</tr>
</tbody>
</table>
## Log Group Name | Log Stream Name
---|---
/aws/sagemaker/Endpoints/[EndpointName] | [production-variant-name]/[instance-id]
/aws/sagemaker/groundtruth/WorkerActivity | aws/sagemaker/groundtruth/worker-activity/[requester-AWS-Id]-[region]/[timestamp]
/aws/sagemaker/LabelingJobs | [labeling-job-name]
/aws/sagemaker/NotebookInstances | [notebook-instance-name]/[LifecycleConfigHook]
/aws/sagemaker/NotebookInstances | [notebook-instance-name]/jupyter.log
/aws/sagemaker/ProcessingJobs | [processing-job-name]/[hostname]-[epoch_timestamp]
/aws/sagemaker/studio | [domain-id]/[user-profile-name]/[app-type]/[app-name]
/aws/sagemaker/studio | [domain-id]/domain-shared/rstudioserverpro/default
/aws/sagemaker/TrainingJobs | [training-job-name]/algo-[instance-number-in-cluster]-[epoch_timestamp]
/aws/sagemaker/TransformJobs | [transform-job-name]/[instance-id]-[epoch_timestamp]
/aws/sagemaker/TransformJobs | [transform-job-name]/[instance-id]-[epoch_timestamp]/data-log
/aws/sagemaker/TransformJobs | [transform-job-name]/[instance-id]-[epoch_timestamp]/[container-name provided in SageMaker model] (For Inference Pipelines)

**Note**
1. The /aws/sagemaker/NotebookInstances/[LifecycleConfigHook] log stream is created when you create a notebook instance with a lifecycle configuration. For more information, see Customize a Notebook Instance Using a Lifecycle Configuration Script (p. 299).
2. For Inference Pipelines, if you don’t provide container names, the platform uses **container-1, container-2**, and so on, corresponding to the order provided in the SageMaker model.

For more information about logging events with CloudWatch logging, see [What is Amazon CloudWatch Logs?](https://docs.aws.amazon.com/AmazonCloudWatch/latest/logs/log_group_and_stream_names.html) in the *Amazon CloudWatch User Guide*.

---

**Log Amazon SageMaker API Calls with AWS CloudTrail**

Amazon SageMaker is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in SageMaker. CloudTrail captures all API calls for SageMaker, with the exception of `InvokeEndpoint` and `InvokeEndpointAsync`, as events. The calls captured include calls from the SageMaker console and code calls to the SageMaker API operations. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for
SageMaker. If you don't configure a trail, you can still view the most recent events in the CloudTrail console in **Event history**. Using the information collected by CloudTrail, you can determine the request that was made to SageMaker, the IP address from which the request was made, who made the request, when it was made, and additional details.

To learn more about CloudTrail, see the [AWS CloudTrail User Guide](https://docs.aws.amazon.com/AmazonCloudWatch/latest/monitoring/aws-cloud-trail.html).

By default, log data is stored in CloudWatch Logs indefinitely. However, you can configure how long to store log data in a log group. For information, see [Change Log Data Retention in CloudWatch Logs](https://docs.aws.amazon.com/AmazonCloudWatch/latest/logs/retention-change-log.html) in the Amazon CloudWatch Logs User Guide.

### SageMaker Information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When activity occurs in Amazon SageMaker, that activity is recorded in a CloudTrail event along with other AWS service events in **Event history**. You can view, search, and download recent events in your AWS account. For more information, see [Viewing Events with CloudTrail Event History](https://docs.aws.amazon.com/AmazonCloudWatch/latest/logs/cloudtrail-view-events.html).

For an ongoing record of events in your AWS account, including events for Amazon SageMaker, create a trail. A **trail** enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see the following:

- **Overview for Creating a Trail**
- **CloudTrail Supported Services and Integrations**
- **Configuring Amazon SNS Notifications for CloudTrail**
- **Receiving CloudTrail Log Files from Multiple Regions** and **Receiving CloudTrail Log Files from Multiple Accounts**

All SageMaker actions, with the exception of **InvokeEndpoint** and **InvokeEndpointAsync**, are logged by CloudTrail and are documented in the **Operations**. For example, calls to the **CreateTrainingJob**, **CreateEndpoint** and **CreateNotebookInstance** actions generate entries in the CloudTrail log files.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root or AWS Identity and Access Management (IAM) user credentials.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another AWS service.

For more information, see the [CloudTrail userIdentity Element](https://docs.aws.amazon.com/AmazonCloudWatch/latest/logs/cloudtrail-view-events.html).

### Operations Performed by Automatic Model Tuning

SageMaker supports logging non-API service events to your CloudTrail log files for automatic model tuning jobs. These events are related to your tuning jobs but, are not the direct result of a customer request to the public AWS API. For example, when you create a hyperparameter tuning job by calling **CreateHyperParameterTuningJob**, SageMaker creates training jobs to evaluate various combinations of hyperparameters to find the best result. Similarly, when you call **StopHyperParameterTuningJob** to stop a hyperparameter tuning job, SageMaker might stop any of the associated running training...
jobs. Non-API events for your tuning jobs are logged to CloudTrail to help you improve governance, compliance, and operational and risk auditing of your AWS account.

Log entries that result from non-API service events have an eventType of AwsServiceEvent instead of AwsApiCall.

Understanding SageMaker Log File Entries

A trail is a configuration that enables delivery of events as log files to an S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files are not an ordered stack trace of the public API calls, so they do not appear in any specific order.

The following examples a log entry for the CreateEndpoint action, which creates an endpoint to deploy a trained model.

```json
{
  "eventVersion": "1.05",
  "userIdentity": {
    "type": "IAMUser",
    "principalId": "AIXDAYQEXAMPLEUMLYNGL",
    "arn": "arn:aws:iam::123456789012:user:intern",
    "accountId": "123456789012",
    "accessKeyId": "ASXIAGXEXAMPLEQULKNXV",
    "userName": "intern"
  },
  "eventTime": "2018-01-02T13:39:06Z",
  "eventSource": "sagemaker.amazonaws.com",
  "eventName": "CreateEndpoint",
  "awsRegion": "us-west-2",
  "sourceIPAddress": "127.0.0.1",
  "userAgent": "USER_AGENT",
  "requestParameters": {
    "endpointName": "ExampleEndpoint",
    "endpointConfigName": "ExampleEndpointConfig"
  },
  "responseElements": {
    "endpointArn": "arn:aws:sagemaker:us-west-2:123456789012:endpoint/exampleendpoint"
  },
  "requestID": "6b1b42b9-EXAMPLE",
  "eventID": "a6f85b21-EXAMPLE",
  "eventType": "AwsApiCall",
  "recipientAccountId": "444455556666"
}
```

The following example is a log entry for the CreateModel action, which creates one or more containers to host a previously trained model.

```json
{
  "eventVersion": "1.05",
  "userIdentity": {
    "type": "IAMUser",
    "principalId": "AIXDAYQEXAMPLEUMLYNGL",
    "arn": "arn:aws:iam::123456789012:user:intern",
    "accountId": "123456789012",
    "accessKeyId": "ASXIAGXEXAMPLEQULKNXV",
    "userName": "intern"
  },
  "eventTime": "2018-01-02T15:23:46Z",
  "eventSource": "sagemaker.amazonaws.com",
  "eventName": "CreateModel",
  "awsRegion": "us-west-2",
  "sourceIPAddress": "127.0.0.1",
  "userAgent": "USER_AGENT",
  "requestParameters": {
    "modelName": "ExampleModel",
    "convertToModelPackage": "true"
  },
  "responseElements": {
    "modelArn": "arn:aws:sagemaker:us-west-2:123456789012:model/examplemodel"
  },
  "requestID": "6b1b42b9-EXAMPLE",
  "eventID": "a6f85b21-EXAMPLE",
  "eventType": "AwsApiCall",
  "recipientAccountId": "444455556666"
}
```
Amazon SageMaker Developer Guide
Monitoring user resource access from Amazon SageMaker Studio

Monitoring user resource access from Amazon SageMaker Studio

With Amazon SageMaker Studio, you can monitor user resource access. To view resource access activity, you can configure AWS CloudTrail to monitor and record user activities by following the steps in Log Amazon SageMaker API Calls with AWS CloudTrail.

However, the AWS CloudTrail logs for resource access only list the Studio execution IAM role as the identifier. This level of logging is enough to audit user activity when each user profile has a distinct execution role. However, when a single execution IAM role is shared between several user profiles, you can't get information about the specific user that accessed the AWS resources.

You can get information about which specific user performed an action in an AWS CloudTrail log when using a shared execution role, using the `sourceIdentity` configuration to propagate the Studio user profile name. For more information about source identity, see Monitor and control actions taken with assumed roles.

Prerequisites

- Install and configure the AWS Command Line Interface following the steps in Installing or updating the latest version of the AWS CLI.
- Ensure that Studio users in your domain don't have a policy that allows them to update or modify the Studio domain.
- All execution roles must have the following trust policy permissions:
  - Any role that the Studio domain's execution role assumes must have the `sts:SetSourceIdentity` permission in the trust policy as follows.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "sagemaker.amazonaws.com"
      },
      "Action": "sts:AssumeRoleWithWebIdentity"
    }
  ]
}
```
When you assume a role with another role, called role chaining, do the following:

- Permissions for sts:SetSourceIdentity are required in both the permissions policy of the principal that is assuming the role, and in the role trust policy of the target role. Otherwise, the assume role operation will fail.
- This role chaining can happen in Studio or any other downstream service, such as Amazon EMR. For more information about role chaining, see Roles terms and concepts.

Enable sourceIdentity

The ability to propagate the user profile name as the sourceIdentity in Studio is turned off by default.

To enable the ability to propagate the user profile name as the sourceIdentity, use the AWS CLI during domain creation and domain update. This feature is enabled at the domain level and not at the user profile level.

After you enable this configuration, administrators can view the user profile in the AWS CloudTrail log for the service accessed. The user profile is given as the sourceIdentity value in the userIdentity section. For more information about using AWS CloudTrail logs with SageMaker, see Log Amazon SageMaker API Calls with AWS CloudTrail.

You can use the following code to enable the propagation of the user profile name as the sourceIdentity during domain creation using the create-domain API.

```
create-domain
--domain-name <value>
--auth-mode <value>
--default-user-settings <value>
--subnet-ids <value>
--vpc-id <value>
[--tags <value>]
[--app-network-access-type <value>]
[--home-efs-file-system-kms-key-id <value>]
[--kms-key-id <value>]
[--app-security-group-management <value>]
[--domain-settings "ExecutionRoleIdentityConfig=USER_PROFILE_NAME"]
[--cli-input-json <value>]
[--generate-cli-skeleton <value>]
```

You can enable the propagation of the user profile name as the sourceIdentity during domain update using the update-domain API.

To update this configuration, all apps in the domain must be in the Stopped or Deleted state. For more information about how to stop and shut down apps, see Shut down and Update Studio Apps.

Use the following code to enable the propagation of the user profile name as the sourceIdentity.

```
update-domain
```
Turn off sourceIdentity

You can also turn off the propagation of the user profile name as the sourceIdentity using the AWS CLI. This occurs during domain update by passing the DISABLED value for the --role-session-context-config parameter as part of the update-domain API call.

**Note**
To update this configuration, all apps in the domain must be in the Stopped or Deleted state. For more information about how to stop and shut down apps, see Shut down and Update Studio Apps.

In the AWS CLI, use the following code to disable the propagation of the user profile name as the sourceIdentity.

```
update-domain
  --domain-id <value>
  [--default-user-settings <value>]
  [--domain-settings-for-update "ExecutionRoleIdentityConfig=DISABLED"]
  [--cli-input-json <value>]
  [--generate-cli-skeleton <value>]
```

Automating Amazon SageMaker with Amazon EventBridge

Amazon EventBridge monitors status change events in Amazon SageMaker. EventBridge enables you to automate SageMaker and respond automatically to events such as a training job status change or endpoint status change. Events from SageMaker are delivered to EventBridge in near real time. You can write simple rules to indicate which events are of interest to you, and what automated actions to take when an event matches a rule. For an example of how to create a rule, see Schedule a Pipeline with Amazon EventBridge (p. 3243).

Some examples of the actions that can be automatically triggered include the following:

- Invoking an AWS Lambda function
- Invoking Amazon EC2 Run Command
- Relaying the event to Amazon Kinesis Data Streams
- Activating an AWS Step Functions state machine
- Notifying an Amazon SNS topic or an AWS SMS queue

**SageMaker events monitored by EventBridge**

- Training job state change (p. 3682)
- Hyperparameter tuning job state change (p. 3683)
- Transform job state change (p. 3684)
- Endpoint state change (p. 3685)
- Feature group state change (p. 3686)
Training job state change

Indicates a change in the status of a SageMaker training job.

If the value of TrainingJobStatus is Failed, the event contains the FailureReason field, which provides a description of why the training job failed.
Hyperparameter tuning job state change

Indicates a change in the status of a SageMaker hyperparameter tuning job.

                                "S3DataDistributionType": "s3DistributionType"
                            }
                        },
                        "ContentType": "contentType",
```
Transform job state change

Indicates a change in the status of a SageMaker batch transform job.

If the value of TransformJobStatus is Failed, the event contains the FailureReason field, which provides a description of why the training job failed.
"TransformJobStatus": "another status... GO",
"FailureReason": "failed why 1",
"ModelName": "i am a beautiful model",
"MaxConcurrentTransforms": 5,
"MaxPayloadInMB": 10,
"BatchStrategy": "Strategizing...",
"Environment": {
  "environment1": "environment2"
},

  "KmsKeyId": "kmsKeyId"
},
"TransformResources": {
  "InstanceType": "instanceType",
  "InstanceCount": 3
},
"CreationTime": "2018-10-06T12:26:13Z",
"TransformStartTime": "2018-10-06T12:26:13Z",
"TransformEndTime": "2018-10-06T12:26:13Z",
"Tags": {}
}

Endpoint state change

Indicates a change in the status of a SageMaker hosted real-time inference endpoint.

The following shows an event with an endpoint in the IN_SERVICE state.

```json
{
  "version": "0",
  "id": "d291b5a-b0ad-cace-a8e3-0f159d018e06",
  "detail-type": "SageMaker Endpoint State Change",
  "source": "aws.sagemaker",
  "account": "123456789012",
  "time": "1583831889050",
  "region": "us-west-2",
  "resources": [
  ],
  "detail": {
    "EndpointName": "MyEndpoint",
    "EndpointConfigName": "MyEndpointConfig",
    "ProductionVariants": [
      {
        "DesiredWeight": 1.0,
        "DesiredInstanceCount": 1.0
      }
    ]
  }
}
```
Feature group state change

Indicates a change either in the FeatureGroupStatus or the OfflineStoreStatus of a SageMaker feature group.

```json
{
  "version": "0",
  "id": "93201303-abdb-36a4-1b9b-4c1c3e3671c0",
  "detail-type": "SageMaker Feature Group State Change",

        }
    }
}
```
Pipeline execution state change

Indicates a change in the status of a SageMaker pipeline execution.

```json
{
  "version": "0",
  "id": "315c1398-40ff-a850-213b-158f7f3kd93ir",
  "detail-type": "SageMaker Model Building Pipeline Execution Status Change",
  "source": "aws.sagemaker",
  "account": "123456789012",
  "time": "2021-03-15T16:10:11Z",
  "region": "us-east-1",
  "resources": ["arn:aws:sagemaker:us-east-1:123456789012:pipeline/myPipeline-123",
    "arn:aws:sagemaker:us-east-1:123456789012:pipeline/myPipeline-123/execution/p4jn9xou8a8s"],
  "detail": {
    "pipelineExecutionDisplayName": "SomeDisplayName",
    "currentPipelineExecutionStatus": "Succeeded",
    "previousPipelineExecutionStatus": "Executing",
    "executionStartTime": "2021-03-15T16:10:11Z",
    "executionEndTime": "2021-03-15T16:10:10Z",
    "pipelineExecutionDescription": "SomeDescription",
    "pipelineArn": "arn:aws:sagemaker:us-east-1:123456789012:pipeline/myPipeline-123",
    "pipelineExecutionArn": "arn:aws:sagemaker:us-east-1:123456789012:pipeline/myPipeline-123/execution/p4jn9xou8a8s"
  }
}
```

Pipeline step state change

Indicates a change in the status of a SageMaker pipeline step.

If there is a cache hit, the event contains the cacheHitResult field.

If the value of currentStepStatus is Failed, the event contains the failureReason field, which provides a description of why the step failed.

```json
{
  "version": "0",
  "id": "ea37ccbb-5e2b-05e9-4073-1daazc940304",
  "detail-type": "SageMaker Model Building Pipeline Execution Step Status Change",
  "source": "aws.sagemaker",
  "account": "123456789012",
  "time": "2021-03-15T16:10:10Z",
  "region": "us-east-1",
  "resources": ["arn:aws:sagemaker:us-east-1:123456789012:pipeline/myPipeline-123",

  }
}
```
SageMaker image state change

Indicates a change in the status of a SageMaker image.

```
{
  "version": "0",
  "id": "cee033a3-17d8-49f8-865f-b9ebf485d9ee",
  "detail-type": "SageMaker Image State Change",
  "source": "aws.sagemaker",
  "account": "123456789012",
  "time": "2021-04-29T01:29:59Z",
  "region": "us-east-1",
  "resources": ["arn:aws:sagemaker:us-west-2:123456789012:image/cee033a3-17d8-49f8-865f-b9ebf485d9ee"]
}
```

SageMaker image version state change

Indicates a change in the status of a SageMaker image version.

```
{
  "version": "0",
  "id": "07fc4615-ebd7-15fc-1746-243411f09f04",
  "detail-type": "SageMaker Image Version State Change",
  "source": "aws.sagemaker",
  "account": "123456789012",
  "time": "2021-04-29T01:29:59Z",
  "region": "us-east-1",
  "resources": ["arn:aws:sagemaker:us-west-2:123456789012:image-version/07800032-2d29-48b7-8f82-5129225b2a85"]
}
```

For more information about the status values and their meanings for SageMaker jobs, endpoints, and pipelines, see the following links:

3689
Important
The following examples may not work for all endpoints. For a list of features that may exclude your endpoint, see the Exclusions (p. 2980) page.

Indicates a state change for an endpoint deployment. The following example shows an endpoint updating with a blue/green canary deployment.

```json
{
   "version": "0",
   "id": "0bd4a141-0a02-9d8a-f977-3924c3fb259c",
   "detail-type": "SageMaker Endpoint Deployment State Change",
   "source": "aws.sagemaker",
   "account": "123456789012",
   "time": "2021-10-25T01:52:12Z",
   "region": "us-west-2",
   "resources": [
   ],
   "detail": {
      "EndpointName": "sample-endpoint",
      "EndpointConfigName": "sample-endpoint-config-1",
      "ProductionVariants": [
         {
            "VariantName": "AllTraffic",
            "CurrentWeight": 1,
            "DesiredWeight": 1,
            "CurrentInstanceCount": 3,
            "DesiredInstanceCount": 3
         }
      ],
      "EndpointStatus": "UPDATING",
      "CreationTime": 1635195148181,
      "LastModifiedTime": 1635195148181,
      "Tags": {},
      "PendingDeploymentSummary": {
         "EndpointConfigName": "sample-endpoint-config-2",
         "StartTime": Timestamp,
         "ProductionVariants": [
            {
```
The following example indicates a state change for an endpoint deployment, which is being updated with new capacity on an existing endpoint configuration.

```
{
  "version": "0",
  "id": "0bd4a141-0a02-9d8a-f977-3924c3fb259c",
  "detail-type": "SageMaker Endpoint Deployment State Change",
  "source": "aws.sagemaker",
  "account": "123456789012",
  "time": "2021-10-25T01:52:12Z",
  "region": "us-west-2",
  "resources": [
  ],
  "detail": {
    "EndpointName": "sample-endpoint",
    "EndpointConfigName": "sample-endpoint-config-1",
    "ProductionVariants": [
      {
        "VariantName": "AllTraffic",
        "CurrentWeight": 1,
        "DesiredWeight": 1,
        "CurrentInstanceCount": 3,
        "DesiredInstanceCount": 6,
        "VariantStatus": [
          {
            "Status": "Updating",
            "StatusMessage": "Scaling out desired instance count to 6.",
            "StartTime": 1635195269181,
          }
        ]
      }
    ],
    "EndpointStatus": "UPDATING",
    "CreationTime": 1635195148181,
    "LastModifiedTime": 1635195148181,
    "Tags": {}
  }
}
```

The following secondary deployment statuses are also available for endpoints (found in the `VariantStatus` object.

- Creating: creating instances for the production variant.
Example message: "Launching X instance(s)."

- Deleting: terminating instances for the production variant.
  
  Example message: "Terminating X instance(s)."

- Updating: updating capacity for the production variant.
  
  Example messages: "Launching X instance(s).", "Scaling out desired instance count to X."

- ActivatingTraffic: turning on traffic for the production variant.
  
  Example message: "Activating traffic on canary capacity of X instance(s)."

- Baking: waiting period to monitor the CloudWatch alarms in the auto-rollback configuration.
  
  Example message: "Baking for X seconds (TerminationWaitInSeconds) with traffic enabled on full capacity of Y instance(s)."
API Reference Guide for Amazon SageMaker

Overview

Amazon SageMaker provides APIs, SDKs, and a command line interface that you can use to create and manage notebook instances and train and deploy models.

- Amazon SageMaker Python SDK (Recommended)
- Amazon SageMaker API Reference
- Amazon Augmented AI API Reference
- AWS Command Line Interface
- AWS SDK for .NET
- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for JavaScript
- AWS SDK for PHP
- AWS SDK for Python (Boto)
- AWS SDK for Ruby
- Amazon SageMaker Spark

You can also get code examples from the Amazon SageMaker example notebooks GitHub repository.

- Example notebooks

Programming Model for Amazon SageMaker

Making API calls directly from code is cumbersome, and requires you to write code to authenticate your requests. Amazon SageMaker provides the following alternatives:

- Use the SageMaker console–With the console, you don't write any code. You use the console UI to start model training or deploy a model. The console works well for simple jobs, where you use a built-in training algorithm and you don’t need to preprocess training data.

- Modify the example Jupyter notebooks–SageMaker provides several Jupyter notebooks that train and deploy models using specific algorithms and datasets. Start with a notebook that has a suitable algorithm and modify it to accommodate your data source and specific needs.

- Write model training and inference code from scratch–SageMaker provides multiple AWS SDK languages (listed in the overview) and the Amazon SageMaker Python SDK, a high-level Python library that you can use in your code to start model training jobs and deploy the resulting models.
• **The SageMaker Python SDK**—This Python library simplifies model training and deployment. In addition to authenticating your requests, the library abstracts platform specifics by providing simple methods and default parameters. For example:

  • To deploy your model, you call only the `deploy()` method. The method creates a SageMaker model artifact, an endpoint configuration, then deploys the model on an endpoint.

  • If you use a custom framework script for model training, you call the `fit()` method. The method creates a .gzip file of your script, uploads it to an Amazon S3 location, and then runs it for model training, and other tasks. For more information, see [Use Machine Learning Frameworks, Python, and R with Amazon SageMaker](p. 13).

• **The AWS SDKs** – The SDKs provide methods that correspond to the SageMaker API (see [Operations](p. 13)). Use the SDKs to programmatically start a model training job and host the model in SageMaker. SDK clients authenticate your requests by using your access keys, so you don’t need to write authentication code. They are available in multiple languages and platforms. For more information, see the preceeding list in the overview.

  In [Get Started with Amazon SageMaker](p. 33), you train and deploy a model using an algorithm provided by SageMaker. That exercise shows how to use both of these libraries. For more information, see [Get Started with Amazon SageMaker](p. 33).

• **Integrate SageMaker into your Apache Spark workflow**—SageMaker provides a library for calling its APIs from Apache Spark. With it, you can use SageMaker-based estimators in an Apache Spark pipeline. For more information, see [Use Apache Spark with Amazon SageMaker](p. 14).
## Document History for Amazon SageMaker
