What is AWS SDK for SAP ABAP?

AWS SDK for SAP ABAP provides an interface to the services offered by AWS in the ABAP language. Using the SDK, you can implement ABAP BADIs, reports, transactions, OData services, and other ABAP artifacts on AWS services, such as Amazon Simple Storage Service (Amazon S3), Amazon DynamoDB, Amazon Translate, and more. You can also develop for ABAP-based systems, starting from SAP NetWeaver 7.4.

Features of AWS SDK for SAP ABAP

AWS SDK for SAP ABAP has been designed to feel familiar and natural to SAP developers. For example, while all AWS services use the true and false strings to represent Boolean data in XML and JSON structures, SDK for SAP ABAP converts these to ABAP-native 'X' and ' ' single-character values. SDK for SAP ABAP uses native ABAP constructs as much as possible, including in data types and timestamp formats. As a result, the ABAP programmer does not need to be concerned about the underlying JSON and XML serialization or with the wire format of the API protocol.

Maintenance and support for SDK major versions

For information about maintenance and support for SDK major versions and their underlying dependencies, see the following in the AWS SDKs and Tools Reference Guide:

- AWS SDKs and tools maintenance policy
- AWS SDKs and tools and version support matrix

API reference

To see a complete list of AWS SDK for SAP ABAP APIs, see AWS SDK for SAP ABAP - API Reference Guide.

To see a complete module list of AWS SDK for SAP ABAP TLAs, see AWS SDK for SAP ABAP - Module List.

Pricing

AWS SDK for SAP ABAP is available to you at no additional cost. You only pay for AWS resources and services that you consume with the SDK.
Additional resources

In addition to this guide, the following online resources are available for SDK for SAP ABAP:

- SAP on AWS documentation
- AWS developer blog
- AWS developer forums
- AWS SDK Code Example Library
- @awsdevelopers (Twitter)
Getting started with AWS SDK for SAP ABAP

This section describes how to get started with AWS SDK for SAP ABAP. It includes information about installing the SDK, performing basic configuration, and creating a Hello World code example that translates a phrase from one language to another. If you are new to AWS SDK, we recommend performing these steps in a sandbox environment.

Steps
- Step 1: Prepare your AWS account (p. 3)
- Step 2: Set up transports (p. 5)
- Step 3: Functional setup (p. 6)
- Step 4: Authorize SAP Users (p. 6)
- Step 5: Write the code (p. 7)
- Step 6: Run the application (p. 8)

Step 1: Prepare your AWS account

To get started with SDK for SAP ABAP, you must have an active AWS account. You need an AWS account even if your SAP system is hosted on-premises or with another cloud provider.

If your SAP system is running on AWS Cloud, then you will be making calls to AWS services in your AWS account.

Topics
- IAM role for SAP users (p. 3)
- Authentication (p. 4)

IAM role for SAP users

- Create an IAM role with the instructions provided in the AWS Identity and Access Management User Guide. For more information, see Creating a role to delegate permissions to an AWS service. Note the Amazon Resource Name (ARN) of the IAM role for later use.
- Select Amazon EC2 as the use case.
- Use SapDemoTranslate as the name of the role.
- Attach TranslateReadOnly profile to the role.
- The role must have the following entities to enable the SAP system to assume the role. Replace "111122223333" with your AWS account number.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
```
Authentication

Authentication depends on where your SAP system is hosted.

Locations

- On AWS Cloud (p. 4)
- On-premises or other cloud (p. 4)

On AWS Cloud

Ensure that the EC2 instance on which your SAP system is running has an instance profile with the following permissions.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "VisualEditor0",
            "Effect": "Allow",
            "Action": "sts:AssumeRole",
            "Resource": "arn:aws:iam::111122223333:role/SapDemoTranslate"
        }
    ]
}
```

Add the ARN that you noted in the previous step.

This permission enables your SAP system to assume the SapDemoTranslate role on behalf of the ABAP user.

On-premises or other cloud

If your SAP system is located on-premises or on other cloud, use the following steps to establish a connection.

1. Create an IAM user. For more information, see Creating IAM users (console).
2. Use SapDemoSID as the name of the IAM user. SID is the system ID of your SAP system.
3. Assign SapDemoTranslate role to this user.

Note the access_key and secret_access_key. You must provide these credentials must to the SAP administrator to be encrypted in the SAP system.

Step 2: Set up transports

In this part of the setup, you import and configure the transports.

Topics
- Import (p. 5)
- Configure (p. 5)

Import

Import SDK for SAP ABAP transports in your SAP system. You can import the transports into any client.

Configure

When the import is complete, run the /AWS1/IMG transaction to open the Implementation Guide for SDK for SAP ABAP. To run this transaction, enter /n/AWS1/IMG in the command bar of your SAP system, and then choose Enter.

- Go to Technical Prerequisites.
  - Review the recommended profile parameter and SSL certificate settings.
- Go to Global Settings → Configure Scenarios.
  - Change the settings, according to the recommendations in Global settings.
- Go to Global Settings → Technical Settings.
  - Change the settings, according to the recommendations in Global settings.
- Go to Runtime Settings → Log And Trace.
  - Select New Entries.
    - Trace level: No Trace.
    - Maximum Dump Lines: 100.
    - OPT-IN: enh telemetry: Keep this blank.
  - Select Save.
- Go to Runtime Settings → Active Scenario.
  - Under New Scenario, select DEFAULT.
  - Select Commit Scenario Change.
  - Accept the prompt.

Prerequisites for On-Premises Systems

If your SAP system is running on-premises or in another cloud, then the credentials must be stored in your SAP database. The credentials are encrypted using SAP SSF and require a configured cryptographic library, such as SAP's CommonCryptoLib.

The steps for configuring SSF for SDK for SAP ABAP are described in the /AWS1/IMG transaction.
Note:
The preceding prerequisite does not apply if your SAP system is running on Amazon EC2. SAP systems running on Amazon EC2 retrieve short-lived, automatically rotating credentials from the Amazon EC2 instance metadata.

Step 3: Functional setup

Run transaction /AWS1/IMG (enter /n/AWS1/IMG in the command bar, and choose Enter) to open the implementation guide for AWS SDK.

• Go to Application Configuration → SDK Profile.
  • Select New Entries.
    • Profile: DEMO.
    • Description: Demo profile.
    • Select Save.
  • Highlight the entry that you created and click on the Authentication And Settings tree branch.
    • Select New Entries.
      • SID: The system ID of the SAP system that you are currently in.
      • Client: The client of the SAP system that you are currently in.
      • Scenario ID: The dropdown list where you'll find the DEFAULT scenario created by your Basis administrator.
      • AWS Region: enter the AWS Region that you want to make calls to. If your SAP system is running in AWS, enter the AWS Region that it is running in.
    • Authentication Method:
      • Select Instance Role via Metadata if your SAP system is running on Amazon EC2.
      • Select Credentials from SSF Storage if your SAP system is running on-premises or in another cloud.
        • Select Set Credentials.
          • Enter the Access Key ID and Secret Access Key that you created in the previous step.
      • Keep Disable IAM roles blank.
      • Select Save.
  • Click on the IAM Role Mapping tree branch.
    • Select New Entries.
      • Enter Sequence number: 010.
      • Enter Logical IAM role: TESTUSER.
      • Enter IAM Role ARN: enter the arn:aws: of the IAM role containing the TranslateReadOnly policy created in the previous step.

Step 4: Authorize SAP Users

SAP users are not authorized to use AWS functionality by default. The users must be explicitly authorized using SAP authorizations.

Create a PFCG role

• Go to transaction PFCG
• Enter the role name ZAWS_SDK_DEMO_TESTUSER and select Create Single Role.
  • Description: Role for demo AWS SDK functionality.
• Go to the **Authorizations** tab.  
• Select **Change Authorization Data** and accept the informational pop-up.  
• At the **Choose Template** pop-up, select **Do not select templates**.  
• Select **Add Manually** from the toolbar.  
• Add the following authorization objects:  
  • /AWS1/LROL  
  • /AWS1/SESS  
• In the authorization tree, enter:  
  • Profile for accessing AWS APIs: DEMO  
  • Logical IAM Role: TESTUSER  
• Select **Save**.  
• Select **Generate**.  
• Select **Back**.  
• Select **Save** to save the role.  

Assign the PFCG role to SAP users  
Any user who has the ZAWS_SDK_DEMO_TESTUSER role assigned will be authorized to use AWS SDK functions with the settings configured in DEMO SDK profile. The authorized user will also assume the IAM role mapped to the TESTUSER logical IAM role in that profile.  
• Run transaction SU01.  
  • Enter the user ID of an SAP user who will be testing AWS SDK functionality.  
  • Select **Change**.  
  • Go to the **Roles** tab and assign ZAWS_SDK_DEMO_TESTUSER role to the user.  
  • Select **Save**.

**Step 5: Write the code**

• Open transaction SE38.  
  • Enter ZDEMO_TRANSLATE_HELLO_WORLD as the program name.  
  • Select **Create**.  
  • Enter AWS SDK Hello World In Any Language as the title.  
  • Type: choose **Executable Program**.  
  • Status: choose **Test Program**.  
  • Select **Save**.  
  • Save the program as a **Local Object**.

Add the following code.

```plaintext
*&---------------------------------------------------------------------*
*& Report  ZAWS1_DEMO_XL8_SIMPLE
*&
*& A simple demo of language translation with AWS Translate
*&---------------------------------------------------------------------*
REPORT zaws1_demo_xl8_simple.
```
START-OF-SELECTION.
PARAMETERS pv_text TYPE /aws1/xl8boundedlengthstring DEFAULT 'Hello, World' OBLIGATORY.
PARAMETERS pv_lang1 TYPE languageiso DEFAULT 'EN' OBLIGATORY.
PARAMETERS pv_lang2 TYPE languageiso DEFAULT 'ES' OBLIGATORY.
TRY.
  DATA(go_session) = /aws1/cl_rt_session_aws=>create( 'DEMO' ).
  DATA(go_xl8) = /aws1/cl_xl8_factory=>create( go_session ).
  DATA(lo_output) = go_xl8->translatetext(
    iv_text
    = pv_text
    iv_sourcelanguagecode = CONV /aws1/xl8languagecodestring( pv_lang1 )
    iv_targetlanguagecode = CONV /aws1/xl8languagecodestring( pv_lang2 )
  ).
  WRITE: / 'Source Phrase: ', pv_text.
CATCH /aws1/cx_xl8unsuppedlanguage00 INTO DATA(lo_lang).
  WRITE: / 'ERROR' COLOR COL_NEGATIVE,
    'Cannot translate from',
    lo_lang->sourcelanguagecode,
    'to',
    lo_lang->targetlanguagecode.
CATCH cx_root INTO DATA(lo_root).
  WRITE: / 'ERROR' COLOR COL_NEGATIVE, lo_root->get_text( ).
ENDTRY.

Step 6: Run the application

Run the application in SE38. If successful, the following will be your output.

Source Phrase: Hello, World
Target Phrase: Hola, mundo

If you are missing authorizations, configuration, or Basis prerequisites, you might get an error message. See the following example.

ERROR Could not find configuration under profile DEMO with scenario DEFAULT for SBX:001

If your SAP role authorizes you to use an SDK profile and map it to a logical IAM role while your IAM permissions are not configured for the SAP system to assume the IAM role, the following will be your output.

ERROR Could not assume role arn:aws:iam::111122223333:role/SapDemoTranslate

In this case, review your IAM permissions and trust configuration on the IAM roles, users, or both defined in the section called "Step 1: Prepare your AWS account" (p. 3).
Setting up

This section provides information about how to set up your development environment to use AWS SDK for SAP ABAP.

- the section called “SAP prerequisites” (p. 9)
- the section called “Installing SDK for SAP ABAP” (p. 12)

SAP prerequisites

The following prerequisites for installing AWS SDK for SAP ABAP are applicable when your SAP systems are hosted on AWS.

Topics

- Basis release (p. 9)
- Kernel release (p. 10)
- Parameters (p. 10)
- Notes (p. 10)
- Outbound connectivity (p. 10)
- HTTPS connectivity (p. 10)
- Access to Amazon EC2 instance metadata (p. 11)

Basis release

SDK for SAP ABAP is compatible with SAP NetWeaver 7.4 and higher. SDK for SAP ABAP doesn't touch any SAP application tables. It is completely agnostic about the applications, such as SAP Enterprise Resource Planning and SAP Landscape Transformation Replication Server.

The minimum supported SP-Level for SAP_BASIS 740 is SP 0008. For more information, see SAP Note 1856171 - Supporting form fields of the same name in CL_HTTP_ENTITY (requires SAP portal access). Based on your business requirements, you can choose a higher SP-Level, as shown in the following image.
There is no minimum SP-Level requirement for SAP BASIS 750 and higher releases.

Kernel release

SDK for SAP ABAP and tools that use the Internet Communication Manager (ICM) for HTTP connectivity, rely on the SAP kernel for its cryptographic, HTTP, XML, and JSON capabilities. We recommend using the latest kernel release that is compatible with your SAP NetWeaver platform. The minimum requirement is kernel release 741. For more information, see SAP Note 2083594 - SAP Kernel Versions and SAP Kernel Patch Levels (requires SAP portal access).

If you are using kernel release 741 or 742, the following patch levels are required:

- 741 patchno 212
- 742 patchno 111

Parameters

Your SAP system must support Server Name Indication (SNI) as described in the following SAP Notes (requires SAP portal access).

- SAP Note 2124480 - ICM/Web Dispatcher: TLS Extension Server Name Indication (SNI) as client
- SAP Note 2582368 - SapSSL update for client-side sending of TLS extension SNI by saphttp, sapkprotp, sldreg

Configure the following parameter in the DEFAULT.PFL file.

```
icm/HTTPS/client_sni_enabled = TRUE
```

Notes

Apply the following SAP Note to your system.

- https://launchpad.support.sap.com/#/notes/0001856171
- https://launchpad.support.sap.com/#/notes/0002619546

Outbound connectivity

SDK for SAP ABAP is an HTTPS client. The SAP system sends HTTPS messages outbound. There is no requirement of an inbound connectivity.

HTTPS connectivity

All AWS API calls are made with encrypted HTTPS channels. The SAP system must be set up to trust AWS certificates to establish an outbound HTTPS connection.

1. Go to https://www.amazontrust.com/repository/.
2. Under Root CAs, download all the certificates using the PEM link.
3. Import these certificates in STRUST of your SSL Client (Standard) PSE on each of your SAP systems, as shown in the following image.
Access to Amazon EC2 instance metadata

ABAP system makes unencrypted HTTP connections to localhost (http://169.254.169.254) to enable Amazon EC2 instance metadata. The HTTP channel is used only to retrieve AWS credentials from the local server. The HTTP traffic stays within the host.

The metadata allows an SAP system in AWS to securely authenticate itself without storing a secret key in the SAP Secure Store. This feature is applicable only to SAP systems hosted on Amazon EC2.

Configure the DEFAULT.PFL file with the following parameter to enable your SAP system to make an unencrypted outbound HTTP connection.

```
icm/server_port_<xx> = PROT=HTTP,PORT=8000,TIMEOUT=60,PROCTIMEOUT=600
```

Use the following parameter to enable the outbound HTTP connection without enabling the inbound connection.

```
icm/server_port_<xx> = PROT=HTTP,PORT=0,TIMEOUT=60,PROCTIMEOUT=600
```

Verify that your SAP system is configured for outbound HTTP connections with the following steps:

1. Run **SMICM** transaction.
2. Go to **Active Services**.
3. Verify that you see a **green check mark** in the HTTP row, under **Active** column, as shown in the following image.
Installing SDK for SAP ABAP

Download SDK for SAP ABAP

```
curl "https://sdk-for-sapabap.aws.amazon.com/awsSdkSapabapV1/release/abapsdk-LATEST.zip" -o "abapsdk-LATEST.zip"
```

When the download is complete, we recommend that you unzip the downloaded file into a directory, such as `/tmp/awssdk`.

Verify SDK for SAP ABAP file – optional

This optional step of validating the signature of your SDK file helps you confirm that your SDK has not been tampered with. Use the following steps to verify your SDK file.

1. Download the SDK SIGNATURE file with the following command.

```
curl "https://sdk-for-sapabap.aws.amazon.com/awsSdkSapabapV1/release/abapsdk-LATEST.sig" -o "abapsdk-LATEST.sig"
```

2. Copy the following public key, and save it to a file named `abapsdk-signing-key.pem`.

```
-----BEGIN PUBLIC KEY-----
MIICIjANBgkqhkiG9w0BAQEFAAOCAg8AMIICCgKCAgEAmS3oN3wKBh4H30Ga0tye15RR509nuw03x0vEDCT709wvUx53mJg6Gb6h6vz2D.doFz+eH4ewT5bV16U3g0V85isTde3jpfLEW11ZZNK3v9f6WKyXqYe+ifmsPmf41Nd2auzpvl20u1SY1JCR8BWZFW+Ux00KLlvz+8CFC5XZMZ2OqtIIIFbGrn6A5aBbwzfOqkgK8UEZK0b86T/AiZNkMdBZGCM9KZMRKKMmxtrxUn+TFCAYyh5pM9tUAbqX4XE5m792UnZG7ur/QY11FSzWhhm9m8hpUaqO0QRC6z3TRzIGKOd/D10cUPJmzFR4LCxEnqh42kaRauU9V207DthPiJ8b7Qca0pMpbF3wzLgbjNnMx0hB0EprgB/nVHspf3zuiscJ21MPkz0cHOR3LMSsMLzmd+g/VkL5tSIR/jwAcFCkXTWvR8/V0WNZXXdVUbefrf1/k7FP60BbzUzILN4pQ16rc4Tk5Derg+wQ7r0WjXkXop2kiCMjbYo0i0K5/At64Pjpz8dH
-----END PUBLIC KEY-----
```
3. Verify the downloaded SDK ZIP file with the following command. The command requires `openssl` that is part of many Linux distributions.

```bash
openssl dgst -sha256 -verify abapsdk-signing-key.pem -keyform PEM -signature abapsdk-LATEST.sig abapsdk-LATEST.zip
```

4. Verify that the output of the preceding command is **Verified OK**.

5. If the output is **Verification Failure**, repeat the preceding steps. If you continue to receive a failed output, don't install the SDK and contact AWS Support.

---

## AWS SDK Transports

### Topics
- [Contents](#) (p. 13)
- [Importing](#) (p. 14)
- [Namespace](#) (p. 16)

### Contents

The installation of SDK for SAP ABAP is completed through ABAP Transports. You must import these transports into your development or sandbox environment.

Each SDK for SAP ABAP release completely replaces the previous one. There is no need to apply incremental transports. The transports are bundled in a ZIP file. The following is the structure of the ZIP file.

```
transports/
transports/core/
transports/core/Knnnnnn.AWS
transports/core/Rnnnnnn.AWS
transports/tla1/
transports/tla1/Knnnnnn.AWS
transports/tla1/Rnnnnnn.AWS
transports/tla2/
transports/tla2/Knnnnnn.AWS
transports/tla2/Rnnnnnn.AWS
```

The `transports` folder contains a `core` subfolder. The `core` subfolder contains the core runtime transports and a subfolder for each module, named by the three letter abbreviation of the module. For a complete module list of the TLAs, see [AWS SDK for SAP ABAP - Module List](#).

AWS SDK transports are workbench requests. Depending on the configuration of your TMS routes, the SDK may not automatically forward to your quality assurance and production queues after importing into the previous system. You must manually add them to the queue of each system.

When your project is ready for the next phase, AWS SDK can be imported along with separate transports containing your own Z code with business functionality. If you are using a change control system, such
as SAP Change Request Management (ChaRM), consult your ChaRM administrator for correct handling of third-party transports.

## Importing

### Topics
- [Key pointers (p. 14)](#)
- [Time to import (p. 15)](#)

AWS SDK transports are client-independent. The core transport is mandatory and contains the SDK runtime code, the API for AWS Security Token Service, and the API for Amazon Simple Storage Service. The remaining SDK modules are each delivered in a separate transport. To keep the size of the SDK small in your system, each SDK module is optional. You can install additional modules later, if required for your business logic.

For example, if you want to use the APIs for Amazon S3 and Amazon Translate, import the core transport (containing core runtime, Amazon S3, and AWS STS modules) and the x18 transport (containing the module for Amazon Translate) transports.

To see a complete list of SDK for SAP ABAP APIs, see [SDK for SAP ABAP - API Reference Guide](#).

The following are key pointers when importing AWS SDK transports.

- Each transport is delivered as Knnnnnn.AWS and Rnnnnnn.AWS
- Knnnnnn.AWS must be copied to /usr/sap/trans/cofiles
- Rnnnnnn.AWS must be copied to /usr/sap/trans/data.
- When importing transports, you must select the **Ignore Invalid Component Version** found at Import Transport Request > Options > Import Options.
- All desired transports can be imported simultaneously.
- If importing the transports separately, the core transport must be imported first.
- The release level of all the transports must be identical.

### Time to import

AWS SDK transports may take many minutes to import. The transports are successful if STMS shows a green (RC=0) or yellow (RC=4) light.

- A red light (RC=8) indicates that the import had a syntax error.
  - Select **Request → Display → Logs to examine the import error**.
- During the import, if an error is thrown because of a missing interface
  IF_SYSTEM_UUID_RFC4122_STATIC, then ensure that SAP Note 2619546 is applied to the system.
  For more information, see [Notes](#).
- If the cause of the error is unknown, contact AWS Support.
- A red lightning bolt (RC=12) indicates that the transport files have not been correctly loaded into /usr/sap/trans or do not have the necessary permissions.

### Key pointers

The following are key pointers when importing AWS SDK transports.

- Each transport is delivered as Knnnnnn.AWS and Rnnnnnn.AWS
- Knnnnnn.AWS must be copied to /usr/sap/trans/cofiles
• Rnnnnnnn. AWS must be copied to /usr/sap/trans/data.

• **Note**  
  When importing transports, you must select the **Ignore Invalid Component Version** found at **Import Transport Request > Options > Import Options**, as shown in the following image.

  ![Import Transport Request](image)

  - All desired transports can be imported simultaneously.
  - If importing the transports separately, the **core** transport must be imported first.
  - The release level of all the transports must be identical.

**Time to import**

AWS SDK transports may take many minutes to import. The transports are successful if STMS shows a green (RC=0) or yellow (RC=4) light.

• A red light (RC=8) indicates the import had a syntax error.
  • Select **Request** → **Display** → **Logs to examine the import error**.
  • During the import, if an error is thrown due to a missing interface **IF_SYSTEM_UUID_RFC4122_STATIC**, then ensure that SAP Note 2619546 is applied to the system. For more information, see **Notes**.
  • If the cause of the error is unknown, contact AWS Support.
• A red lightning bolt (RC=12) indicates the transport files have not been correctly loaded into /usr/sap/trans or do not have the necessary permissions.

Namespace

SDK for SAP ABAP uses the /AWS1/ namespace and does not modify SAP objects or any other objects in your system with the following exception.

• AWS auth objects are in an Auth Object Class. Auth Object Classes are limited to four characters and do not support namespaces. SDK for SAP ABAP uses Auth Object Class is YAW1. If you already have an auth object class YAW1 in transaction SU21, contact AWS Support before installation.
Configuring AWS SDK for SAP ABAP

Before using AWS SDK for SAP ABAP, you must IMG-style settings in transaction/AWS1/IMG. This transaction includes both technical and functional settings that are necessary for SDK operations. Some settings are transportable and some are runtime settings. Many of the settings are directly analogous to the settings defined in .INI files for other SDKs.

To run the configuration transaction, enter /n/AWS1/IMG in the SAPGUI command bar. If you do not have permissions to configure AWS SDK, see SAP authorizations.

SDK for SAP ABAP configuration, except for Runtime settings, must be completed in your development environment. You can transport configurations to QA and production following the usual transport and change control rules. We do not recommend using transportable configuration directly in production.

This section covers the following topics.

Topics
- Global settings (p. 17)
- Application configuration (p. 18)
- Runtime settings (p. 19)
- Refresh, trace, and telemetry topics for AWS SDK for SAP ABAP (p. 20)
- Advanced connectivity scenarios (p. 21)

Global settings

This section covers the following topics.

Topics
- Technical settings (p. 17)
- Configure scenarios (p. 18)

Technical settings

The Global settings of /AWS1/IMG transaction affect the behavior of the entire SDK. These settings are generally configured by a Basis administrator. You can set these values to the following recommended settings.

- Select New Entries.
- S3 regionalization: Access us-east-1 buckets by using s3.amazonaws.com.
- STS regionalization: Access STS by using global endpoint.
- Disable EC2 metadata: Keep this field blank.
- Metadata Endpt Mode: Use IPv4 metadata endpoint.
- Metadata Endpt URL: Keep this field blank.
- Select Save.
Configure scenarios

Scenarios enable AWS SDK to more efficiently switch settings during a multi-Region disaster testing or disaster recovery testing scenario. You may not need this feature, and instead need only to configure the following DEFAULT scenario.

- Select **New Entries**.
  - Scenario ID: DEFAULT
  - Scenario Description: Default Scenario
- Select **Save**.

If you have a multi-Region disaster recovery setup or other unique cases that require a quick change of settings, then you can configure multiple scenarios.

- DEFAULT - Standard operation.
- DR - Special configuration if a disaster requires moving the entire system to another Region.
- DR_TEST - Special configuration for simulating a disaster, for example, in a temporary clone of production.

Application configuration

Configuring SDK for SAP ABAP is similar to configuring other ABAP-based applications. It is organized into different *profiles* to group the settings of various scenarios. An ABAP SDK profile defines the settings required for a specific application scenario. For example, if transactions ZVA01, ZVA02, and ZVA03 are invoice-related transactions enhanced and runs on AWS services, such as Amazon S3, AWS Lambda, and Amazon SageMaker, then an SDK profile called ZINVOICE can be made. This profile can group the technical settings, SAP authorizations, and IAM role mappings for the invoice-related functionality.

Topics
- SDK profile (p. 18)
- Logical resource resolver (p. 19)
- Example (p. 19)

SDK profile

An ABAP SDK profile defines the following.

- The default AWS Region for all API calls. For example, if your SAP systems are running in the us-east-1 Region, it is likely that your other AWS resources are also in the same Region, and this should be your default Region. Your ABAP code can override the default Region.
- Authentication method
  - For SAP systems running on Amazon EC2, we strongly recommend choosing instance role metadata to benefit from the short-lived, automatically rotating credentials.
  - For SAP systems running on-premises or in another cloud, you must choose credentials from SSF storage.
  - A mapping of logical IAM roles to IAM roles.
  - This mapping is sorted in the order of descending priority.
  - An IAM role of highest priority for which a user is authorized in a PFCG role will automatically be selected for the user.
When an ABAP program wants to connect to an AWS service, it will specify an ABAP SDK profile that pulls the necessary settings. An AUTHORIZATION-CHECK will be performed to confirm that the user has permissions to access the SDK profile. Your SAP Security Administrator can define a PFCG role granting you access to the appropriate users.

Logical resource resolver

Logical resource resolver enables you with a standard place to store resource names. It ships with SDK for SAP ABAP. Its action is similar to the way that FILE transaction maps logical file names to physical file names.

A logical resource defines the concept of an AWS resource, such as the Amazon S3 bucket that holds our invoices. This logical resource, for example, can be named ZINVOICES_OUTBOUND and it can map to a different physical bucket name, depending on whether the SAP system is development, QA, or production.

SDK for SAP ABAP is set up such that a QA system resolves logical resources to the QA physical resources, even after a system refresh from production. The resource mappings for all systems are defined in your development SAP system and transported forward. This approach is different from the usual setup in SAP systems where the mapping is handled as master data and set in each system. The advantage of logical resource resolver offered by SDK for SAP ABAP is that the chances of a mistaken transport after system refreshes are almost none.

Example

There are four separate Amazon S3 buckets - one each for development, production, and QA, as well as a second QA bucket for regression testing.

When the SDK resolves a logical resource like ZINVOICE_OUTBOUND to a physical resource, it checks SY-SYSID and SY-MANDT to ask Which SID and client am I running in?, and automatically selects the correct physical resource.

If the mapping of a resource in production needs to change, you must change the mapping in the IMG of the development system and transport it forward. This ensures that reassigning AWS resources to an SAP system is subject to change control as with any other transport.

Note
As the SDK configuration is client-dependent, reassignment of resources is transported in a customizing request, and the transport must be imported into each client.

Runtime settings

This section covers the following topics.

Note
These settings are not transportable and are local to each SAP system.

Topics
- Log and trace (p. 19)
- OPT-IN: enhanced telemetry (p. 20)
- Active scenario (p. 20)

Log and trace

You can activate a trace for debugging purposes. It is recommended to keep the trace level at No Trace, unless diagnosing a technical issue. For more information, see secure operation.
OPT-IN: enhanced telemetry

All SDKs send telemetry information to AWS for support purposes. You can opt in for enhanced telemetry. This is particularly useful when you contact AWS Support to identify the source of a particular API call. For more information, see Trace and Telemetry.

Active scenario

Activate your DEFAULT scenario in this transaction. This activation is required only once for each system and should not be changed unless the system is undergoing a multi-Region disaster recovery. In a multi-Region setup, you can use this setting to switch your SAP system to a disaster recovery environment or disaster recovery test scenarios.

Refresh, trace, and telemetry topics for AWS SDK for SAP ABAP

This section covers the following topics.

Topics
- SAP system refresh (p. 20)
- Trace (p. 21)
- Telemetry (p. 21)

SAP system refresh

After a system refresh, the primary challenge for a Basis administrator is to ensure that the separate systems are not accessing each other’s resources. For example, you may want to ensure that your QA SAP system is not accessing the resources, such as an S3 bucket, of your Production landscape.

SDK for SAP ABAP provides a safety-conscious approach of logical resources to this challenge. A business analyst can take the following steps.

1. Define a logical resource, such as ZINVOICE_OUTBOUND.
2. Map all systems and clients in the development system.
3. Transport the configuration of ALL systems forward until the production landscape.

Basis steps after a refresh

1. Check the authentication

   - If the system is using Secret Access Key authentication, the SSF-encrypted credentials will be invalid because they are stored in master data. The credentials must be re-entered, which may require regenerating a new Secret Access Key in https://console.aws.amazon.com/iam/.
   - If the system is authenticating with EC2 instance metadata, no steps are required.

    Check the trace settings

   - In /AWS1/IMG, ensure that the trace settings are what you want. These settings are not transportable.
Trace

Trace output is controlled in the **IMG runtime settings**.

The trace levels that you can use are:

- **No Trace**
- **Trace API calls**
- **Trace API calls and payload**
  
  *This option contains unencrypted payload information.*
- **Trace API calls, payload, and internal XML transformation**
  
  *This option contains unencrypted payload information.*

If API trace is activated, traces are written to `DIR_WORK` in `aws1_trace-YYYY-MM-DD.log` file.

If payload trace is additionally activated, additional files with the title `aws1_payload_*` are created for each call and payload component. The payload trace length can be limited with the length limit applying to each individual payload trace fail.

Payload traces are primarily intended to collect information to be provided to AWS Support in the event of a serialization error. We recommend that you choose **No Trace** unless you're attempting to diagnose an SDK error.

**Note**

Payload traces can contain unencrypted business information. We recommend turning these traces on only for a request by AWS Support to help you troubleshoot. You can turn these traces off after resolution. Traces are not automatically deleted, and need to be removed by the system administrator when no longer needed.

Telemetry

SDKs send telemetry information to AWS Support. SDK for SAP ABAP collects the following information:

- OS release and patch level
- SAP_BASIS release and patch level
- SAP Kernel release and patch level

You can opt in to send the following information to AWS Support.

- SAP SID and instance name (`host_sid_nn`)
- SAP Client (SY-MANDT)
- Transaction code (SY-TCODE) and report (SY-REPID)

The additional information enables AWS Support to help you better. AWS Support can detect why a certain API call was made and can further find the relevant transaction in a SAP system.

Advanced connectivity scenarios

AWS SDK for SAP ABAP consumes AWS services by making HTTPS calls to AWS endpoints. In general, AWS endpoints are accessible over the internet. An SAP system must be able to reach out to the internet
to establish these outbound connections. SDK for SAP ABAP never requires an inbound connection from the internet into the SAP system.

The following scenarios offer different ways to establish the outbound connection.

**Scenarios**
- [Connection through a proxy server (p. 22)](#proxy)
- [Connection through a packet inspecting firewall (p. 22)](#firewall)
- [Gateway endpoints (p. 22)](#gateway)
- [Custom interface endpoints (p. 22)](#custom)
- [Accessing endpoints in multiple Regions (p. 23)](#multiple)

**Connection through a proxy server**

To establish a connection through a proxy server, use the following steps.

1. In the SDK, go to Transaction **SICF**.
2. Choose **Execute**.
3. In the menu, choose **Client > Proxy server**.
4. Set **Proxy setting** as **Active**.
5. In the field for **No Proxy for the Following Addresses**, list any exceptions separated by semicolons.
6. In the **HTTP Protocol** and **HTTPS Protocol** fields, specify the connection details for your proxy server.

The SDK is unaware of the proxy server, and does not require any settings to use the SAP system's proxy server configuration.

**Note**

If you use [Amazon EC2 instance metadata authentication](https://aws.amazon.com/ec2), then the SAP system cannot use the proxy server to access the local instance metadata at `http://169.254.169.254`. You must include `169.254.169.254` in the field for **No Proxy for the Following Addresses**.

**Connection through a packet inspecting firewall**

You can configure a packet inspecting firewall for outbound connection. These firewalls decrypt the SSL traffic, and then re-encrypt it before passing it on to the endpoint. This configuration usually requires the firewall to issue its own certificates to the SAP system that is consuming an AWS service. You must install your firewall's CA certificate in **STRUST**. For more information, see [HTTPS connectivity](https://aws.amazon.com/ssl/).

**Gateway endpoints**

Some AWS services offer gateway endpoints to provide a VPC with high-performance access without internet. These endpoints are transparent to SDK for SAP ABAP, and do not require any configuration.

For more information, see [Gateway endpoints](https://aws.amazon.com/ssl/).

**Custom interface endpoints**

If you need to override the default endpoint resolution with a custom endpoint, you can use an interface endpoint to provide your VPC with high-performance access without internet. For more information, see [Configure an interface endpoint](https://aws.amazon.com/ssl/).
When not using private DNS, these endpoints have their own DNS addresses, and an ABAP program must explicitly override the usual endpoint resolution logic. For more information, see AWS re:Post – Why can’t I resolve service domain names for an interface VPC endpoint?

In the following example, an interface endpoint is created for AWS STS and Amazon Translate. The SAP system is not using private DNS, and calls the services with custom endpoint. The logical resources defined in /AWS1/IMG represent the physical interface endpoint addresses, such as vpce-0123456789abcdef-hd52vxxz.translate.us-west-2.vpce.amazonaws.com. This avoids hard coding the DNS in code.

In the following code, the logical resources in /AWS1/IMG are first resolved to physical endpoint names. They are then provided to the factory methods of AWS session class (that uses AWS STS to assume an IAM role) and translate API class.

```
" This example assumes we have defined our logical endpoints in /AWS1/IMG
" as logical resources so that we don't hardcode our endpoints in code.
" The endpoints may be different in Dev, QA and Prod environments.
DATA(lo_config) = /aws1/cl_rt_config=>create( 'DEMO' ).
DATA(lo_resolver) = /aws1/cl_rt_lresource_resolver=>create( lo_config ).

" logical resource STS_ENDPOINT should resolve to the interface endpoint
" for example vpce-0123456789-abcdefg.sts.us-west-2.vpce.amazonaws.com
DATA(lv_sts_endpoint) = lo_resolver->resolve_lresource( 'STS_ENDPOINT' ).

" logical resource XL8_ENDPOINT should resolve to the interface endpoint
" e.g. vpce-0123456789abcdefg-12345567.translate.us-west-2.vpce.amazonaws.com
DATA(lv_xl8_endpoint) = lo_resolver->resolve_lresource( 'XL8_ENDPOINT' ).

" the session itself uses the sts service to assume a role, so the
" session creation process requires a custom endpoint, specified here
DATA(lo_session) = /aws1/cl_rt_session_aws=>create(
  iv_profile_id = 'DEMO'
  iv_custom_sts_endpoint = |https://{lv_sts_endpoint}|).

" now we create an API object, and override the default endpoint with
" the custom endpoint
DATA(lo_xl8) = /aws1/cl_xl8_factory=>create(
  lo_session = lo_session
  iv_custom_endpoint = |https://{lv_xl8_endpoint}| " provide custom endpoint).

" now calls to lo_xl8 go to custom endpoint...
```

As shown in the example, any method calls on go_xl8 go to the endpoint https://vpce-0123456789abcdefg-12345567.translate.us-west-2.vpce.amazonaws.com.

### Accessing endpoints in multiple Regions

AWS endpoint is automatically determined from your default AWS Region that is defined in the SDK profile. You can also specify a region programmatically, overriding the default region. This can be overridden in the factory CREATE() method, or later with the SDK's configuration object. For more information, see Programmatic configuration.

In the following example, the factory CREATE() method is used to set the region and list the Amazon SQS queues in both us-east-1 and us-west-2 Regions.

```
REPORT zdemo_sqs_queue_list.
parameters: profile type /AWS1/RT_PROFILE_ID OBLIGATORY.
START-OF-SELECTION.
```
DATA(go_session) = /aws1/cl_rt_session_aws=>create( profile ).
data(lt_region) = VALUE stringtab(
  ( |us-east-1| )
  ( |us-west-2| )
).
LOOP AT lt_region INTO DATA(lv_region).
  DATA(go_sqs)  = /aws1/cl_sqs_factory=>create(
    io_session = go_session
    iv_region = conv /AWS1/RT_REGION_ID( lv_region )
  ).
  WRITE: / lv_region COLOR COL_HEADING.
  LOOP AT go_sqs->listqueues( )->get_queueurls( ) INTO DATA(lo_url).
    WRITE: / lo_url->get_value( ).
  ENDLOOP.
ENDLOOP.
Using AWS SDK for SAP ABAP

SDK for SAP ABAP has two major components.

- SDK Runtime (package /AWS1/RT) – a set of objects that underpin the security, authentication, tracing, configuration, data conversion, and other cross-API functions.
- APIs (package /AWS1/API and its sub-packages) – a sub-package for each API where the objects of each API are completely independent of each other, ensuring that a change in one API does not break another API. To see a complete list of AWS SDK for SAP ABAP APIs, see AWS SDK for SAP ABAP - API Reference Guide.

This section covers the following topics.

Topics
- Representation of data in ABAP (p. 25)
- Amazon S3 example program (p. 27)
- SDK for SAP ABAP concepts (p. 30)
- AWS SDK for SAP ABAP features (p. 1)
- Limitations (p. 35)

Representation of data in ABAP

This section covers the following topics.

Topics
- Data types (p. 25)
- AWS data types (p. 26)

Data types

AWS services have a standard set of data types that must be mapped to ABAP data types. See the following table for more details.

<table>
<thead>
<tr>
<th>AWS data type</th>
<th>ABAP data type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>C</td>
<td>Single character &quot;X&quot; and &quot; &quot;</td>
</tr>
<tr>
<td>String</td>
<td>STRING</td>
<td></td>
</tr>
<tr>
<td>Byte</td>
<td>INT2</td>
<td>INT2 has a larger range than 0-255. Most AWS services will truncate overflows but this behavior is not formally defined.</td>
</tr>
<tr>
<td>Short</td>
<td>INT2</td>
<td></td>
</tr>
<tr>
<td>Integer</td>
<td>INT4</td>
<td></td>
</tr>
<tr>
<td>Long</td>
<td>DEC19</td>
<td>INT8 is not available until ABAP 750. DEC19 is used for compatibility and consistency</td>
</tr>
</tbody>
</table>
AWS SDK for SAP ABAP Developer Guide

AWS data types

### AWS data type | ABAP data type | Comments
--- | --- | ---
Blob | XSTRING | Represents binary data across all supported ABAP platforms.
Float | STRING | While ABAP supports DECFLOATs, it cannot represent values such as NaN, Infinity and -Infinity. AWS SDK represents these internally as STRINGs, and converts them to DECFLOAT16 at runtime. If NaN, Infinity or +Infinity are represented, the developer may process these in response to a special set of exceptions or mappings.
Double | STRING | These values represent infinite-length numbers that cannot be represented in ABAP, and STRINGs are used instead of bigInteger.
bigInteger | STRING | bigDecimal | STRING | These values represent infinite-length numbers that cannot be represented in ABAP, and STRINGs are used instead of bigInteger.
Timestamp | TZNTSTMP | TZNTSTMP | Enables processing with native ABAP timestamp functions.

AWS services also return the following aggregate data types.

### AWS data type | ABAP data type | Comments
--- | --- | ---
Structure | Class | A union is the same as a structure, except that a union will never have more than one field set. All other fields will be set to No Value.
Union | Class | Array | STANDARD TABLE | The hashed table will only have two columns: a KEY (string) and a VALUE (class).
Hash | HASHED TABLE |  

**AWS data types**

The following approaches have been integrated to support AWS services in ABAP.

- Certain AWS data types cannot be represented in ABAP. For example, the float data type in ABAP does not support the NaN, Infinity, or -Infinity values. Therefore, the float data type is represented as STRING and is translated to DECFLOAT16 at runtime.
- AWS data is represented on the wire as JSON or XML, and the values are optional. For example, see the following examples returned by an AWS service in JSON.
Fullname: {  
    Firstname: "Ana",  
    Middlename: "Carolina",  
    Lastname: "Silva"  
}

If Ana doesn't have a middle name, the service returns the following output.

Fullname: {  
    Firstname: "Ana",  
    Lastname: "Silva"  
}

ABAP does not distinguish between a string of length 0 and a string that has no value. Other languages might assign a NULL value to the string or wrap the string in a construct (such as, Java's Optional<> wrapper). These are not supported in ABAP. Therefore, SDK for SAP ABAP facilitates the distinction in values by providing variants of the getter method.

Amazon S3 example program

This section walks you through a simple example program to list the contents of an Amazon S3 bucket by calling ListObjectsV2.

Topics
- Prerequisites (p. 27)
- Code (p. 28)
- Code sections (p. 28)

Prerequisites

You must meet the following prerequisites to run this example program.

- You have an Amazon S3 bucket. In this tutorial, the bucket is named demo-invoices.customer.com.
- Transaction /AWS1/IMG:
  - Has a defined SDK profile named DEMO_S3.
    - In the SDK profile, the logical IAM role TESTUSER must map to an IAM role, such as arn:aws:iam::111122223333:role/SapDemoFinance which grants s3:ListBucket permission to list the contents of your Amazon S3 bucket.
  - Has a logical resource named DEMO_BUCKET that is mapped to your Amazon S3 bucket with the SID and client of your SAP system.
  - Your user has a PFCG role that:
    - Authorizes the user to access DEMO_S3 SDK profile via auth object - /AWS1/SESS.
    - Authorizes the user for logical IAM role TESTUSER access via auth object - /AWS1/LROL.
  - Your SAP system can authenticate itself to AWS using the method defined in the SDK profile.
  - Your Amazon EC2 instance profile grants your SAP system the rights to sts:assumeRole in the IAM role arn:aws:iam::111122223333:role/SapDemoFinance mapped in the SDK profile.
The following code block demonstrates what your code would look like.

```
REPORT zdemo_s3_listbuckets.

START-OF-SELECTION.
  PARAMETERS pv_lres TYPE /aws1/rt_resource_logical
                DEFAULT 'DEMO_BUCKET' OBLIGATORY.

  DATA(go_session) = /aws1/cl_rt_session_aws=>create( 'DEMO_S3'  ).
  DATA(gv_bucket) = go_session->resolve_lresource( pv_lres ).
  DATA(go_s3) = /aws1/cl_s3_factory=>create( go_session ).

  TRY.
    DATA(lo_output) = go_s3->listobjectsv2(
      iv_bucket = CONV string( gv_bucket )
      iv_maxkeys = 100
    ).
    LOOP AT lo_output->get_contents( ) INTO DATA(lo_object).
      DATA lv_mdate TYPE datum.
      CONVERT TIME STAMP lo_object->get_lastmodified( )
        TIME ZONE 'UTC'
        INTO DATE lv_mdate.
      WRITE: /  CONV text30( lo_object->get_key( ) ),
             lv_mdate, lo_object->get_size( ).
    ENDLOOP.
  CATCH /aws1/cx_rt_generic INTO DATA(lo_ex).
    DATA(lv_msg) = lo_ex->if_message~get_text( )
    MESSAGE lv_msg TYPE 'I'.
  ENDTRY.
```

### Code sections

The following is a review of the code in sections.

```
PARAMETERS pv_lres TYPE /aws1/rt_resource_logical
                DEFAULT 'DEMO_BUCKET' OBLIGATORY.

The user can't specify a physical bucket name. They specify a logical bucket and the system
administrators (specifically the business analyst) in coordination with the AWS administrator map logical
buckets to physical buckets in /AWS1/IMG. In most business scenarios, the user doesn't have a chance to
choose the logical bucket — the logical resource ID is hard coded in the code or configured in a custom
configuration table.

DATA(go_session) = /aws1/cl_rt_session_aws=>create( 'DEMO_S3'  ).
```

This line establishes a security session and declares that this ABAP program expects to use the DEMO_S3
SDK profile. This call is the connection to the SDK configuration and pulls in the default Region,
authentication settings, and the desired IAM Role. A call to AUTHORIZATION-CHECK is automatically
made to ensure that authorization object /AWS1/SESS is satisfied. Additionally, AUTHORIZATION-
CHECK calls will be made to determine the most powerful (lower sequence number) logical IAM role the
user is authorized for, based on the authorization object /AWS1/LROL. The SDK will assume that the IAM
role is mapped to the logical IAM role for the SID and client. Then, the session object activates tracing based on the trace settings in the IMG.

If the user is not authorized for the requested SDK profile or for any available logical IAM role, an exception will be raised.

```
DATA(gv_bucket) = go_session->resolve_lresource( pv_lres ).
```

This line resolves the logical resource to a physical bucket name. If the logical resource cannot be resolved because the configuration has no mapping for this SID/client combination, an exception will be raised.

```
DATA(go_s3) = /aws1/cl_s3_factory=>create( go_session ).
```

This line creates an API object for Amazon S3 using the create() method of /aws1/cl_s3_factory. The returned object is of type /aws1/if_s3 which is the interface for an Amazon S3 API. A separate API object must be created for each service. For example, if an ABAP program is consuming Amazon S3, AWS Lambda, and DynamoDB, then it creates API objects from /aws1/cl_s3_factory, /aws1/cl_lmd_factory, and /aws1/cl_dyn_factory.

There are some optional parameters to the constructor which enable you to specify the Region if you want to override the default Region configured IMG. In this way, there can be two instances of /aws1/if_s3, one for us-east-1 and one for us-west-2, if you want to copy objects from a bucket in one Region to a bucket in another Region. Similarly, you can create two different security session objects and use them to create two separate instances of /aws1/cl_s3, if you need a report to read from a finance-related bucket and write objects to a logistics-related bucket.

```
DATA(lo_output) = go_s3->listobjectsv2(  
    iv_bucket = CONV string( gv_bucket )  
    iv_maxkeys = 100  
  ).
```

This line is a call to ListObjectsV2. It requires simple input arguments and returns a single object. These objects may represent deep JSON and XML data, de-serialized into an ABAP object-oriented construct. It can be quite complicated in some cases. Now, you only need to process the output to list the contents of the bucket.

```
LOOP AT lo_output->get_contents(  ) INTO DATA(lo_object).  
  DATA lv_mdate TYPE datum.  
  CONVERT TIME STAMP lo_object->get_lastmodified( )  
    TIME ZONE 'UTC'  
    INTO DATE lv_mdate.  
  WRITE: /  
    CONV text30( lo_object->get_key(  ) ),  
    lv_mdate, lo_object->get_size( ).
ENDLOOP.
```

The data is accessed using a GET...() style method that hides the internal representation of the data. GET_CONTENTS( ) returns an ABAP table and each row itself contains an object representing a single Amazon S3 entry. In most cases, AWS SDK takes this object-oriented approach and all data is represented as objects and tables. The LastModified field is represented as a timestamp that can be converted to a date with the ABAP-native CONVERT TIME STAMP command. The GET_SIZE() returns an INT4 for easy math and formatting operations.
All errors – connection, 4xx client, 5xx server, or any ABAP error, such as authorization or configuration errors, are represented as exceptions. You can tackle each exception separately. You have the choice of whether an exception should be handled as an informational error, a retry, warning, short dump, or any other kind of handling.

SDK for SAP ABAP concepts

This section covers the basic concepts of AWS SDK for SAP ABAP.

Topics
- API classes (p. 30)
- Additional objects (p. 30)
- Structure classes (p. 31)
- Arrays (p. 32)
- Maps (p. 33)

API classes

Each AWS service is assigned a three-letter acronym or TLA. The service is represented by an interface in the /AWS1/IF_<TLA> format. We will call this the service interface. The API class is in the /AWS1/API_<TLA> package. The service interface consists of one method for each AWS operation (we will call these methods Operation Methods). To see a complete module list of AWS SDK for SAP ABAP TLAs, see AWS SDK for SAP ABAP - Module List.

Each operation method has some IMPORTING arguments and at the most one RETURNING argument. Often, these arguments will be objects with complicated constructors and a long set of GET…() methods. In many cases, the objects will contain nested objects, recursive references, tables of objects, tables of tables, and so forth. This is because AWS services are passing deep XML and JSON structures, which cannot be represented by a flat set of arguments.

The arguments are always classes, even if the class contains only a single attribute.

Additional objects

In addition to containing the primary API class, each API package contains various related repository and data dictionary objects.

- A class for each structure-type object.
- A class for any primitive data type which appears in a table. For example, if a service returns a table of strings, the ABAP API will represent it as a table of objects, where each object is a wrapper class that encapsulates a string. This is so that the wrapper class can hide the details of representing a null string that cannot be represented natively in ABAP.
- An exception class for any specific errors defined by the service.
- Data elements for each primitive data type. Each data type has its own data element in order to be self-documenting.
• Additional objects for internal processing, such as XSLT transforms for serializing and de-serializing XML and JSON payloads.

Structure classes

Most AWS data, sent and received by the service, is represented by AWS SDK as classes. These classes represent structures of data and hide the internal details of the storage. In particular, the classes hide the way the SDK represents this field has no value.

For each field in a structure class, there are three methods.

GET_field( )

The GET_field( ) method

• Returns the value of the field, or
• If the field has no value, it returns a default value, which you can set as an optional parameter.

For example, consider the following code that prints the location constraint of a bucket.

```plaintext
DATA(lo_location) = go_s3->getbucketlocation( iv_bucket = CONV string( gv_bucket ) ).
WRITE: / 'Bucket Location: ',
lo_location->get_locationconstraint( ).
```

If the bucket has no location constraint at all (as in the case of us-east-1), then GET_LOCATIONCONSTRAINT( ) will return the empty string. You can override this behavior and specify the desired value if the field has no value at all.

```plaintext
DATA(lo_location) = go_s3->getbucketlocation( iv_bucket = CONV string( gv_bucket ) ).
WRITE: / 'Bucket Location: ',
lo_location->get_locationconstraint( iv_value_if_missing = 'assuming us-east-1' ).
```

Now the program will write Bucket Location: assuming us-east-1 if getbucketlocation()'s result does not return a location.

It is possible to ask the GET( ) method to return a specific result if the requested value is completely missing, see the following code example.

```plaintext
data(lo_location) = go_s3->GETBUCKETLOCATION(
    new /AWS1/CL_S3_GET_BUCKET_LOC_REQ( iv_bucket = gv_bucket )
).write: / 'Location constraint: ',
lo_location->GET_LOCATIONCONSTRAINT( 'NopeNopeNope' ).
```

In this case, if there is no location constraint, GET_LOCATIONCONSTRAINT( ) will return NopeNopeNope.

HAS_field( )

HAS_field( ) method is a way to find out if the field has a value or not. See the following example.
if NOT lo_location->HAS_LOCATIONCONSTRAN( ).
    write: / 'There is no location constraint'.
endif.

If a certain field is known to always have a value, there will be no HAS_field( ) method.

ASK_field( )

The ASK_field( ) method returns the value of the field or raises an exception if it has no value. This is a convenient way to process a number of fields, and bail out of the logic and take a different approach if any of the fields have no value.

TRY.
    WRITE: / 'Location constraint: ', lo_location->ask_locationconstraint( ).
    CATCH /aws1/cx_rt_value_missing.
        WRITE: / 'Never mind, there is no location constraint'.
ENDTRY.

Note that /AWS1/CX_RT_VALUE_MISSING is a static exception and you will get a warning if you choose not to catch it.

Best practices

In general, you can use the GET_field( ) method as it treats a null string as an empty string and is the most ABAP-like of the three options. However, it does not let you easily distinguish between situations where the field has a blank value and where the field has no value. If your business logic depends on distinguishing missing data versus blank data, then the HAS or ASK methods let you handle these cases.

Arrays

Arrays are represented as ABAP standard tables of objects.

A JSON array can contain null values, such as the following array: ['cat', 'dog', null, 'horse']. This is referred to as a sparse array. It is represented in ABAP as an internal table of object references, and the null value is represented in the table as a true ABAP null value. When iterating through a sparse table, you must check for null values to avoid accessing a null object and getting a CX_SY_REF_IS_INITIAL exception. In practice, sparse arrays are rare in AWS services.

To initialize an array of objects, it is convenient to use the new ABAP 7.40 constructs. Consider this launch of an Amazon EC2 instance with several security groups assigned:

```bash
ao_ec2->runinstances(
    iv_imageid = lo_latest_ami->get_imageid( ),
    iv_instancetype = 't2.micro',
    iv_maxcount = 1,
    iv_mincount = 1,
    it_securitygroupids = VALUE /aws1/
        cl_ec2secgrpidsstrlist_w=>tt_securitygroupidstringlist(
            ( NEW /aws1/cl_ec2secgrpidsstrlist_w( 'sg-12345678' ) )
            ( NEW /aws1/cl_ec2secgrpidsstrlist_w( 'sg-55555555' ) )
            ( NEW /aws1/cl_ec2secgrpidsstrlist_w( 'sg-99999999' ) )
        )
    iv_subnetid = ao_snet->get_subnetid( ),
    it_tagspecifications = make_tag_spec( 'instance' )
)```
Maps

JSON maps are represented in ABAP as Hashed Tables where each table row has only two components.

- **KEY** – a string which is the UNIQUE KEY of the table.
- **VALUE** – an object containing the value.

A map is one of the very few cases where AWS SDK uses a true structure, rather than a class. This is necessary because ABAP hashed tables cannot have an object reference as the key field, and AWS map keys are always non-null strings.

AWS SDK for SAP ABAP features

AWS SDK for SAP ABAP provides the following features.

Topics

- Programmatic configuration (p. 33)
- Waiters (p. 34)
- Paginators (p. 34)

Programmatic configuration

The primary mechanism for configuring the SDK is through the IMG transaction /AWS1/IMG. You can now configure the SDK programmatically.

To begin programmatic configuration, begin by retrieving a configuration object with the `get_config()` command.

```abap
data(lo_config) = lo_s3->get_config( ).
```

Each configuration object implements /AWS1/IF_RT_CONFIG interface that includes GETters and SETters corresponding to the IMG. For example, the default region can be overridden. See the following example command.

```abap
lo_s3->get_config( )->/aws1/if_rt_config~set_region( 'us-east-1' ).
```

Some configuration objects have no IMG representation and can only be set programmatically, such as maximum retry attempts. See the following example command.

```abap
lo_s3->get_config( )->/aws1/if_rt_config~set_max_attempts( 10 ).
```

The configuration object of AWS services can also include service specific methods that are not represented in /aws1/if_rt_config. For example, Amazon S3 can address a bucket named foobucket using either foobucket.s3.region.amazonaws.com virtual endpoint or s3.region.amazonaws.com/foobucket path style. You can enforce the use of path style with the following example command.

```abap
lo_s3->get_config( )->set_forcepathstyle( abap_true ).
```
For more information about service configurations, see AWS SDK for SAP ABAP – API Reference Guide.

# Waiters

When working with asynchronous AWS APIs, you need to wait for a certain resource to become available before taking further actions. For example, the CREATETABLE() API of Amazon DynamoDB responds right away with table status CREATING. You can initiate read or write operations only after the status of the table has changed to ACTIVE. Waiters give you the ability to confirm that AWS resources are in a particular state before performing actions on them.

Waiters use service operations to poll the status of AWS resources until the resource reaches the intended state or until it is determined that the resource doesn’t reach the desired state. It can be time-consuming and error-prone to write the code to poll AWS resources continually. Waiters help in simplifying this complexity by taking the responsibility of performing polls on your behalf.

See the following Amazon S3 example using waiter.

```plaintext
DATA(lo_session) = /aws1/cl_rt_session_aws=>create( cv_pfl ).
DATA(lo_s3) = /aws1/cl_s3_factory=>create( lo_session ).

" Create a bucket - initiates the process of creating an S3 bucket and might return before the bucket exists
lo_s3#createbucket( iv_bucket = |example-bucket| ).

" Wait until the newly created bucket becomes available
lo_s3->get_waiter( )->bucketexists( 
    iv_max_wait_time = 200
    iv_bucket = |example-bucket|
).
```

- In this example, Amazon S3 client is used to create a bucket. The get_waiter() command is implemented to specify when the bucketexists.
- You must specify the iv_max_wait_time parameter for each waiter. It represents the total amount of time a waiter must wait before completion. In the preceding example, a waiter can run for 200 seconds.
- You may need to provide additional inputs for required parameters. In the preceding example, Amazon S3 bucket name is required for iv_bucket parameter.
- /AWS1/CX_RT_WAITER_FAILURE exception indicates that the waiter exceeded the maximum time specified in iv_max_wait_time parameter.
- /AWS1/CX_RT_WAITER_TIMEOUT exception indicates that the waiter has stopped due to not reaching the desired state.

# Paginators

Some AWS service operations offer paged responses. They are paginated to return a fixed amount of data with each response. You need to make subsequent requests with a token or a marker to retrieve the entire set of results. For instance, the ListObjectsV2 Amazon S3 operation return up to 1,000 objects at a time. You must make subsequent requests with the appropriate token to get the next page of results.

Pagination is the process of sending successive requests to pick up where a previous request left off. Paginators are iterators of results provided by SDK for SAP ABAP. You can use paginated APIs with ease, and without understanding the underlying mechanism of API using pagination tokens.
Working with paginators

You can create paginators with the `get_paginator()` method that returns a paginator object. The paginator object calls the operation being paginated. The paginator object accepts required parameters to be provided to the underlying API. This process returns an iterator object that can be used to iterate over paginated results, using the `has_next()` and `get_next()` methods.

- `has_next()` returns a boolean value indicating if there are more responses or pages available for the called operation.
- `get_next()` returns the operation response.

The following example list all objects in an S3 bucket retrieved by using paginator.

```abap
DATA(lo_session) = /aws1/cl_rt_session_aws=>create( 'DEMO' ).
DATA(lo_s3) = /aws1/cl_s3_factory=>create( lo_session ).
TRY.
  DATA(lo_paginator) = lo_s3->get_paginator( ).
  DATA(lo_iterator) = lo_paginator->listobjectsv2( iv_bucket = 'example_bucket' ).
  WHILE lo_iterator->has_next( ).
    DATA(lo_output) = lo_iterator->get_next( ).
    LOOP AT lo_output->get_contents( ) INTO DATA(lo_object).
      WRITE: / lo_object->get_key( ), lo_object->get_size( ).
    ENDLOOP.
  ENDWHILE.
CATCH /aws1/cx_rt_generic INTO DATA(lo_ex).
  MESSAGE lo_ex->if_message~get_text( ) TYPE 'I'.
ENDTRY.
```

Limitations

SDK for SAP ABAP includes SDK modules for all AWS services. Some of these modules may have limitations, as described here.

- Modules that rely on MQTT protocol bindings, such as `iot` and `iotevents`, will not work. MQTT is not an HTTP-based protocol and is currently not supported by AWS SDK for SAP ABAP.
- Modules that rely on HTTP/2 streaming features are not yet supported. Certain operations of services that work with event streams are not yet supported, and media streaming operations of services, such as Amazon Kinesis Video Streams will not work.

SDK for SAP ABAP has the following feature limitations.

- Steampunk is not supported. On-premises SAP systems are supported, including on-premises systems running in cloud environments or third-party datacenter.
- The following Amazon S3 features are not yet supported.
  - Multi-Region access points
  - Amazon S3 client-side encryption
SDK for SAP ABAP code examples

The code examples in this topic show you how to use the AWS SDK for SAP ABAP with AWS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

*Cross-service examples* are sample applications that work across multiple AWS services.

**Examples**
- Actions and scenarios using SDK for SAP ABAP (p. 36)

**Actions and scenarios using SDK for SAP ABAP**

The following code examples show how to perform actions and implement common scenarios by using the AWS SDK for SAP ABAP with AWS services.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

## Actions

### Invoke a model

The following code example shows how to invoke an Amazon Bedrock model to run inference.

**SDK for SAP ABAP**

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Invoke a Claude V2 foundation model. This example uses features of /US2/CL_JSON which might not be available on some NetWeaver versions.

```
"Claude V2 Input Parameters should be in a format like this:
* {  
  * "prompt":"\nHuman:\nTell me a joke\nAssistant:\n",  
  * "max_tokens_to_sample":2048,  
  * "temperature":0.5,  
  * "top_k":250,  
  * "top_p":1.0,  
  * "stop_sequences":[]  
  * }

DATA: BEGIN OF ls_input,
  prompt               TYPE string,
  max_tokens_to_sample TYPE /aws1/rt_shape_integer,
  temperature          TYPE /aws1/rt_shape_float,
  top_k                TYPE /aws1/rt_shape_integer,
  top_p                TYPE /aws1/rt_shape_float,
  stop_sequences       TYPE /aws1/rt_stringtab,
END OF ls_input.

"Leave ls_input-stop_sequences empty.
ls_input-prompt = \nHuman:\n{ iv_prompt }
Assistant:
|. 
ls_input-max_tokens_to_sample = 2048. 
ls_input-temperature = '0.5'. 
ls_input-top_k = 250. 
ls_input-top_p = 1.

"Serialize into JSON with /ui2/cl_json -- this assumes SAP_UI is installed.
DATA(lv_json) = /ui2/cl_json=>serialize(
  EXPORTING data = ls_input
  pretty_name   = /ui2/cl_json=>pretty_mode-low_case ).

TRY.
  DATA(lo_response) = lo_bdr->invokemodel(
```
Invoke a Stable Diffusion foundation model.

"Stable Diffusion Input Parameters should be in a format like this:

```plaintext
{
  "text_prompts": [
    {"text":"Draw a dolphin with a mustache"},
    {"text":"Make it photorealistic"}
  ],
  "cfg_scale":10,
  "seed":0,
  "steps":50
}
```

TYPES: BEGIN OF prompt_ts,
  text TYPE /aws1/rt_shape_string,
END OF prompt_ts.

DATA: BEGIN OF ls_input,

Actions

Create a metric alarm

The following code example shows how to create or update an Amazon CloudWatch alarm and associate it with the specified metric, metric math expression, anomaly detection model, or Metrics Insights query.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
TRY.
  lo_cwt->putmetricalarm(
    iv_alarmname                 = iv_alarm_name,
    iv_comparisonoperator        = iv_comparison_operator,
    iv_evaluationperiods         = iv_evaluation_periods,
    iv_metricname                = iv_metric_name,
    iv_namespace                 = iv_namespace,
    iv_statistic                 = iv_statistic,
    iv_threshold                 = iv_threshold,
    iv_actionsenabled            = iv_actions_enabled,
    iv_alarmdescription          = iv_alarm_description,
    iv_unit                      = iv_unit,
    iv_period                    = iv_period,
    it_dimensions                = it_dimensions
  ).
  MESSAGE 'Alarm created.' TYPE 'I'.
  CATCH /aws1/cx_cwtlimitexceededfault.
  MESSAGE 'The request processing has exceeded the limit' TYPE 'E'.
ENDTRY.
```

For API details, see PutMetricAlarm in AWS SDK for SAP ABAP API reference.

Delete alarms

The following code example shows how to delete Amazon CloudWatch alarms.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
TRY.
  lo_cwt->deletealarms(
    it_alarmnames = it_alarm_names
  ).
  MESSAGE 'Alarms deleted.' TYPE 'I'.
  CATCH /aws1/cx_cwtresourcenotfound.
  MESSAGE 'Resource being accessed is not found.' TYPE 'E'.
ENDTRY.
```
For API details, see DeleteAlarms in AWS SDK for SAP ABAP API reference.

Describe alarms

The following code example shows how to describe Amazon CloudWatch alarms.

SDK for SAP ABAP

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
TRY.
  oo_result = lo_cwt->describealarms(                 " oo_result is returned for
testing purposes. "                 it_alarmnames = it_alarm_names
).  MESSAGE 'Alarms retrieved.' TYPE 'I'.
CATCH /aws1/cx_rt_service_generic INTO DATA(lo_exception).
  DATA(lv_error) = |"{ lo_exception->av_err_code }" - { lo_exception->av_err_msg }|.
  MESSAGE lv_error TYPE 'E'.
ENDTRY.
```

For API details, see DescribeAlarms in AWS SDK for SAP ABAP API reference.

Disable alarm actions

The following code example shows how to disable Amazon CloudWatch alarm actions.

SDK for SAP ABAP

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
"Disables actions on the specified alarm. "
TRY.
  lo_cwt->disablealarmactions(                          "Disables actions on
                                                               the specified alarm. "
    it_alarmnames = it_alarm_names
 ).
  MESSAGE 'Alarm actions disabled.' TYPE 'I'.
CATCH /aws1/cx_rt_service_generic INTO DATA(lo_exception).
  DATA(lv_error) = |"{ lo_exception->av_err_code }" - { lo_exception->av_err_msg }|.
  MESSAGE lv_error TYPE 'E'.
ENDTRY.
```

For API details, see DisableAlarmActions in AWS SDK for SAP ABAP API reference.

Enable alarm actions

The following code example shows how to enable Amazon CloudWatch alarm actions.
**SDK for SAP ABAP**

**Note**
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

"Enable actions on the specified alarm."
TRY.
   lo_cwt->enablealarmactions(          " Enable actions on the specified alarm."
      it_alarmnames = it_alarm_names
   ).
   MESSAGE 'Alarm actions enabled.' TYPE 'I'.
CATCH /aws1/cx_rt_service_generic INTO DATA(lo_exception).
   DATA(lv_error) = "{ lo_exception->av_err_code }" - { lo_exception->av_err_msg }.
   MESSAGE lv_error TYPE 'E'.
ENDTRY.

• For API details, see [EnableAlarmActions](https://aws-sdk-for-sap-abap.developerguide.amazonaws.com/APIReference/ApiReferenceExample.html) in AWS SDK for SAP ABAP API reference.

**List metrics**

The following code example shows how to list the metadata for Amazon CloudWatch metrics. To get data for a metric, use the GetMetricData or GetMetricStatistics actions.

**SDK for SAP ABAP**

**Note**
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

"The following list-metrics example displays the metrics for Amazon CloudWatch."
TRY.
   oo_result = lo_cwt->listmetrics(          " The following list-metrics example displays the metrics for Amazon CloudWatch."
      iv_namespace = iv_namespace
   ).
   DATA(lt_metrics) = oo_result->get_metrics( ).
   MESSAGE 'Metrics retrieved.' TYPE 'I'.
CATCH /aws1/cx_cwtinvparamvalueex .
   MESSAGE 'The specified argument was not valid.' TYPE 'E'.
ENDTRY.

• For API details, see [ListMetrics](https://aws-sdk-for-sap-abap.developerguide.amazonaws.com/APIReference/ApiReferenceExample.html) in AWS SDK for SAP ABAP API reference.

**Scenarios**

**Get started with alarms**

The following code example shows how to:

• Create an alarm.
• Disable alarm actions.
• Describe an alarm.
• Delete an alarm.
SDK for SAP ABAP

DynamoDB examples using SDK for SAP ABAP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for SAP ABAP with DynamoDB.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
  • Actions (p. 37)
  • Scenarios (p. 42)

Actions

Create a table

The following code example shows how to create a DynamoDB table.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.
"Adjust read/write capacities as desired.
DATA(lo_dynprovthroughput) = NEW /aws1/cl_dynprovthroughput(
  iv_readcapacityunits = 5
  iv_writecapacityunits = 5 ).
oo_result = lo_dyn->createtable(  
  it_keyschema = lt_keyschema 
  iv_tablename = iv_table_name 
  it_attributedefinitions = lt_attributedefinitions 
  lo_provisionedthroughput = lo_dynprovthroughput ).
"Table creation can take some time. Wait till table exists before returning.
lo_dyn->get_waiter()->tableexists(  
  iv_max_wait_time = 200 
  iv_tablename = iv_table_name ).
MESSAGE 'DynamoDB Table' && iv_table_name && 'created.' TYPE 'I'.
"This exception can happen if the table already exists.
CATCH /aws1/cx_dynresourceinuseex INTO DATA(lo_resourceinuseex).
DATA(lv_error) = |"{ lo_resourceinuseex->av_err_code }" - { lo_resourceinuseex->av_err_msg }|.
MESSAGE lv_error TYPE 'E'.
ENDTRY.

• For API details, see CreateTable in AWS SDK for SAP ABAP API reference.

Delete a table
The following code example shows how to delete a DynamoDB table.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

TRY.
  lo_dyn->deletetable( iv_tablename = iv_table_name ).
  "Wait till the table is actually deleted.
  lo_dyn->get_waiter()->tablenotexists(  
    iv_max_wait_time = 200 
    iv_tablename = iv_table_name ).
  MESSAGE 'Table ' && iv_table_name && ' deleted.' TYPE 'I'.
CATCH /aws1/cx_dynresourcenotfoundex.
  MESSAGE 'The table ' && iv_table_name && ' does not exist' TYPE 'E'.
CATCH /aws1/cx_dynresourceinuseex.
  MESSAGE 'The table cannot be deleted since it is in use' TYPE 'E'.
ENDTRY.

• For API details, see DeleteTable in AWS SDK for SAP ABAP API reference.

Delete an item from a table
The following code example shows how to delete an item from a DynamoDB table.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.
TRY.
  DATA(lo_resp) = lo_dyn->deleteitem(  
    iv_tablename = iv_table_name  
    it_key = it_key_input ).
  MESSAGE 'Deleted one item.' TYPE 'I'.

      CATCH /aws1/cx_dyntransactconflictex.
        MESSAGE 'Another transaction is using the item' TYPE 'E'.
    ENDTRY.

• For API details, see DeleteItem in AWS SDK for SAP ABAP API reference.

Get an item from a table

The following code example shows how to get an item from a DynamoDB table.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

TRY.
  oo_item = lo_dyn->getitem(  
    iv_tablename = iv_table_name  
    it_key ).
  DATA(lt_attr) = oo_item->get_item( ).
  DATA(lo_title) = lt_attr[ key = 'title' ]-value.
  DATA(lo_year) = lt_attr[ key = 'year' ]-value.
  DATA(lo_rating) = lt_attr[ key = 'rating' ]-value.
  MESSAGE 'Movie name is: ' && lo_title->get_s( )  
    && 'Movie year is: ' && lo_year->get_n( )  
    && 'Movie rating is: ' && lo_rating->get_n( ) TYPE 'I'.
  CATCH /aws1/cx_dynresourcenotfoundex.
    MESSAGE 'The table or index does not exist' TYPE 'E'.
  ENDTRY.

• For API details, see GetItem in AWS SDK for SAP ABAP API reference.

Get information about a table

The following code example shows how to get information about a DynamoDB table.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

TRY.
  oo_result = lo_dyn->describetable( iv_tablename = iv_table_name ).
  DATA(lv_tablename) = oo_result->get_table( )->ask_tablename( ).
  DATA(lv_tablearn) = oo_result->get_table( )->ask_tablearn( ).
DATA(lv_tablestatus) = oo_result->get_table( )->ask_tablestatus( ).
DATA(lv_itemcount) = oo_result->get_table( )->ask_itemcount( ).

    && '. The table ARN is ' && lv_tablearn
    && '. The tablestatus is ' && lv_tablestatus
    && '. Item count is ' && lv_itemcount TYPE 'I'.
CATCH /aws1/cx_dynresourcenotfoundex.
MESSAGE 'The table ' && lv_tablename && ' does not exist' TYPE 'E'.
ENDTRY.
• For API details, see DescribeTable in AWS SDK for SAP ABAP API reference.

List tables

The following code example shows how to list DynamoDB tables.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the
AWS Code Examples Repository.

TRY.
    oo_result = lo_dyn->listtables( ).
    " You can loop over the oo_result to get table properties like this.
    LOOP AT oo_result->get_tablenames( ) INTO DATA(lo_table_name).
    DATA(lv_tablename) = lo_table_name->get_value( ).
    ENDLOOP.
    DATA(lv_tablecount) = lines( oo_result->get_tablenames( ) ).
    MESSAGE 'Found ' && lv_tablecount && ' tables' TYPE 'I'.
    CATCH /aws1/cx_rt_service_generic INTO DATA(lo_exception).
    DATA(lv_error) = |"{ lo_exception->av_err_code }" - { lo_exception->av_err_msg }|.
    MESSAGE lv_error TYPE 'E'.
ENDTRY.
• For API details, see ListTables in AWS SDK for SAP ABAP API reference.

Put an item in a table

The following code example shows how to put an item in a DynamoDB table.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the
AWS Code Examples Repository.

TRY.
    DATA(lo_resp) = lo_dyn->putitem(
        iv_tablename = iv_table_name
        it_item      = it_item ).
    MESSAGE '1 row inserted into DynamoDB Table' && iv_table_name TYPE 'I'.
    CATCH /aws1/cx_dyncondalcheckfaile00.
    MESSAGE 'A condition specified in the operation could not be evaluated.' TYPE 'E'.
    CATCH /aws1/cx_dyncconcheckfaile00.
    MESSAGE 'A condition specified in the operation could not be evaluated.' TYPE 'E'.
    CATCH /aws1/cx_dynresourcenotfoundex.
    MESSAGE 'The table or index does not exist' TYPE 'E'.

CATCH /aws1/cx_dyntransactconflictex.
  MESSAGE 'Another transaction is using the item' TYPE 'E'.
ENDTRY.

- For API details, see **PutItem** in *AWS SDK for SAP ABAP API reference*.

### Query a table

The following code example shows how to query a DynamoDB table.

**SDK for SAP ABAP**

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](https://github.com/awsdocs/aws-sdk-sap-abap-get-started).

```abap
TRY.
  " Query movies for a given year .
  DATA(lt_attributelist) = VALUE /aws1/cl_dynattributevalue=>tt_attributevaluelist(
    ( NEW /aws1/cl_dynattributevalue( iv_n = |{ iv_year }| ) ) ) )).
  DATA(lt_key_conditions) = VALUE /aws1/cl_dyncondition=>tt_keyconditions(
    ( VALUE /aws1/cl_dyncondition=>ts_keyconditions_maprow(
      key = 'year'
      value = NEW /aws1/cl_dyncondition( 
        it_attributevaluelist = lt_attributelist
        iv_comparisonoperator = |EQ|
      ) ) ) ) )).
  oo_result = lo_dyn->query(
    iv_tablename = iv_table_name
    it_keyconditions = lt_key_conditions ).
  DATA(lt_items) = oo_result->get_items( ).
  "You can loop over the results to get item attributes.
  LOOP AT lt_items INTO DATA(lt_item).
    DATA(lo_title) = lt_item[ key = 'title' ]-value.
    DATA(lo_year) = lt_item[ key = 'year' ]-value.
  ENDDO.
  DATA(lv_count) = oo_result->get_count( ).
  MESSAGE 'Item count is: ' && lv_count TYPE 'I'.
CATCH /aws1/cx_dynresourcenotfoundex.
  MESSAGE 'The table or index does not exist' TYPE 'E'.
ENDTRY.
```

- For API details, see **Query** in *AWS SDK for SAP ABAP API reference*.

### Scan a table

The following code example shows how to scan a DynamoDB table.

**SDK for SAP ABAP**

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](https://github.com/awsdocs/aws-sdk-sap-abap-get-started).

```abap
TRY.
  " Scan movies for rating greater than or equal to the rating specified
```

48
DATA(lt_attribute_list) = VALUE /aws1/
  cl_dynattributevalue=>tt_attributevalue_list(
    ( NEW /aws1/cl_dynattributevalue( iv_n = |{ iv_rating }| ) ) ).
DATA(lt_filter_conditions) = VALUE /aws1/
  cl_dyncondition=>tt_filtercondition_map(
    ( VALUE /aws1/cl_dyncondition=>ts_filtercondition_map_maprow(

        it_attributevalue_list = lt_attribute_list 
        iv_comparison_operator = |GE| ) ) ) ).
oo_scan_result = lo_dyn->scan( iv_tablename = iv_table_name 
  it_scanfilter = lt_filter_conditions ).
DATA(lt_items) = oo_scan_result->get_items( ).
LOOP AT lt_items INTO DATA(lo_item).
  " You can loop over to get individual attributes.
  DATA(lo_title) = lo_item[ key = 'title' ]-value.
  DATA(lo_year) = lo_item[ key = 'year' ]-value.
ENDLOOP.
DATA(lv_count) = oo_scan_result->get_count( ).
MESSAGE 'Found ' && lv_count && ' items' TYPE 'I'.
CATCH /aws1/cx_dynresource_not_found.
  MESSAGE 'The table or index does not exist' TYPE 'E'.
ENDTRY.

• For API details, see Scan in AWS SDK for SAP ABAP API reference.

Update an item in a table

The following code example shows how to update an item in a DynamoDB table.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

TRY.
  oo_output = lo_dyn->updateitem( 
    iv_tablename = iv_table_name 
    it_key = it_item_key 
    it_attribute_updates = it_attribute_updates ).
MESSAGE '1 item updated in DynamoDB Table' && iv_table_name TYPE 'I'.
CATCH /aws1/cx_dynconditionalcheck_fail.
  MESSAGE 'A condition specified in the operation could not be evaluated.' TYPE 'E'.
  CATCH /aws1/cx_dynresource_not_found.
  MESSAGE 'The table or index does not exist' TYPE 'E'.
  CATCH /aws1/cx Dyntransact_conflict.
  MESSAGE 'Another transaction is using the item' TYPE 'E'.
ENDTRY.

• For API details, see UpdateItem in AWS SDK for SAP ABAP API reference.

Scenarios

Get started with tables, items, and queries

The following code example shows how to:
• Create a table that can hold movie data.
• Put, get, and update a single movie in the table.
• Write movie data to the table from a sample JSON file.
• Query for movies that were released in a given year.
• Scan for movies that were released in a range of years.
• Delete a movie from the table, then delete the table.

**SDK for SAP ABAP**

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](https://github.com/aws-samples/aws-sdk-for-sap-abap).

Amazon EC2 examples using SDK for SAP ABAP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for SAP ABAP with Amazon EC2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
  • Actions (p. 37)
Actions

Allocate an Elastic IP address

The following code example shows how to allocate an Elastic IP address for Amazon EC2.

**SDK for SAP ABAP**

**Note**
There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](https://github.com/aws/aws-sap-abi-sdk).

```abap
TRY.
  oo_result = lo_ec2->allocateaddress( iv_domain = 'vpc' ).  " oo_result is
  returned for testing purposes. "
  MESSAGE 'Allocated an Elastic IP address.' TYPE 'I'.
  CATCH /aws1/cx_rt_service_generic INTO DATA(lo_exception).
  DATA lv_error = |"{ lo_exception->av_err_code }" - { lo_exception->
    av_err_msg }|.  
  MESSAGE lv_error TYPE 'E'.
ENDTRY.
```

- For API details, see [AllocateAddress](https://aws.amazon.com/sap-abi-sdk/api-reference) in *AWS SDK for SAP ABAP API reference*.

Associate an Elastic IP address with an instance

The following code example shows how to associate an Elastic IP address with an Amazon EC2 instance.

**SDK for SAP ABAP**

**Note**
There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](https://github.com/aws/aws-sap-abi-sdk).

```abap
TRY.
  oo_result = lo_ec2->associateaddress( iv_allocationid = iv_allocation_id
    iv_instanceid = iv_instance_id ) .
  MESSAGE 'Associated an Elastic IP address with an EC2 instance.' TYPE 'I'.
  CATCH /aws1/cx_rt_service_generic INTO DATA(lo_exception).
  DATA lv_error = |"{ lo_exception->av_err_code }" - { lo_exception->
    av_err_msg }|.  
  MESSAGE lv_error TYPE 'E'.
ENDTRY.
```

- For API details, see [AssociateAddress](https://aws.amazon.com/sap-abi-sdk/api-reference) in *AWS SDK for SAP ABAP API reference*.

Create a security group

The following code example shows how to create an Amazon EC2 security group.
SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

TRY.
   oo_result = lo_ec2->createsecuritygroup( iv_key_name = iv_key_name ).
   " oo_result is returned for testing purposes. "
   MESSAGE 'Security group created.' TYPE 'I'.
   CATCH /aws1/cx_rt_service_generic INTO DATA(lo_exception).
   DATA(kv_error) = |"{ lo_exception->av_err_code }" - { lo_exception->av_err_msg }|.
   MESSAGE kv_error TYPE 'E'.
ENDTRY.

• For API details, see CreateSecurityGroup in AWS SDK for SAP ABAP API reference.

Create a security key pair

The following code example shows how to create a security key pair for Amazon EC2.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

TRY.
   oo_result = lo_ec2->createkeypair( iv_key_name = iv_key_name ).
   " oo_result is returned for testing purposes. "
   MESSAGE 'Amazon EC2 key pair created.' TYPE 'I'.
   CATCH /aws1/cx_rt_service_generic INTO DATA(lo_exception).
   DATA(kv_error) = |"{ lo_exception->av_err_code }" - { lo_exception->av_err_msg }|.
   MESSAGE kv_error TYPE 'E'.
ENDTRY.

• For API details, see CreateKeyPair in AWS SDK for SAP ABAP API reference.

Create and run an instance

The following code example shows how to create and run an Amazon EC2 instance.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.
"Create tags for resource created during instance launch."

CATCH /aws1/cx_rt_service_generic INTO DATA(lo_exception).
DATA(lv_error) = |"{ lo_exception->av_err_code }" - { lo_exception->av_err_msg }|.
MESSAGE lv_error TYPE 'E'.
ENDTRY.

Delete a security group

The following code example shows how to delete an Amazon EC2 security group.

**SDK for SAP ABAP**

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the
AWS Code Examples Repository.

TRY.

  lo_ec2->deletesecuritygroup( iv_groupid = iv_security_group_id ).
  MESSAGE 'Security group deleted.' TYPE 'I'.
CATCH /aws1/cx_rt_service_generic INTO DATA(lo_exception).
  DATA(lv_error) = |"{ lo_exception->av_err_code }" - { lo_exception->av_err_msg }|.
  MESSAGE lv_error TYPE 'E'.
ENDTRY.

Delete a security key pair

The following code example shows how to delete an Amazon EC2 security key pair.

**For API details, see [RunInstances](#) in [AWS SDK for SAP ABAP API reference](#).**

**For API details, see [DeleteSecurityGroup](#) in [AWS SDK for SAP ABAP API reference](#).**
SDK for SAP ABAP

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

TRY.
   lo_ec2->deletekeypair( iv_keyname = iv_key_name ).
   MESSAGE 'Amazon EC2 key pair deleted.' TYPE 'I'.
   CATCH /aws1/cx_rt_service_generic INTO DATA(lo_exception).
   DATA(lv_error) = |"{ lo_exception->av_err_code }" - { lo_exception->av_err_msg }|. 
   MESSAGE lv_error TYPE 'E'.
ENDTRY.

• For API details, see DeleteKeyPair in AWS SDK for SAP ABAP API reference.

Describe Availability Zones

The following code example shows how to describe Amazon EC2 Availability Zones.

SDK for SAP ABAP

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

TRY.
   oo_result = lo_ec2->describeavailabilityzones( ) .                        " oo_result is returned for testing purposes. "
   DATA(lt_zones) = oo_result->get_availabilityzones( ).
   MESSAGE 'Retrieved information about Availability Zones.' TYPE 'I'.

• Scenarios (p. 42)
### Actions

#### Create a stream

The following code example shows how to create a Kinesis stream.

**SDK for SAP ABAP**

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```plaintext
TRY.
    lo_kns->create_stream(
        iv_streamname = iv_stream_name
        iv_shardcount = iv_shard_count
    ).
    MESSAGE 'Stream created.' TYPE 'I'.
    CATCH /aws1/cx_knsinvalidargumentex.
        MESSAGE 'The specified argument was not valid.' TYPE 'E'.
    CATCH /aws1/cx_knslimitexceededex.
        MESSAGE 'The request processing has failed because of a limit exceed exception.' TYPE 'E'.
    CATCH /aws1/cx_knsresourceinuseex.
        MESSAGE 'The request processing has failed because the resource is in use.' TYPE 'E'.
ENDTRY.
```

- For API details, see [CreateStream](#) in *AWS SDK for SAP ABAP API reference*.

#### Delete a stream

The following code example shows how to delete a Kinesis stream.

**SDK for SAP ABAP**

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```plaintext
TRY.
    lo_kns->delete_stream(
        iv_streamname = iv_stream_name
    ).
    MESSAGE 'Stream deleted.' TYPE 'I'.
    CATCH /aws1/cx_knslimitexceededex.
        MESSAGE 'The request processing has failed because of a limit exceed exception.' TYPE 'E'.
    CATCH /aws1/cx_knsresourceinuseex.
        MESSAGE 'The request processing has failed because the resource is in use.' TYPE 'E'.
ENDTRY.
```

- For API details, see [DeleteStream](#) in *AWS SDK for SAP ABAP API reference*.
Describe a stream

The following code example shows how to describe a Kinesis stream.

**SDK for SAP ABAP**

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```abap
TRY.
  oo_result = lo_kns->describestream(
    iv_streamname = iv_stream_name
  ).
  DATA(lt_stream_description) = oo_result->get_streamdescription( ).
  MESSAGE 'Streams retrieved.' TYPE 'I'.
  CATCH /aws1/cx_knslimitexceededex .
    MESSAGE 'The request processing has failed because of a limit exce
    type.' TYPE 'E'.
  CATCH /aws1/cx_knsresourcenotfoundex .
    MESSAGE 'Resource being accessed is not found.' TYPE 'E'.
ENDTRY.
```

- For API details, see [DescribeStream](https://aws.amazon.com) in AWS SDK for SAP ABAP API reference.

Get data in batches from a stream

The following code example shows how to get data in batches from a Kinesis stream.

**SDK for SAP ABAP**

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```abap
TRY.
  oo_result = lo_kns->getrecords(             " oo_result is returned for testing
    ' oo_result is returned for testing purposes."
    iv_sharditerator = iv_shard_iterator
  ).
  DATA(lt_records) = oo_result->get_records( ).
  MESSAGE 'Record retrieved.' TYPE 'I'.
  CATCH /aws1/cx_knsexpirediteratorex .
    MESSAGE 'Iterator expired.' TYPE 'E'.
  CATCH /aws1/cx_knsinvalidargumentex .
    MESSAGE 'The specified argument was not valid.' TYPE 'E'.
  CATCH /aws1/cx_knskmsaccessdeniedex .
    MESSAGE 'You do not have permission to perform this AWS KMS action.' TYPE 'E'.
  CATCH /aws1/cx_knskmsdisabledex .
    MESSAGE 'KMS key used is disabled.' TYPE 'E'.
  CATCH /aws1/cx_knskmsinvalidstateex .
    MESSAGE 'KMS key used is in an invalid state.' TYPE 'E'.
  CATCH /aws1/cx_knskmsnotfoundex .
    MESSAGE 'KMS key used is not found.' TYPE 'E'.
  CATCH /aws1/cx_knskmsoptionrequired .
    MESSAGE 'KMS key option is required.' TYPE 'E'.
  CATCH /aws1/cx_knskmsnotoptedin .
    MESSAGE 'The rate of requests to AWS KMS is exceeding the request quotas.' TYPE
    'E'.
```
For API details, see the following topics in *AWS SDK for SAP ABAP API reference*.

- GetRecords
- GetShardIterator

**List streams**

The following code example shows how to list information about one or more Kinesis streams.

**SDK for SAP ABAP**

*Note*

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](https://github.com/aws-sdk-code-examples).

```abap
TRY.
  oo_result = lo_kns->liststreams(        " oo_result is returned for testing purposes. "
                                          "Set Limit to specify that a maximum of streams should be returned."

Lambda examples using SDK for SAP ABAP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for SAP ABAP with Lambda.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
  • Actions (p. 37)
  • Scenarios (p. 42)

Actions

Create a function

The following code example shows how to create a Lambda function.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.
iv_role = iv_role_arn
iv_handler = iv_handler
io_code = io_zip_file
iv_description = 'AWS Lambda code example'
).
MESSAGE 'Lambda function created.' TYPE 'I'.
CATCH /aws1/cx_lmdcodesigningcfgn00.
  MESSAGE 'Code signing configuration does not exist.' TYPE 'E'.
CATCH /aws1/cx_lmdcodestorageexcdex.
  MESSAGE 'Maximum total code size per account exceeded.' TYPE 'E'.
CATCH /aws1/cx_lmdcodeverification00.
  MESSAGE 'Code signature failed one or more validation checks for signature mismatch or expiration.' TYPE 'E'.
CATCH /aws1/cx_lmdinvaliddesignsigex.
  MESSAGE 'Code signature failed the integrity check.' TYPE 'E'.
CATCH /aws1/cx_lmdinvaliddesignsigex.
  MESSAGE 'The request contains a non-valid parameter.' TYPE 'E'.
CATCH /aws1/cx_lmdresourceconflictex.
  MESSAGE 'Resource already exists or another operation is in progress.' TYPE 'E'.
CATCH /aws1/cx_lmdresourcenotfoundex.
  MESSAGE 'The requested resource does not exist.' TYPE 'E'.
CATCH /aws1/cx_lmdserviceexception.
  MESSAGE 'An internal problem was encountered by the AWS Lambda service.' TYPE 'E'.
CATCH /aws1/cx_lmdtoomanyrequestsex.
  MESSAGE 'The maximum request throughput was reached.' TYPE 'E'.
ENDTRY.

• For API details, see CreateFunction in AWS SDK for SAP ABAP API reference.

Delete a function

The following code example shows how to delete a Lambda function.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

TRY.
  lo_lmd->deletefunction( iv_functionname = iv_function_name ).
  MESSAGE 'Lambda function deleted.' TYPE 'I'.
CATCH /aws1/cx_lmdinvaliddesignsigex.
  MESSAGE 'The request contains a non-valid parameter.' TYPE 'E'.
CATCH /aws1/cx_lmdresourceconflictex.
  MESSAGE 'Resource already exists or another operation is in progress.' TYPE 'E'.
CATCH /aws1/cx_lmdresourcenotfoundex.
  MESSAGE 'The requested resource does not exist.' TYPE 'E'.
CATCH /aws1/cx_lmdserviceexception.
  MESSAGE 'An internal problem was encountered by the AWS Lambda service.' TYPE 'E'.
CATCH /aws1/cx_lmdtoomanyrequestsex.
  MESSAGE 'The maximum request throughput was reached.' TYPE 'E'.
ENDTRY.

• For API details, see DeleteFunction in AWS SDK for SAP ABAP API reference.
Get a function

The following code example shows how to get a Lambda function.

SDK for SAP ABAP

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```plaintext
TRY.
oo_result = lo_lmd->getfunction( iv_functionname = iv_function_name ).   " oo_result is returned for testing purposes."
MESSAGE 'Lambda function information retrieved.' TYPE 'I'.
CATCH /aws1/cx_lmdinvparamvalueex.
  MESSAGE 'The request contains a non-valid parameter.' TYPE 'E'.
CATCH /aws1/cx_lmdserviceexception.
  MESSAGE 'An internal problem was encountered by the AWS Lambda service.' TYPE 'E'.
  CATCH /aws1/cx_lmdtoomanyrequestsex.
    MESSAGE 'The maximum request throughput was reached.' TYPE 'E'.
ENDTRY.
```

• For API details, see GetFunction in AWS SDK for SAP ABAP API reference.

Invoke a function

The following code example shows how to invoke a Lambda function.

SDK for SAP ABAP

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```plaintext
TRY.
  DATA(lv_json) = /aws1/cl_rt_util=>string_to_xstring( 
    '{"action": "increment", "number": 10}'
  ).
  oo_result = lo_lmd->invoke( 
    iv_functionname = iv_function_name 
    iv_payload = lv_json
  ).
  MESSAGE 'Lambda function invoked.' TYPE 'I'.
CATCH /aws1/cx_lmdinvparamvalueex.
  MESSAGE 'The request contains a non-valid parameter.' TYPE 'E'.
CATCH /aws1/cx_lmdinvrequestcontex.
  MESSAGE 'Unable to parse request body as JSON.' TYPE 'E'.
CATCH /aws1/cx_lmdinvalidzipfileex.
  MESSAGE 'The deployment package could not be unzipped.' TYPE 'E'.
CATCH /aws1/cx_lmdrequesttoolargeex.
  MESSAGE 'Invoke request body JSON input limit was exceeded by the request payload.' TYPE 'E'.
CATCH /aws1/cx_lmdresourceconflictex.
  MESSAGE 'Resource already exists or another operation is in progress.' TYPE 'E'.
```
List functions

The following code example shows how to list Lambda functions.

**SDK for SAP ABAP**

*Note*
There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](https://github.com/aws-samples/aws-sdk-sapabh).

```abap
TRY.
  oo_result = lo_lmd->listfunctions( ).       " oo_result is returned for
testing purposes."
  DATA(lt_functions) = oo_result->get_functions( ).
  MESSAGE 'Retrieved list of Lambda functions.' TYPE 'I'.
  CATCH /aws1/cx_lmdinvparamvalueex.
    MESSAGE 'The request contains a non-valid parameter.' TYPE 'E'.
  CATCH /aws1/cx_lmdserviceexception.
    MESSAGE 'An internal problem was encountered by the AWS Lambda service.' TYPE 'E'.
  CATCH /aws1/cx_lmdtoomanyrequestsex.
    MESSAGE 'The maximum request throughput was reached.' TYPE 'E'.
  ENDTRY.
```

*For API details, see [ListFunctions](https://docs.aws.amazon.com/sdk-for-sap-abap/api/1.0/reference/cx_lmdlistfunctions.html) in AWS SDK for SAP ABAP API reference.*

Update function code

The following code example shows how to update Lambda function code.

**SDK for SAP ABAP**

*Note*
There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](https://github.com/aws-samples/aws-sdk-sapabh).

```abap
TRY.
  oo_result = lo_lmd->updatefunctioncode(     " oo_result is returned for testing
purposes."
    iv_functionname = iv_function_name
    iv_zipfile = io_zip_file).
```

*For API details, see [UpdateFunctionCode](https://docs.aws.amazon.com/sdk-for-sap-abap/api/1.0/reference/cx_lmdupdatefunctioncode.html) in AWS SDK for SAP ABAP API reference.*
• For API details, see UpdateFunctionCode in AWS SDK for SAP ABAP API reference.

Update function configuration

The following code example shows how to update Lambda function configuration.

SDK for SAP ABAP

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.
MESSAGE 'An internal problem was encountered by the AWS Lambda service.' TYPE 'E'.
CATCH /aws1/cx_lmdtoomanyrequestsex.
MESSAGE 'The maximum request throughput was reached.' TYPE 'E'.
ENDTRY.

- For API details, see UpdateFunctionConfiguration in AWS SDK for SAP ABAP API reference.

Scenarios

Get started with functions

The following code example shows how to:

- Create an IAM role and Lambda function, then upload handler code.
- Invoke the function with a single parameter and get results.
- Update the function code and configure with an environment variable.
- Invoke the function with new parameters and get results. Display the returned execution log.
- List the functions for your account, then clean up resources.

For more information, see Create a Lambda function with the console.

Amazon S3 examples using SDK for SAP ABAP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for SAP ABAP with Amazon S3.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
  • Actions (p. 37)
  • Scenarios (p. 42)

Actions

Copy an object from one bucket to another

The following code example shows how to copy an S3 object from one bucket to another.
SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

TRY.
  lo_s3->copyobject(
    iv_bucket = iv_dest_bucket
    iv_key = iv_dest_object
    iv_copysource = '{{ iv_src_bucket }}/{{ iv_src_object }}'
  ).
  MESSAGE 'Object copied to another bucket.' TYPE 'I'.
  CATCH /aws1/cx_s3_nosuchbucket.
  MESSAGE 'Bucket does not exist.' TYPE 'E'.
  CATCH /aws1/cx_s3_nosuchkey.
  MESSAGE 'Object key does not exist.' TYPE 'E'.
ENDTRY.

• For API details, see CopyObject in AWS SDK for SAP ABAP API reference.

Create a bucket

The following code example shows how to create an S3 bucket.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

TRY.
  lo_s3->createbucket(
    iv_bucket = iv_bucket_name
  ).
  MESSAGE 'S3 bucket created.' TYPE 'I'.
  CATCH /aws1/cx_s3_bucketalrdyexists.
  MESSAGE 'Bucket name already exists.' TYPE 'E'.
  CATCH /aws1/cx_s3_bktalrdyownedbyyou.
  MESSAGE 'Bucket already exists and is owned by you.' TYPE 'E'.
ENDTRY.

• For API details, see CreateBucket in AWS SDK for SAP ABAP API reference.

Delete an empty bucket

The following code example shows how to delete an empty S3 bucket.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

TRY.
lo_s3->deletebucket(  
  iv_bucket = iv_bucket_name  
).  
MESSAGE 'Deleted S3 bucket.' TYPE 'I'.  
CATCH /aws1/cx_s3_nosuchbucket.  
  MESSAGE 'Bucket does not exist.' TYPE 'E'.  
ENDTRY.

• For API details, see DeleteBucket in AWS SDK for SAP ABAP API reference.

Delete an object

The following code example shows how to delete an S3 object.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

TRY.
  lo_s3->deleteobject(  
    iv_bucket = iv_bucket_name  
    iv_key = iv_object_key  
  ).  
  MESSAGE 'Object deleted from S3 bucket.' TYPE 'I'.  
  CATCH /aws1/cx_s3_nosuchbucket.  
    MESSAGE 'Bucket does not exist.' TYPE 'E'.  
  ENDTRY.

• For API details, see DeleteObject in AWS SDK for SAP ABAP API reference.

Get an object from a bucket

The following code example shows how to read data from an object in an S3 bucket.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

TRY.
  oo_result = lo_s3->getobject(           " oo_result is returned for testing purposes. "  
    iv_bucket = iv_bucket_name  
    iv_key = iv_object_key  
  ).  
  DATA(lv_object_data) = oo_result->get_body( ).  
  MESSAGE 'Object retrieved from S3 bucket.' TYPE 'I'.  
  CATCH /aws1/cx_s3_nosuchbucket.  
    MESSAGE 'Bucket does not exist.' TYPE 'E'.  
    CATCH /aws1/cx_s3_nosuchkey.  
      MESSAGE 'Object key does not exist.' TYPE 'E'.  
      ENDTRY.
• For API details, see `GetObject` in *AWS SDK for SAP ABAP API reference*.

**List objects in a bucket**

The following code example shows how to list objects in an S3 bucket.

**SDK for SAP ABAP**

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](https://aws.amazon.com/code-examples/).

```abap
TRY.
  oo_result = lo_s3->listobjectsv2('oo_result is returned for testing purposes.'
                                   iv_bucket = iv_bucket_name
                                 ).
  MESSAGE 'Retrieved list of objects in S3 bucket.' TYPE 'I'.
  CATCH /aws1/cx_s3_nosuchbucket.
  MESSAGE 'Bucket does not exist.' TYPE 'E'.
ENDTRY.
```

• For API details, see `ListObjectsV2` in *AWS SDK for SAP ABAP API reference*.

**Upload an object to a bucket**

The following code example shows how to upload an object to an S3 bucket.

**SDK for SAP ABAP**

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](https://aws.amazon.com/code-examples/).

```abap
"Get contents of file from application server."
DATA lv_body TYPE xstring.
OPEN DATASET iv_file_name FOR INPUT IN BINARY MODE.
READ DATASET iv_file_name INTO lv_body.
CLOSE DATASET iv_file_name.

"Upload/put an object to an S3 bucket."
TRY.
  lo_s3->putobject('iv_bucket = iv_bucket_name
                      iv_key = iv_file_name
                      iv_body = lv_body
                    ).
  MESSAGE 'Object uploaded to S3 bucket.' TYPE 'I'.
  CATCH /aws1/cx_s3_nosuchbucket.
  MESSAGE 'Bucket does not exist.' TYPE 'E'.
ENDTRY.
```

• For API details, see `PutObject` in *AWS SDK for SAP ABAP API reference*. 
Scenarios

Get started with buckets and objects

The following code example shows how to:

- Create a bucket and upload a file to it.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the bucket objects and the bucket.

SDK for SAP ABAP

Note

Scenarios

Get started with models and endpoints

The following code example shows how to:

• Start a training job and create a SageMaker model.
• Create an endpoint configuration.
• Create an endpoint, then clean up resources.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Amazon SNS examples using SDK for SAP ABAP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for SAP ABAP with Amazon SNS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
  • Actions (p. 37)
  • Scenarios (p. 42)

Actions

Create a topic

The following code example shows how to create an Amazon SNS topic.
SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```TRY.
  oo_result = lo_sns->createtopic( iv_name = iv_topic_name ). " oo_result is returned for testing purposes."
  MESSAGE 'SNS topic created' TYPE 'I'.
  CATCH /aws1/cx_snstopiclimitexcdex.
  MESSAGE 'Unable to create more topics. You have reached the maximum number of topics allowed.' TYPE 'E'.
ENDTRY.
```

• For API details, see **CreateTopic** in **AWS SDK for SAP ABAP API reference**.

Delete a subscription

The following code example shows how to delete an Amazon SNS subscription.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```TRY.
  lo_sns->unsubscribe( iv_subscriptionarn = iv_subscription_arn ).
  MESSAGE 'Subscription deleted.' TYPE 'I'.
  CATCH /aws1/cx_snsnotfoundexception.
  MESSAGE 'Subscription does not exist.' TYPE 'E'.
  CATCH /aws1/cx_snsinvalidparameterex.
  MESSAGE 'Subscription with "PendingConfirmation" status cannot be deleted/unsubscribed. Confirm subscription before performing unsubscribe operation.' TYPE 'E'.
ENDTRY.
```

• For API details, see **Unsubscribe** in **AWS SDK for SAP ABAP API reference**.

Delete a topic

The following code example shows how to delete an Amazon SNS topic and all subscriptions to that topic.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```TRY.
  lo_sns->deletetopic( iv_topicarn = iv_topic_arn ).
  MESSAGE 'SNS topic deleted.' TYPE 'I'.
  CATCH /aws1/cx_snsnotfoundexception.
  MESSAGE 'Topic does not exist.' TYPE 'E'.
ENDTRY.
```
• For API details, see DeleteTopic in AWS SDK for SAP ABAP API reference.

Get the properties of a topic

The following code example shows how to get the properties of an Amazon SNS topic.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```abap
TRY.
  oo_result = lo_sns->gettopicattributes( iv_topicarn = iv_topic_arn ). " oo_result is returned for testing purposes."
  DATA(lt_attributes) = oo_result->get_attributes( ).
  MESSAGE 'Retrieved attributes/properties of a topic.' TYPE 'I'.
  CATCH /aws1/cx_snsnotfoundexception.
    MESSAGE 'Topic does not exist.' TYPE 'E'.
ENDTRY.
```

• For API details, see GetTopicAttributes in AWS SDK for SAP ABAP API reference.

List the subscribers of a topic

The following code example shows how to retrieve the list of subscribers of an Amazon SNS topic.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```abap
TRY.
  oo_result = lo_sns->listsubscriptions( ). " oo_result is returned for testing purposes."
  DATA(lt_subscriptions) = oo_result->get_subscriptions( ).
  MESSAGE 'Retrieved list of subscribers.' TYPE 'I'.
  CATCH /aws1/cx_rt_generic.
    MESSAGE 'Unable to list subscribers.' TYPE 'E'.
ENDTRY.
```

• For API details, see ListSubscriptions in AWS SDK for SAP ABAP API reference.

List topics

The following code example shows how to list Amazon SNS topics.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.
TRY.
    oo_result = lo_sns->listtopics( ).            " oo_result is returned for
    testing purposes."    
    DATA(lt_topics) = oo_result->get_topics( ).
    MESSAGE 'Retrieved list of topics.' TYPE 'I'.
    CATCH /aws1/cx_rt_generic.
    MESSAGE 'Unable to list topics.' TYPE 'E'.
ENDTRY.

• For API details, see [ListTopics](#) in [AWS SDK for SAP ABAP API reference](#).

### Publish to a topic

The following code example shows how to publish messages to an Amazon SNS topic.

**SDK for SAP ABAP**

*Note*
There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

TRY.
    oo_result = lo_sns->publish(              " oo_result is returned for testing
    iv_topicarn = iv_topic_arn
    iv_message = iv_message
    ).
    MESSAGE 'Message published to SNS topic.' TYPE 'I'.
    CATCH /aws1/cx_snsnotfoundexception.
    MESSAGE 'Topic does not exist.' TYPE 'E'.
ENDTRY.

• For API details, see [Publish](#) in [AWS SDK for SAP ABAP API reference](#).

### Set topic attributes

The following code example shows how to set Amazon SNS topic attributes.

**SDK for SAP ABAP**

*Note*
There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

TRY.
    lo_sns->settopicattributes(        " oo_result is returned for testing
    iv_topicarn = iv_topic_arn
    iv_attributename  = iv_attribute_name
    iv_attributevalue = iv_attribute_value
    ).
    MESSAGE 'Set/updated SNS topic attributes.' TYPE 'I'.
    CATCH /aws1/cx_snsnotfoundexception.
    MESSAGE 'Topic does not exist.' TYPE 'E'.
ENDTRY.
Subscribe an email address to a topic

The following code example shows how to subscribe an email address to an Amazon SNS topic.

**SDK for SAP ABAP**

*Note*
There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](https://github.com/aws-samples/aws-sdk-sap-abap).

```
TRY.
   oo_result = lo_sns->subscribe(                      
      iv_topicarn = iv_topic_arn
      iv_protocol = 'email'
      iv_endpoint = iv_email_address
      iv_returnsubscriptionarn = abap_true
   ).
   MESSAGE 'Email address subscribed to SNS topic.' TYPE 'I'.
ENDTRY.
```

• For API details, see [Subscribe](https://docs.aws.amazon.com/sdk-for-sap-abap/api/latest/api_reference.htm) in *AWS SDK for SAP ABAP API reference*.

### Scenarios

Create and publish to a FIFO topic

Actions

Create a queue

The following code example shows how to create an Amazon SQS queue.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create an Amazon SQS standard queue.

```
TRY.
  oo_result = lo_sqs->createqueue( iv_queue_name = iv_queue_name ). " oo_result is returned for testing purposes. "
  MESSAGE 'SQS queue created.' TYPE 'I'.
  CATCH /aws1/cx_sqsqueuedeldrecently.
    MESSAGE 'After deleting a queue, wait 60 seconds before creating another queue with the same name.' TYPE 'E'.
    CATCH /aws1/cx_sqsqueuealreadyexists.
    MESSAGE 'A queue with this name already exists.' TYPE 'E'.
  ENDTRY.
```

Create an Amazon SQS queue that waits for a message to arrive.

```
TRY.
  DATA lt_attributes TYPE /aws1/cl_sqsqueueattrmap_w=>tt_queueattributemap.
  DATA ls_attribute TYPE /aws1/cl_sqsqueueattrmap_w=>ts_queueattributemap_maprow.
  ls_attribute-key = 'ReceiveMessageWaitTimeSeconds'. " Time in seconds for long polling, such as how long the call waits for a message to arrive in the queue before returning. "
  ls_attribute-value = NEW /aws1/cl_sqsqueueattrmap_w( iv_value = iv_wait_time ).
  INSERT ls_attribute INTO TABLE lt_attributes.
  oo_result = lo_sqs->createqueue( " oo_result is returned for testing purposes. "
```

103
iv_queue_name = iv_queue_name
it_attributes = lt_attributes
).
MESSAGE 'SQS queue created.' TYPE 'I'.
CATCH /aws1/cx_sqsqueuedeldrecently.
MESSAGE 'After deleting a queue, wait 60 seconds before creating another queue
with the same name.' TYPE 'E'.
CATCH /aws1/cx_sqssqssqunsetexists.
MESSAGE 'A queue with this name already exists.' TYPE 'E'.
ENDTRY.

• For API details, see CreateQueue in AWS SDK for SAP ABAP API reference.

Delete a queue

The following code example shows how to delete an Amazon SQS queue.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the
AWS Code Examples Repository.

TRY.
lo_sqs->deletequeue( iv_queueurl = iv_queue_url ).
MESSAGE 'SQS queue deleted' TYPE 'I'.
ENDTRY.

• For API details, see DeleteQueue in AWS SDK for SAP ABAP API reference.

Get the URL of a queue

The following code example shows how to get the URL of an Amazon SQS queue.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the
AWS Code Examples Repository.

TRY.
oo_result = lo_sqs->getqueueurl( iv_queue_name = iv_queue_name ).
" oo_result is returned for testing purposes. "
MESSAGE 'Queue URL retrieved.' TYPE 'I'.
CATCH /aws1/cx_sqssqssqsetdoesnotexist.
MESSAGE 'The requested queue does not exist.' TYPE 'E'.
ENDTRY.

• For API details, see GetQueueUrl in AWS SDK for SAP ABAP API reference.

List queues

The following code example shows how to list Amazon SQS queues.
SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

TRY.
  oo_result = lo_sqs->listqueues( ). " oo_result is returned for testing purposes."
  MESSAGE 'Retrieved list of queues.' TYPE 'I'.
ENDTRY.

• For API details, see ListQueues in AWS SDK for SAP ABAP API reference.

Receive messages from a queue

The following code example shows how to receive messages from an Amazon SQS queue.

SDK for SAP ABAP

Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Receive a message from an Amazon SQS queue.

TRY.
  oo_result = lo_sqs->receivemessage( iv_queueurl = iv_queue_url ). " oo_result is returned for testing purposes."
  DATA(lt_messages) = oo_result->get_messages( ).
  MESSAGE 'Message received from SQS queue.' TYPE 'I'.
  CATCH /aws1/cx_sqsoverlimit.
  MESSAGE 'Maximum number of in-flight messages reached.' TYPE 'E'.
ENDTRY.

Receive a message from an Amazon SQS queue using long-poll support.

TRY.
  oo_result = lo_sqs->receivemessage( iv_queueurl = iv_queue_url iv_waittimeseconds = iv_wait_time ). " oo_result is returned for testing purposes."
  DATA(lt_messages) = oo_result->get_messages( ).
  MESSAGE 'Message received from SQS queue.' TYPE 'I'.
  CATCH /aws1/cx_sqsoverlimit.
  MESSAGE 'Maximum number of in-flight messages reached.' TYPE 'E'.
ENDTRY.

• For API details, see ReceiveMessage in AWS SDK for SAP ABAP API reference.

Send a message to a queue

The following code example shows how to send a message to an Amazon SQS queue.
Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

TRY.

oo_result = lo_sqs->sendmessage(  
  " oo_result is returned for testing purposes. 
  iv_queueurl = iv_queue_url
  iv_messagebody = iv_message
);
MESSAGE 'Message sent to SQS queue.' TYPE 'I'.
CATCH /aws1/cx_sqsinvalidmsgconts.
  MESSAGE 'Message contains non-valid characters.' TYPE 'E'.
CATCH /aws1/cx_sqsunsupportedop.
  MESSAGE 'Operation not supported.' TYPE 'E'.
ENDTRY.

Scenarios
Create and publish to a FIFO topic
The following code example shows how to create and publish to a FIFO Amazon SNS topic.

SDK for SAP ABAP
Note
There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create a FIFO topic, subscribe an Amazon SQS FIFO queue to the topic, and publish a message to an Amazon SNS topic.

TRY.

oo_result = lo_sqs->sendmessage(  
  " oo_result is returned for testing purposes. 
  iv_queueurl = iv_queue_url
  iv_messagebody = iv_message
);
MESSAGE 'Message sent to SQS queue.' TYPE 'I'.
CATCH /aws1/cx_sqsinvalidmsgconts.
  MESSAGE 'Message contains non-valid characters.' TYPE 'E'.
CATCH /aws1/cx_sqsunsupportedop.
  MESSAGE 'Operation not supported.' TYPE 'E'.
ENDTRY.

For API details, see SendMessage in AWS SDK for SAP ABAP API reference.
Only Amazon Simple Queue Service (Amazon SQS) FIFO queues can be subscribed to an SNS FIFO topic.

```
TRY.
    DATA(lo_subscribe_result) = lo_sns->subscribe(
        iv_topicarn = lv_topic_arn
        iv_protocol = 'sqs'
        iv_endpoint = iv_queue_arn
    ).
    DATA(lv_subscription_arn) = lo_subscribe_result->get_subscriptionarn( ).
    ov_subscription_arn = lv_subscription_arn.                      " ov_subscription_arn is returned for testing purposes. "
    MESSAGE 'SQS queue was subscribed to SNS topic.' TYPE 'I'.
    CATCH /aws1/cx_snsnotfoundexception.
      MESSAGE 'Topic does not exist.' TYPE 'E'.
    CATCH /aws1/cx_snssubscriptionlimite00.
      MESSAGE 'Unable to create subscriptions. You have reached the maximum number of subscriptions allowed.' TYPE 'E'.
    ENDTRY.

  " Publish message to SNS topic. "
  TRY.
    DATA lt_msg_attributes TYPE /aws1/
      cl_snsmessageattrvalue=>tt_messageattributemap.
    DATA ls_msg_attributes TYPE /aws1/
      cl_snsmessageattrvalue=>ts_messageattributemap_maprow.
    ls_msg_attributes-key = 'Importance'.
    ls_msg_attributes-value = NEW /aws1/cl_snsmessageattrvalue( iv_datatype = 'String' iv_stringvalue = 'High' ).
    INSERT ls_msg_attributes INTO TABLE lt_msg_attributes.
    DATA(lo_result) = lo_sns->publish(
        iv_topicarn = lv_topic_arn
        iv_message = 'The price of your mobile plan has been increased from $19 to $23'
        iv_subject = 'Changes to mobile plan'
        iv_messagegroupid = 'Update-2'
        iv_messagededuplicationid = 'Update-2.1'
        it_messageattributes = lt_msg_attributes
    ).
    ov_message_id = lo_result->get_messageid( ).                      " ov_message_id is returned for testing purposes. "
    MESSAGE 'Message was published to SNS topic.' TYPE 'I'.
    CATCH /aws1/cx_snsnotfoundexception.

Amazon Textract examples using SDK for SAP ABAP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for SAP ABAP with Amazon Textract.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- Actions (p. 37)
- Scenarios (p. 42)

**Actions**

**Analyze a document**

The following code example shows how to analyze a document using Amazon Textract.

**SDK for SAP ABAP**

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the **AWS Code Examples Repository**.

```abap
"Detects text and additional elements, such as forms or tables,"
"in a local image file or from in-memory byte data."
"The image must be in PNG or JPG format."

Security in AWS SDK for SAP ABAP

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from data centers and network architectures that are built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the AWS Compliance Programs. To learn about the compliance programs that apply to AWS SDK for SAP ABAP, see AWS services in Scope by Compliance Program.

- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company’s requirements, and applicable laws and regulations.

This section covers the following topics.

**Topics**

- SAP system authentication on AWS (p. 121)
- Best practices for IAM Security (p. 122)
- SAP authorizations (p. 125)
- Secure operations (p. 126)

SAP system authentication on AWS

Before an SAP system can make calls to AWS on behalf of SAP users, the SAP system must authenticate itself to AWS. SDK for SAP ABAP supports two methods of authentication that are selected in the SDK profile settings in IMG.

**Topics**

- Amazon EC2 instance metadata authentication (p. 121)
- Secret access key authentication (p. 122)
- Next step (p. 122)

Amazon EC2 instance metadata authentication

SAP systems running on Amazon EC2 can acquire short-lived, automatically-rotating credentials from Amazon EC2 instance metadata. For more information, see Using credentials for Amazon EC2 instance metadata.

We strongly recommend this method of authentication while using SDK for SAP ABAP. To enable, the Basis administrator must enable outbound HTTP communication. No further Basis configuration is required.
**Note**
This method of authentication applies only if your SAP systems are running on Amazon EC2. SAP systems hosted on-premises or in other cloud environments cannot authenticate using this method.

**Secret access key authentication**

With this method, you use an Access Key ID and a Secret Access Key to authenticate your SAP system on AWS. The SAP system logs into AWS using an IAM user. For more information, see [Managing Access Keys for IAM Users](#).

The Basis administrator receives an Access Key ID and a Secret Access Key from the AWS IAM administrator. Your SAP system must be configured with the SSF functionality to store the Access Key ID and Secret Access Key. For more information, see [Digital Signatures and Encryption](#). You can also test SSF's envelope and develope functionality with the SSF02 report. For more information, see [Testing the SSF Installation](#).

The steps for configuring SSF for SDK for SAP ABAP are described in the /AWS1/IMG transaction. Go to [Technical Prerequisites](#), and then select [Additional Settings](#) for On-Premises Systems.

**Next step**

After authenticating your SAP system in AWS, SDK for SAP ABAP automatically performs an `sts:assumeRole` to assume the appropriate IAM role for the SAP user's business function.

**Best practices for IAM Security**

The IAM administrator will be responsible for the following three key areas.

- Ensuring that the SAP system can authenticate itself with Amazon EC2 metadata or Secret Key credentials.
- Ensuring that the SAP system has the permissions it needs to elevate itself with `sts:assumeRole`.
- For each logical IAM role, creating an IAM role for SAP users with the permissions required to perform the business functions (for example, the necessary permissions for Amazon S3, DynamoDB, or other services). These are the roles that SAP users will assume.

For more information, see the [Security](#) chapter in the SAP Lens: AWS Well-Architected Framework.

**Topics**

- [Best practice for Amazon EC2 instance profile (p. 122)](#)
- [IAM roles for SAP users (p. 123)](#)

**Best practice for Amazon EC2 instance profile**

The Amazon EC2 instance on which your SAP system runs has a set of authorizations based on its instance profile. Generally, the instance profile only needs to have permissions to call `sts:assumeRole`, to allow the SAP system to assume business-specific IAM roles as needed. This elevation to other roles ensures that an ABAP program can assume a role that gives the user the least privilege needed to do their job. For example, an instance profile might contain the following statement.

```
IAM roles for SAP users

The ABAP program needs permissions to perform the user's job: read a DynamoDB table, invoke Amazon Textract on a PDF object in Amazon S3, run an AWS Lambda function. The same security model is used in all AWS SDKs. You can use an existing IAM role that was used for another AWS SDK.

The SAP business analyst will ask the IAM administrator for the arn:aws:: of an IAM role for each logical role needed. For example, in a financial scenario, the business analyst may define the following logical IAM roles.

- CFO
- AUDITOR
- REPORTING

The IAM administrator will define IAM roles for each logical IAM role.

CFO

- arn:aws:iam::0123456789:role/finance-cfo
- read and write permissions to an Amazon S3 bucket
- read and write permissions to a DynamoDB database

AUDITOR

- arn:aws:iam::0123456789:role/finance-auditor
- read permissions to an Amazon S3 bucket
- read permissions to a DynamoDB database

REPORTING
• arn:aws:iam::0123456789:role/finance-reporting
• read permissions to a DynamoDB database
• no permission for the Amazon S3 bucket

The business analyst will enter the IAM roles into a mapping table to map the logical IAM roles with the physical IAM roles.

IAM roles for SAP users need to allow the sts:assumeRole action for trusted principals. The trusted principals can vary based on how the SAP system is authenticated on AWS. For more details, see Specifying a principal.

The following are some examples of the most common SAP scenarios.

• SAP system running on Amazon EC2 with an instance profile assigned – here, an Amazon EC2 instance profile is attached to an IAM role.

```
{  
  "Version": "2012-10-17",
  "Statement": [
    {  
      "Effect": "Allow",
      "Action": [  
        "sts:AssumeRole"
      ],
      "Principal": {
        "AWS": "arn:aws:iam::123456789012:role/SapInstanceProfile"
      }
    }
  ]
}
```

• SAP systems running on Amazon EC2 without an instance profile – here, Amazon EC2 assumes roles for SAP users.

```
{  
  "Version": "2012-10-17",
  "Statement": [
    {  
      "Effect": "Allow",
      "Action": [  
        "sts:AssumeRole"
      ],
      "Principal": {
        "Service": [ "ec2.amazonaws.com"
      }
    }
  ]
}
```

• SAP systems running on-premises – SAP systems that run on-premises can only authenticate using the Secret Access Key. For more information, see SAP system authentication on AWS.

Here, any IAM role assumed by an SAP user must have a trust relationship that trusts the SAP user.

```
{  
  "Version": "2012-10-17",
  "Statement": [
    {  
      "Effect": "Allow",
      "Action": [  
        "sts:AssumeRole"
      ]
    }
  ]
}
```
SAP authorizations

This section covers the following topics.

Topics

- Authorizations for configuration (p. 125)
- SAP authorizations for end users (p. 125)

Authorizations for configuration

The following authorizations are required to configure SDK for SAP ABAP.

- S_TCODE
  - TCD = /AWS1/IMG
- S_TABU_DIS
  - ACTVT = 02, 03
- DICBERCLS

Choose from the following authorization groups.

- /AWS1/CFG - AWS SDK for SAP ABAP v1 - Config
- /AWS1/MOD - AWS SDK for SAP ABAP v1 - Runtime
- /AWS1/PFL - AWS SDK for SAP ABAP v1 - SDK Profile
- /AWS1/RES - AWS SDK for SAP ABAP v1 - Logical Resources
- /AWS1/TRC - AWS SDK for SAP ABAP v1 - Trace

SAP authorizations for end users

Prerequisite: Define SDK Profiles

Before the SAP security administrator can define their roles, the Business Analyst will define SDK profiles in transaction /AWS1/IMG. Typically, an SDK profile will be named according to its business function: ZFINANCE, ZBILLING, ZMFG, ZPAYROLL, etc. For each SDK profile, the Business Analyst will define logical IAM roles with short names, such as CFO, AUDITOR, REPORTING. These will be mapped to the real IAM roles by the IAM security administrator.

Define PFCG Roles

The SAP security administrator will then add authorization object /AWS1/SESS to grant access to an SDK profile.

Auth Object /AWS1/SESS
Secure operations

Encryption Of Data At Rest

AWS Secret Access Keys are used for authentication in SDK for SAP ABAP. They are encrypted using the SSF functionality by SAP.

Encryption Of Data In Transit

All calls to AWS services are encrypted with HTTPS. The SAP ICM manages the HTTPS connection. AWS certificates must be trusted in STRUST.

API Usage

When an ABAP user assumes a role using sts:assumeRole, the session name is titled USERID-SID-MANDT, where:

- USERID is the ABAP user from SY-UNAME variable.
- SID is the ABAP system ID from SY-SYSID variable.
- MANDT is the ABAP client from SY-MANDT variable.
The session name appears in CloudTrail as *user name*. This ensures that API calls from an ABAP user can be traced back to the system, client, and user that initiated the call. For more information, see [What is AWS CloudTrail?](#)
Troubleshoot AWS SDK for SAP ABAP

This section provides troubleshooting steps for possible error scenarios.

Topics
- Import failure (p. 128)
- Unspecified location constraint (p. 128)
- SSL errors (p. 129)
- Profile configuration (p. 129)
- IAM authorization (p. 130)
- Authorization for performing required actions (p. 130)
- Active scenario (p. 20)
- Special characters in code (p. 131)
- Connectivity (p. 131)

Import failure

Problem – Class ‘CL_SYSTEM_UUID’ doesn't contain an interface ‘IF_SYSTEM_UUID_RFC4122_STATIC

Cause – SAP Note 0002619546 is missing on your system.

Resolution – Ensure that the SAP Note 0002619546 is applied to your system.

Unspecified location constraint

Problem – The unspecified location constraint is incompatible for the region specific endpoint this request was sent to

Cause – Your Amazon S3 bucket is missing the AWS Region in io_createbucketconfiguration parameter.

Resolution – When creating a bucket in any Region, except us-east-1, specify your Amazon S3 bucket’s Region using io_createbucketconfiguration parameter in createbucket(). You don't have to specify a constraint for us-east-1.

The following example shows a correctly configured io_createbucketconfiguration parameter.

createbucket(  
  iv_bucket = 'test-bucket'  
  io_createbucketconfiguration = NEW /aws1/cl_s3_createbucketconf( 'us-west-1' )  
).
SSL errors

**Problem** – SSL Server Certificate Hostname Mismatch or SSL handshake with docs.aws.amazon.com:443 failed: SSSLERR_NO_SSL_RESPONSE

**Cause** – icm/HTTPS/client_sni_enabled parameter is not set to TRUE in the DEFAULT profile.

**Resolution** – Use the following steps to troubleshoot the given problems or any other SSL-related problem.

1. Open the SAPGUI and go to the command bar.
2. Run transaction RZ10.
3. Go to Profile and choose DEFAULT profile. The version is populated automatically.
4. In the **Edit Profile** section, select **Extended maintenance**, and then select **Change**.
5. Search for the icm/HTTPS/client_sni_enabled parameter.
   - If the parameter exists, edit the **Parameter value** and set it to TRUE.
   - If the parameter doesn't exist, create a parameter using the following steps.
     1. Select **Parameter**.
        
        **Note**
        Ensure that you are selecting the Parameter for creation, and not editing (pencil icon).
     2. Enter icm/HTTPS/client_sni_enabled in the **Parameter Name** field.
     3. Enter TRUE in the **Parameter value** field.
     4. Select **Save**.
     5. Save these changes in the DEFAULT profile, and Exit.

Profile configuration

**Problem** – Could not find configuration under profile <profile_name> with scenario DEFAULT for <sid>:<client>

**Causes** – The <profile_name> is incorrect or hasn't been configured.

**Resolution** – Use the following steps to configure the profile.

1. Open SAPGUI and run transaction /n/AWS1/IMG.
2. Go to **Application Configuration > SDK Profile**.
   - If your profile is configured, verify that the profile name is correct.
   - If your profile is not configured, follow along the steps to configure a profile.
3. Select **New Entries**.
   a. Enter a Name and Description for the profile.
   b. Select **Save**.
4. Choose the entry you created in the previous step, and then select **Authentication and Settings**.
5. Select **New Entries**, enter the following details, and then select **Save**.
   - SID
   - Client
IAM authorization

**Problem** – Could not assume role <iam_role_arn> or User: <user_arn> is not authorized to perform: sts:AssumeRole on resource:<iam_role_arn>

**Causes** – the following may be the possible reasons for this error.

- Incorrect IAM role ARN has been specified
- IAM user lacks permission to access the IAM role
- Lack of trust relationship between the assumed IAM role and the assuming IAM role or IAM user

**Resolution** – Use the following steps to ensure that the IAM role ARN is correct.

1. Open SAPGUI and run transaction /n/AWS1/IMG.
2. Go to Application Configuration > SDK Profile, and choose the profile that has been configured with your IAM role.
3. Select IAM Role Mapping and verify or correct your IAM role ARN.
   - If your IAM role ARN is correct, ensure that your IAM role has been configured properly. For more information, see Troubleshooting IAM roles.

Authorization for performing required actions

**Problem** – User <user_arn> is not authorized to perform: <action> on resource: <resource_arn>

**Cause** – User does not have permissions to perform an action.

**Resolution** – user_arn must be set up with required permissions on resource_arn to perform a specified action. For more information, see Permissions required to access IAM resources.

Active scenario

**Problem** – No active scenario configured

**Cause** – The setup of active scenario was missed.

**Resolution** – See Runtime settings to configure an active scenario.
Special characters in code

**Warning** – The character 0x00A0 cannot be part of an ABAP word

**Note**
This warning may be preceded by varied error messages.

**Cause** – Copying and pasting code from different sources can insert special characters in your code.

**Resolution** – When you paste any code in the ABAP source code editor, you see the following pop-up.

*Non-breaking space characters were detected. Convert to spaces?*

Choose **Yes** to answer this question. Also, we recommend selecting the code to copy it, instead of using the copy button in code boxes.

**Connectivity**

**Problem** – SCLNT_HTTP(411) : Direct connect to tla.region.amazonaws.com:443 failed: NIECONN_REFUSED(-10)

**Cause** – The SAP system does not have internet connectivity, and cannot establish a TCP/IP connection to port 443 of tla.region.amazonaws.com.

**Resolution** – The SAP system must be able to establish connection to AWS endpoints on HTTPS port 443, either directly or through a proxy server. You can establish/verify internet connectivity with one of the following options.

- Direct outbound connection to internet through a NAT or internet gateway
- Connection through a proxy server

For more information, see [Connection through a proxy server](#).
Additional topics

This section covers the following topics.

Topics

• AWS SDK for SAP ABAP releases (p. 132)
• SAP licensing (p. 133)

AWS SDK for SAP ABAP releases

This topic covers the following sections.

Topics

• Release strategy (p. 132)
• Best practices (p. 122)
• Patching SDK for SAP ABAP (p. 132)
• Installing an additional module (p. 132)
• Uninstalling SDK for SAP ABAP (p. 133)

Release strategy

Version 1 of AWS SDK for SAP ABAP is updated frequently. New patches are released weekly or daily based on the releases and updates of AWS services. The patches for AWS services can include bug fixes and other changes that update patch level of the SDK. For more information, see AWS SDKs and Tools maintenance policy.

Best practices

We recommended retaining same patch level of SDK for SAP ABAP for all SAP systems (development, QA, and production).

When patching the SDK, import the latest version in your sandbox. You can then import it to the development, QA, and production systems, following your normal change control procedures.

Patching SDK for SAP ABAP

Each SDK for SAP ABAP release is delivered as a set of cumulative transports, including all bug fixes, features, and updates. There is no difference between a patch and an installation transport. You must import the latest transports to patch SDK for SAP ABAP. For more information, see SDK transports.

Due to dependencies of core Runtime and API modules, you must patch the core module and all other modules that you installed, even if you are not using those modules anymore. For example, if you imported the core, ec2, and lmd transports when you installed the SDK, you must import the latest transports for core, ec2, and lmd when patching.

Installing an additional module

Import the transport for the new module at the same patch level as your existing core and modules to install an additional API module in your SAP system. Follow the guidelines in the section called "Patching.
Uninstalling SDK for SAP ABAP

To uninstall SDK for SAP ABAP, you must download a deletion transports kit from https://sdk-for-sapabap.aws.amazon.com/awsSdkSapabapV1/release/uninstall-abapsdk-LATEST.zip.

You can download a signature file from https://sdk-for-sapabap.aws.amazon.com/awsSdkSapabapV1/release/uninstall-abapsdk-LATEST.sig. To validate the file, see Verify SDK for SAP ABAP.

For each SDK module installed on your SAP system, the corresponding deletion transport must be imported from the preceding ZIP file. You can remove a single module without uninstalling the entire SDK. You can do so by importing only the deletion transport for module you want to remove. If you are uninstalling the entire SDK with all of its modules, then the core deletion transport must be imported last.

We recommend that you test the uninstallation in a sandbox before attempting in development, QA or production systems.

Considerations

Before uninstalling the SDK, see the following considerations.

- Configuration settings from the /AWS1/IMG transaction will be lost. The IMG must be reconfigured on installation.
- If you have Z programs that rely on the SDK, they will generate syntax errors after the removal of the SDK.
- PFCG roles containing SDK authorization references will have invalid authorizations after the removal of the SDK. Remove SDK authorization references from the PFCG roles before uninstalling the SDK.

SAP licensing

The use of SAP software is subject to SAP's terms. You are responsible for complying with SAP licensing terms, including software distribution and indirect licensing conditions. Any information provided is not legal advice, and should not be relied upon for licensing compliance purposes. If you have questions about your licensing or rights to SAP software, consult your legal team, SAP, and/or your SAP reseller.

Question: Will SDK for SAP ABAP usage affect my SAP license?

Answer: AWS SDK for SAP ABAP enables you to consume AWS services with your own ABAP code. It is used in integration scenarios between an SAP system and AWS services. Any scenario where data from the SAP system is sent to a third-party (non-SAP) system, or created by that system, may have implications for indirect licensing. SAP has multiple approaches for defining indirect access, such as user-based calculations and outcome-based calculations. The methodology to define indirect access depends on your contract with SAP. You must be aware of the guidance provided in your contract with SAP, and you can further discuss this with SAP or their reseller.

In 2018, SAP released two documents – Indirect Access Guide for SAP Installed Base Customers and SAP ERP Pricing for Digital Age - Addressing Indirect/Digital Access. These documents can be found on SAP websites, and are examples of indirect licensing approaches. However, these documents do not reflect your particular agreement with SAP.
## Document history for AWS SDK for SAP ABAP Developer Guide

The following table describes the documentation releases for AWS SDK for SAP ABAP.

<table>
<thead>
<tr>
<th>Change</th>
<th>Description</th>
<th>Date</th>
