What Is Amazon QuickSight?

Amazon QuickSight is a business analytics service you can use to build visualizations, perform ad hoc analysis, and get business insights from your data. It can automatically discover AWS data sources and also works with your data sources. Amazon QuickSight enables organizations to scale to hundreds of thousands of users, and delivers responsive performance by using a robust in-memory engine (SPICE).

Using Amazon QuickSight, you can do the following:

- **Get started quickly** – Sign in, choose a data source, and create your first visualization in minutes
- **Access data from multiple sources** – Upload files, connect to AWS data sources, or use your own external data sources
- **Take advantage of dynamic visualizations** – Smart visualizations are dynamically created based on the fields that you select
- **Get answers fast** – Generate fast, interactive visualizations on large data sets
- **Tell a story with your data** – Create data dashboards and point-in-time visuals, share insights and collaborate with others

Amazon QuickSight offers Standard and Enterprise editions. For more information about Amazon QuickSight editions and pricing, see Different Editions of Amazon QuickSight (p. 413) and Amazon QuickSight.

You can create Amazon QuickSight data sets by using your own data sources or other data sources that are shared with you. Then you can create Data Analyses (p. 2), visualize the data, and share it through data dashboards. To get a first look at how it works, you can explore Amazon QuickSight using the sample data sets we provide. These can be downloaded from the following links, in case you don’t already have them:

- Business overview (revenue data)
- People overview—human resources (HR) data
- Sales pipeline
- Web and social media analytics (marketing data)

There are also a variety of data sets available free online that you can use with Amazon QuickSight, for example:

- AWS public datasets
- Eighteen places to find data sets for data science projects
- Search for BI sample data
- Search for sample data for visualization
- Search for Free Sample Databases

These data sets come in a variety of formats. Some may require you to import them into a database engine before you can access their data.

To learn more about the major components and processes of Amazon QuickSight and the typical workflow for creating data visualizations, see the following sections.

**Topics**

- Data Sources and Data Preparation (p. 2)
Data Sources and Data Preparation

You can use a variety of sources for data analysis, including files, AWS services, and on-premises databases. To learn more about what data sources work with Amazon QuickSight, see Supported Data Sources (p. 49).

To get ready to create analyses, you create data sets based on your data sources. A data set identifies the specific fields and rows that you want to use. In addition to raw data, a data set stores any changes you make, so it's ready the next time you want to analyze the data. For example, you can rename fields, change data types, and add calculated fields.

You can create multiple analyses using the same data set. You can also use multiple data sets in a single analysis.

To learn more about creating data sets, see Creating Data Sets (p. 66).

Data Preparation

Data preparation is the process of transforming raw data for use in an analysis. This includes making changes like the following:

- Filtering out data so you can focus on what's important to you
- Renaming fields to make them easier to read
- Changing data types so they are more useful
- Adding calculated fields to enhance analysis
- Creating SQL queries to refine data

To learn more about data preparation, see Preparing Data (p. 115).

SPICE

SPICE is Amazon QuickSight's Super-fast, Parallel, In-memory Calculation Engine. SPICE is engineered to rapidly perform advanced calculations and serve data. The storage and processing capacity available in SPICE speeds up the analytical queries that you run against your imported data. By using SPICE, you save time because you don't need to retrieve the data every time you change an analysis or update a visual.

To learn more about using SPICE, see Managing SPICE Capacity (p. 451).

Data Analyses

A data analysis is the basic workspace for creating and interacting with visuals, which are graphical representations of your data. Each analysis contains a collection of visuals that you assemble and arrange for your purposes, such as a sales analysis, cost analysis, or tracking key performance indicators. Each analysis can contain stories, which you can use to save a sequential slide show of different iterations of...
the analysis. This is useful if you want to show changes over time or provide visual comparisons of your data.

To learn more about Amazon QuickSight analyses, see Working with Analyses (p. 211).

Visuals

A visual, also known as a data visualization, is a graphical representation of a data set using a type of diagram, chart, graph, or table. All visuals begin in AutoGraph mode, which automatically selects a visualization based on the fields you select. You can also take control and choose your own visuals. Amazon QuickSight supports a variety of visuals including combo charts, heat and tree maps, pivot tables, and more. Or you can enhance your visualizations by applying filters, changing colors, or by arranging several in the workspace, just to name a few options.

To learn more about Amazon QuickSight visuals, see Working with Amazon QuickSight Visuals (p. 265).

Sheets

A sheet is a set of visuals that are all based on the same data source and are all viewed together. When you create an analysis, you place visuals in the workspace. After you publish the analysis as a dashboard, the workspace becomes a sheet. You can imagine this a sheet from a newspaper, except that it is filled with data visualizations.

Stories

A story is a set of one or more scenes (captured visuals) that you can play like a slideshow. You can use these to step through different iterations of an analysis. A scene is a representation of an analysis at a given point in time, or with specific settings. It shows the visuals that are on the analysis at that time, but the data in those visuals continues to update. It is not a static snapshot. You capture a scene for use in a story.

To learn more about Amazon QuickSight stories, see Working with Stories (p. 402).

Dashboards

A dashboard is a read-only snapshot of an analysis that you can share with other Amazon QuickSight users for reporting purposes. When you create and publish a dashboard, you specify which users have access to it. They can view and filter the dashboard visuals without changing the underlying data.

To learn more about Amazon QuickSight dashboards, see Working with Dashboards (p. 407).

Typical Amazon QuickSight Workflow

The first time you create an analysis, the typical workflow looks like this:

1. Add or upload a data source, and use it to create a new data set.
2. (Optional) Prepare the data – get it ready for reports by standardizing field names, or adding calculations, for example.
3. Visualize (create) a new analysis from the data set.
4. Choose some fields to create the first visual in the analysis. You can use AutoGraph to dynamically create a visual based on the number and type of fields you choose. Alternatively, you can choose the visual type you want to use.
5. (Optional) Make changes to the visual if you want to (for example, by adding a filter or changing the visual type).
6. (Optional) Add more visuals to the analysis. You can resize and arrange them in the workspace.
7. (Optional) Capture the analysis into a story to create a narrative about some aspect of the data analysis.
8. (Optional) Publish the analysis as a dashboard to share insights with other users.

After you connect to your data and create a data set, you can create an analysis of it and share it in a dashboard, as shown in the following illustration:

Next Steps

If you are a new to Amazon QuickSight, see Signing Up for Amazon QuickSight (p. 417) to learn more about subscribing.

If you are an administrator, see Administration (p. 413).

Compliance

This is a HIPAA Eligible Service. For more information about AWS, U.S. Health Insurance Portability and Accountability Act of 1996 (HIPAA), and using AWS services to process, store, and transmit protected health information (PHI), see HIPAA Overview.

For information about this service and ISO 27001, a security management standard that specifies security management best practices, see ISO 27001 Overview.

Content delivered to Amazon S3 buckets might contain customer content. For more information about removing sensitive data, see How Do I Empty an S3 Bucket? or How Do I Delete an S3 Bucket?
Using Data Dashboards in Amazon QuickSight

Viewing Dashboard Data

In Amazon QuickSight, you can view data dashboards in email or interact with them on a webpage or your mobile device. If you are an Amazon QuickSight reader, you don't need a monthly subscription. To learn how to get the most out of reading your dashboards, use the following section.

Each dashboard is like a sheet from a newspaper that is filled with data visualizations. You can focus on any graph or chart. You can filter, and sort, and update chart colors. Dashboard that have controls embedded at the top give you easier access and control over what you see in some or all of the visuals on that sheet.

Any changes that you make to a dashboard are only temporary. They don’t change the data, and they don’t affect other users. If you want to save your settings and you have authoring access, use Save as to create your own private copy of the dashboard. If you want to share your changes with other users, you can work with the dashboard owner to update the dashboard on the server. This way, everyone can see the same version of data in the same way.

Filtering Dashboard Data

You can filter data in a visual in three ways:

- If your dashboard has filtering controls at the top of the screen, you can use them to filter all the visuals at once.
- You can use the filter icon at the top of each visual to filter visuals one at a time.
- You can create your own filters by using the filter pane on the left side of the page.

Export Data to a CSV file

To export data from an analysis or dashboard to a comma-separated value (CSV) file, use the v-shaped menu at the top right of a visual. Data exports only for the visual you choose.
Using the Visuals on Your Dashboard

When you choose a data point on a visual, several actions are available. You can click or tap on a data point, for example on a bar in a bar chart, on a point where the line bends on a line chart, and so on. The available actions vary slightly based on what type of visual it is. The following screenshot shows a list of actions available on most chart types.

These actions are as follows:

- **Focus on or exclude**
  
  You can focus on or exclude specific data in a field in that visual, for example regions, metrics, or dates.

- **Drill up or drill down**
  
  If your dashboard contains data on which you can drill down or up, you can drill up to a higher level or drill down to explore deeper details.

- **Custom URL actions**
  
  If your dashboard contains URL actions, you can activate them by choosing a data point on a visual. For example, you might be able to email someone directly from the visual, or open another URL and send it data points (values) from this one.

- **Change chart colors or specific field colors**
  
  You can change all the chart colors to a specific color. Alternatively, you can choose a specific field value to change its color, if that field is part of the color well (usually in the legend).
Welcome to the Amazon QuickSight Quick Start Guide, designed for business analysts. Using Amazon QuickSight, you can import or connect to your data, analyze your data, and share your data visualizations in a dashboard. You can let Amazon QuickSight choose the format of your visual by leaving the AutoGraph on, or you can choose from a wide variety of charts, graphs, tables to create a customized visual data analysis. You can then group these together to form stories and dashboards. Then you can share them with your team.

How Does Amazon QuickSight Work?

You begin by choosing a dataset. You can groom your dataset by adding new data elements, creating calculations, or filtering out data. When you're satisfied that the dataset works for you, you can start analyzing it through graphics.

First, you can create a visual representation of your data. If you don't know what kind of chart you should use, Amazon QuickSight can help you by choosing a visual type for you. To see this in action, choose some fields. As you choose more fields, Amazon QuickSight's AutoGraph changes the type of visual it displays. It adapts to what you choose.

You can continue to add more visuals to the same analysis, based on different views of the same underlying data. To fit more visuals on a page, you can resize and rearrange them. Scroll down to find more space on the page.

By creating a series of visuals, you create a story. This visual narrative tells you what is happening in the subject you're investigating. You can save multiple stories, using filters to show how the data changes over time. Any of these visual data analyses can be shared with other people, who can then further analyze the data.

You can use Amazon QuickSight to publish data dashboards. These are read-only snapshots that you can share for reporting. If you choose, you can also allow other people to create a new analysis and dashboard based on the one you shared with them.

The first Amazon QuickSight user on your AWS account is free, and receives 1 GB SPICE capacity. To learn more about free trials and pricing for multiple users, see Amazon QuickSight. For more information about the Standard and Enterprise editions, see Different Editions of Amazon QuickSight (p. 413)

Ready to Get Started?

Depending on your experience with Amazon QuickSight or tools like it, you can begin by looking at one of the following sections:

- Guided Tour (demos)
- Getting Started with Data Analysis in Amazon QuickSight (p. 9)
Amazon QuickSight Demos, Walkthroughs, and Articles

In the following section, you can find demos, walkthroughs, and articles that cover aspects of working with Amazon QuickSight.

If you want to see additional or different material added here, let us know. To do this, choose Feedback at the bottom of the screen.

Demo Videos

Following, you can find a list of videos that demonstrate the use of Amazon QuickSight, most shorter than 15 minutes long:

- Data Visualization with Amazon QuickSight (AWS re:Invent 2017 - DEM74), December 2017
- Sharing Your Analysis and Insights Using Amazon QuickSight, May 2017
- Customizing Your Visuals in Amazon QuickSight, May 2017
- Using SQL to Import Data into Amazon QuickSight, May 2017
- Accessing Amazon Redshift Data from Amazon QuickSight, May 2017
- Demos from the Amazon QuickSight official website, various dates

Walkthroughs, Deep Dives, and Articles

Following, you can find a list of walkthrough and deep-dive videos demonstrating use of Amazon QuickSight, most longer than 30 minutes:

- Deep Dive on Amazon QuickSight—January 2017 AWS Online Tech Talks, January 2017
- Building Visualizations and Dashboards with Amazon QuickSight (AWS re:Invent 2017 - ABD206), December 2017
- Serverless Analytics—Amazon Redshift Spectrum, AWS Glue, and Amazon QuickSight, October 2017
- Visualizing Amazon S3 Storage Management with Amazon QuickSight—2017 AWS Online Tech Talks, August 2017
- Deploying Business Analytics at Enterprise Scale with Amazon QuickSight (AWS re:Invent 2017 - ABD311), December 2017
- Analyzing AWS Billing Data Using Amazon QuickSight, May 2017
- Tackle Your Dark Data Challenge with AWS Glue (and Visualize It in Amazon QuickSight)—2017 AWS Online Tech Talks, September 2017
- Serverless Big Data Analytics—Amazon Athena & Amazon QuickSight—2017 AWS Online Tech Talks, May 2017
- Data Visualization with Amazon QuickSight (AWS re:Invent 2017 - DEM74), December 2017

Following is a list of blog posts and quick start articles, most of which discuss how to accomplish a specific complex task using Amazon QuickSight:

- List of all the official Amazon QuickSight blog posts
- Build a social media dashboard using machine learning and BI services, January 2018
Getting Started with Data Analysis in Amazon QuickSight

Use the topics in this section to create your first analysis. You can use sample data to create either a simple or a more advanced analysis, or you can connect to your own data to create an analysis.

Topics
- Setting Up Amazon QuickSight (p. 9)
- Signing In to Amazon QuickSight (p. 11)
- Quick Start: Create an Analysis with a Single Visual Using Sample Data (p. 12)
- Tutorial: Create A Multivisual Analysis and a Dashboard Using Sample Data (p. 15)
- Create an Analysis Using Your Own Local Text File Data (p. 37)
- Create an Analysis Using Your Own Amazon S3 Data (p. 38)
- Create an Analysis Using Your Own Database Data (p. 39)

Setting Up Amazon QuickSight

The following section explains how to get setup to use Amazon QuickSight. If you can already sign in to Amazon QuickSight, you should skip this section, and proceed to Signing In to Amazon QuickSight (p. 11).

To get signed up for Amazon QuickSight, choose one of the following.

Topics
- Setup a Free Standalone User Account in Amazon QuickSight (p. 10)
- Sign Up for AWS and a Free Amazon QuickSight Account as an Educator or Student (p. 10)
- Set up Amazon QuickSight for an existing AWS user (p. 10)
Setup a Free Standalone User Account in Amazon QuickSight

This section covers the fastest way to setup a free Amazon QuickSight account. Amazon QuickSight offers a 60 day free trial for 4 users. If you maintain 1 user only, the Amazon QuickSight account remains free.

Do you already have an AWS account? See Set up Amazon QuickSight for an existing AWS user (p. 10).

Are you a student or educator, new to AWS? See Sign Up for AWS and a Free Amazon QuickSight Account as an Educator or Student (p. 10).

The automated sign up guides you through the following steps. To begin, choose Sign Up at the top right of the Amazon QuickSight website.

The process works like this:

- First, you create a free AWS account. This step takes about ten minutes. It asks for your name, email, address, and phone number. You need to have a phone and a credit card to complete the process.
- Next, you create a free Amazon QuickSight account. In this step, you can choose either Standard or Enterprise edition. You also set up an Amazon QuickSight account name.
- After that, you open Amazon QuickSight and get some sample data to explore.

If you signed up for Amazon QuickSight using this method, you are ready to explore what you can do with Amazon QuickSight. See Getting Started with Data Analysis in Amazon QuickSight (p. 9)

Sign Up for AWS and a Free Amazon QuickSight Account as an Educator or Student

If you are an educator or a student, you can sign up using AWS Educate instead. You can use an AWS Educate Starter Account, if your institution doesn't have an AWS Account.

Set up Amazon QuickSight for an existing AWS user

This section covers how to setup a free Amazon QuickSight account, when you already have an existing AWS account. Amazon QuickSight offers a 60 day free trial for 4 users. If you maintain 1 user only, the Amazon QuickSight account remains free.
If you don’t already have an AWS account, see Setup a Free Standalone User Account in Amazon QuickSight (p. 10).

If you’re a student or educator, new to AWS, see Sign Up for AWS and a Free Amazon QuickSight Account as an Educator or Student (p. 10) instead.

This process guides you through the following steps:

• Create a free Amazon QuickSight account. You can choose either Standard or Enterprise Edition. You also set up an Amazon QuickSight account name.
• Open Amazon QuickSight and get some sample data to explore.

To start the signup process, navigate to Amazon QuickSight in the AWS console.

If you successfully completed signup, you are ready to explore what you can do with Amazon QuickSight.

Request Access to Amazon QuickSight

If your organization is already using Amazon QuickSight, you should talk to an Amazon QuickSight administrator or an AWS administrator to find out how to get access.

Signing In to Amazon QuickSight

You can sign in on the Amazon QuickSight page, https://quicksight.aws.amazon.com/. Follow the screen prompts to sign in. For your convenience, the procedure is outlined here. It varies slightly depending on the type of account you have.

1. For Account name, type the Amazon QuickSight account name. This is the name that was created for this Amazon QuickSight subscription. You should take note of it in case you need it later.
2. If you are prompted for your email address, type it in.
3. If the username is blank, type the user name you want to use to sign in. Choose one of the following:
   • For organizational users – the user name provided by your administrator.
   Your account can be based on IAM credentials, a Single Sign-On (SSO) service, or your email address. If you received an invitation email from another Amazon QuickSight user, it indicates what type of credentials to use.
   • For individual users – the user name you created for yourself.
   This is usually the IAM credentials you created.

User names that contain a semicolon (;) aren't supported.

4. Type the associated password in Password. If you aren't sure, ask the administrator. If you create a new password, there is a Confirm password field. Type your password again.

Passwords are case-sensitive, must be between 8 and 64 characters in length, and must contain at least one character from three of the following categories:

• Lowercase letters (a–z)
• Uppercase letters (A–Z)
• Numbers (0–9)
• Nonalphanumeric characters (~!@#$%^&*_-+=`\|(){}[]:;"'<>,.?/)

5. Choose Sign in. In some cases, this button is labeled Create account and sign in.
6. (Only for users invited by email.) You are prompted to type the account name provided in your email invitation. If you mistype it, you get an authentication error. To change the account name, choose the account name next to the Account name, and type in the correct one.

Signing In to Amazon QuickSight Using an Identity Provider

If your organization uses an identity provider, you must first sign in through the identity provider before you use Amazon QuickSight.

An identity provider supports single sign-on (SSO) access. This means you don’t need to provide sign-in information to Amazon QuickSight. When you access Amazon QuickSight, you shouldn’t see a sign-in screen.

If you do see a sign-in screen in this case, no credentials will work. Before you can use Amazon QuickSight, you must sign in through your identity provider.

Quick Start: Create an Analysis with a Single Visual Using Sample Data

Use the following procedure to use the Web and Social Media Analytics sample data set to create an analysis containing a line chart visual. This visual shows the count by month of people that have added themselves to the mailing list.

1. On the Amazon QuickSight start page, choose New analysis. If you don’t have the sample data, you can download it from http://quicksightsampleddata.s3.amazonaws.com/MarketingData_QuickSightSample.csv.

   To upload the sample data, use the following steps:
   a. Choose New data set from the New analysis screen. (Or, choose Manage data to locate the New data set screen.)
   b. Choose Upload a file.
   c. Choose the sample file, MarketingData_QuickSightSample.csv, from your drive.
   d. Confirm file upload settings by choosing Next on the Confirm file upload settings screen.
   e. Choose Visualize on the Data source details screen.
   f. Skip the next step. Choosing Visualize brings you to the same screen as the process in Step 2.

2. On the Your data sets page, choose the Web and Social Media Analytics data set, and then choose Create Analysis.
3. In the Fields list pane, choose Date, and then choose Mailing list adds.

Amazon QuickSight uses AutoGraph to create the visual, selecting the visual type that it determines is most compatible with those fields. In this case, it selects a line chart that shows mailing list adds by year, which is the date granularity default.
4. Expand the **Field wells** pane by choosing the expand icon.

5. Choose the **X axis** field well, choose **Aggregate**, and then choose **Month**.
Tutorial: Create A Multivisual Analysis and a Dashboard Using Sample Data

Use the procedures in the following sections to complete these tasks:

- Create and prepare a Marketing data set using the Web and Social Media Analytics sample data.
- Create a Marketing analysis and add several visuals to it.
- Modify the visuals in the analysis, including the following:
  - Adding another measure to an existing visual
  - Changing chart colors
  - Changing date granularity
  - Changing the size and layout of the visuals
  - Applying a filter
- Publish a dashboard based on the analysis.

Topics

- Tutorial: Create a Prepared Data Set (p. 16)
- Tutorial: Create an Analysis (p. 20)
- Tutorial: Modify Visuals (p. 24)
- Tutorial: Create a Dashboard (p. 36)
Tutorial: Create a Prepared Data Set

Use the following procedure to prepare the Marketing data set and create an analysis. If you don't see the Web and Social Media Analytics sample data already in Amazon QuickSight, you can download it from http://quicksightsampleddata.s3.amazonaws.com/MarketingData_QuickSightSample.csv.

1. On the Amazon QuickSight start page, choose Manage data.

2. On the Your data sets page, choose New data set.

3. In the FROM EXISTING DATA SOURCES section of the Create a Data Set page, choose the Web and Social Media Analytics Amazon S3 data source and then choose Edit/Preview data.

   Amazon QuickSight opens the data preparation page.

4. Name the data set.

   Highlight Group 1 in the data set name box, and type Marketing Sample.

5. Change the field selection to remove some fields we won't be working with.

   In the Fields pane, unselect the Twitter followers cumulative and Mailing list cumulative fields.
6. Rename a field.

In the data preview pane, scroll to the **Website Pageviews** field and choose the edit icon.

Highlight the field name, type **Website page views**, and then choose **Apply**.

7. Add a calculated field that substitutes a text string for any 0-length string value in the **Events** field.
   a. On the data preparation page, expand the **Fields** pane, and then choose **New Field**.
b. In the New calculated field pane, highlight the value in Calculated field name, and then type populated_event.

c. Choose the ifelse function from the Function list and then choose Add. This adds the function to the calculated field formula.

d. Scroll down in the Field list, choose the Events field, and then choose Add. This adds the field to the calculated field formula.
e. In **Formula**, type the additional functions and parameters required, highlighted following:

```
ifelse(strlen((Events))=0, 'Unknown', (Events))
```

f. Choose **Create**.

The new calculated field is created, and appears in the **Calculated fields** section at the top of the **Fields** pane.
8. Choose **Save**.

Next Steps

Create an analysis by using the procedure in Tutorial: Create an Analysis (p. 20).

**Tutorial: Create an Analysis**

Create an analysis, add a visual using AutoGraph, and add another visual by choosing a specific visual type. This procedure builds on the data set you create and prepare using the steps in Tutorial: Create a Prepared Data Set (p. 16).

**Create the Analysis**

Create the analysis.

1. On the Amazon QuickSight start page, choose **New analysis**.
2. On the **Your data sets** page, choose the **Marketing Sample** data set and then choose **Create Analysis**.

**Create a Visual By Using AutoGraph**

Create a visual by using AutoGraph, which is selected by default.

On the analysis page, choose **Date** and **Return visitors** in the **Fields list** pane.

Amazon QuickSight creates a line chart using this data.
Create a Scatter Plot Visual

Create a visual by choosing a visual type and dragging fields to the field wells.

1. On the analysis page, choose Add and then Add visual on the application bar. A new, blank visual is created, and AutoGraph is selected by default.

2. In the Visual types pane, choose the scatter plot icon.
3. Choose fields in the **Fields list** pane to add to the **Field wells** pane.
   - Choose **Desktop Uniques** to populate the **X axis** field well.
   - Choose **Mobile Uniques** to populate the **Y axis** field well.
   - Choose **Date** to populate the **Group/Color** field well.

A scatter plot is created using these fields.
Next Steps

Modify the visuals in the analysis by using the procedure in Tutorial: Modify Visuals (p. 24).

Tutorial: Modify Visuals

Use the following procedures to modify the visuals created using the procedures in Tutorial: Create an Analysis (p. 20).

Modify the Line Chart Visual

Modify the line chart visual by making it show an additional measure by date, and also by changing the chart color.

1. In the analysis, select the line chart visual.
2. Add another measure to the visual.

Select the New visitors SEO field in the Fields list pane. This measure is added to the Value field well, and the line chart updates with a line to represent it. Note that the visual title updates as well.
3. Change the color of the line used to represent the Return visitors measure.

Choose the line on the chart that represents Return visitors. To do this, choose the end of the line, not the middle of the line.

Choose Color Return visitors, and then choose the red icon from the color selector.
Modify the Scatter Plot Visual

Modify the scatter plot visual by changing the data granularity.

1. In the analysis, select the scatter plot visual.
2. Expand the Field wells pane by choosing the expand icon.
3. Choose the Group/Color field well, choose Aggregate, and then choose Month.
The scatter plot updates to show the measures by month, rather than by the default of by year.
Modify Both Visuals by Changing Visual Layout and Adding a Filter

Modify both visuals by changing visual size and location, and by adding a filter and applying it to both of them.

Change the Visual Layout

Modify both visuals by changing visual size and location.

1. In the analysis, select the line chart visual.
2. Choose the resize handle in the lower right corner of the visual and drag up and to the left, until the visual is half its former size both horizontally and vertically.
3. Repeat this procedure on the scatter plot visual.
4. Choose the move handle on the scatter plot visual, and drag it up to the right of the line chart visual so that they are side-by-side.
Modify Both Visuals by Adding a Filter

Modify both visuals by adding a filter and applying it to both of them.

1. In the analysis, choose the scatter plot visual.
2. Choose **Filter** in the tool bar.
3. On the **Applied filters** pane, choose the new filter icon, and then choose the **Date** field to filter on.
4. Choose the new filter to expand it.

5. Choose the **After** comparison type.

6. Enter a start date value of 1/1/2014.

   Choose **Start Date**, choose the month expander, and then choose **January**.
Choose the year expander and then choose 2014.
Choose the calendar and then choose 1.
7. Choose **Apply**.

The filter is applied to the currently selected visual, which is the scatter plot visual. This is indicated with a filter icon next to the visual title.
8. Apply the filter to the line chart visual as well.

Choose the selector next to the filter name, and then choose *All visuals for this data set*.

**Next Steps**

Create a dashboard from the analysis by using the procedure in Tutorial: Create a Dashboard (p. 36).

**Tutorial: Create a Dashboard**

Use the following procedure to create a dashboard from the analysis created using the procedure in Tutorial: Create an Analysis (p. 20).

1. In the analysis, choose **Share** and then **Create dashboard** on the application bar.

2. Choose **Create new dashboard as**, type the name **Marketing Dashboard**, and then choose **Create dashboard**.
Create an Analysis Using Your Own Local Text File Data

To create your first analysis using your own local text file data, follow these steps:

**Topics**
- Step 1: Create a File Data Set and an Analysis (p. 37)
- Step 2: Create a Visual (p. 37)

**Step 1: Create a File Data Set and an Analysis**

Complete the following procedure to create a data set and an analysis:

1. Check [Data Source Limits (p. 52)] to make sure your target file doesn't exceed data source limits.
2. On the Amazon QuickSight start page, choose **Manage data**.
3. On the **Your Data Sets** page, choose **New data set**.
4. In the **FROM NEW DATA SOURCES** section of the **Create a Data Set** page, choose **Upload a file**.
5. In the **Open** dialog box, browse to a text file, select it, and then choose **Open**.

   A file must be 1 GB or less to be uploaded to Amazon QuickSight.
6. Choose **Next**.
7. Choose **Visualize**.

**Step 2: Create a Visual**

Next, create a visual.

In the **Fields list** pane of the analysis page, choose the fields you want to use.

Amazon QuickSight creates the visual, using AutoGraph to determine the most appropriate visual type for the fields you selected. For more information about AutoGraph, see [Using AutoGraph (p. 346)](Using%20AutoGraph%20(p.346)). For more information about modifying the visual, see [Working with Amazon QuickSight Visuals (p. 265)](Working%20with%20Amazon%20QuickSight%20Visuals).
Create an Analysis Using Your Own Amazon S3 Data

To create your first analysis using your own Amazon S3 data, follow these steps:

**Topics**
- Step 1: Create an Amazon S3 Data Set and an Analysis (p. 38)
- Step 2: Create a Visual (p. 39)

**Step 1: Create an Amazon S3 Data Set and an Analysis**

Complete the following procedure to create a data set and an analysis:

1. Create a manifest file to identify the S3 files you want to import, using one of the formats specified in [Supported Formats for Amazon S3 Manifest Files](#) (p. 72).
2. Check [Data Source Limits](#) (p. 52) to make sure your target file set doesn't exceed data source limits.
3. Either save the manifest file to a local directory or upload it into Amazon S3.
4. On the Amazon QuickSight start page, choose Manage data.
5. On the Your Data Sets page, choose New data set.
6. In the FROM NEW DATA SOURCES section of the Create a Data set page, choose the Amazon S3 icon.
7. For Data source name, type a name for the data source.
8. For Upload a manifest file, do one of the following options:
Create an Analysis Using Your Own Database Data

To create your first analysis using your own database data, follow these steps:

**Topics**
- Connect to a Database Data Source (p. 40)
- Step 2: Create a Database Data Set and an Analysis (p. 41)
- Step 3: Create a Visual (p. 43)
Connect to a Database Data Source

Choose the situation that applies to you and follow the steps in the procedure to connect to your data source.

**Your Amazon QuickSight Account**

- Your Amazon QuickSight Account Has Autodiscovered AWS Data Sources (p. 40)
- Your Amazon QuickSight Account Does Not Have Autodiscovered AWS Data Sources (p. 40)

**Your Amazon QuickSight Account Has Autodiscovered AWS Data Sources**

If your Amazon QuickSight account has any autodiscovered AWS data sources, icons for those data sources appear on your start page. If you have credentials for one of these AWS data sources, use the following procedure. Otherwise, use the procedure in *Your Amazon QuickSight Account Does Not Have Autodiscovered AWS Data Sources* (p. 40).

1. Check Data Source Limits (p. 52) to make sure your target table or query doesn’t exceed data source limits.
2. Confirm that the database credentials you plan to use have appropriate permissions as described in Required Permissions for Database Credentials (p. 81).
3. Make sure you have configured the cluster or instance for Amazon QuickSight access by following the instructions in Network and Database Configuration Requirements (p. 82).
4. On the Amazon QuickSight start page, choose Manage data.
5. On the Your Data Sets page, choose New data set.
6. In the FROM NEW DATA SOURCES section of the Create a Data Set page, choose either the RDS or the Redshift Auto-discovered icon, depending on the AWS service you want to connect to.
7. Enter the connection information for the data source, as follows:
   - For Data source name, type a name for the data source.
   - For Instance ID, choose the name of the instance or cluster you want to connect to.
   - **Database name** shows the default database for the **Instance ID** cluster or instance. If you want to use a different database on that cluster or instance, type its name.
   - For Username, type the user name of an account that has permissions to access the target database, and also to read (perform a SELECT statement on) any tables in that database that you want to use.
   - For Password, type the password associated with the user account you entered.
8. (Optional) Choose Validate connection to verify your connection information is correct.
9. Choose Create data source.

**Note**

Amazon QuickSight automatically secures connections to Amazon RDS instances and Amazon Redshift clusters by using Secure Sockets Layer (SSL). You don’t need to do anything to enable this.

10. Go to Step 2: Create a Database Data Set and an Analysis (p. 41).

**Your Amazon QuickSight Account Does Not Have Autodiscovered AWS Data Sources**

If you don’t have any autodiscovered AWS data sources, use the following procedure:

1. Check Data Source Limits (p. 52) to make sure your target table or query doesn’t exceed data source limits.
2. Confirm that the database credentials you plan to use have appropriate permissions as described in Required Permissions for Database Credentials (p. 81).

3. Make sure you have configured the cluster or instance for Amazon QuickSight access by following the instructions in Network and Database Configuration Requirements (p. 82).

4. On the Amazon QuickSight start page, choose Manage data.

5. On the Your Data Sets page, choose New data set.

6. In the FROM NEW DATA SOURCES section of the Create a Data Set page, choose the Redshift Manual connect icon if you want to connect to an Amazon Redshift cluster in another region or associated with a different AWS account, or choose the appropriate database management system icon to connect to an instance of Amazon Aurora, MariaDB, Microsoft SQL Server, MySQL, or PostgreSQL.

7. Enter the connection information for the data source, as follows:
   - For Data source name, type a name for the data source.
   - For Database server, type or paste one of the following values:
     - For an Amazon Redshift cluster or Amazon RDS instance, type the endpoint of the cluster or instance without the port number. For example, if the endpoint value is `clustername.1234abcd.us-west-2.redshift.amazonaws.com:1234`, then type `clustername.1234abcd.us-west-2.redshift.amazonaws.com`. You can get the endpoint value from the Endpoint field on the cluster or instance detail page in the AWS console.
     - For an Amazon EC2 instance of MariaDB, Microsoft SQL Server, MySQL, or PostgreSQL, type the public DNS. You can get the public DNS value from the Public DNS field on the instance detail pane in the EC2 console.
     - For a non–Amazon EC2 instance of MariaDB, Microsoft SQL Server, MySQL, or PostgreSQL, type the host name or public IP address of the database server.
   - For Port, type the port that the cluster or instance uses for connections.
   - For Database name, type the name of the database that you want to use.
   - For Username, type the user name of an account that has permissions to access the target database and also to read (perform a SELECT statement on) any tables in that database that you want to use.
   - For Password, type the password associated with the user account you entered.

8. (Optional) If you are connecting to anything other than an Amazon Redshift cluster and you don’t want a secured connection, uncheck Enable SSL. We strongly recommend leaving this checked, as an unsecured connection can be open to tampering. For more information on how the target instance uses Secure Sockets Layer (SSL) to secure connections, refer to the documentation for that database management system.

   Amazon QuickSight automatically secures connections to Amazon Redshift clusters by using SSL. You don't need to do anything to enable this.

9. (Optional) Choose Validate connection to verify your connection information is correct.

10. Choose Create data source.

11. Go to Step 2: Create a Database Data Set and an Analysis (p. 41).

### Step 2: Create a Database Data Set and an Analysis

Complete the following procedure to create a data set and an analysis:

1. For Schema: contain sets of tables, choose Select and then choose a schema. Note that in some cases where there is only a single schema in the database, that schema will be automatically chosen and the schema selection option won't be displayed.
2. Choose a table and then choose **Select**.

3. Choose the **Import to SPICE for quicker analytics** radio button and then create an analysis by choosing **Visualize**.
Create an Analysis Using Your Own Database Data

Step 3: Create a Visual

Next, create a visual.

In the Fields list pane of the analysis page, choose the fields you want to use.

Amazon QuickSight creates the visual, using AutoGraph to determine the most appropriate visual type for the fields you selected. For more information about AutoGraph, see Using AutoGraph (p. 346). For more information about modifying the visual, see Working with Amazon QuickSight Visuals (p. 265).
Navigating the User Interface

This chapter explains briefly how to use the Amazon QuickSight user interface. After you sign in to Amazon QuickSight, you see the Amazon QuickSight start page. The start page provides tabs for your analyses, your dashboards, and our tutorial videos. It also provides options for searching Amazon QuickSight, accessing your user account, creating new analyses, and managing data sources.

If you have autodiscovered data sources, your start screen will look like the following screenshot. Optionally, you can dismiss this data source information by choosing the X icon near the top right.

To view videos about Amazon QuickSight, choose the Tutorial videos tab. Choose a video to play it.
To access the user account menu, choose your user icon in the upper right of any page in Amazon QuickSight. Use this menu to manage Amazon QuickSight features, visit the community, send product feedback, get help from the documentation, or sign out of Amazon QuickSight.

Manage QuickSight – If you have appropriate permissions, you can access administrative functions such as managing users, subscriptions, SPICE (p. 2) capacity, and account settings.

Community – Choose this option to visit the Amazon QuickSight online community.

Send feedback – This is your direct connection to the product team. Use this simple form to report problems, request features, or tell us how you are using Amazon QuickSight.

Help – This will open the official AWS documentation, which you can view online, in Kindle, or as a PDF.

Sign out – Choose this option to sign out of Amazon QuickSight and your AWS session.

Note
The following image also shows the region menu icon, which allows you to choose the AWS region where your work will be saved. Your default region is configured by your Amazon QuickSight administrator. Consult your administrator before changing your region.
Using the Amazon QuickSight Start Page

To see available dashboards, choose the **All dashboards** tab. Choose any dashboard to open it.

To see available analyses, choose the **All analyses** tab. This is the default tab when Amazon QuickSight opens. Choose any analysis to open it.

To create a new analysis, choose **New analysis**, near the top left. This takes you to **Your Data Sets**. Choose one to start analyzing it.

To see current data sets, or to create a new data set, choose **Manage data**, near the top right. This takes you to **Your Data Sets**, which displays the data sets that you have access to. (If they don't all fit on one page, there will be an option to navigate between pages.) From here, you can choose a data set to analyze.
To create a new data set from Your Data Sets, choose New data set. From here, you can upload a file, or you can create a new data set based on a data source (a connection to external data). Icons for new data sources are at the top of the screen. Icons for existing data sources are shown below them.

From the search bar, you can search for analyses and dashboards.

Searching Amazon QuickSight

From the search bar, you can search for analyses and dashboards.

To use the search tool, choose the search box at the top of the page. Then type in the name, or part of the name, of the data set, analyses, or dashboard you want to find. The search is not case sensitive.

After you've located the item you are looking for, you can open it directly from the search results. You can modify a data set, create an analysis from a data set, or access an analysis or dashboard. Choose an item from the search results to open it.
Searching Amazon QuickSight

Search results matching "Sales", showing 1-10 of 39 results.

Working with Data in Amazon QuickSight

You can base your Amazon QuickSight analyses on a variety of data sources, including AWS data stores, Salesforce, files in common formats, and popular database engines. You connect to these data sources and create data sets, which identify the specific data from that data source that you want to work with. Data sets also store any data preparation you have done on that data, so that you can reuse that prepared data in multiple analyses. For more information on preparing data, see Preparing Data (p. 115).

You can view your available data sets on the Your Data Sets page, which you reach by choosing Manage data on the Amazon QuickSight start page. You can view available data sources and create a new data set on the Create a Data Set page, which you reach by choosing New data set on the Your Data Sets page.

Topics
- Working with Data Sources in Amazon QuickSight (p. 49)
- Working with Data Sets (p. 65)

Supported Data Sources

Amazon QuickSight supports a variety of data sources that you can use to provide data for analyses. The following data sources are supported:

Relational Data Sources

You can use any of the following relational data stores as data sources for Amazon QuickSight:

- Amazon Athena
- Amazon Aurora
- Amazon Redshift
- Amazon Redshift Spectrum
- Amazon S3
• Amazon S3 Analytics
• Apache Spark 2.0 or later
• MariaDB 10.0 or later
• Microsoft SQL Server 2012 or later
• MySQL 5.1 or later
• Presto 0.167 or later
• Snowflake
• Teradata 14.0 or later

Note
You can access additional data sources not listed here by linking or importing them through supported data sources.

You can retrieve data from tables and materialized views in PostgreSQL instances, and from tables in all other database instances.

Amazon Redshift clusters, Amazon Athena databases, and Amazon Relational Database Service (RDS) instances must be in AWS. Other database instances must be in one of the following environments to be accessible from Amazon QuickSight:

• Amazon EC2
• On your local network
• In a data center or some other internet-accessible environment

File Data Sources
You can use files in Amazon S3 or on your local network as data sources for Amazon QuickSight. Amazon QuickSight supports files in the following formats:

• CSV/TSV – Delimited text files
• ELF/CLF – Extended and common log format files
• JSON – Flat or semi-structured data files
• XLSX – Microsoft Excel files

Files in Amazon S3 that have been compressed with zip, or gzip (www.gzip.org), can be imported as-is. If you used another compression program for files in Amazon S3, or if the files are on your local network, you need to unzip them before importing them.

JSON Data Sources
Amazon QuickSight natively supports JSON flat files and JSON semi structure data files.

You can either upload a JSON file or connect to your Amazon S3 bucket that contains JSON data. Amazon QuickSight automatically performs schema and type inference on JSON files and embedded JSON objects. Then it flattens the JSON, so you can analyze and visualize application-generated data.

Basic support for JSON flat file data includes the following:

• Inferring the schema
• Determining data types
• Flattening the data
• Parsing JSON (JSON embedded objects) from flat files
Support for JSON file structures (.json) includes the following:

- JSON records with structures
- JSON records with root elements as arrays

You can also use the `parseJson` function to extract values from JSON objects in a text file. For example, if your CSV file has a JSON object embedded in one of the fields, you can extract a value from a specified key value pair (KVP). For more information on how to do this, see `parseJson (p. 200)`.

The following JSON features aren't supported:

- Reading JSON with a structure containing a list of records
- List attributes and list objects within a JSON record are skipped during import
- Customizing upload or configuration settings
- `parseJSON` functions for SQL and analyses
- Error messaging for invalid JSON
- Extracting a JSON object from a JSON structure
- Reading delimited JSON records

You can use the `parseJson` function to parse flat files during data preparation. This function extracts elements from valid JSON structures and lists.

The following JSON values are supported:

- JSON object
- String (double quoted)
- Number (integer and float)
- Boolean
- NULL

**Software as a Service (SaaS) Data Sources**

The following list shows which SaaS data sources are currently supported by Amazon QuickSight. The ones that aren't labeled "direct connection" use OAuth to connect instead. For sources using OAuth, the connector takes you to the SaaS site to authorize the connection before letting you create the data source.

**Note**
For this to work, the SaaS data source must be accessible to Amazon QuickSight over the network.

- Adobe Analytics
- GitHub
- JIRA (direct connection)
- Salesforce

You can use reports or objects in the following editions of Salesforce as data sources for Amazon QuickSight. Joined reports aren't supported as Amazon QuickSight data sources.

- Enterprise Edition
- Unlimited Edition
- Developer Edition
- ServiceNow (direct connection)
Data Source Limits

Data sources that you use with Amazon QuickSight must conform to the following limits.

File Limits

The total size of the files specified in the manifest file can't exceed 25 GB when imported into SPICE. This limit isn't based on the actual size of the files. Instead, the limit is based on the space that the files occupy after they are imported into SPICE. The SPICE capacity is calculated using the formula described in Capacity Planning for SPICE (p. 451).

The total number of files specified in the manifest file can't exceed 1000.

Files can have up to 1000 columns. Each column name can have up to 127 characters.

Table and Query Limits

Any table or query result set you want to import into SPICE (p. 2) must use 25 GB or less of space in SPICE. The size limit is calculated based on the capacity the data occupies after imported into SPICE. The SPICE capacity is calculated using the formula described in Capacity Planning for SPICE (p. 451).

If you want to retrieve data from a larger table, you can use one of several methods to reduce the size of the data. You can deselect columns, or apply filters. In a SQL query, you can also use predicates, such as WHERE, HAVING.

Tables can have up to 1000 columns. Each column name can have up to 127 characters.

Field Limits

Data in any field of a data set you import into SPICE must be 511 characters or less. Each field name can have up to 127 characters.

Supported Data Types

Amazon QuickSight currently supports the following primitive data types:

- **Date.** Dates must be in one of the Supported Date Formats (p. 55).
- **Decimal.** The decimal data type supports up to four decimal places to the right of the decimal point. Values that have a higher scale than this are truncated to the fourth decimal place when displayed in data preparation or analyses and when imported into SPICE. For example, 13.00049 is truncated to 13.0004.

  During data preparation, calculated fields that use decimal data with more than four decimal places use the full value to perform the calculation. If the result is again decimal data that uses more than four decimal places, the result is then truncated as described preceding. For more information, see Handling Decimal Values in Calculated Fields (p. 144).
- **Integer**
- **String**

Make sure that any table or file that you use as a data source contains only fields that can be implicitly converted to these data types. Amazon QuickSight skips any data rows that can't be converted.

The following table lists the source data types that are supported. Boolean data types are converted to integers in Amazon QuickSight.
<table>
<thead>
<tr>

<tr>
<td></td>
<td>• text</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• varchar</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Unsupported Data Values

If a field contains values that don't conform with the data type that Amazon QuickSight assigns to the field, the rows containing those values are skipped. For example, take the following source data.

<table>
<thead>
<tr>
<th>Sales ID</th>
<th>Sales Date</th>
<th>Sales Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>001</td>
<td>10/14/2015</td>
<td>12.43</td>
</tr>
<tr>
<td>002</td>
<td>5/3/2012</td>
<td>25.00</td>
</tr>
<tr>
<td>003</td>
<td>Unknown</td>
<td>18.17</td>
</tr>
<tr>
<td>004</td>
<td>3/8/2009</td>
<td>86.02</td>
</tr>
</tbody>
</table>

Amazon QuickSight interprets Sales Date as a date field and drops the row containing a nongdate value, so only the following rows are imported.

<table>
<thead>
<tr>
<th>Sales ID</th>
<th>Sales Date</th>
<th>Sales Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>001</td>
<td>10/14/2015</td>
<td>12.43</td>
</tr>
<tr>
<td>002</td>
<td>5/3/2012</td>
<td>25.00</td>
</tr>
<tr>
<td>004</td>
<td>3/8/2009</td>
<td>86.02</td>
</tr>
</tbody>
</table>

Also, if a database field contains values that can't be interpreted by the JDBC driver for the source database engine, the uninterpretable values are replaced by null so that the rows can be imported. The only known occurrence of this issue is with MySQL date, datetime, and timestamp fields that have all-zero values, for example 0000-00-00 00:00:00. For example, take the following source data.

<table>
<thead>
<tr>
<th>Sales ID</th>
<th>Sales Date</th>
<th>Sales Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>001</td>
<td>2004-10-12 09:14:27</td>
<td>12.43</td>
</tr>
<tr>
<td>002</td>
<td>2012-04-07 12:59:03</td>
<td>25.00</td>
</tr>
<tr>
<td>003</td>
<td>0000-00-00 00:00:00</td>
<td>18.17</td>
</tr>
<tr>
<td>004</td>
<td>2015-09-30 01:41:19</td>
<td>86.02</td>
</tr>
</tbody>
</table>

In this case, the following data is imported.
Handling Date Time Zones

Amazon QuickSight uses UTC time for querying, filtering, and displaying date data.

When date data doesn't specify a time zone, Amazon QuickSight assumes UTC values. When date data does specify a time zone, Amazon QuickSight converts it to display in UTC time. For example, a date field with a time zone offset like 2015-11-01T03:00:00-08:00 is converted to UTC and displayed in Amazon QuickSight as 2015-11-01T15:30:00.

Supported Date Formats

Data in date fields must be in one of the following supported formats, depending on the data source type.

For file uploads, Amazon S3 sources, Athena and Salesforce, Amazon QuickSight supports the use of date and time formats (both 24 hr and am/pm) described in the Joda API documentation. See Class DateTimeFormat for a complete list of Joda date formats.

For relational database sources, including Amazon Redshift, Amazon RDS, PostgreSQL, MySQL, Aurora, MariaDB, and Microsoft SQL Server, Amazon QuickSight supports the following date and time formats (24 hr only):

Amazon QuickSight supports dates in the range from Jan 1, 1900 00:00:00 UTC to Dec 31, 2037 23:59:59 UTC.

1. dd/MM/yyyy HH:mm:ss, for example 31/12/2016 15:30:00.
2. dd/MM/yyyy, for example 31/12/2016.
3. dd/MMM/yyyy HH:mm:ss, for example 31/DEC/2016 15:30:00.
4. dd/MMM/yyyy, for example 31/DEC/2016.
5. dd–MMM–yyyy HH:mm:ss, for example 31-DEC-2016 15:30:00.
6. dd–MMM–yyyy, for example 31-DEC-2016.
7. dd–MMM–yyyy HH:mm:ss, for example 31-12-2016 15:30:00.
8. dd–MMM–yyyy, for example 31-12-2016.
9. MMM/dd/yyyy HH:mm:ss, for example 12/31/2016 15:30:00.
10. MMM/dd/yyyy, for example 12/31/2016.
11. MMMM–dd–yyyy HH:mm:ss, for example 12-31-2016 15:30:00.
12. MMMM–dd–yyyy, for example 12-31-2016.
13. MMM/d/yyyy HH:mm:ss, for example DEC/31/2016 15:30:00.
14. MMM/d/yyyy, for example DEC/31/2016.
15. MMMM–dd–yyyy HH:mm:ss, for example DEC-31-2016 15:30:00.
16. MMMM–dd–yyyy, for example DEC-31-2016.
17. yyyy/MM/dd HH:mm:ss, for example 2016/12/31 15:30:00.
18. yyyy/MM/dd, for example 2016/12/31.
19. yyyy–MMM–dd HH:mm:ss, for example 2016/DEC/31 15:30:00.
20. yyyy–MMM–dd, for example 2016/DEC/31.
21. yyyy–dd–mmm HH:mm:ss, for example 2016-12-31 15:30:00.
Creating a Data Source

An associated data source is automatically created when you create an Amazon Athena, Amazon S3, Salesforce, or database data set. No data source is created when you create a data set by uploading a file.

• For information about creating an Amazon S3 data set, see Creating a Data Set Using Amazon S3 Files (p. 68).
• For information about creating an Amazon Athena data set, see Creating a Data Set Using Amazon Athena Data (p. 76).
• For information about creating a Salesforce data set, see Creating a Data Set from Salesforce (p. 79).
• For information about creating a data set from a database, see Creating Data Sets from New Database Data Sources (p. 81).

When you create a Presto or Apache Spark data set, you must configure Presto or Apache Spark for Amazon QuickSight, as described following.

Topics

• Creating a Data Source and Data Set from SaaS Sources (p. 56)
• Creating a Data Source Using Presto (p. 62)
• Creating a Data Source Using Apache Spark (p. 62)

Creating a Data Source and Data Set from SaaS Sources

To analyze and report on data from software as a service (SaaS) applications, you can use SaaS connectors to access your data directly from Amazon QuickSight. The SaaS connectors simplify accessing 3rd party application sources using OAuth, without any need to export the data to an intermediate data store.

You can use either cloud-based or server-based instances of the SaaS. To connect to an SaaS that is running on your corporate network, you need to make sure that the DNS name of your SaaS is accessible to Amazon QuickSight over the network. If Amazon QuickSight can't access the SaaS, it generates an unknown host error.

Here are examples of some ways you can use SaaS data:

• Engineering teams who use JIRA to track issues and bugs can report on developer efficiency and bug burndown.
• Marketing organizations can integrate Amazon QuickSight with Adobe Analytics to build consolidated dashboards to visualize their online and web marketing data.
• Teams using social media can access Twitter data to analyze and understand their customers' sentiment.

Use the following procedure to create a data source and data set by connecting to sources available through Software-as-a-Service (SaaS). In this procedure, we use a connection to GitHub as an example. Other SaaS data sources follow the same process, although the screens – especially the SaaS screens – might look different.
1. On the Amazon QuickSight start page, choose **Manage data**.
2. On the **Your Data Sets** page, choose **New data set**.
3. In the **FROM NEW DATA SOURCES** section of the **Create a Data Set** page, choose the icon that represents the SaaS you want to use. For example, you might choose Adobe Analytics or GitHub.

   For sources using OAuth, the connector takes you to the SaaS site to authorize the connection before letting you create the data source. A screen similar to one of the following appears:

   ![New data source](image1.png)

   Or:

   ![New data source](image2.png)

   Or, if the SaaS data source doesn't use OAuth, this screen appears:
4. Choose a name for the data source, and type it in. If there are more screen prompts, type in the appropriate information. Then choose **Create data source**.

5. If you are prompted to do so, enter your credentials on the SaaS login page.

6. When prompted, authorize the connection between your SaaS data source and Amazon QuickSight.

   The following example shows the authorization for Amazon QuickSight to access the GitHub account for the Amazon QuickSight documentation.

   **Note**
   Amazon QuickSight documentation is now available on GitHub. If you’d like to make changes to this user guide, you can use GitHub to edit it directly.
(Optional) If your SaaS account is part of an organizational account, you might be asked to request organization access as part of authorizing Amazon QuickSight. If you want to do this, follow the prompts on your SaaS screen, then choose to authorize Amazon QuickSight.
7. After authorization is complete, choose a table or object to connect to. Then choose Select.
8. On the following screen, choose one of these options:

- To save the data source and data set, choose **Edit/Preview data**. Then choose **Save** from the top menu bar.

- To create a data set and an analysis using the data as-is, choose **Visualize**. This option automatically saves the data source and the data set.

You can also choose **Edit/Preview data** to prepare the data before creating an analysis. This opens the data preparation screen. For more information about data preparation, see [Preparing Data Sets](p. 115).

- **Note**
  If you don’t have enough **SPICE** (p. 2) capacity, choose **Edit/Preview data**. In the data preparation screen, you can remove fields from the data set to decrease its size or apply a filter that reduces the number of rows returned. For more information about data preparation, see [Preparing Data Sets](p. 115).
Creating a Data Source Using Presto

You can connect to a variety of databases using Amazon QuickSight as a Presto client. Presto processes the analytic queries on backend databases. Then it returns results to the Amazon QuickSight client.

The results of analytic queries run through the Presto query engine can be turned into Amazon QuickSight data sets. You can either directly query your data through Presto, or you can import the results of your query into SPICE (p. 2).

Before you use Amazon QuickSight as a Presto client to run queries, you must configure Presto for Amazon QuickSight.

Amazon QuickSight requires your Presto server to be secured and authenticated using Lightweight Directory Access Protocol (LDAP), which is available to Presto version 0.167 or later. If Presto is configured to allow unauthenticated access, Amazon QuickSight refuses the connection to the server. To use Amazon QuickSight as a Presto client, you must configure LDAP authentication to work with Presto.

Presto's documentation contains information on how to set this up. To start, you'll need to configure it to enable front-end LDAP authentication over HTTPS. For general information on Presto, see the Presto documentation. For information specifically on Presto and LDAP, see Presto LDAP documentation.

To make sure that you have configured your server for Amazon QuickSight access, follow the instructions in Network and Database Configuration Requirements (p. 82).

Creating a Data Source Using Apache Spark

You can connect directly to Apache Spark using Amazon QuickSight, or you can connect to Spark through Spark SQL. Using the results of queries, or direct links to tables or views, you create data sources in Amazon QuickSight. You can either directly query your data through Spark, or you can import the results of your query into SPICE (p. 2).
Before you use Amazon QuickSight with Spark products, you must configure Spark for Amazon QuickSight.

Amazon QuickSight requires your Spark server to be secured and authenticated using LDAP, which is available to Spark version 2.0 or later. If Spark is configured to allow unauthenticated access, Amazon QuickSight refuses the connection to the server. To use Amazon QuickSight as a Spark client, you must configure LDAP authentication to work with Spark.

The Spark documentation contains information on how to set this up. To start, you need to configure it to enable front-end LDAP authentication over HTTPS. For general information on Spark, see the Apache Spark website. For information specifically on Spark and security, see Spark security documentation.

To make sure that you have configured your server for Amazon QuickSight access, follow the instructions in Network and Database Configuration Requirements (p. 82).

Editing a Data Source

You can edit an existing database data source to update the connection information, such as the server name or the user credentials. You can also edit an existing Amazon Athena data source to update the data source name. You can't edit Amazon S3 or Salesforce data sources.

Editing a Database Data Source

Use the following procedure to edit a database data source.

1. In the FROM EXISTING DATA SOURCES section of the Create a Data Set page, choose a database data source.
2. Choose Edit Data Source.
3. Modify the data source information.
   - If you are editing an autodiscovered database data source, you can modify any of the following settings:
     - For Data source name, type a name for the data source.
     - For Instance ID, choose the name of the instance or cluster you want to connect to from the list provided.
     - Database name shows the default database for the Instance ID cluster or instance. If you want to use a different database on that cluster or instance, type its name.
     - For UserName, type the user name of an account that has permissions to access the target database and also to read (perform a SELECT statement on) any tables in that database that you want to use.
     - For Password, type the password associated with the user account you entered.
   - If you are editing an external database data source, you can modify any of the following settings:
     - For Data source name, type a name for the data source.
     - For Database server, type or paste one of the following values:
• For an Amazon Redshift cluster, type the endpoint of the cluster without the port number. For example, if the endpoint value is `clustername.1234abcd.us-west-2.redshift.amazonaws.com:1234`, then type `clustername.1234abcd.us-west-2.redshift.amazonaws.com`. You can get the endpoint value from the Endpoint field on the cluster detail page in the Amazon Redshift console.

• For an Amazon EC2 instance of PostgreSQL, MySQL, or SQL Server, type the public DNS. You can get the public DNS value from the Public DNS field on the instance detail pane in the EC2 console.

• For a non-Amazon EC2 instance of PostgreSQL, MySQL, or SQL Server, type the hostname or public IP address of the database server.

• For Port, type the port that the cluster or instance uses for connections.

• For Database name, type the name of the database that you want to use.

• For Username, type the user name of an account that has permissions to access the target database and also to read (perform a SELECT statement on) any tables in that database that you want to use.

• For Password, type the password associated with the user account you entered.

4. Choose Validate connection.

5. If the connection validates, choose Update data source. If not, correct the connection information and try validating again.

6. If you want to create a new data set using the updated data source, proceed with the instructions at Creating a Data Set from a Database (p. 85). Otherwise, close the Choose your table dialog.

### Editing an Athena Data Source

Use the following procedure to edit an Athena data source.

1. In the FROM EXISTING DATA SOURCES section of the Create a Data Set page, choose an Athena data source.

2. Choose Edit Data Source.

3. For Data source name, type a new name.

4. Choose Update data source.

5. If you want to create a new data set using the updated data source, proceed with the instructions at Creating a Data Set Using Amazon Athena Data (p. 76). Otherwise, close the Choose your table dialog.
Deleting a Data Source

You can delete a data source if it is no longer necessary. Deleting a query-based database data source makes any associated data sets unusable. Deleting an Amazon S3, Salesforce, or SPICE-based database data source doesn't affect your ability to use any associated data sets, because the data is stored in SPICE (p. 2). However, you can no longer refresh those data sets.

Use the following procedure to delete a data source.

1. In the **FROM EXISTING DATA SOURCES** section of the Create a Data Set page, choose the data source you want to delete.
2. Choose **Delete**.
3. Choose **Yes**.

Working with Data Sets

A data set identifies the specific data in a data source that you want to use. For example, the data source might be a table if you are connecting to a database data source, or a file if you are connecting to an Amazon S3 data source. A data set also stores any data preparation you have performed on that data, such as renaming a field or changing its data type. Storing this preparation means that you don't have to reprepare the data each time you want to create an analysis based on it.

Importing Data into SPICE

SPICE is Amazon QuickSight's in-memory optimized calculation engine, designed specifically for fast, ad hoc data visualization. SPICE stores your data in a system architected for high availability, where it is saved until you choose to delete it. You can improve the performance of database data sets by importing the data into SPICE instead of using a direct query to the database. All data sets that aren't based on database data sources must use SPICE.

Each Amazon QuickSight account receives 10 GB of SPICE capacity per paid user, which is allocated when the user signs into Amazon QuickSight for the first time. Each Amazon QuickSight account also receives one free user with 1 GB of SPICE capacity. SPICE capacity is pooled across users for the Amazon QuickSight account. For example, if you have four users (three paid and one free), you have 31 GB of SPICE capacity available, which can be utilized by any of the users in the account. All of your default SPICE capacity is allocated to your home AWS Region, and the other regions have no SPICE capacity unless you choose to purchase some.

To free up SPICE capacity, delete any unused data sets that you have imported into SPICE. For more information about deleting a data set, see Deleting a Data Set (p. 113).

You can purchase additional SPICE capacity if you want to, and you can also release purchased SPICE capacity that you aren't using. For information about purchasing or releasing SPICE capacity, as well as monitoring SPICE usage, see Managing SPICE Capacity (p. 451).
Creating Data Sets

To create a data set, choose New data set on the Your Data Sets page. You can then create a data set based on an existing data source, or connect to a new data source and base the data set on that.

Topics
- Creating Data Sets Using New Data Sources (p. 66)
- Creating a Data Set Using an Existing Data Source (p. 90)

Creating Data Sets Using New Data Sources

To create a data set from a new data source, you must provide connection information to the data source.

- For local text or Excel files, you can simply identify the file location and upload the file.
- For Amazon S3, you must provide a manifest identifying the files or buckets that you want to use, and also the import settings for the target files.
- For Amazon Athena, all Athena databases associated with your AWS account are returned. No additional credentials are required.
- For Salesforce, you must provide credentials to connect with.
- For Amazon Redshift, Amazon RDS, Amazon EC2, or other database data sources, you must provide information about the server and database that host the data, as well as valid credentials for that instance.

Topics
- Creating a Data Set Using a Local Text File (p. 66)
- Creating a Data Set Using a Microsoft Excel File (p. 67)
- Creating a Data Set Using Amazon S3 Files (p. 68)
- Creating a Data Set Using Amazon Athena Data (p. 76)
- Creating a Data Set from Salesforce (p. 79)
- Creating Data Sets from New Database Data Sources (p. 81)

Creating a Data Set Using a Local Text File

To create a data set using a local text file data source, identify the location of the file, and then upload it. The file data will be automatically imported into SPICE (p. 2) as part of creating a data set.

Use the following procedure to create a data set based on a local text file.

1. Check Data Source Limits (p. 52) to make sure that your target file doesn't exceed data source limits.
   - Supported file types include .csv, .tsv, .json, .clf, or .elf files.
2. On the Amazon QuickSight start page, choose Manage data.
3. On the Your Data Sets page, choose New data set.
4. In the FROM NEW DATA SOURCES section of the Create a Data Set page, choose Upload a file.
5. In the Open dialog box, browse to a file, select it, and then choose Open.
   - A file must be 1 GB or less to be uploaded to Amazon QuickSight.
6. To prepare the data before creating the data set, choose Edit/Preview data, otherwise choose Visualize to create an analysis using the data as-is. If you choose the former, you can specify a data
set name as part of preparing the data. If you choose the latter, a data set with the same name as the source file is created. To learn more about data preparation, see Preparing Data (p. 115).

Creating a Data Set Using a Microsoft Excel File

To create a data set using a Microsoft Excel file data source, upload an .xlsx file from a local or networked drive. The data will be imported into SPICE (p. 2).

For more information about creating new Amazon S3 data sets using Amazon S3 data sources, see Creating a Data Set Using an Existing Amazon S3 Data Source (p. 90) or Creating a Data Set Using Amazon S3 Files (p. 68).

Use the following procedure to create a data set based on an Excel file.

1. Check Data Source Limits (p. 52) to make sure that your target file doesn't exceed data source limits.
2. On the Amazon QuickSight start page, choose Manage data.
3. On the Your Data Sets page, choose New data set.
4. In the FROM NEW DATA SOURCES section of the Create a Data Set page, choose Upload a file.
5. In the Open dialog box, choose a file, and then choose Open.

A file must be 1 GB or less to be uploaded to Amazon QuickSight.

6. If the Excel file contains multiple sheets, choose the sheet to import. You can change this later by preparing the data.

7. Note
   On the following screens, you have multiple chances to prepare the data. Each of these takes you to the Prepare Data screen. This screen is the same one where you can access after the data import is complete. It allows you to change the upload settings even after the upload is complete.

   Choose Select to confirm your settings. Or, you can choose Edit/Preview data to prepare the data immediately.

8. A preview of the data appears on the next screen. You can't make changes directly to the data preview. If the data headings and content don't look correct, you can choose Edit settings and prepare data to correct the file upload settings.

   Otherwise, choose Next.
9. On the **Data Source Details** screen, you can choose **Edit/Preview data**. You can specify a data set name in the **Prepare Data** screen.

If you don't need to prepare the data, you can choose to create an analysis using the data as-is. Choose **Visualize**. Doing this names the data set the same as the source file, and takes you to the **Analysis** screen. To learn more about data preparation and excel upload settings, see **Preparing Data** (p. 115).

### Creating a Data Set Using Amazon S3 Files

To create a data set using one or more text files (.csv, .tsv, .clf, or .elf) from Amazon S3, create a manifest that Amazon QuickSight can use to identify the files that you want to use, and also the upload settings needed to import them. When you create a data set using Amazon S3, the file data is automatically imported into **SPICE** (p. 2).

You must grant Amazon QuickSight access to any Amazon S3 buckets that you want to read files from. For information about granting Amazon QuickSight access to AWS resources, see **Managing Amazon QuickSight Permissions to AWS Resources** (p. 475).

Use the following procedure to create an Amazon S3 data set.
1. Check Data Source Limits (p. 52) to make sure that your target file set doesn't exceed data source limits.

2. Create a manifest file to identify the text files you want to import, using one of the formats specified in Supported Formats for Amazon S3 Manifest Files (p. 72).

3. You can save the manifest file to a local directory, or upload it into Amazon S3.

4. On the Amazon QuickSight start page, choose Manage data.

5. On the Your Data Sets page, choose New data set.

6. In the FROM NEW DATA SOURCES section of the Create a Data Set page, choose the Amazon S3 icon.

7. For Data source name, type a description of the data source. This name should be something that helps you distinguish this data source from others.

8. For Upload a manifest file, do one of the following:
   - To use a local manifest file, choose Upload, and then choose Upload a JSON manifest file. For Open, choose a file, and then choose Open.
   - To use a manifest file from Amazon S3, choose URL, and type the URL for the manifest file. To find the URL of a pre-existing manifest file in the Amazon S3 console, navigate to the appropriate file and choose it. A properties panel displays, including the link URL. You can copy the URL and paste it into Amazon QuickSight.

9. Choose Connect.

10. To make sure that the connection is complete, choose Edit/Preview data. Otherwise, choose Visualize to create an analysis using the data as-is. If you choose Edit/Preview data, you can specify a data set name as part of preparing the data. Otherwise, the data set name matches the name of the manifest file.

To learn more about data preparation, see Preparing Data (p. 115).

Data Sets Based on Multiple Amazon S3 Files

You can use one of several methods to merge or combine files from Amazon S3 inside Amazon QuickSight:

- **Combine files by using a manifest** – In this case, the files must have the same number of fields (columns). The data types must match between fields in the same position in the file. For example, the first field must have the same data type in each file. The same goes for the second field, and the third field, and so on. Amazon QuickSight takes field names from the first file.

  The files must be listed explicitly in the manifest. However, they don't have to be inside the same S3 bucket.

  In addition, the files must follow the rules described in Supported Formats for Amazon S3 Manifest Files (p. 72).

  For more details about combining files using a manifest, see Creating a Data Set Using Amazon S3 Files (p. 68).

- **Merge files without using a manifest** – To merge multiple files into one without having to list them individually in the manifest, you can use Athena. With this method, you can simply query your text files, like they are in a table in a database. For more information, see the post Analyzing Data in Amazon S3 Using Athena in the Big Data blog.

- **Use a script to append files before importing** – You can use a script designed to combine your files before uploading.
Data Sets Using S3 Files in Another AWS Account

Use this section to learn how to set up security so you can use Amazon QuickSight to access Amazon S3 files in another AWS account.

For you to access files in another account, the owner of the other account must first set Amazon S3 to grant you permissions to read the file. Then, in Amazon QuickSight, you must set up access to the buckets that were shared with you. After both of these steps are finished, you can use a manifest to create a data set.

**Note**
To access files that are shared with the public, you don’t need to set up any special security. However, you still need a manifest file.

**Topics**
- Setting Up Amazon S3 to Allow Access from a Different Amazon QuickSight Account (p. 70)
- Setting Up Amazon QuickSight to Access Amazon S3 Files in Another AWS Account (p. 70)

Setting Up Amazon S3 to Allow Access from a Different Amazon QuickSight Account

Use this section to learn how to set permissions in Amazon S3 files so they can be accessed by Amazon QuickSight in another AWS account.

For information on accessing another account’s Amazon S3 files from your Amazon QuickSight account, see Setting Up Amazon QuickSight to Access Amazon S3 Files in Another AWS Account (p. 70). For more information about S3 permissions, see Managing Access Permissions to Your Amazon S3 Resources and How Do I Set Permissions on an Object?

You can use the following procedure to set this access from the S3 console. Alternatively, you can grant permissions by using the AWS CLI or by writing a script. If you have a lot of files to share, you can instead create an S3 bucket policy on the s3:GetObject action. To use a bucket policy, add it to the bucket permissions, not to the file permissions. For information on bucket policies, see Bucket Policy Examples in the Amazon S3 Developer Guide.

1. Get the email address of the AWS account email you want to share with. Alternatively, you can get and use the canonical user ID. For more information on canonical user IDs, see AWS Account Identifiers in the AWS General Reference.
2. Sign in to the AWS Management Console and open the Amazon S3 console at https://console.aws.amazon.com/s3/.
3. Locate the Amazon S3 bucket that you want to share with Amazon QuickSight. Choose Permissions.
4. Choose Add Account, and then type in an email address, or paste in a canonical user ID, for the AWS account that you want to share with. This email address should be the primary one associated with the AWS account.
5. Choose Yes for Read bucket permissions.
6. Locate the file you want to share, and open the file’s permission settings.
7. Type in an email address or canonical user ID for the AWS account you want to share with. This email address should be the primary one associated with the AWS account.
8. Enable Read object permissions for each file that Amazon QuickSight needs access to.
9. Notify the Amazon QuickSight user that the files are now available for use.

Setting Up Amazon QuickSight to Access Amazon S3 Files in Another AWS Account

Use this section to learn how to set up Amazon QuickSight so you can access Amazon S3 files in another AWS account. For information on allowing someone else to access your Amazon S3 files from their
Amazon QuickSight account, see Setting Up Amazon S3 to Allow Access from a Different Amazon QuickSight Account (p. 70).

Use the following procedure to access another account's Amazon S3 files from Amazon QuickSight. Before you can use this procedure, the users in the other AWS account must share the files in their Amazon S3 bucket with you.

1. Verify that the user or users in the other AWS account gave your account read and write permission to the S3 bucket in question.
2. Choose your profile icon, and then choose Manage QuickSight.
3. Choose Edit AWS Permissions.
4. Choose Choose S3 buckets.
5. On the Select Amazon S3 buckets screen, choose the S3 buckets you can access across AWS tab.
The default tab is named **S3 buckets linked to QuickSight account**. It shows all the buckets your Amazon QuickSight account has access to.

6. If you want to add all the buckets you have permission to use, choose **Choose accessible buckets from other AWS accounts**. Otherwise, type the name of the Amazon S3 bucket that you want to add. It must exactly match the unique name of the Amazon S3 bucket.

   If you don't have the appropriate permissions, you see the error message "We can't connect to this S3 bucket. Make sure that any S3 buckets you specify are associated with the AWS account used to create this QuickSight account." This error message appears if you don't have either account permissions or Amazon QuickSight permissions.

   **Note**
   To use Amazon Athena, Amazon QuickSight needs to access the Amazon S3 buckets that Athena uses. You can add them here one by one, or use the **Choose accessible buckets from other AWS accounts** option.

7. Choose **Select buckets** to confirm your selection.

8. Create a new data set based on Amazon S3, and upload your manifest file. For more information Amazon S3 data sets, see [Creating a Data Set Using Amazon S3 Files](p. 68).

**Supported Formats for Amazon S3 Manifest Files**

You use JSON manifest files to specify files in Amazon S3 to import into Amazon QuickSight. These JSON manifest files can use either the Amazon QuickSight format described following or the Amazon Redshift format described in [Using a Manifest to Specify Data Files](p. 98). You don't have to use Amazon Redshift to use the Amazon Redshift manifest file format.

If you use an Amazon QuickSight manifest file, it must have a .json extension, for example my_manifest.json. If you use an Amazon Redshift manifest file, it can have any extension.

If you use an Amazon Redshift manifest file, Amazon QuickSight processes the optional **mandatory** flag similarly to Amazon Redshift, terminating the import process and returning an error if the associated file is not found.

Files you select for import must be delimited-text (for example, .csv or .tsv), log (.clf), or extended log (.elf) format, or JSON (.json). All files identified in one manifest file must use the same file format. Plus, they must have the same number and type of columns. If you are importing JSON files, then for **globalUploadSettings** you need to specify **format**, but not **delimiter**, **textqualifier**, and **containsHeader**.

Any files you specify must be in Amazon S3 buckets that you have granted Amazon QuickSight access to. For information about granting Amazon QuickSight access to AWS resources, see [Managing Amazon QuickSight Permissions to AWS Resources](p. 475).

**Manifest File Format for Amazon QuickSight**

Amazon QuickSight manifest files use the following JSON format.

```json
{
  "fileLocations": [
    {
      "URIs": [
        "uri1",
        "uri2",
        "uri3"
      ],
    },
  ]
}
```
Use the fields in the `fileLocations` element to specify the files to import, and the fields in the `globalUploadSettings` element to specify import settings for those files, such as field delimiters.

The manifest file elements are described following.

- **fileLocations** — Use this element to specify the files to import. You can use either or both of the `URIs` and `URIPrefixes` arrays to do this. You must specify at least one value in one or the other of them.

- **URIs** — Use this array to list URIs for specific files to import.

Amazon QuickSight can access Amazon S3 files that are in any AWS Region. However, you must use a URI format that identifies the AWS Region of the Amazon S3 bucket if it is different from that used by your Amazon QuickSight account.

URIs in the following formats are supported:

<table>
<thead>
<tr>
<th>URI Format</th>
<th>Example</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>s3://&lt;bucket name&gt;/&lt;file name&gt;</td>
<td>s3://data_bucket/data.csv</td>
<td></td>
</tr>
<tr>
<td><a href="https://s3-">https://s3-</a>&lt;region name&gt;.amazonaws.com/&lt;bucket name&gt;/&lt;file name&gt;</td>
<td><a href="https://s3-us-east-1.amazonaws.com/data_bucket/data.csv">https://s3-us-east-1.amazonaws.com/data_bucket/data.csv</a></td>
<td>This URI type identifies the AWS Region for the Amazon S3 bucket.</td>
</tr>
<tr>
<td>https://&lt;bucket name&gt;.s3-&lt;region name&gt;.amazonaws.com/&lt;file name&gt;</td>
<td><a href="https://data_bucket.s3-us-east-1.amazonaws.com/data.csv">https://data_bucket.s3-us-east-1.amazonaws.com/data.csv</a></td>
<td>This URI type identifies the AWS Region for the Amazon S3 bucket.</td>
</tr>
</tbody>
</table>

- **URIPrefixes** — Use this array to list URI prefixes for S3 buckets and folders. All files in a specified bucket or folder are imported. Amazon QuickSight recursively retrieves files from child folders.

Amazon QuickSight can access Amazon S3 buckets or folders that are in any AWS Region. However, you must use a URI prefix format that identifies the AWS Region of the Amazon S3 bucket if it is different from that used by your Amazon QuickSight account.
URI prefixes in the following formats are supported:

<table>
<thead>
<tr>
<th>URI Prefix Format</th>
<th>Example</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>s3://&lt;bucket name&gt;</td>
<td>s3://data_bucket/</td>
<td></td>
</tr>
<tr>
<td>s3://&lt;bucket name&gt;/&lt;folder name1&gt;/(&lt;folder name2&gt;/etc.)</td>
<td>s3://data_bucket/folder1/</td>
<td></td>
</tr>
<tr>
<td><a href="https://s3-">https://s3-</a>&lt;region name&gt;.amazonaws.com/&lt;bucket name&gt;/</td>
<td><a href="https://s3-us-east-1.amazonaws.com/data_bucket/">https://s3-us-east-1.amazonaws.com/data_bucket/</a></td>
<td></td>
</tr>
<tr>
<td><a href="https://s3-">https://s3-</a>&lt;region name&gt;.amazonaws.com/&lt;bucket name&gt;/&lt;folder name1&gt;/(&lt;folder name2&gt;/etc.)</td>
<td><a href="https://s3-us-east-1.amazonaws.com/data_bucket/folder1/">https://s3-us-east-1.amazonaws.com/data_bucket/folder1/</a></td>
<td></td>
</tr>
<tr>
<td>https://&lt;bucket name&gt;.s3-&lt;region name&gt;.amazonaws.com</td>
<td><a href="https://data_bucket.s3-us-east-1.amazonaws.com">https://data_bucket.s3-us-east-1.amazonaws.com</a></td>
<td></td>
</tr>
</tbody>
</table>

- **globalUploadSettings** — (Optional) Use this element to specify import settings for the Amazon S3 files, such as field delimiters. If this element is not specified, Amazon QuickSight uses the default values for the fields in this section.

  Important
  For log (.clf) and extended log (.elf) files, only the **format** field in this section is applicable, so you can skip the other fields. If you choose to include them, their values are ignored.

- **format** — (Optional) Specify the format of the files to be imported. Valid formats are **CSV**, **TSV**, **CLF**, **ELF**, and **JSON**. The default value is **CSV**.

- **delimiter** — (Optional) Specify the file field delimiter. This must map to the file type specified in the **format** field. Valid formats are commas (,) for .csv files and tabs (\t) for .tsv files. The default value is comma (,).

- **textqualifier** — (Optional) Specify the file text qualifier. Valid formats are single quote (‘), double quotes ("), or no value if no qualifier is used. The leading backslash is a required escape character for a double quote in JSON. The default value is double quotes ("').

- **containsHeader** — (Optional) Specify whether the file has a header row. Valid formats are **true** or **false**. The default value is **true**.

**Manifest File Examples for Amazon QuickSight**

The following are some examples of completed Amazon QuickSight manifest files.
The following example shows a manifest file that identifies two specific .csv files for import. These files use double quotes for text qualifiers. The format, delimiter, and containsHeader fields are skipped because the default values are acceptable.

```json
{
    "fileLocations": [
        {
            "URIs": [
                "https://data_bucket.s3.amazonaws.com/data.csv",
                "https://data_bucket.s3.amazonaws.com/data2.csv"
            ]
        },
        "globalUploadSettings": {
            "textqualifier": "\"
        }
    ]
}
```

The following example shows a manifest file that identifies one specific .tsv file for import, and also a bucket in another AWS Region that contains additional .tsv files for import. The textqualifier and containsHeader fields are skipped because the default values are acceptable.

```json
{
    "fileLocations": [
        {
            "URIs": [
                "https://s3.amazonaws.com/data_bucket/data.tsv"
            ],
            "URIprefixes": [
                "https://s3-us-east-1.amazonaws.com/data_bucket/"
            ]
        },
        "globalUploadSettings": {
            "format": "TSV",
            "delimiter": "\t"
        }
    ]
}
```

The following example identifies two buckets that contain .clf files for import. One is in the same AWS Region as the Amazon QuickSight account, and one in a different AWS Region. The delimiter, textqualifier, and containsHeader fields are skipped because they are not applicable to log files.

```json
{
    "fileLocations": [
        {
            "URIprefixes": [
                "https://data_bucket.s3-us-east-1.amazonaws.com",
                "s3://other_data_bucket/"
            ]
        },
        "globalUploadSettings": {
            "format": "CLF"
        }
    ]
}
```

The following example uses the Amazon Redshift format to identify a .csv file for import.
The following example uses the Amazon Redshift format to identify two JSON files for import.

```json
{
  "fileLocations": [
  
  "https://data_bucket.s3.amazonaws.com/data.json",
  "https://data_bucket.s3.amazonaws.com/data2.json"
  
  ],
  "globalUploadSettings": {
  "format": "JSON"
  }
}
```

**Creating a Data Set Using Amazon Athena Data**

You can connect to Amazon Athena data sources and use Athena data to create Amazon QuickSight data sets.

Before you try to read files from Amazon S3 buckets, make sure that you grant Amazon QuickSight access to them. For more information, see Managing Amazon QuickSight Permissions to AWS Resources (p. 475).

**To create an Athena data set**

1. Check Data Source Limits (p. 52) to make sure that your target table or query doesn't exceed data source limits.
2. On the Amazon QuickSight start page, choose Manage data.
3. On the Your Data Sets page, choose New data set.
4. In the FROM NEW DATA SOURCES section of the Create a Data Set page, choose the Athena icon.
5. For Data source name, type a name for the data source.
6. Choose Validate connection to validate the connection. If validation fails, make sure Amazon QuickSight has permission to access Athena resources. Then, try validating again. For more information on setting Amazon QuickSight permissions to AWS resources, see Managing Amazon QuickSight Permissions to AWS Resources (p. 475).
7. Choose Create data source.
   
   **Note**
   Amazon QuickSight automatically secures connections to Athena instances by using Secure Sockets Layer (SSL). You don't need to do anything to enable this.
8. For Database: contain sets of tables, choose Select, and then choose your Athena database.
Choose your table

transport

Database: contain sets of tables.

Choose Prepare data to create a SQL query or perform other data preparation, otherwise choose Select table.

Note
If you want to create a custom SQL query, choose Edit/Preview data to edit a query. If you do this without selecting a table, an error appears in the data preview area. You can safely ignore this. The error is saying that there is no data to display until your query is created.

9. Choose one of the following options:

- To prepare the data before creating an analysis, choose Edit/Preview data to begin data preparation. Choose to prepare data at this point if you are planning on writing a SQL query, rather than selecting data from a single table. For more information about data preparation, see Preparing Data Sets (p. 115).
- Otherwise, choose a table, and then choose Select to confirm.
10. If you did not choose to prepare the data in the previous step, you will see the following screen.

Choose your table

Transport

Database: contain sets of tables.

quicksighttest

Tables: contain the data you can visualize.

- qs_test

Edit/Preview data

To load your data into SPICE (p. 2), choose Import to SPICE. The green indicator shows whether or not you have space available.

Alternatively, you can choose to query your data without using SPICE. To do this, choose Directly query your data.
11. After choosing how to query your data, choose one of the following options:

- To prepare the data before creating an analysis, choose **Edit/Preview data** to begin data preparation for the selected table. For more information about data preparation, see **Preparing Data Sets** (p. 115).
- To create a data set and analyze the data using the table as-is, choose **Visualize**.

**Creating a Data Set from Salesforce**

Use the following procedure to create a data set by connecting to Salesforce and selecting a report or object to provide data.

1. Check **Data Source Limits** (p. 52) to make sure that your target report or object doesn't exceed data source limits.
2. On the Amazon QuickSight start page, choose **Manage data**.
3. On the **Your Data Sets** page, choose **New data set**.
4. In the **FROM NEW DATA SOURCES** section of the **Create a Data Set** page, choose the **Salesforce** icon.
5. Type a name for the data source and then choose **Create data source**.

   ![New Salesforce data source](image)

6. On the Salesforce login page, enter your Salesforce credentials.
7. For **Data elements: contain your data**, choose **Select** and then choose either **REPORT** or **OBJECT**.

   **Note**
   Joined reports aren't supported as Amazon QuickSight data sources.
8. Choose one of the following options:

- To prepare the data before creating an analysis, choose **Edit/Preview data** to open data preparation. For more information about data preparation, see Preparing Data Sets (p. 115).

- Otherwise, choose a report or object and then choose **Select**.

9. Choose one of the following options:

- To create a data set and an analysis using the data as-is, choose **Visualize**.
Creating Data Sets

Note
If you don't have enough SPICE (p. 2) capacity, choose Edit/Preview data. In data preparation, you can remove fields from the data set to decrease its size or apply a filter that reduces the number of rows returned. For more information about data preparation, see Preparing Data Sets (p. 115).

Creating Data Sets from New Database Data Sources

You can use a variety of database data sources to provide data to Amazon QuickSight. This includes Amazon RDS instances and Amazon Redshift clusters. It also includes MariaDB, Microsoft SQL Server, MySQL, and PostgreSQL instances in your organization, Amazon EC2, or similar environments.

When creating a new database data set, you can select one table, join several tables, or create a SQL query to retrieve the data that you want. You can also change whether the data set uses a direct query or instead stores data in SPICE (p. 2).

When you create a data set based on an AWS service like Amazon RDS, Amazon Redshift, or Amazon EC2, data transfer charges might apply when consuming data from that source. Those charges might also vary depending on whether that AWS resource is in the home AWS Region that you chose for your Amazon QuickSight account. For details on pricing, see the pricing page for the service in question.

Topics
- Required Permissions for Database Credentials (p. 81)
- Network and Database Configuration Requirements (p. 82)
- Creating a Data Set from a Database (p. 85)

Required Permissions for Database Credentials

To connect to a database, you must provide a user name and password. The user account identified by these credentials must have SELECT permissions on some system tables in order to allow Amazon QuickSight to do things like discover table schemas and estimate table size.

The following table identifies the tables that the user account must have SELECT permissions on, depending on the type of database you are connecting to. These requirements apply for all database instances you connect to, regardless of their environment—that is, whether they are on-premises, in Amazon RDS, in Amazon EC2, or elsewhere.
### Instance Type

### Network and Database Configuration Requirements

To serve as data sources, databases need to be configured so that Amazon QuickSight can access them. Use the following sections to make sure that your database is configured appropriately.

**Important**

Because a database instance on Amazon EC2 is administered by you rather than AWS, it must meet both the Network Configuration Requirements (p. 82) as well as the Database Configuration Requirements for Self-Administered Instances (p. 85).

### Network Configuration Requirements

To be usable from Amazon QuickSight, a database server must be accessible from the internet. It must also allow inbound traffic from Amazon QuickSight servers.

If the database is on AWS and in the same AWS Region as your Amazon QuickSight account, you can auto-discover the instance to make connecting to it easier. To do this, you must grant Amazon QuickSight permissions to access it. For more information, see Managing Amazon QuickSight Permissions to AWS Resources (p. 475).

**Network Configuration for an AWS Instance in a Default VPC**

In some cases, your database might be on an AWS cluster or instance that you created in a default VPC and so is publicly accessible (that is, you didn't choose to make private). In such cases, your database is already appropriately configured to be accessible from the internet. However, you still need to enable access from Amazon QuickSight servers to your AWS cluster or instance. For further details on how to do this, choose the appropriate topic following:

- Authorizing Connections from Amazon QuickSight to Amazon RDS DB Instances (p. 460)
- Authorizing Connections from Amazon QuickSight to Amazon Redshift Clusters (p. 464)

---

**Note**

If you are using MySQL or PostgreSQL, verify that you are connecting from an allowed host or IP address. For more detail, see Database Configuration Requirements for Self-Administered Instances (p. 85).
Network Configuration for an AWS Instance in a Non-Default VPC

If you are configuring an AWS instance in a non-default VPC, make sure that the instance is publicly accessible and that the VPC has the following:

- An internet gateway.
- A public subnet.
- A route in the route table between the internet gateway and the AWS instance.
- Network access control lists (ACLs) in your VPC that allow traffic between the cluster or instance and Amazon QuickSight servers. These ACLs must do the following:
  - Allow inbound traffic from the appropriate Amazon QuickSight IP address range and all ports to the IP address and port that the database is listening on.
  - Allow outbound traffic from the database’s IP address and port to the appropriate Amazon QuickSight IP address range and all ports.

For more information about Amazon QuickSight IP address ranges, see IP Address Ranges for Amazon QuickSight (p. 85) following.

For more information about configuring VPC ACLs, see Network ACLs.

- Security group rules that allow traffic between the cluster or instance and Amazon QuickSight servers. For further details on how to create appropriate security group rules, see Authorizing Connections from Amazon QuickSight to AWS Data Stores (p. 459).

For more information about configuring a VPC in the Amazon VPC service, see Networking in Your VPC.

Network Configuration for an AWS Instance in a Private VPC

If your database is on an AWS cluster or instance that you created in a private VPC, you can use it with Amazon QuickSight. For more information, see Working with Amazon VPC (p. 482).

For more information on Amazon Virtual Private Cloud, see Amazon VPC and Amazon VPC Documentation.

Network Configuration for an AWS Instance That is Not in a VPC

If you are configuring an AWS instance that is not in a VPC, make sure that the instance is publicly accessible. Also, make sure that there is a security group rule that allows traffic between the cluster or instance and Amazon QuickSight servers. For further details on how to do this, choose the appropriate topic following:

- Authorizing Connections from Amazon QuickSight to Amazon RDS DB Instances (p. 460)
- Authorizing Connections from Amazon QuickSight to Amazon Redshift Clusters (p. 464)
- Authorizing Connections from Amazon QuickSight to Amazon EC2 Instances (p. 471)

Network Configuration for a Non-AWS Database Instance

If you want to use SSL to secure your connections to your database (recommended), make sure that you have a certificate signed by a recognized certificate authority (CA). Amazon QuickSight doesn’t accept certificates that are self-signed or issued from a non-public CA. For more information, see Amazon QuickSight SSL and CA Certificates (p. 84).

If your database is on a non-AWS server, you must change that server’s firewall configuration to accept traffic from the appropriate Amazon QuickSight IP address range. For more information about Amazon
QuickSight IP address ranges, see IP Address Ranges for Amazon QuickSight (p. 85). Refer to your operating system documentation for any other steps you need to take to enable internet connectivity.

Amazon QuickSight SSL and CA Certificates

Following is a list of accepted public Certificate Authorities. If you are using a non-AWS database instance, your certificate must be on this list, or it won't work.

- AAA Certificate Services
- AddTrust Class 1 CA Root
- AddTrust External CA Root
- AddTrust Qualified CA Root
- AffirmTrust Commercial
- AffirmTrust Networking
- AffirmTrust Premium
- AffirmTrust Premium ECC
- America Online Root Certification Authority 1
- America Online Root Certification Authority 2
- Baltimore CyberTrust Code Signing Root
- Baltimore CyberTrust Root
- Buypass Class 2 Root CA
- Buypass Class 3 Root CA
- Certum CA
- Certum Trusted Network CA
- Chambers of Commerce Root
- Chambers of Commerce Root - 2008
- Class 2 Primary CA
- Class 3P Primary CA
- Deutsche Telekom Root CA 2
- DigiCert Assured ID Root CA
- DigiCert Global Root CA
- DigiCert High Assurance EV Root CA
- Entrust.net Certification Authority (2048)
- Entrust Root Certification Authority
- Entrust Root Certification Authority - G2
- Equifax Secure eBusiness CA-1
- Equifax Secure Global eBusiness CA-1
- GeoTrust Global CA
- GeoTrust Primary Certification Authority
- GeoTrust Primary Certification Authority - G2
- GeoTrust Primary Certification Authority - G3
- QuoVadis Root CA 2
- QuoVadis Root CA 3
- QuoVadis Root Certification Authority
- SecureTrust CA
- Sonera Class1 CA
- Sonera Class2 CA
- Starfield Root Certificate Authority - G2
- Starfield Services Root Certificate Authority - G2
- SwissSign Gold CA - G2
- SwissSign Platinum CA - G2
- SwissSign Silver CA - G2
- TC TrustCenter Class 2 CA II
- TC TrustCenter Class 4 CA II
- TC TrustCenter Universal CA I
- Thawte Personal Freemail CA
- Thawte Premium Server CA
- thawte Primary Root CA
- thawte Primary Root CA - G2
- thawte Primary Root CA - G3
- Thawte Server CA
- Thawte Timestamping CA
- T-TeleSec GlobalRoot Class 2
- T-TeleSec GlobalRoot Class 3
- UTN - DATACorp SGC
- UTN-USERFirst-Client Authentication and Email
- UTN-USERFirst-Hardware
- UTN-USERFirst-Object
- Valicert
- VeriSign Class 1 Public Primary Certification Authority - G3
- VeriSign Class 2 Public Primary Certification Authority - G3
- VeriSign Class 3 Public Primary Certification Authority - G3
- VeriSign Class 3 Public Primary Certification Authority - G4
- VeriSign Class 3 Public Primary Certification Authority - G5
- VeriSign Class 3 Public Primary Certification Authority - G5
Creating Data Sets

- GeoTrust Universal CA
- Global Chambersign Root - 2008
- GlobalSign
- GlobalSign Root CA
- Go Daddy Root Certificate Authority - G2
- GTE CyberTrust Global Root
- KEYNECTIS ROOT CA
- VeriSign Universal Root Certification Authority
- XRamp Global Certification Authority

IP Address Ranges for Amazon QuickSight

For more information on the IP address ranges for Amazon QuickSight in supported regions, see AWS Regions and IP Address Ranges (p. 416).

Database Configuration Requirements for Self-Administered Instances

For a database to be accessible to Amazon QuickSight, it must meet the following criteria:

- It must be accessible from the internet. To enable internet connectivity, see your database management system documentation.
- It must be configured to accept connections and authenticate access using the user credentials that you provide as part of creating the data set.
- If you are connecting to MySQL or PostgreSQL, the database engine must be accessible from your host or IP range. This optional security limitation is specified in MySQL or PostgreSQL connection settings. If this limitation is in place, any attempt to connect from a nonspecified host or IP address is rejected, even if you have the correct user name and password.
- In MySQL, the server accepts the connection only if the user and host are verified in the user table. For more information, see Access Control, Stage 1: Connection Verification in the MySQL documentation.
- In PostgreSQL, you must control client authentication by using the pg_hba.conf file in the database cluster's data directory, although this file might be named and located differently on your system. For more information, see Client Authentication in the PostgreSQL documentation.

Creating a Data Set from a Database

The following procedures walk you through connecting to database data sources and creating data sets. Use Creating a Data Set from an Autodiscovered Amazon Redshift Cluster or Amazon RDS Instance (p. 85) to create data sets from AWS data sources that your Amazon QuickSight account autodiscovered, or use Creating a Data Set Using a Database That's Not Autodiscovered (p. 88) to create data sets from any other database data sources.

Creating a Data Set from an Autodiscovered Amazon Redshift Cluster or Amazon RDS Instance

Use the following procedure to create a connection to an autodiscovered AWS data source.

1. Check Data Source Limits (p. 52) to make sure that your target table or query doesn't exceed data source limits.
2. Confirm that the database credentials you plan to use have appropriate permissions as described in Required Permissions for Database Credentials (p. 81).
3. Make sure that you have configured the cluster or instance for Amazon QuickSight access by following the instructions in Network and Database Configuration Requirements (p. 82).
4. On the Amazon QuickSight start page, choose Manage data.
5. On the Your Data Sets page, choose New data set.
6. In the **FROM NEW DATA SOURCES** section of the **Create a Data Set** page, choose either the **RDS** or the **Redshift Auto-discovered** icon, depending on the AWS service you want to connect to.

7. Enter the connection information for the data source, as follows:
   - For **Data source name**, type a name for the data source.
   - For **Instance ID**, choose the name of the instance or cluster you want to connect to.
   - **Database name** shows the default database for the **Instance ID** cluster or instance. If you want to use a different database on that cluster or instance, type its name.
   - For **UserName**, type the user name of an account that has permissions to access the target database and also to read (perform a SELECT statement on) any tables in that database that you want to use.
   - For **Password**, type the password associated with the user account you entered.

8. Choose **Validate connection** to verify your connection information is correct.

9. If the connection validates, choose **Create data source**. If not, correct the connection information and try validating again.

   **Note**
   Amazon QuickSight automatically secures connections to Amazon RDS instances and Amazon Redshift clusters by using Secure Sockets Layer (SSL). You don't need to do anything to enable this.

10. Choose one of the following:
   - **Custom SQL**
     
     On the next screen, you can choose to write a query with the **Use custom SQL** option. Doing this opens a screen named **Enter custom SQL query**, where you can type a name for your query, and then enter the SQL. For best results, compose the query in a SQL editor, and then paste it into this window. After you name and enter the query, you can choose **Edit/Preview data** or **Confirm query**. Choose **Edit/Preview data** to immediately go to data preparation. Choose **Confirm query** to validate the SQL and make sure that there are no errors.
   - **Choose tables**
     
     If you prefer to connect to specific tables, for **Schema: contain sets of tables**, choose **Select** and then choose a schema. In some cases where there is only a single schema in the database, that schema is automatically chosen, and the schema selection option isn't displayed.
     
     To prepare the data before creating an analysis, choose **Edit/Preview data** to open data preparation. Use this option if you want to join to more tables.
     
     Otherwise, after choosing a table, choose **Select**.

11. Choose one of the following options:
   - To prepare the data before creating an analysis, choose **Edit/Preview data** to open data preparation for the selected table. For more information about data preparation, see **Preparing Data Sets** (p. 115).
   - To create a data set and analysis using the table data as-is, and to import the data set data into SPICE for improved performance (recommended), check the table size and the SPICE indicator to see if you have enough capacity.
If you have enough SPICE capacity, choose **Import to SPICE for quicker analytics**, and then create an analysis by choosing **Visualize**.

**Note**
If you want to use SPICE and you don't have enough space, choose **Edit/Preview data**. In data preparation, you can remove fields from the data set to decrease its size, apply a filter, or write a SQL query that reduces the number of rows or columns returned. For more information about data preparation, see [Preparing Data Sets](#) (p. 115).

- To create a data set and an analysis using the table data as-is, and to have the data queried directly from the database, choose the **Directly query your data** option, and then create an analysis by choosing **Visualize**.
Creating a Data Set Using a Database That's Not Autodiscovered

Use the following procedure to create a connection to any database other than an autodiscovered Amazon Redshift cluster or Amazon RDS instance. Such databases include Amazon Redshift clusters and Amazon RDS instances that are in a different AWS Region or are associated with a different AWS account. They also include MariaDB, Microsoft SQL Server, MySQL, and PostgreSQL instances that are on-premises, in Amazon EC2, or in some other accessible environment.

1. Check Data Source Limits (p. 52) to make sure that your target table or query doesn't exceed data source limits.
2. Confirm that the database credentials that you plan to use have appropriate permissions as described in Required Permissions for Database Credentials (p. 81).
3. Make sure that you have configured the cluster or instance for Amazon QuickSight access by following the instructions in Network and Database Configuration Requirements (p. 82).
4. On the Amazon QuickSight start page, choose Manage data.
5. On the Your Data Sets page, choose New data set.
6. In the FROM NEW DATA SOURCES section of the Create a Data Set page, choose the Redshift Manual connect icon if you want to connect to an Amazon Redshift cluster in another AWS Region or associated with a different AWS account. Or, choose the appropriate database management system icon to connect to an instance of Amazon Aurora, MariaDB, Microsoft SQL Server, MySQL, or PostgreSQL.
7. Enter the connection information for the data source, as follows:
   - For Data source name, type a name for the data source.
   - For Database server, type or paste one of the following values:
     - For an Amazon Redshift cluster or Amazon RDS instance, type the endpoint of the cluster or instance without the port number. For example, if the endpoint value is clustername.1234abcd.us-west-2.redshift.amazonaws.com:1234, then type clustername.1234abcd.us-west-2.redshift.amazonaws.com. You can get the endpoint value from the Endpoint field on the cluster or instance detail page in the AWS console.
     - For an Amazon EC2 instance of MariaDB, Microsoft SQL Server, MySQL, or PostgreSQL, type the public DNS. You can get the public DNS value from the Public DNS field on the instance detail pane in the Amazon EC2 console.
     - For a non-Amazon EC2 instance of MariaDB, Microsoft SQL Server, MySQL, or PostgreSQL, type the hostname or public IP address of the database server. If you are using Secure Sockets Layer (SSL) for a secured connection (recommended), you likely need to provide the hostname to match the information required by the SSL certificate. For a list of accepted certificates see Amazon QuickSight SSL and CA Certificates (p. 84).
   - For Port, type the port that the cluster or instance uses for connections.
   - For Database name, type the name of the database that you want to use.
   - For UserName, type the user name of an account that has permissions to access the target database and also to read (perform a SELECT statement on) any tables in that database that you want to use.
   - For Password, type the password associated with the user account you entered.
8. (Optional) If you are connecting to anything other than an Amazon Redshift cluster and you don’t want a secured connection, make sure that Enable SSL is clear. We strongly recommend leaving this checked, as an unsecured connection can be open to tampering.

For more information on how the target instance uses SSL to secure connections, see the documentation for the target database management system. Amazon QuickSight doesn’t accept self-signed SSL certificates as valid. For a list of accepted certificates, see Amazon QuickSight SSL and CA Certificates (p. 84).
Amazon QuickSight automatically secures connections to Amazon Redshift clusters by using SSL. You don't need to do anything to enable this.

Some databases, such as Presto and Apache Spark, must meet additional requirements before Amazon QuickSight can connect. For more information, see Creating a Data Source Using Presto (p. 62), or Creating a Data Source Using Apache Spark (p. 62).

9. (Optional) Choose **Validate connection** to verify your connection information is correct.

10. If the connection validates, choose **Create data source**. If not, correct the connection information and try validating again.

11. Choose one of the following:
   - **Custom SQL**
     
     On the next screen, you can choose to write a query with the **Use custom SQL** option. Doing this opens a screen named **Enter custom SQL query**, where you can type a name for your query, and then enter the SQL. For best results, compose the query in a SQL editor, and then paste it into this window. After you name and enter the query, you can choose **Edit/Preview data** or **Confirm query**. Choose **Edit/Preview data** to immediately go to data preparation. Choose **Confirm query** to validate the SQL and make sure that there are no errors.
   - **Choose tables**
     
     If you prefer to connect to specific tables, for **Schema: contain sets of tables**, choose **Select** and then choose a schema. In some cases where there is only a single schema in the database, that schema is automatically chosen, and the schema selection option isn't displayed.

     To prepare the data before creating an analysis, choose **Edit/Preview data** to open data preparation. Use this option if you want to join to more tables.

     Otherwise, after choosing a table, choose **Select**.

12. Choose one of the following options:
   - To prepare the data before creating an analysis, choose **Edit/Preview data** to open data preparation for the selected table. For more information about data preparation, see Preparing Data Sets (p. 115).
   - To create a data set and an analysis using the table data as-is, and to import the data set data into SPICE for improved performance (recommended), check the table size and the SPICE indicator to see if you have enough space.

![Image of data set creation]

If you have enough SPICE capacity, choose **Import to SPICE for quicker analytics**, and then create an analysis by choosing **Visualize**.
Note
If you want to use SPICE and you don't have enough space, choose Edit/Preview data. In data preparation, you can remove fields from the data set to decrease its size, apply a filter, or write a SQL query that reduces the number of rows or columns returned. For more information about data preparation, see Preparing Data Sets (p. 115).

To create a data set and an analysis using the table data as-is, and to have the data queried directly from the database, choose the Directly query your data option, and then create an analysis by choosing Visualize.

Creating a Data Set Using an Existing Data Source

After you make an initial connection to a Salesforce, AWS data store, or other database data source, Amazon QuickSight saves the connection information and adds the data source to the FROM EXISTING DATA SOURCES section of the Create a Data Set page. You can use these existing data sources to create new data sets without re-specifying connection information.

Creating a Data Set Using an Existing Amazon S3 Data Source

Use the following procedure to create a data set using an existing Amazon S3 data source.

1. On the Amazon QuickSight start page, choose Manage data.
2. On the Your Data Sets page, choose New data set.
3. In the FROM EXISTING DATA SOURCES section of the Create a Data Set page, choose the Amazon S3 data source to use.
4. To prepare the data before creating the data set, choose **Edit/Preview data**, to create an analysis using the data as-is, choose **Visualize**.

**Creating a Data Set Using an Existing Amazon Athena Data Source**

If you want to create a data set using an existing Amazon Athena data source, use the following procedure.

To create a data set using an existing Amazon Athena data source

1. On the Amazon QuickSight start page, choose **Manage data**.
2. On the **Your Data Sets** page, choose **New data set**.
3. In the **FROM EXISTING DATA SOURCES** section of the **Create a Data Set** page, choose the Athena data source to use.
4. Choose **Create data set**.
5. Choose one of the following:
   - **Custom SQL**
     
     On the next screen, you can choose to write a query with the **Use custom SQL** option. Doing this opens a screen named **Enter custom SQL query**, where you can type a name for your query, and then enter the SQL. For best results, compose the query in a SQL editor, and then paste it into this window. After you name and enter the query, you can choose **Edit/Preview data** or **Confirm query**. Choose **Edit/Preview data** to immediately go to data preparation. Choose **Confirm query** to validate the SQL and make sure that there are no errors.
   - **Choose tables**

     If you prefer to connect to specific tables, for **Schema: contain sets of tables**, choose **Select** and then choose a schema. In some cases where there is only a single schema in the database, that schema is automatically chosen, and the schema selection option isn't displayed.

     To prepare the data before creating an analysis, choose **Edit/Preview data** to open data preparation. Use this option if you want to join to more tables.

     Otherwise, after choosing a table, choose **Select**.

6. If you didn't choose to prepare the data in the previous step, the following screen appears.
To load your data into SPICE (p. 2), choose Import to SPICE. The green indicator shows whether or not you have space available.

Alternatively, you can choose to query your data without using SPICE. To do this, choose Directly query your data.

7. After choosing how to query your data, choose one of the following options:

- To prepare the data before creating an analysis, choose Edit/Preview data to begin data preparation for the selected table. For more information about data preparation, see Preparing Data Sets (p. 115).
- To create a data set and analyze the data using the table as-is, choose Visualize.

Create a Data Set Using an Existing Salesforce Data Source

Use the following procedure to create a data set using an existing Salesforce data source.

1. On the Amazon QuickSight start page, choose Manage data.
2. On the Your Data Sets page, choose New data set.
3. In the FROM EXISTING DATA SOURCES section of the Create a Data Set page, choose the Salesforce data source to use.
4. Choose Create Data Set.
5. Choose one of the following:

   - Custom SQL

     On the next screen, you can choose to write a query with the Use custom SQL option. Doing this opens a screen named Enter custom SQL query, where you can type a name for your query, and then enter the SQL. For best results, compose the query in a SQL editor, and then paste it into this window. After you name and enter the query, you can choose Edit/Preview data or Confirm query. Choose Edit/Preview data to immediately go to data preparation. Choose Confirm query to validate the SQL and make sure that there are no errors.

   - Choose tables

     If you prefer to connect to specific tables, for Data elements: contain your data, choose Select and then choose either REPORT or OBJECT.

     To prepare the data before creating an analysis, choose Edit/Preview data to open data preparation. Use this option if you want to join to more tables.

     Otherwise, after choosing a table, choose Select.
6. On the next screen, choose one of the following options:

- To create a data set and an analysis using the data as-is, choose **Visualize**.

  **Note**
  
  If you don't have enough SPICE (p. 2) capacity, choose **Edit/Preview data**. In data preparation, you can remove fields from the data set to decrease its size or apply a filter that reduces the number of rows returned. For more information about data preparation, see **Preparing Data Sets (p. 115)**.

- To prepare the data before creating an analysis, choose **Edit/Preview data** to open data preparation for the selected report or object. For more information about data preparation, see **Preparing Data Sets (p. 115)**.
Creating a Data Set Using an Existing Database Data Source

Use the following procedure to create a data set using an existing database data source.

1. On the Amazon QuickSight start page, choose Manage data.
2. On the Your Data Sets page, choose New data set.
3. In the FROM EXISTING DATA SOURCES section of the Create a Data Set page, choose the database data source to use, and then choose Create Data Set.
4. Choose one of the following:
   - Custom SQL
     On the next screen, you can choose to write a query with the Use custom SQL option. Doing this opens a screen named Enter custom SQL query, where you can type a name for your query, and then enter the SQL. For best results, compose the query in a SQL editor, and then paste it into this window. After you name and enter the query, you can choose Edit/Preview data or Confirm query. Choose Edit/Preview data to immediately go to data preparation. Choose Confirm query to validate the SQL and make sure that there are no errors.
   - Choose tables
     If you prefer to connect to specific tables, for Schema: contain sets of tables, choose Select and then choose a schema. In some cases where there is only a single schema in the database, that schema is automatically chosen, and the schema selection option isn't displayed.

To prepare the data before creating an analysis, choose Edit/Preview data to open data preparation. Use this option if you want to join to more tables.

Otherwise, after choosing a table, choose Select.

5. Choose one of the following options:
   - To prepare the data before creating an analysis, choose Edit/Preview data to open data preparation for the selected table. For more information about data preparation, see Preparing Data Sets (p. 115).
   - To create a data set and an analysis using the table data as-is, and to import the data set data into SPICE (p. 2) for improved performance (recommended), check the SPICE indicator to see if you have enough space.

![Finish data set creation](image)

If you have enough SPICE capacity, choose Import to SPICE for quicker analytics, and then create an analysis by choosing Visualize.

**Note**
If you want to use SPICE and you don't have enough space, choose Edit/Preview data. In data preparation, you can remove fields from the data set to decrease its size, apply
a filter, or write a SQL query that reduces the number of rows or columns returned. For more information about data preparation, see Preparing Data Sets (p. 115).

- To create a data set and an analysis using the table data as-is, and to have the data queried directly from the database, choose the Directly query your data option, and then create an analysis by choosing Visualize.

Editing a Data Set

You can edit an existing data set to perform data preparation. For more information about Amazon QuickSight data preparation functionality, see Preparing Data (p. 115).

You can open a data set for editing from the Your Data Sets page, or from the analysis page. Editing a data set from either location modifies the data set for all analyses that use it.

Editing a Data Set from the Your Data Sets Page

To edit a data set from the Your Data Sets page, choose the data set, and then choose Edit Data Set. The data set opens in the data preparation page.
If you want to create a copy of the data set, choose **Duplicate data set**, and type a name for the copy.

### Editing a Data Set from the Analysis Page

Use the following procedure to edit a data set from the analysis page.

1. On the analysis page, choose the data set list at the top of the *Fields list* pane and then choose **Edit analysis data sets.**

2. In **Data sets in this analysis**, choose the data set you want to edit, and then choose **Edit**. The data set opens in the data preparation page.
Duplicating a Data Set

You can duplicate an existing data set to save a copy of it with a new name. The new data set is a completely separate copy.

If you want to create a copy of the data set, open the Your Data Sets page and choose the data set that you want to make a copy of. Then choose Duplicate data set, and type a name for the copy.

Refreshing Data

You can refresh your SPICE (p. 2) data sets at any time. Refreshing imports the data into SPICE again, so the data includes any changes since the last import.

You can refresh SPICE data by taking any of the following approaches:

- You can use the options on the Your Data Sets page.
- You can refresh a data set during data preparation.
- You can schedule refreshes of the data.
In the following sections, you can find an explanation of each approach.

**Topics**
- Refreshing a Data Set from the Your Data Sets Page (p. 98)
- Refreshing a Data Set During Data Preparation (p. 99)
- Refreshing a Data Set on a Schedule (p. 101)

For data that is not stored in SPICE, you can do the following:
- To refresh file-based data, you must delete and recreate the data set.
- To refresh data from a database, reopen your data set or the visualization you created.

**Refreshing a Data Set from the Your Data Sets Page**

Use the following procedure to refresh a SPICE (p. 2) data set based on an Amazon S3 or database data source on the Your Data Sets page.

**To refresh SPICE data from the Your Data Sets page**

1. On the **Your Data Sets** page, choose the data set, and then choose **Refresh Now**.

2. Leave the refresh type as **Full refresh**.

3. If you are refreshing an Amazon S3 data set, choose one of the following options for **S3 Manifest**: 
   - **Refresh Now**
   - **Schedule refresh**

4. If refreshing from a database, reopen your data set or the visualization you created.
• To use the same manifest file you last provided to Amazon QuickSight, choose Existing Manifest. If you have changed the manifest file at the file location or URL that you last provided, the data returned reflects those changes.

• To specify a new manifest file by uploading it from your local network, choose Upload Manifest, and then choose Upload manifest file. For Open, choose a file, and then choose Open.

• To specify a new manifest file by providing a URL, type the URL of the manifest in Input manifest URL. You can find the manifest file URL in the Amazon S3 console by opening the context (right-click) menu for the manifest file, choosing Properties, and looking at the Link box.

5. If you are refreshing an Amazon S3 data set, choose OK, then OK again.

If you are refreshing a database data set, choose OK.

Refresh a Data Set During Data Preparation

Use the following procedure to refresh a SPICE (p. 2) data set based on an Amazon S3 or database data source during data preparation.

To refresh SPICE data during data preparation

1. On the Your Data Sets page, choose the data set, and then choose Edit Data Set.
2. On the pane, choose **Refresh now**.

3. Leave the refresh type as **Full refresh**.

4. If you are refreshing an Amazon S3 data set, choose one of the following options for **S3 Manifest**:
   - To use the same manifest file you last provided to Amazon QuickSight, choose **Existing Manifest**. If you have changed the manifest file at the file location or URL that you last provided, the data returned reflects those changes.
   - To specify a new manifest file by uploading it from your local network, choose **Upload Manifest**, and then choose **Upload manifest file**. For **Open**, choose a file, and then choose **Open**.
   - To specify a new manifest file by providing a URL, type the URL of the manifest in **Input manifest URL**. You can find the manifest file URL in the Amazon S3 console by opening the context (right-click) menu for the manifest file, choosing **Properties**, and looking at the **Link** box.

5. Choose **Refresh**.
6. If you are refreshing an Amazon S3 data set, choose OK, then OK again.

   If you are refreshing a database data set, choose OK.

Refreshing a Data Set on a Schedule

Use the following procedure to schedule refreshing the data. If your data set is based on a direct query and not stored in SPICE (p. 2), you can refresh your data by opening the data set or refreshing the page in an analysis or dashboard.

To refresh **SPICE (p. 2)** data on a schedule

1. On the **Your Data Sets** page, choose the data set, and then choose **Schedule refresh**.

   ![Sales Pipeline](image)

   a. **Time zone**: Choose the time zone that applies to the data refresh.

   b. For **Repeats**: Choose one of the following:

      - For Standard or Enterprise editions, you can choose **Daily**, **Weekly**, or **Monthly**.

2. For **Schedule Refresh**, choose **Create**.

   ![Schedule Refresh](image)

3. On the **Create a Schedule** screen, choose settings for your schedule.

   a. **Time zone**: Choose the time zone that applies to the data refresh.

   b. For **Repeats**: Choose one of the following:

      - For Standard or Enterprise editions, you can choose **Daily**, **Weekly**, or **Monthly**.
• **Daily**: Repeats every day
• **Weekly**: Repeats on the same day of each week
• **Monthly**: Repeats on the same day number of each month. To refresh data on the 29th, 30th or 31st day of the month, choose **Last day of month** from the list.

For Enterprise edition only, you can choose **Hourly**. This setting refreshes your data set every hour, beginning at the time you choose. So, if you select 1:05 as the starting time, the data refreshes at five minutes after the hour, every hour.

If you decide to use an hourly refresh, you can't also use additional refresh schedules. To create an hourly schedule you must remove any other existing schedules for that data set; and you must remove any existing hourly schedule before you can create a daily, weekly, or monthly schedule.

c. **Starting**: Choose a date for the refresh to start.

d. **At**: Specify the time that the refresh should start. Use HH:MM and 24-hour format, for example 13:30.

4. Choose **Create**.

You can create five schedules for each data set. When you have created five, the **Create** button is disabled.

**Changing a Data Set**

In two situations, changes to a data set might cause concern. One is if you deliberately edit the data set. The other is if your data source has changed so much that it affects the analyses based on it.
Important
Analyses that are in production usage should be protected so they continue to function correctly.

We recommend the following when you're dealing with data changes:

- Document your data sources and data sets, and the visuals that rely upon them. Documentation should include screenshots, fields used, placement in field wells, filters, sorts, calculations, colors, formatting, and so on. Record everything that you need to recreate the visual.
- When you edit a data set, try not to make changes that might break existing visuals. For example, don't remove columns that are being used in a visual. If you must remove a column, create a calculated column in its place. The replacement column should have the same name and data type as the original.
- If your data source or data set changes in your source database, adapt your visual to accommodate the change, as described previously. Or you can try to adapt the source database. For example, you might create a view of the source table (document). Then if the table changes, you can adjust the view to include or exclude columns (attributes), change data types, fill null values, and so on. Or, in another circumstance, if your data set is based on a slow SQL query, you might create a table to hold the results of the query.

If you can't sufficiently adapt the source of the data, recreate the visuals based on your documentation of the analysis.

- If you no longer have access to a data source, your analyses based on that source are empty. The visuals you created still exist, but they can't display until they have some data to show. This result can happen if permissions are changed by your administrator.

- If you remove the data set a visual is based on, you might need to recreate it from your documentation. You can edit the visual and select a new data set to use with it. If you need to consistently use a new file to replace an older one, store your data in a location that is consistently available. For example, you might store your .csv file in S3 and create an S3 data set to use for your visuals. For more information on access files stored in S3, see Creating a Data Set Using Amazon S3 Files (p. 68).

Alternatively, you can import the data into a table, and base your visual on a query. This way, the data structures don't change, even if the data contained in them changes.

Sharing Data Sets

You can give other Amazon QuickSight users and groups access to a data set by sharing it with them. Then they can create analyses from it. If you make them co-owners, they can also refresh, edit, delete, or reshare the data set.

Sharing a Data Set

Use the following procedure to share a data set.

1. On the Your Data Sets page, choose the data set, and then choose Share (if this data set hasn't been shared with anyone) or Shared with <X> users (if the data set has been shared with others).
2. Choose **Invite Users**.

3. Type in user or group you want to share this data set with. Then choose the add icon. You can only invite users who belong to the same Amazon QuickSight account.

   Repeat this step until you have entered information for everyone you want to share the data set with.
4. For **Permission**, choose the role for each user or group, to give them permissions on the data set.

Choose **User** to allow the user to create analyses from the data set. Choose **Owner** to allow the user to do that and also refresh, edit, delete, and re-share the data set.

5. Choose **Share**.

Users receive emails with a link to the data set. Groups don't receive invitation emails.
Viewing and Editing the Permissions of Users That a Data Set Is Shared With

If you have Owner permissions on a data set, you can use the following procedure to view, edit, or change user access to it.

1. On the Your Data Sets page, choose the data set, and then choose Share (if this data set hasn't been shared with anyone) or Shared with <X> users (if the data set has been shared with others).

A list of all users with access to the data set is displayed.

2. (Optional) To change roles, choose the field in the Permission column next to the user or group. Then choose either User or Owner.
Revoking Access to a Data Set

If you have Owner permissions on a data set, you can use the following procedure to revoke user access to a data set.

1. On the **Your Data Sets** page, choose the data set, and then choose **Share** (if this data set hasn't been shared with anyone) or **Shared with <X> users** (if the data set has been shared with others).

A list of all users with access to the data set is displayed.
2. In the **Actions** column for the user, choose **Revoke access**.

**Restricting Access to a Data Set by Using Row-Level Security**

In the Enterprise edition of Amazon QuickSight, you can restrict access to a data set by configuring row-level security on it. You can do this before or after you have shared the data set. Only the users you shared with can see any of the data. By adding row-level security to all or some of these users, you can further control their access.

To do this, you create a query or file that has one column named `UserName`. You can also think of this as *adding a rule* for that user. Then you can add one column to the query or file for each field that you want to grant or restrict access to. For each user name that you add, you add the values for each field. You can use NULL (no value) to mean all values. To see examples of data set rules, see Creating Data Set Rules for Row-Level Security (p. 109).
To apply the data set rules, you add the rules as a permissions data set to your data set. Then you choose to explicitly allow or deny access based on the data set rules. Allowing access is the default. Keep in mind these points when you allow and deny access.

- **If you use the rules to grant access**, each user specified can see only the rows that match the field values in the data set rules.

  If you add a rule for a user, and leave all the other columns with no value (NULL), you grant that user access to all the data.

  If you don’t add a rule for a user, that user can’t see any of the data.

- **If you use the rules to deny access**, each user specified can see only the rows that don’t match the field values in the data set rules.

  If you add a rule for a user, and leave all the other columns with no value (NULL), you deny that user access to all the data.

  If you don’t add a rule for a user, the user is denied nothing — in other words, that user can see all the data.

Amazon QuickSight treats spaces as literal values. So, if you have a space in a field that you are restricting, the data set rule applies to those rows. Amazon QuickSight treats both NULLs and blanks (empty strings “” ) as “no value”. A NULL is an empty field value.

You can upload data set rules from a text file or spreadsheet. Alternatively, depending on what data source your data set is coming from, you can configure a direct query to access a table of permissions. If you use a direct query, you can easily change the query in the original data source. If you use file-based data set rules, you must apply any changes by overwriting the existing rules in the data set’s permissions settings.

Data sets that are restricted are marked with the word **REstricted** in the Your Data Sets screen.

Row-level security only works for fields containing textual data (string, char, varchar, and so on). It doesn’t currently work for dates or numeric fields.

**Creating Data Set Rules for Row-Level Security**

Use the following procedure to create a permissions files or query to use as data set rules.

1. Create a file or a query that contains the data set rules (permissions).

   It doesn’t matter what order the fields are in. However, all the fields are case-sensitive. They must exactly match the field names and values.

   The structure should look similar to the following.

<table>
<thead>
<tr>
<th>UserName</th>
<th>Region</th>
<th>Segment</th>
</tr>
</thead>
<tbody>
<tr>
<td>AlejandroRosalez</td>
<td>EMEA</td>
<td>Enterprise, SMB, Startup</td>
</tr>
<tr>
<td>MarthaRivera</td>
<td>US</td>
<td>Enterprise</td>
</tr>
<tr>
<td>NikhilJayashankar</td>
<td>US</td>
<td>SMB, Startup</td>
</tr>
<tr>
<td>PauloSantos</td>
<td>US</td>
<td>Startup</td>
</tr>
<tr>
<td>SaanviSarkar</td>
<td>APAC</td>
<td>Enterprise, SMB</td>
</tr>
</tbody>
</table>
Restricting Access to a Data Set
by Using Row-Level Security

<table>
<thead>
<tr>
<th>UserName</th>
<th>Region</th>
<th>Segment</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="mailto:sales-tps@example.com">sales-tps@example.com</a></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ZhangWei</td>
<td>APAC</td>
<td>Enterprise, Startup</td>
</tr>
</tbody>
</table>

Alternatively, if you prefer to use a .csv file, the structure should look similar to the following.

<table>
<thead>
<tr>
<th>UserName, Region, Segment</th>
</tr>
</thead>
<tbody>
<tr>
<td>AlejandroRosalez,EMEA,&quot;Enterprise,SMB,Startup&quot;</td>
</tr>
<tr>
<td>MarthaRivera,US,Enterprise</td>
</tr>
<tr>
<td>NikhilJayashankars,US,SMB</td>
</tr>
<tr>
<td>PauloSantos,US,Startup</td>
</tr>
<tr>
<td>SaanviSarkar,APAC,&quot;SMB,Startup&quot;</td>
</tr>
<tr>
<td><a href="mailto:sales-tps@example.com">sales-tps@example.com</a>,&quot;&quot;,&quot;&quot;</td>
</tr>
<tr>
<td>ZhangWei,APAC,&quot;Enterprise,Startup&quot;</td>
</tr>
</tbody>
</table>

Following is a SQL example.

```sql
select User as UserName, Region, Segment
from tps-permissions
```

2. Create a data set for the data set rules. To make sure you can easily find it, give it a meaningful name, for example “Permissions-Sales-Pipeline”.

Creating Row-Level Security

Use the following procedure to apply row-level permissions by using a file or query that contains data set rules.

1. Confirm that you have added your rules as a new data set. If you added them, but don't see them under the list of data sets, refresh the screen.

2. On the **Your Data Sets** page, choose the data set, and then choose **Permissions**.
3. From the list of data sets, choose your permissions data set.
Restricting Access to a Data Set by Using Row-Level Security

4. Choose the permissions policy. There are two choices:
   - To use the data set rules to allow access to the data, choose **Grant access to data set**.
   - To use the data set rules to prevent access to the data, choose **Deny access to data set**.

Each data set has only one active permissions data set. If you try to add a second permissions data set, it overwrites the existing one.

**Important**
Some restrictions apply to NULL and empty string values when working with row-level security.
If your data set has NULL values or empty strings (""") in the restricted fields, these rows are ignored when the restrictions are applied.

Inside the permissions data set, NULL values and empty strings are treated differently. For more information, see the following table.

<table>
<thead>
<tr>
<th>Rules for UserName, Region, Segment</th>
<th>Result If You Grant Access</th>
<th>Result If You Deny Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>AlejandroRosalez, EMEA,&quot;Enterprise,&quot;SMB, &quot;Startup&quot;</td>
<td>Sees all EMEA Enterprise, SMB, and Startup</td>
<td>Doesn't see EMEA Enterprise, SMB, or Startup</td>
</tr>
<tr>
<td><a href="mailto:sales-tps@example.com">sales-tps@example.com</a>,&quot;&quot;,&quot;&quot;</td>
<td>Sees no rows</td>
<td>Sees all rows</td>
</tr>
</tbody>
</table>

Anyone you shared your dashboard with can see all the data in it, unless the data set is restricted by data set rules.

There are two ways to create a super user. If you use your permissions data set to grant access, list all possible values for each field for that user. Alternatively, if you use your permissions data set to deny access, leave the values blank for all restricted fields for that user. In either case, a user configured this way can see all values.

5. To save your changes, choose **Apply data set.** Then, on the **Confirm: saving data set rules** screen, choose **Apply data set.** Changes in permissions apply immediately to existing users.

6. (Optional) To remove permissions, first remove the data set rules from the data set.

   Make certain the data set rules are removed. Then, choose the permissions data set and choose **Remove data set.**

   To overwrite permissions, choose a new permissions data set and apply it. You can reuse the same data set name, but you need to apply the new permissions in the **Permissions** screen to make these permissions active. SQL queries dynamically update, so these can be managed outside of Amazon QuickSight. In this case, permissions refresh when the direct query cache is automatically refreshed.

If you delete a file-based permissions data set before you remove it from the target data set, restricted users can’t access the data set. While the data set is in this state, it remains marked as **RESTRICTED.** However, when you view **Permissions** for that data set, you can see that it has no selected data set rules. To fix this, you can specify new data set rules. Creating a data set with the same name is not enough to fix this. You must choose the new permissions data set in the **Permissions** screen. This restriction doesn’t apply to direct SQL queries.

### Deleting a Data Set

You can delete a data set from the **Your Data Sets** page. Choose the data set, and then choose **Delete Data Set.**
You receive a warning if you have any analyses that use the data set you have chosen for deletion. Continuing with the data set deletion does not delete the dependent analyses. The next time you open any of those analyses, you are prompted to select a new data set for any visuals that were based on the deleted data set.
Preparing Data

Data sets store any data preparation you have done on that data, so that you can reuse that prepared data in multiple analyses. Data preparation provides options such as adding calculated fields, applying filters, and changing field names or data types. If you are basing the data source on a SQL database, you can also use data preparation to join tables. Alternatively, you can enter a SQL query if you want to work with data from more than a single table.

If you want to transform the data from a data source before using it in Amazon QuickSight, you can prepare it to suit your needs and then save this preparation as part of the data set.

You can prepare a data set when you create it, or by editing it later. For more information about creating a new data set and preparing it, see Creating Data Sets (p. 66). For more information about opening an existing data set for data preparation, see Editing a Data Set (p. 95).

Use the following topics to learn more about data preparation.

Topics

- Preparing Data Sets (p. 115)
- Choosing File Upload Settings (p. 125)
- Joining Tables (p. 126)
- Using a SQL Query (p. 133)
- Selecting Fields (p. 136)
- Changing a Field Name (p. 140)
- Changing a Field Data Type (p. 141)
- Using Unsupported or Custom Dates (p. 142)
- Working with Calculated Fields (p. 143)
- Adding a Filter (p. 149)
- Adding Geospatial Data (p. 165)

Preparing Data Sets

You can prepare data in any data set to make it more suitable for analysis, for example changing a field name or adding a calculated field. For database data sets, you can also determine the data used by specifying a SQL query or joining two or more tables.

Use the following topics to learn how to prepare data sets.

Topics

- Preparing a Data Set Based on File Data (p. 115)
- Preparing a Data Set Based on Salesforce Data (p. 119)
- Preparing a Data Set Based on Database Data (p. 122)

Preparing a Data Set Based on File Data

Use the following procedure to prepare a data set based on text or Microsoft Excel files from either your local network or Amazon S3.
1. Open a file data set for data preparation by choosing one of the following options:
   - Create a new local file data set, and then choose **Edit/Preview data**. For more information about creating a new data set from a local text file, see *Creating a Data Set Using a Local Text File* (p. 66). For more information about creating a new data set from a Microsoft Excel file, see *Creating a Data Set Using a Microsoft Excel File* (p. 67).
   - Create a new Amazon S3 data set, and then choose **Edit/Preview data**. For more information about creating a new Amazon S3 data set using a new Amazon S3 data source, see *Creating a Data Set Using Amazon S3 Files* (p. 68). For more information about creating a new Amazon S3 data set using an existing Amazon S3 data source, see *Creating a Data Set Using an Existing Amazon S3 Data Source* (p. 90).
   - Open an existing Amazon S3, text file, or Microsoft Excel data set for editing, from either the analysis page or the **Your Data Sets** page. For more information about opening an existing data set for data preparation, see *Editing a Data Set* (p. 95).

2. (Optional) On the data preparation page, type a new name into the data set name box on the application bar.

   This name defaults to the file name for local files. For example, it defaults to **Group 1** for Amazon S3 files.

3. Review the file upload settings and correct them if necessary. For more information about file upload settings, see *Choosing File Upload Settings* (p. 125).

   **Important**

   If you want to change upload settings, make this change before you make any other changes to the data set. New upload settings cause Amazon QuickSight to reimport the file. This process overwrites all of your other changes.

4. Prepare the data by doing one or more of the following:
   - **Selecting Fields** (p. 136)
   - **Changing a Field Name** (p. 140)
   - **Changing a Field Data Type** (p. 141)
   - **Adding a Calculated Field During Data Preparation** (p. 144)
   - **Adding a Filter** (p. 149)

5. Check the **SPICE** (p. 2) indicator to see if you have enough capacity to import the data set. File data sets automatically load into SPICE. The import happens when you choose either **Save & visualize** or **Save**.

   If you don't have access to enough SPICE capacity, you can make the data set smaller by using one of the following options:
   - Apply a filter to limit the number of rows.
   - Select fields to remove from the data set.
Preparing a Data Set Based on a Microsoft Excel File

Use the following procedure to prepare a Microsoft Excel data set.

1. Open a text file data set for preparation by choosing one of the following options:
   - Create a new Microsoft Excel data set, and then choose Edit/Preview data. For more information about creating a new Excel data set, see Creating a Data Set Using a Microsoft Excel File (p. 67).
   - Open an existing Excel data set for editing. You can do this from the analysis page or the Your Data Sets page. For more information about opening an existing data set for data preparation, see Editing a Data Set (p. 95).

2. (Optional) On the data preparation page, type a name into the data set name box in the application bar. If you don't rename the data set, its name defaults to the Excel file name.

3. Review the file upload settings and correct them if necessary. For more information about file upload settings, see Choosing File Upload Settings (p. 125).

   Important
   If it's necessary to change upload settings, make this change before you make any other changes to the data set. Changing upload settings causes Amazon QuickSight to reimport the file. This process overwrites any changes you have made so far.

4. (Optional) Change the sheet selection.
5. (Optional) Change the range selection. To do this, open **Upload Settings** from the on–data set menu beneath the login name at the top right.

6. Prepare the data by doing one or more of the following:
   - Selecting Fields (p. 136)
   - Changing a Field Name (p. 140)
   - Changing a Field Data Type (p. 141)
   - Adding a Calculated Field During Data Preparation (p. 144)
   - Adding a Filter (p. 149)

7. Check the **SPICE** (p. 2) indicator to see if you have enough space to import the data set. Amazon QuickSight must import Excel data sets into SPICE. This import happens when you choose either **Save & visualize** or **Save**.

   If you don't have enough SPICE capacity, you can choose to make the data set smaller using one of the following methods:
   - Apply a filter to limit the number of rows.
   - Select fields to remove from the data set.
   - Define a smaller range of data to import.
Preparation of a Data Set Based on Salesforce Data

Use the following procedure to prepare a Salesforce data set.

1. Open a Salesforce data set for preparation by choosing one of the following options:
   - Create a new Salesforce data set and choose Edit/Preview data. For more information about creating a new Salesforce data set using a new Salesforce data source, see Creating a Data Set from Salesforce (p. 79). For more information about creating a new Salesforce data set using an existing Salesforce data source, see Create a Data Set Using an Existing Salesforce Data Source (p. 92).
   - Open an existing Salesforce data set for editing from either the analysis page or the Your Data Sets page. For more information about opening an existing data set for data preparation, see Editing a Data Set (p. 95).

2. (Optional) On the data preparation page, type a name into the data set name box in the application bar if you want to change the data set name (this defaults to the report or object name).

3. (Optional) Change the data element selection to see either reports or objects.
4. (Optional) Change the data selection to choose a different report or object.

If you have a long list in the Data pane, you can search to locate a specific item by typing a search term into the Search tables box. Any item whose name contains the search term is shown. Search is case-insensitive and wildcards are not supported. Choose the cancel icon (X) to the right of the search box to return to viewing all items.
5. Prepare the data by doing one or more of the following:

- Selecting Fields (p. 136)
- Changing a Field Name (p. 140)
- Changing a Field Data Type (p. 141)
- Adding a Calculated Field During Data Preparation (p. 144)
- Adding a Filter (p. 149)

6. Check the SPICE (p. 2) indicator to see if you have enough space to import the data set. Importing data into SPICE is required for Salesforce data sets. Importing occurs when you choose either Save & visualize or Save.

   If you don't have enough SPICE capacity, you can remove fields from the data set or apply a filter to decrease its size. For more information about adding and removing fields from a data set, see Selecting Fields (p. 136).

   **Note**
   The SPICE indicator doesn't update to reflect the potential savings of removing fields or filtering the data. It continues to reflect the size of the data set as retrieved from the data source.

7. Choose Save to save your work, or Cancel to cancel it.

   You might also see Save & visualize. This option appears based on the screen you started from. If this option isn't there, you can create a new visualization by starting from the data set screen.
Preparing a Data Set Based on Database Data

Use the following procedure to prepare a data set based on a query to a database. The data for this data set can be from an AWS database data source like Amazon Athena, Amazon RDS, or Amazon Redshift, or from an external database instance. You can choose whether to import a copy of your data into SPICE (p. 2), or to query the data directly.

1. Open a database data set for preparation by choosing one of the following options:
   - Create a new database data set and choose Edit/Preview data. For more information about creating a new data set using a new database data source, see Creating Data Sets from New Database Data Sources (p. 81). For more information about creating a new data set using an existing database data source, see Creating a Data Set Using an Existing Database Data Source (p. 94).
   - Open an existing database data set for editing from either the analysis page or the Your Data Sets page. For more information about opening an existing data set for data preparation, see Editing a Data Set (p. 95).

2. (Optional) On the data preparation page, type a name into the data set name box on the application bar.
   This name defaults to the table name if you selected one before data preparation. Otherwise, it's Untitled data source.

3. Decide how your data is selected by choosing one of the following:
   - To use a single table to provide data, choose a table or change the table selection.
If you have a long table list in the **Tables** pane, you can search for a specific table by typing a search term for **Search tables**.

Any table whose name contains the search term is shown. Search is case-insensitive and wildcards are not supported. Choose the cancel icon (X) to the right of the search box to return to viewing all tables.
• To use two or more joined tables to provide data, choose two tables and join them using the join pane. You must import data into SPICE (p. 2) if you choose to use joined tables. For more information about joining tables using the Amazon QuickSight interface, see Joining Tables (p. 126).

• To use a custom SQL query to provide data in a new data set, choose Switch to Custom SQL tool on the Tables pane. For more information, see Using a SQL Query (p. 133).

To change the SQL query in an existing data set, choose Edit SQL on the Fields pane to open the SQL pane and edit the query.

4. Prepare the data by doing one or more of the following:

• Selecting Fields (p. 136)
• Changing a Field Name (p. 140)
• Changing a Field Data Type (p. 141)
• Adding a Calculated Field During Data Preparation (p. 144)
• Adding a Filter (p. 149)

5. If you aren't joining tables, choose whether to query the database directly or to import the data into SPICE by selecting either the Query or SPICE radio button. We recommend using SPICE for enhanced performance.
If you want to use SPICE, check the SPICE indicator to see if you have enough space to import the data set. Importing occurs when you choose either **Save & visualize** or **Save**. If you don't have enough space, you can remove fields from the data set or apply a filter to decrease its size.

**Note**
The SPICE indicator doesn't update to reflect the potential savings of removing fields or filtering the data. It continues to reflect the size of the data set as retrieved from the data source.

6. Choose **Save** to save your work, or **Cancel** to cancel it.

You might also see an option to **Save & visualize**. This option appears based on the screen you started from. If this option isn't there, you can create a new visualization by starting from the data set screen.

### Choosing File Upload Settings

If you are using a file data source, you should confirm the upload settings that Amazon QuickSight uses to import the file into **SPICE (p. 2)**, and correct them if necessary.

**Important**
If it's necessary to change upload settings, make these changes before you make any other changes to the data set. Changing upload settings causes Amazon QuickSight to reimport the file. This process overwrites any changes you have made so far.

### Changing Text File Upload Settings

Text file upload settings include the file header indicator, file format, text delimiter, text qualifier, and start row. If you are working with an Amazon S3 data source, the upload settings you select are applied to all files you choose to use in this data set.

Use the following procedure to change text file upload settings.

1. On the data preparation page, open the **Upload Settings** pane by choosing the expand icon.
2. In **File format**, choose the file format type.
3. If you chose the *custom separated (CUSTOM)* format, specify the separating character in **Delimiter**.
4. If the file doesn't contain a header row, deselect the **Files include headers** check box.
5. If you want to start from a row other than the first row, specify the row number in **Start from row**. If the **Files include headers** check box is selected, the new starting row is treated as the header row. If the **Files include headers** check box is not selected, the new starting row is treated as the first data row.
6. In **Text qualifier**, choose the text qualifier, either single quotes (') or double quotes (").

## Changing Microsoft Excel File Upload Settings

Microsoft Excel file upload settings include the range header indicator and whole sheet selector.

Use the following procedure to change Microsoft Excel file upload settings.

1. On the data preparation page, open the **Upload Settings** pane by choosing the expand icon.
2. Leave **Upload whole sheet** selected.
3. If the file doesn't contain a header row, deselect the **Range contains headers** check box.

## Joining Tables

If you want to use fields from multiple tables in your data set, you can use Amazon QuickSight's join interface to join two or more tables from the same data source. On the join interface, you can specify the join type and the fields to use to join the tables. The fields used in the join must be from the data source and not calculated fields. The join interface doesn't let you use any additional SQL statements to refine the data set. If you want to do this, use a custom SQL query instead. For more information about using a SQL query to create a data set, see **Using a SQL Query** (p. 133).

To successfully join tables, make sure that these requirements are in place:

- The target of the join is a SPICE (p. 2) data set.
- Both data sets are based on the same SQL database data source.

To join tables from different data sources, create the join before importing to Amazon QuickSight.
Important
If you chose a table and made changes to the fields (for example, changing a field name or adding a calculated field), these changes are discarded when you add tables using the join interface.

Creating a Join

Use the following procedure to join several tables to use in a data set.

1. On the data preparation page, expand the **Tables** pane and then choose a table. This table is on the left when you are choosing a join type and join columns. The table appears in the join interface.

   **Note**
   You can only join tables if they are members of the same SQL database data source. Others don't appear in the list.

2. In the **Tables** pane, choose another table. This table is on the right when you are choosing a join type and join columns. The table appears in the join interface and a join appears between the two tables.

3. Choose the join to open the **Configure join** pane.
4. Enter the join column information:

- In the Data sources section of the Configure join pane, choose the join column for the left table. This should be a column that has a matching column in the table to the right. For example, a Customers table usually has a customer ID column to uniquely identify the customer. An Orders table usually has a customer ID column to identify what customer that order belongs to.
Choose the join column for the table to the right.

(Optional) If the tables you selected join on multiple columns, choose **Add a new join clause** and specify the next set of join columns. Repeat this process until you have identified all of the join columns for the tables.
5. In the **Configure join** pane, choose a join type.

You can choose from the following join types:

- **Inner** — An inner join records only where both tables have matching values in the join columns. This join type is the most commonly used one. For example, suppose that you perform an inner join on the following Safety Ratings and Widgets tables.

```
<table>
<thead>
<tr>
<th>rating_id</th>
<th>safety_rating</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>A+</td>
</tr>
<tr>
<td>2</td>
<td>A</td>
</tr>
<tr>
<td>3</td>
<td>A-</td>
</tr>
<tr>
<td>4</td>
<td>B+</td>
</tr>
<tr>
<td>5</td>
<td>B</td>
</tr>
</tbody>
</table>
```

```
<table>
<thead>
<tr>
<th>widget_id</th>
<th>widget safety_rating_id</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```
Creating a Join

In the result set, widgets without safety ratings aren't shown, and safety ratings that aren't associated with any widget aren't shown.

<table>
<thead>
<tr>
<th>rating_id</th>
<th>safety_rating</th>
<th>widget_id</th>
<th>widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>A+</td>
<td>2</td>
<td>WidgetB</td>
</tr>
<tr>
<td>1</td>
<td>A+</td>
<td>3</td>
<td>WidgetC</td>
</tr>
<tr>
<td>2</td>
<td>A-</td>
<td>1</td>
<td>WidgetA</td>
</tr>
<tr>
<td>3</td>
<td>A-</td>
<td>1</td>
<td>WidgetA</td>
</tr>
<tr>
<td>4</td>
<td>B+</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>B</td>
<td>6</td>
<td>WidgetF</td>
</tr>
</tbody>
</table>

- **Left** — A left outer join returns all records from the left table, and only records that have a value in the join column for the table to the right. For example, suppose that you perform a left outer join on the Safety Ratings (left table) and Widgets (right table) tables. In this case, all safety ratings records are returned, and only matching widget records are returned.

<table>
<thead>
<tr>
<th>rating_id</th>
<th>safety_rating</th>
<th>widget_id</th>
<th>widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>A+</td>
<td>2</td>
<td>WidgetB</td>
</tr>
<tr>
<td>2</td>
<td>A-</td>
<td>1</td>
<td>WidgetA</td>
</tr>
<tr>
<td>3</td>
<td>A-</td>
<td>1</td>
<td>WidgetA</td>
</tr>
<tr>
<td>4</td>
<td>B+</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>B</td>
<td>6</td>
<td>WidgetF</td>
</tr>
</tbody>
</table>

- **Right** — A right outer join returns all records from the table to the right, and only records that have a value in the join column for the left table. For example, suppose that you perform a right outer join on the Safety Ratings (left table) and Widgets (right table) tables. In this case, all widget records are returned, and only matching safety ratings records are returned.

<table>
<thead>
<tr>
<th>rating_id</th>
<th>safety_rating</th>
<th>widget_id</th>
<th>widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>A+</td>
<td>2</td>
<td>WidgetB</td>
</tr>
<tr>
<td>2</td>
<td>A-</td>
<td>1</td>
<td>WidgetA</td>
</tr>
<tr>
<td>3</td>
<td>A-</td>
<td>1</td>
<td>WidgetA</td>
</tr>
<tr>
<td>4</td>
<td>B+</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>B</td>
<td>6</td>
<td>WidgetF</td>
</tr>
</tbody>
</table>

- **Outer** — A full outer join returns all records from both tables, regardless of the values in the join columns. This type of join can return very large result sets because it includes all rows from both tables. For example, if you perform a full outer join on the Safety Ratings and Widgets tables, all records are returned.

<table>
<thead>
<tr>
<th>rating_id</th>
<th>safety_rating</th>
<th>widget_id</th>
<th>widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>A+</td>
<td>2</td>
<td>WidgetB</td>
</tr>
<tr>
<td>1</td>
<td>A+</td>
<td>3</td>
<td>WidgetC</td>
</tr>
<tr>
<td>2</td>
<td>A</td>
<td>4</td>
<td>WidgetD</td>
</tr>
<tr>
<td>3</td>
<td>A-</td>
<td>1</td>
<td>WidgetA</td>
</tr>
<tr>
<td>4</td>
<td>B+</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>B</td>
<td>6</td>
<td>WidgetF</td>
</tr>
</tbody>
</table>
6. Choose **Apply**.

The join icon updates to indicate that the join type and columns have been selected.

7. (Optional) Repeat steps 2–6 to add more tables. The table you selected in Step 1 is the left table and the new table is the right table for each join you add.

**Modifying Existing Joins**

To modify an existing join, choose the join icon to open it in the **Configure join** pane.

To remove a table from the data set, either deselect it in the **Tables** pane, or hover over it in the relationship pane and then choose the delete icon.
Using a SQL Query

When creating a new data set based on a direct query to a database, you can choose an existing SQL query or create a new SQL query. You can use either an existing or new query to refine the data retrieved from a database, or to combine data from multiple tables. Using a SQL query, you can specify SQL statements in addition to any join criteria to refine the data set. If you want to join tables only by specifying the join type and the fields to use to join the tables, you can use the join interface instead. For more information about using the join interface, see Joining Tables (p. 126).

You can specify a SQL query only for data sets based on SQL database data sources.

Important
If you chose a table and made any changes to the fields (for example, changing a field name or adding a calculated field), these changes are discarded when you switch from the table selector to the Custom SQL tool.

Creating a Custom SQL Query

Use the following procedure to create a custom SQL query for a data set.

1. Create a new data set that points to a database source. For more information about creating a data set from a database, see Creating Data Sets from New Database Data Sources (p. 81).
2. Choose one of the following:
   - Custom SQL
     On the next screen, you can choose to write a query with the Use custom SQL option. Doing this opens a screen named Enter custom SQL query, where you can type a name for your query, and then enter the SQL. For best results, compose the query in a SQL editor, and then paste it into this window. After you name and enter the query, you can choose Edit/Preview data or Confirm query. Choose Edit/Preview data to immediately go to data preparation. Choose Confirm query to validate the SQL and make sure that there are no errors.
   - Choose tables
     If you prefer to connect to specific tables, for Schema: contain sets of tables, choose Select and then choose a schema.

             all_flights                      airport_id

To prepare the data before creating an analysis, choose Edit/Preview data to open data preparation. Use this option if you want to join to more tables.

Otherwise, after choosing a table, choose Select.
After you choose Use SQL, the Tables pane is renamed to Custom SQL. You can choose this new pane to switch back to using tables.

**Note**
You can explore the fields in your tables by using the Tables pane. After you select a table, its structure displays in the viewer. This view can be useful if you are unfamiliar with the field names, and want to write SQL.
In some cases, Amazon QuickSight can't change a table data source into a query. In this case, the screen doesn't display the option to switch to a custom SQL query. To use a query instead, create a new data set that is based on the query you want to use.
If your newly created data set doesn't appear on Your Data Sets screen, refresh your page.
Likewise, if you choose your new data set and its dialog box has no options except Create analysis, close this dialog box and reopen it.

3. Enter information for a new SQL query:
   - In the Custom SQL pane, choose Use SQL.
   - For Custom SQL name, type a query name.
   - For Custom SQL, type or paste in a SQL query. The query must conform to the SQL syntax of the target database engine in terms of capitalization, command termination, and other requirements.

**Note**
The Custom SQL box has no query editing functionality. It's easier to create the query that you want in your SQL editor of choice and then paste it in.
• Choose Finish. The query is processed and a sample of the query results displays in the data preview pane.

After you have selected or created a SQL query, the SPICE (p. 2) indicator updates to reflect the size of the data set returned by the query.

Switching Back to Using a Table

To stop using a SQL query and use regular table data instead, choose Switch to table selector in the Custom SQL pane, and then choose a table. You can only do this with new data sets. Once you have saved the data set to use a SQL query, you can edit the query, but you can’t switch to using a table.

Modifying Existing Queries

To update an existing data set based on a SQL query, open the Fields pane, and choose Edit SQL to open the SQL pane and edit the query.
Selecting Fields

When you prepare data, only the fields you select on the data preparation page are available for subsequent use in a visual. By default, all of the fields in the table or file you are preparing are selected. You can toggle a field by either selecting or deseleting its check box in the Fields pane.
You can also toggle a field by hovering over the field menu, which appears next to each field on hover. Then choose either **Exclude field** or **Include field**. The same menu contains additional actions, such as **Rename field**, **Add calculation**, and **Change data type**.
You can select or deselect all fields at once by choosing either **All** or **None** at the top of the **Fields** pane.
If you edit a data set and exclude a field that is used in a visual, that visual breaks. You can fix it the next time you open that analysis.

**Searching for Fields**

If you have a long field list in the **Fields** pane, you can search to locate a specific field by typing a search term for **Search fields**. Any field whose name contains the search term is shown.

Search is case-insensitive and wildcards are not supported. Choose the cancel icon (X) to the right of the search box to return to viewing all fields.
Changing a Field Name

You can change any field name from what is provided by the data source. If you change the name of a field used in a calculated field, make sure also to change it in the calculated field function. Otherwise, the function fails.

Use the following procedure to change a field name.

1. In the data preview pane, choose the edit icon on the field that you want to change.

2. Highlight the field name and type a new name.
Changing a Field Data Type

When Amazon QuickSight retrieves data, it assigns each field a data type based on the data in the field. The possible data types are as follows:

- **Date** — The date data type is used for date data in a supported format. For information about the date formats Amazon QuickSight supports, see Data Source Limits (p. 52).
- **Decimal** — The decimal data type is used for numeric data that requires one or more decimal places of precision, for example 18.23. The decimal data type supports values with up to four decimal places to the right of the decimal point. Values that have a higher scale than this are truncated to the fourth decimal place when displayed in data preparation or analyses and when imported into SPICE (p. 2). For example, 13.00049 is truncated to 13.0004.
- **Int** — The int data type is used for numeric data that only contains integers, for example 39.
- **String** — The string data type is used for nondate alphanumeric data.

During data preparation, you can change the data type of any field from the data source but not that of any calculated field you create. Amazon QuickSight converts the field data according to the data type you choose. Rows that contain data that is incompatible with that data type are skipped. For example, suppose that you convert the following field from String to Int.

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>10020</td>
<td>36803</td>
<td>14267a</td>
<td>98457</td>
<td>78216b</td>
</tr>
</tbody>
</table>

All records containing alphabetic characters in that field are skipped, as shown following.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>10020</td>
<td>36803</td>
</tr>
</tbody>
</table>
If you have a database data set with fields whose data types aren't supported by Amazon QuickSight, use a SQL query during data preparation. Then use `CAST` or `CONVERT` commands (depending on what is supported by the source database) to change the field data types. For more information about adding a SQL query during data preparation, see Using a SQL Query (p. 133). For more information about how different source data types are interpreted by Amazon QuickSight, see Supported Data Types (p. 52).

If you have numeric fields that act as dimensions rather than metrics, for example ZIP codes and most ID numbers, it's helpful to give them a string data type during data preparation. Doing this lets Amazon QuickSight understand that they are not useful for performing mathematical calculations and can only be aggregated with the Count function. For more information about how Amazon QuickSight uses dimensions and measures, see Setting a Field as a Dimension or Measure (p. 220).

In SPICE (p. 2), numbers converted from numeric into an integer are truncated by default. If you want to round your numbers instead, you can create a calculated field using the round (p. 202) function. To see whether numbers are rounded or truncated before they are ingested into SPICE, check your database engine.

**To change a field data type**

1. In the data preview pane, choose the data type icon under the field you want to change.

2. Choose the target data type. Only data types other than the one currently in use are listed.

---

**Using Unsupported or Custom Dates**

Amazon QuickSight natively supports a limited number of date formats. However, you can’t always control the format of the data provided to you. When your data contains a date in an unsupported format, you can tell Amazon QuickSight how to interpret it.

You can do this by editing the data set, and changing the format of the column from text or numeric to date. A screen appears after you make this change, so you can enter the format. For example, if you are using a relational data source, you can specify MM-dd-yyyy for a text field containing '09-19-2017', so it is interpreted as 2017-09-19T00:00:00.000Z. If you are using a nonrelational data source, you can do the same thing starting with a numeric field or a text field.
Amazon QuickSight only supports text to date for relational (SQL) sources.

For more information on supported date formats, see Supported Date Formats (p. 55).

Use this procedure to help Amazon QuickSight understand dates in different formats.

1. For a data set containing unsupported date formats, edit the data as follows. For the column containing your datetime data, change the data type from text to date. Do this by choosing the colorful data type icon beneath the column name in the data preview.

   Note
   Integer dates that aren’t Unix epoch datetimes don’t work as is. For example, these formats are not supported as integers: MMddyy, MMddyyyy, ddMMyy, ddMMyyyy, and yyMMdd. The workaround is to first change them to text format. Make sure all your rows contain six digits (not five). Then change the text data type to datetime.

   For more information on Unix epoch datetimes, see epochDate (p. 184).

   When you change the data type to date, the Edit date format screen appears.

2. Type your date format, indicating which parts are month, date, year, or time. Formats are case-sensitive.

3. Choose Validate to make sure Amazon QuickSight can now interpret your datetime data with the format you specified. Rows that don’t validate are skipped and omitted from the data set.

4. When you are satisfied with the results, choose Update. Otherwise, choose Close.

Working with Calculated Fields

Create calculated fields to use operators or functions to analyze or transform field data. For details about supported functions and operators, see Amazon QuickSight Calculated Field Function and Operator Reference (p. 175).

You can use multiple functions and operators in a calculated field. For example, you might use the formatDate function to extract the year from a date field, and then the ifelse function to segment records based on the year.
Handling Decimal Values in Calculated Fields

The decimal data type supports up to four decimal places to the right of the decimal point. During data preparation, calculated fields that use decimal data with more than four decimal places use the full value to perform the calculation. If the result is again decimal data that uses more than four decimal places, the result is then truncated when the data set is imported into SPICE or displayed in an analysis.

As an example, take decimal field FieldA with a value of 0.00006, which is displayed in the user interface as 0.0. The full value 0.00006 is still used in all calculations. The following are some examples of how you can use this value in calculations:

- FieldA > 0 = true. The calculated field value displayed in the analysis or imported into SPICE is true.
- ceil(FieldA) = 1. The calculated field value displayed in the analysis or imported into SPICE is 1.
- FieldA + 0.00009 = 0.00015. The calculated field value displayed in the analysis or imported into SPICE is 0.0001.
- FieldA * 1.5 = 0.00009. The calculated field value displayed in the analysis or imported into SPICE is 0.0.

Adding a Calculated Field During Data Preparation

Create calculated fields to use functions and operators to analyze or transform field data. For details about supported functions and operators, see Amazon QuickSight Calculated Field Function and Operator Reference. For more information about using calculated fields, see Working with Calculated Fields.

You can add calculated fields to a data set during data preparation or from the analysis page. When you add a calculated field to a data set during data preparation, it's available to all analyses that use that data set. When you add a calculated field to a data set in an analysis, it's available only in that analysis.
Adding a Calculated Field

Use the following procedure to add a calculated field.

1. Do one of the following:
   - Create a calculated field without having the formula populated by a field.
     
     On the data preparation page, expand the Fields pane, and then choose New Field.
     
     ![New Field](image1.png)
     
     - Create a calculated field and have the formula populated with a specified field.
     
     On the data preparation page, expand the Fields pane. Hover over the field that you want to use as the basis for the calculated field, choose the ellipsis at its right, and then choose Add calculation based on <field name>.
     
     ![Add calculation](image2.png)
   
2. In the Calculated field pane, highlight the value in Calculated field name, and then type a name for the calculated field.
3. Add a function to the calculated field formula by doing one of the following:

   - If you created the calculated field by choosing **New Field**, choose a function from **Function list** and then choose **Add**.

   - If you created the calculated field by choosing a specific field to use, place your cursor in front of the field name in **Formula**. Then type the name of the function that you want to use and an open parenthesis, then place your cursor after the field name and type a close parenthesis.
4. In **Formula**, type any parameters needed by the function (help for the function displays below **Formula**). As needed, choose fields from **Field list** and then choose **Add** to add them to the formula. You can also choose additional functions from the **Function list** to complete the formula.

If you use a field name that has a space or a nonalphanumeric character other than an underscore, enclose the field name in curly braces when referencing it, for example `{customer id}`. Curly braces are optional if the field name has no space or a nonalphanumeric character.

5. Choose **Create**.

The new calculated field is created, and appears in the **Calculated fields** section at the top of the **Fields** pane.

**Editing a Calculated Field**

To edit a calculated field, locate the field you want to edit in the **Calculated fields** section of the **Fields** pane, hover over it, choose the ellipsis that appears to the right of it, and then choose **Edit <field name>**.
Deleting a Calculated Field

To delete a calculated field, locate the field you want to delete in the Calculated fields section of the Fields pane, hover over it, choose the ellipsis that appears to the right of it, and then choose Delete <field name>.

As with regular fields, if you delete a calculated field that is used in a visual, that visual breaks. You then need fix it the next time you open the relevant analysis.
Adding a Filter

You can use filters to refine the data in a data set. Each filter applies only to a single field. You can apply filters to both regular and calculated fields.

If you create multiple filters, all top-level filters apply together using AND. If you group filters by adding them inside a top-level filter, the filters in the group apply using OR.

Amazon QuickSight applies all of the enabled filters to the field. For example, if there is one filter of state = WA and another filter of sales >= 500, then the data set only contains records that meet both of those criteria. If you disable one of these, only one filter applies.

Take care that multiple filters applied to the same field aren't mutually exclusive.

**Note**
The data preview shows you the results of your combined filters only as they apply to the first 1000 rows. If all of the first 1000 rows are filtered out, then no rows show in the preview. This effect occurs even when rows after the first 1000 aren't filtered out.

**Topics**
- Viewing Filters (p. 150)
- Adding a Filter (p. 151)
- Editing a Filter (p. 162)
- Deleting a Filter (p. 164)
Viewing Filters

To see the filters for a data set, start on the data preparation page. Choose the Filters pane on the left side of the screen. It's located beneath the Fields pane.

If a single field has multiple filters, they are grouped together. They display in order of create date, with the oldest filter on top.

Viewing Filter Details

Choose the filter to open the Edit Filter view and see filter details.

Choose the Edit filter selector to close that view and return to the Filters view.
Adding a Filter

You can apply filters to both regular and calculated fields, which include text (string data type), numeric (int or decimal data types), and date fields. Depending on the data type of the field you choose, you are offered different filtering options as described in the following topics.

**Topics**
- Adding a Text Filter (p. 151)
- Adding a Numeric Filter (p. 154)
- Adding a Date Filter (p. 156)

## Adding a Text Filter

You have two options for creating text field filters. You can specify multiple field values to include or exclude using the **Custom filter list** filter type, or specify a single value that the field value must equal or not equal using the **Custom filter** filter type.

### Adding a Text Filter by Specifying Multiple Field Values

With the **Custom filter list** filter type, you specify one or more field values to filter on, and whether you want to include or exclude records that contain those values. The specified value and actual field value must match exactly for the filter to be applied to a given record.

Use the following procedure to create a text field filter by specifying multiple field values.

1. On the data preparation page, expand the **Filters** pane.
2. Choose **New filter**, and then choose a text field to filter on. Doing this creates a new filter with no criteria.
3. Choose the new filter to expand it.
4. Change the filter type to **Custom filter list**.
5. Type a field value in **Enter a value to add**, and then choose the add icon.
To remove a field value from the criteria, choose its delete icon.

6. (Optional) Repeat Step 5 until you have added all of the field values that you want to filter on.
7. Choose whether to include or exclude records that contain the field values you selected.
8. Choose Apply.

Adding a Text Filter by Specifying a Single Field Value

With the Custom filter filter type, you specify a single value that the field value must equal or not equal. If you choose an equal comparison, the specified value and actual field value must match exactly in order for the filter to be applied to a given record.

Use the following procedure to create a text field filter by specifying one field value.

1. On the data preparation page, expand the Filters pane.
2. Choose New filter, and then choose a text field to filter on.
   Doing this creates a new filter with no criteria.
3. Choose the new filter to expand it.
4. Change the filter type to Custom filter.
5. Choose a comparison type.

6. Type a field value in the value box.

7. Choose Apply.

Adding a Numeric Filter

Fields with decimal or int data types are considered numeric fields. You create filters on numeric fields by specifying a comparison type, for example Greater than or Between, and a comparison value or values as appropriate to the comparison type. Comparison values must be positive integers and should not contain commas.
You can use the following comparison types in numeric filters:

- Equals
- Does not equal
- Greater than
- Greater than or equal to
- Less than
- Less than or equal to
- Between

**Creating a Numeric Filter**

Use the following procedure to create a numeric field filter.

1. On the data preparation page, expand the **Filters** pane.
2. Choose **New filter**, and then choose a numeric field to filter on.

   Doing this creates a new filter with no criteria.

3. Choose the new filter to expand it.

4. Choose a comparison type.

5. If you have chosen a comparison type other than **Between** or **Not between**, type a comparison value.
6. Choose **Apply**.

### Adding a Date Filter

You create filters on date fields by selecting the filter conditions and date values that you want to use. There are two filter types for dates:

- **Range** – A series of dates based on a time range and comparison type. You can filter records based on whether the date field value is before or after a specified date, or within a date range. You enter date values in the format MM/DD/YYYY. You can use the following comparison types:
  - **Between** – Between a start date and an end date
  - **After** – After a specified date
  - **Before** – Before a specified date
• **Relative** – A series of date/time elements based on the current date. You can filter records based on the current date and your selected unit of measure (UOM). Date filter UOMs include years, quarters, months, weeks, days, and hours. You can use the following comparison types:

  • **Previous** – The previous UOM—for example, the previous year.
  
  • **This** – This UOM, which includes all dates and times that fall within the select UOM, even if they occur in the future.

  • **to date or up to now** – UOM to date, or UOM up to now. The displayed phrase adapts to the UOM you choose. However, in all cases this option filters out data that is not between the beginning of the current UOM and the current moment.

  • **Last n** – The last specified number of the given UOM, which includes all of this UOM and all of the last \( n-1 \) UOM. For example, let's say today is May 10, 2017. You choose to use years as your UOM, and set Last \( n \) years to 3. The filtered data includes data for all of 2017, plus all of 2016, and all of 2015. If you have any data for the future dates of the current year (2017 in this example), these records are included in your data set.

Comparisons are applied inclusive to the date specified. For example, if you apply the filter `<date> Before 1/1/16`, the records returned include all rows with date values through 1/1/16 23:59:59.

**Note**

If a column or attribute has no time zone information, then the client query engine sets the default interpretation of that datetime data. For example, suppose that a column contains a timestamp, rather than a timestamptz, and you are in a different time zone than the data's origin. In this case, the engine can render the timestamp differently than you expect. Amazon QuickSight and SPICE (p. 2) both use Universal Coordinated Time (UTC) times.

**Creating a Date Filter**

Use the following procedure to create a filter for a date field.

1. Choose **Filter** on the tool bar.

2. On the **Applied filters** pane, choose **Create one**, and then choose a date field to filter on.

   Doing this creates a new filter with no criteria.

3. If the filter does not expand to show options, choose the new filter to expand it.
4. Choose a filter type.

5. Do the following to create a date filter on a time range:
   
   a. To create a date filter on a time range, choose a comparison type.
b. Type date values.

If you choose a **Between** comparison, type a start and end date, or select the **Start date** or **End date** field to bring up the date picker control and select dates.
If you choose a **Before** or **After** comparison, type a date, or choose the date field to bring up the date picker control and select a date instead.

6. Do the following to create a date filter on relative dates:
a. Choose a unit of measure (UOM).

b. Choose one option. If you choose \textbf{Last} \textit{n UOM}, specify a number for your range—for example, last 3 years, or last 2 hours.

For more information about date filter options, see \textit{Adding a Date Filter (p. 156)}. 
7. Choose **Apply**.

**Editing a Filter**

You can edit a filter by changing the filter criteria or enabling or disabling the filter.

You can't change the field a filter applies to. To apply a filter to a different field, create a new filter instead.

**Enabling or Disabling a Filter**

You can use the filter menu to enable or disable a filter. When you create a filter, it's enabled by default.

1. On the data preparation page, expand the **Filters** pane.
2. Choose the filter you want to enable or disable, and then choose the selector to the right of the filter name.
On the filter menu, choose **Enable filter** or **Disable filter**.

### Changing Filter Criteria

Use the following procedure to modify a filter.

1. On the data preparation page, expand the **Filters** pane.
2. Choose the filter you want to modify to see the filter details.
3. Change the comparison type or values.
4. Choose **Apply**.
Deleting a Filter

Use the following procedures to delete a filter.

1. On the data preparation page, expand the Filters pane.

2. Choose the filter you want to enable or disable, and then choose the selector to the right of the filter name.

3. On the filter menu, choose Delete filter.
Adding Geospatial Data

You can flag geographic fields in your data, so that Amazon QuickSight can display them on a map. Amazon QuickSight can chart latitude and longitude coordinates. It also recognizes geographic components such as country, state, county, city, and zip code. You can also create geographic hierarchies that can disambiguate similar entities, for example the same city name in two states.

**Note**
For now, automatic geocoding works only for US locations. You can add latitude and longitude coordinates to your data to make geospatial charts. Geospatial charts in Amazon QuickSight aren’t currently supported in some geographies, including India and China. We are working on adding support for more regions.

Use the following procedures to add geospatial data types and hierarchies to your data set.

1. On the data preparation page, label the geographic components with the correct data type.

   There are several ways to do this. One is to choose the field under **Fields** and use the ellipses icon (…) to open the context menu.

   ![Fields panel with place name selected](image)

   Then choose the correct geospatial data type.

   ![Geospatial data types](image)

   You can also change the data type in the work area with the data sample. To do this, choose the data type listed under the field name. Then choose the data type you want to assign.

2. Verify that all geospatial fields necessary for mapping are labeled as geospatial data types. You can check this by looking for the place marker icon. This icon appears under the field names across the top of the page, and also in the **Fields** pane on the left.
Also check the name of the data type, for example latitude or country.

3. (Optional) You can set up a hierarchy or grouping for geographical components (state, city), or for latitude and longitude coordinates. For coordinates, you must add both latitude and longitude to the geospatial field wells.

   **Note**
   Currently drill-down is not working in map charts. We are working to add this.

To create a hierarchy or grouping, first choose one of these fields in the **Fields** pane. Each field can only belong to one hierarchy. It doesn't matter which one you choose first, or what order you add the fields in.

Choose the ellipsis icon (...) next to the field name. Then choose **Add to a hierarchy**.

4. On the **Add field to hierarchy** screen, choose one of the following:
   - Choose **Create a new geospatial hierarchy** to create a new grouping.
   - Choose **Add to existing geospatial hierarchy** to add a field to a grouping that already exists. The existing hierarchies displayed include only those of matching geospatial types.
5. On the **Create hierarchy** screen, name your hierarchy.

If you are creating a latitude and longitude grouping, the **Create hierarchy** screen appears as follows. Depending on whether you chose latitude or longitude in the previous steps, either latitude or longitude displays on this screen. Make sure your latitude field shows under **Field to use for latitude**. Also make sure your longitude shows under **Field to use for longitude**.

Choose **Add** to confirm your choice.
For geographical components, the Create hierarchy screen has two choices:

- Choose **This hierarchy is for a single country** if your data only contains one country. Choose the specific country from the list. Your data doesn't need to contain every level of the hierarchy. You can add fields to the hierarchy in any order.

- Choose **This hierarchy is for multiple countries** if your data contains more than one country. Choose the field that contains the country names. Currently, Amazon QuickSight only supports US geographical areas. Thus, at this time, you can't create a hierarchy containing other geographical types.
For either hierarchy type, choose **Update** to continue.

6. Continue by adding as many fields to the hierarchy as you need to.

Your geospatial groupings appear in the **Fields** pane.
Changing a Geospatial Grouping

You can change a geospatial hierarchy or grouping that exists in a data set.

Use the following procedure to edit or disband a geospatial hierarchy.

1. Open the data set. In the Fields pane, choose the hierarchy name.

2. Choose the ellipsis icon (…), then choose one of the following options.

Choose **Disband hierarchy** to remove the hierarchy from the data set. You can't undo this operation. However, you can recreate your hierarchy or grouping by starting again at step 1. Disbanding the hierarchy doesn't remove any fields from the data set.
Choose **Edit hierarchy** to make changes to the hierarchy. Doing this reopens the creation screens, so you can make different choices in rebuilding your hierarchy.

# Geospatial Troubleshooting

Use this section to discover QuickSight's requirements for correctly processing geospatial data. If QuickSight doesn't recognize your geospatial data as geospatial, use this section to help troubleshoot the issue. Make sure that your data follows the guidelines listed, so that it works in geospatial visuals.

**Note**

Geospatial charts in Amazon QuickSight currently aren't supported in some geographies, including India and China. We are working on adding support for more regions.

If your geography follows all the guidelines listed here, and still generates errors, contact the Amazon QuickSight team from within the Amazon QuickSight console.

## Topics

- Geocoding Issues (p. 171)
- Issues with Latitude and Longitude (p. 172)

## Geocoding Issues

Amazon QuickSight geocodes place names into latitude and longitude coordinates. It uses these coordinates to display place names on the map. Amazon QuickSight skips any places that it can't geocode.

For this process to work properly, your data must include at least the country. Also, there can't be duplicate place names inside of a parent place name.

A few issues prevent place names from showing up on a map chart. These issues include unsupported, ambiguous, or invalid locations, as described following.

### Topics

- Issues with Unsupported Areas (p. 171)
- Issues with Ambiguous Locations (p. 171)
- Issues with Invalid Geospatial Data (p. 172)
- Issues with the Default Country in Geocoding (p. 172)

## Issues with Unsupported Areas

**Important**

At this time, Amazon QuickSight only supports geographical place names in data related to the US.

To map locations in countries other than the US, include latitude and longitude coordinates in your data. Use these coordinates in the geospatial field well to make locations show on a map chart.

## Issues with Ambiguous Locations

Geospatial data can't contain ambiguous locations. For example, suppose that the data contains a city named **Springfield**, but the next level in the hierarchy is country. Because multiple states have a city named **Springfield**, it isn't possible to geocode the location to a specific point on a map.

To avoid this problem, you can add enough geographical data to indicate what location should show on a map chart. For example, you can add a state level into your data and its hierarchy. Or, you might add latitude and longitude.
Issues with Invalid Geospatial Data

Invalid geospatial data occurs when a place name (a city, for example) is listed under an incorrect parent (a state, for example). This issue might be a simple misspelling, or data entry error.

Note
Amazon QuickSight doesn't support regions (for example, West Coast or South) as geospatial data. However, you can use a region as a filter in a visual.

Issues with the Default Country in Geocoding

Make sure that you are using the correct default country.

The default for each hierarchy is based on the country or country field that you choose when you create the hierarchy.

To change this default, you can return to the Create hierarchy screen. Then edit or create a hierarchy, and choose a different country.

If you don’t create a hierarchy, your default country is based on your region. For details, see the following table.

<table>
<thead>
<tr>
<th>Region</th>
<th>Default Country</th>
</tr>
</thead>
<tbody>
<tr>
<td>US West (Oregon) Region</td>
<td>US</td>
</tr>
<tr>
<td>US East (Ohio) Region</td>
<td>US</td>
</tr>
<tr>
<td>US East (N. Virginia) Region</td>
<td>US</td>
</tr>
<tr>
<td>Asia Pacific (Singapore)</td>
<td>Singapore</td>
</tr>
<tr>
<td>Asia Pacific (Sydney)</td>
<td>Australia</td>
</tr>
<tr>
<td>EU (Ireland) Region</td>
<td>Ireland</td>
</tr>
</tbody>
</table>

Issues with Latitude and Longitude

Amazon QuickSight uses latitude and longitude coordinates in the background to find place names on a map. However, you can also use coordinates to create a map without using place names. This approach also works with unsupported place names.

Latitude and longitude values must be numeric. For example, the map point indicated by 28.5383355 -81.3792365 is compatible with Amazon QuickSight. But 28° 32’ 18.0096'' N 81° 22’ 45.2424’’ W is not.

Topics
- Valid Ranges for Latitude and Longitude Coordinates (p. 172)
- Using Coordinates in Degrees, Minutes, and Seconds (DMS) Format (p. 173)

Valid Ranges for Latitude and Longitude Coordinates

Amazon QuickSight supports latitude and longitude coordinates within specific ranges.

<table>
<thead>
<tr>
<th>Coordinate</th>
<th>Valid Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Latitude</td>
<td>Between -90 and 90</td>
</tr>
<tr>
<td>Coordinate</td>
<td>Valid Range</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Longitude</td>
<td>Between -180 to 180</td>
</tr>
</tbody>
</table>

Amazon QuickSight skips any data outside these ranges. Out-of-range points can’t be mapped on a map chart.

**Using Coordinates in Degrees, Minutes, and Seconds (DMS) Format**

You can use a calculated field with a formula to create a numeric latitude and longitude out of character strings. Use this section to find different ways that you can create calculated fields in Amazon QuickSight, to parse GPS latitude and longitude into numeric latitude and longitude.

The following sample converts latitude and longitude to numeric format from separate fields. For example, suppose that you parse `51° 30' 26.4636'' N 0° 7' 39.9288'' W` using space as a delimiter. In this case, you can use something like the following sample to convert the resulting fields to numeric latitude and longitude.

In this example, the seconds are followed by two single quotation marks. If your data has a double quotation mark instead, then you can use `strlen(LatSec)-1)` instead of `strlen(LatSec)-2).`

```sql
/*Latitude*/
ifelse(  
  LatDir = "N",  
  parseInt(split(LatDeg, "°", 1)) +  
  (parseFloat(split(LatMin, ",", 1)) /60) +  
  (parseFloat(substring(LatSec, 1, strlen(LatSec)-2)) /3600),  
  (parseInt(split(LatDeg, "°", 1)) +  
  (parseFloat(split(LatMin, ",", 1)) /60) +  
  (parseFloat(substring(LatSec, 1, strlen(LatSec)-2)) /3600)) * -1  
)

/*Longitude*/
ifelse(  
  LongDir = "E",  
  parseInt(split(LongDeg, "°", 1)) +  
  (parseFloat(split(LongMin, ",", 1)) /60) +  
  (parseFloat(substring(LongSec, 1, strlen(LongSec)-2)) /3600),  
  (parseInt(split(LongDeg, "°", 1)) +  
  (parseFloat(split(LongMin, ",", 1)) /60) +  
  (parseFloat(substring(LongSec, 1, strlen(LongSec)-2)) /3600)) * -1  
)
```

If your data doesn’t include the symbols for degree, minute and second, the formula looks like the following.

```sql
/*Latitude*/
ifelse(  
  LatDir = "N",  
  (LatDeg + (LatMin / 60) + (LatSec / 3600)),  
  (LatDeg + (LatMin / 60) + (LatSec / 3600)) * -1  
)

/*Longitude*/
ifelse(  
  LongDir = "E",  
  (LongDeg + (LongMin / 60) + (LongSec / 3600)),  
  (LongDeg + (LongMin / 60) + (LongSec / 3600)) * -1  
)
The following sample converts $53\degree 21\arcmin N$ $06\degree 15\arcmin W$ to numeric format. However, without the seconds, this location doesn’t map as accurately.

```sql
/*Latitude*/
ifelse(
    right(Latitude, 1) = "N",
    parseInt(split(Latitude, ' ', 1)) +
    parseDecimal(substring(Latitude, (locate(Latitude, ' ',3)+1), 2) ) / 60),
    parseInt(split(Latitude, ' ', 1)) +
    parseDecimal(substring(Latitude, (locate(Latitude, ' ',3)+1), 2) ) / 60) * -1
)
/*Longitude*/
ifelse(
    right(Longitude, 1) = "E",
    parseInt(split(Longitude, ' ', 1)) +
    parseDecimal(substring(Longitude, (locate(Longitude, ' ',3)+1), 2) ) / 60),
    parseInt(split(Longitude, ' ', 1)) +
    parseDecimal(substring(Longitude, (locate(Longitude, ' ',3)+1), 2) ) / 60) * -1
)
```

The formats of GPS latitude and longitude can vary, so customize your formulas to match your data. For more information, see the following links:

- Degrees Minutes Seconds to Decimal Degrees on LatLong.net

- Geographic Coordinate Conversion on Wikipedia
Amazon QuickSight Calculated Field Function and Operator Reference

You can use the following functions and operators to create calculated fields.

For information on aggregating calculated fields, see Using Aggregate Functions in Calculated Fields (p. 245). You can only aggregate calculated fields in an analysis, not in a data set.

Topics
• Arithmetic and Comparison Operators (p. 175)
• Functions by Category (p. 178)
• Function Index (p. 179)

Arithmetic and Comparison Operators

You can use the following arithmetic and comparison operators in calculated fields:

• Addition (+)
• Subtraction (−)
• Multiplication (*)
• Division (/)
• Equal (=)
• Not equal (<>)
• Greater than (>)
• Greater than or equal to (>=)
• Less than (<)
• Less than or equal to (<=)
• AND
• OR
• NOT

Equal (=) and not equal (<>) comparisons are case-sensitive. For example, if the condition is state = 'WA' and the value in the field is wa, those values are not considered to be equivalent.

Amazon QuickSight uses the standard order of operations: parentheses, exponents, multiplication, division, addition, subtraction.

To make lengthy calculations easier to read, you can use parenthesis to clarify groupings and precedence in calculations.

In the following statement, you don't need parentheses. The multiplication statement is processed first, and then the result is added to five, returning a value of 26. However, parentheses make the statement easier to read and thus maintain.

5 + (7 * 3)
Because parenthesis are first in the order of operations, you can change the order in which other operators are applied. For example, in the following statement the addition statement is processed first, and then the result is multiplied by three, returning a value of 36.

\[(5 + 7) \times 3\]

**Example: Arithmetic Operators**

The following example uses multiple arithmetic operators to determine a sales total after discount.

\[(\text{Quantity} \times \{\text{Sales Amount}\}) - \{\text{Discount Amount}\}\]

**Example: (=) Equal**

Using = performs a case-sensitive comparison of values. Rows where the comparison is TRUE are included in the result set.

In the following example, rows where the **Region** field is **South** are included in the results. If the **Region** is **south**, these rows are excluded.

Region = 'South'

In the following example, the comparison evaluates to FALSE.

Region = 'south'

The following example shows a comparison that converts **Region** to all uppercase (**SOUTH**), and compares it to **SOUTH**. This returns rows where the region is **south**, **South**, or **SOUTH**.

toUpper(Region) = 'SOUTH'

**Example: (<>)**

The not equal symbol <> means *less than or greater than*.

So, if we say \(x<>1\), then we are saying *if \(x\) is less than 1 OR if \(x\) is greater than 1*. Both < and > are evaluated together. In other words, *if \(x\) is any value except 1*. Or, *\(x\) is not equal to 1*.

**Note**

Use <>, not !=

The following example compares **Status Code** to a numeric value. This returns rows where the **Status Code** is not equal to 1.

statusCode <> 1

The following example compares multiple statusCode values. In this case, active records have an **activeFlag = 1**. This example returns rows where one of the following applies:

- For active records, show rows where the status isn't 1 or 2
- For inactive records, show rows where the status is 99 or -1
Use the AND, OR, and NOT operators to refine your selection criteria. These operators are helpful when you need to show relationships between different comparisons.

\[
( \text{activeFlag} = 1 \text{ AND (statusCode} > 1 \text{ AND statusCode} > 2) ) \text{ OR }
( \text{activeFlag} = 0 \text{ AND (statusCode} = 99 \text{ OR statusCode} = -1) )
\]

Example: AND, OR, and NOT

The following example uses AND, OR, and NOT to compare multiple expressions using conditional operators to tag top customers NOT in Washington or Oregon with a special promotion, who made more than 10 orders. If no values are returned, the value 'n/a' is used.

```python
ifelse(( (NOT (State = 'WA' OR State = 'OR')) AND {Number of Orders} > 10), 'Special Promotion XYZ', 'n/a')
```

Example: Creating Comparison Lists Like "in" or "not in"

This example uses operators to create a comparison to find values that exist, or don't exist, in a specified list of values.

The following example compares `promoCode` a specified list of values. This example returns rows where the `promoCode` is in the list \( \{1, 2, 3\} \).

```
promoCode = 1
OR promoCode = 2
OR promoCode = 3
```

The following example compares `promoCode` a specified list of values. This example returns rows where the `promoCode` is NOT in the list \( \{1, 2, 3\} \).

```
NOT
( promoCode = 1
OR promoCode = 2
OR promoCode = 3
)
```

Another way to express this is to provide a list where the `promoCode` is not equal to any items in the list.

```
promoCode <> 1
AND promoCode <> 2
AND promoCode <> 3
```

Example: Creating a "between" Comparison

This example uses comparison operators to create a comparison showing values that exist between one value and another.

The following example examines `Order Date` and returns rows where the `Order Date` is between the first day and last day of 2016. In this case, we want the first and last day included, so we use "or equal to" on the comparison operators.

```
{Order Date} >= "1/1/2016" AND {Order Date} <= "12/31/2016"
```
Functions by Category

In this section, you can find a list of the functions available in Amazon QuickSight sorted by category.

Topics
- Aggregate Functions (p. 178)
- Conditional Functions (p. 178)
- Date Functions (p. 178)
- Numeric Functions (p. 179)
- String Functions (p. 179)

Aggregate Functions

The aggregate functions for calculated fields in Amazon QuickSight include the following. These are only available in SPICE, while you are in the analysis screen. Each of these functions returns values grouped by the chosen dimension or dimensions.

- `avg` (p. 245) averages the set of numbers in the specified measure.
- `count` (p. 246) calculates the number of values in a dimension or measure.
- `distinct_count` (p. 246) calculates the number of distinct values in a dimension or measure.
- `max` (p. 247) returns the maximum value of the specified measure.
- `min` (p. 247) returns the minimum value of the specified measure.
- `sum` (p. 247) adds the set of numbers in the specified measure.

Conditional Functions

The conditional functions for calculated fields in Amazon QuickSight include the following:

- `coalesce` (p. 181) returns the value of the first argument that is not null.
- `ifelse` (p. 188) evaluates a set of `if, then` expression pairings, and returns the value of the `then` argument for the first `if` argument that evaluates to true.
- `isNotNull` (p. 189) evaluates an expression to see if it is not null.
- `isNull` (p. 190) evaluates an expression to see if it is null. If the expression is null, `isNull` returns `true`, and otherwise it returns `false`.
- `nullIf` (p. 193) compares two expressions. If they are equal, the function returns null. If they are not equal, the function returns the first expression.

Date Functions

The date functions for calculated fields in Amazon QuickSight include the following:

- `dateDiff` (p. 183) returns the difference in days between two date fields. (SPICE enabled)
- `epochDate` (p. 184) converts an epoch date into a standard date. (SPICE enabled)
- `extract` (p. 185) returns a specified portion of a date value. (SPICE enabled)
- `formatDate` (p. 187) formats a date using a pattern you specify.
- `now` (p. 193) returns the current date and time, using either settings for a database, or UTC for file and Salesforce.
Numeric Functions

The numeric functions for calculated fields in Amazon QuickSight include the following.

- `truncDate` (p. 209) returns a date value that represents a specified portion of a date. (SPICE enabled)
- `ceil` (p. 180) rounds a decimal value to the next highest integer. (SPICE enabled)
- `decimalToInt` (p. 183) converts a decimal value to an integer. (SPICE enabled)
- `floor` (p. 186) decrements a decimal value to the next lowest integer. (SPICE enabled)
- `intToDecimal` (p. 189) converts an integer value to a decimal. (SPICE enabled)
- `round` (p. 202) rounds a decimal value to the closest integer or, if scale is specified, to the closest decimal place. (SPICE enabled)

String Functions

The string (text) functions for calculated fields in Amazon QuickSight include the following.

- `concat` (p. 182) concatenates two or more strings.
- `left` (p. 191) returns the specified number of leftmost characters from a string.
- `locate` (p. 191) locates a substring within another string, and returns the number of characters before the substring.
- `ltrim` (p. 192) removes preceding whitespace from a string.
- `parseDate` (p. 194) parses a string to determine if it contains a date value, and returns the date if found.
- `parseDecimal` (p. 198) parses a string to determine if it contains a decimal value.
- `parseInt` (p. 199) parses a string to determine if it contains an integer value.
- `parseJson` (p. 200) parses values from a JSON object in a text field.
- `replace` (p. 201) replaces part of a string with a new string.
- `right` (p. 202) returns the specified number of rightmost characters from a string.
- `rtrim` (p. 203) removes following whitespace from a string.
- `split` (p. 204) splits a string into an array of substrings, based on a delimiter that you choose, and returns the item specified by the position.
- `strlen` (p. 205) returns the number of characters in a string.
- `substring` (p. 205) returns the specified number of characters in a string, starting at the specified location.
- `tolower` (p. 206) formats a string in all lowercase.
- `toString` (p. 207) formats the input expression as a string.
- `toUpperCase` (p. 207) formats a string in all uppercase.
- `trim` (p. 208) removes both preceding and following whitespace from a string.

Function Index

In this section, you can find a list of functions available in Amazon QuickSight. Some functions are available in SPICE (p. 2), while you are in the analysis screen.

To view a list of functions sorted by category, with brief definitions, see Functions by Category (p. 178).
ceil

ceil rounds a decimal value to the next highest integer. For example, ceil(29.02) returns 30.

ceil is supported for use with analyses based on SPICE (p. 2) data sets.

Syntax

```
ceil(decimal)
```
Arguments

decimal

A field that uses the decimal data type, a literal value like 17.62, or a call to another function that outputs a decimal.

Return Type

Integer

Example

The following example rounds a decimal field to the next highest integer.

ceil(sales_amount)

The following are the given field values.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>20.13</td>
<td>892.03</td>
<td>57.54</td>
</tr>
</tbody>
</table>

For these field values, the following values are returned.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>21</td>
<td>893</td>
</tr>
<tr>
<td></td>
<td>58</td>
</tr>
</tbody>
</table>

coalesce

coalesce returns the value of the first argument that is not null. When a non-null value is found, the remaining arguments in the list are not evaluated. If all arguments are null, the result is null. 0-length strings are valid values and are not considered equivalent to null.

Syntax

coalesce(expression, expression [, expression, ...])

Arguments

coalesce takes two or more expressions as arguments. All of the expressions must have the same data type or be able to be implicitly cast to the same data type.

expression

The expression can be numeric, datetime, or string. It can be a field name, a literal value, or another function.

Return Type

coalesce returns a value of the same data type as the input arguments.
**Example**

The following example retrieves a customer’s mailing address if it exists, her street address if there is no mailing address, or returns "No address listed" if neither address is available.

```
coalesce(mailingAddress, streetAddress, 'No address listed')
```

**concat**

`concat` concatenates two or more strings.

**Syntax**

```
concat(expression, expression [ , expression ... ])
```

**Arguments**

`concat` takes two or more string expressions as arguments.

**expression**

The expression must be a string. It can be the name of a field that uses the string data type, a literal value like '12 Main Street', or a call to another function that outputs a string.

**Return Type**

String

**Examples**

The following example concatenates three string fields and adds appropriate spacing.

```
concat(salutation, ' ', first_name, ' ', last_name)
```

The following are the given field values.

<table>
<thead>
<tr>
<th>salutation</th>
<th>first_name</th>
<th>last_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ms.</td>
<td>Jane</td>
<td>Doe</td>
</tr>
<tr>
<td>Dr.</td>
<td>Sally</td>
<td>Roe</td>
</tr>
<tr>
<td>Mr.</td>
<td>John</td>
<td>Smith</td>
</tr>
</tbody>
</table>

For these field values, the following values are returned.

- Ms. Jane Doe
- Dr. Sally Roe
- Mr. John Smith

The following example concatenates two string literals.

```
concat('Hello', 'world')
```
The following value is returned.

| Helloworld |

**decimalToInt**

`decimalToInt` converts a decimal value to the integer data type by stripping off the decimal point and any numbers after it. `decimalToInt` does not round up. For example, `decimalToInt(29.99)` returns 29.

`decimalToInt` is supported for use with analyses based on SPICE (p. 2) data sets.

**Syntax**

```
decimalToInt(decimal)
```

**Arguments**

- `decimal`
  
  A field that uses the decimal data type, a literal value like `17.62`, or a call to another function that outputs a decimal.

**Return Type**

Integer

**Example**

The following example converts a decimal field to an integer.

```
decimalToInt(sales_amount)
```

The following are the given field values.

| 20.13   | 892.03  | 57.54 |

For these field values, the following values are returned.

| 20     | 892    | 58    |

**dateDiff**

`dateDiff` returns the difference in days between two date fields.

`dateDiff` is supported for use with analyses based on SPICE (p. 2) data sets.
Syntax

dateDiff(date, date)

Arguments

dateDiff takes two dates as arguments.

date

A date field or a call to another function that outputs a date.

Return Type

Integer

Example

The following example returns the difference between two dates.

dateDiff({Order Date}, {Ship Date})

The following are the given field values.

<table>
<thead>
<tr>
<th>order date</th>
<th>ship date</th>
</tr>
</thead>
<tbody>
<tr>
<td>01/01/14</td>
<td>01/05/14</td>
</tr>
<tr>
<td>09/13/16</td>
<td>09/20/16</td>
</tr>
</tbody>
</table>

For these field values, the following values are returned.

4

7

epochDate

ePOCHDate converts an epoch date into a standard date in the format yyyy-MM-dd'T'kk:mm:ss.SSSZ, using the format pattern syntax specified in Class DateTimeFormat in the Joda project documentation. An example is 2015-10-15T19:11:51.003Z.

ePOCHDate is supported for use with analyses based on SPICE (p. 2) data sets.

Syntax

ePOCHDate(epochdate)

Arguments

ePOCHdate

An epoch date, which is an integer representation of a date as the number of seconds since 00:00:00 UTC on January 1, 1970.
**epochdate** must be an integer. It can be the name of a field that uses the integer data type, a literal integer value, or a call to another function that outputs an integer. If the integer value is longer than 10 digits, the digits after the tenth place are discarded.

**Return Type**

Date

**Example**

The following example converts an epoch date to a standard date.

```
epochDate(3100768000)
```

The following value is returned.

```
2068-04-04T12:26:40.000Z
```

**extract**

`extract` returns a specified portion of a date value. Requesting a time-related portion of a date that doesn’t contain time information returns 0.

`extract` is supported for use with analyses based on SPICE (p. 2) data sets.

**Syntax**

```
extract('period', date)
```

**Arguments**

`period`

The period that you want extracted from the date value. Valid periods are as follows:

- YYYY: This returns the year portion of the date.
- MM: This returns the month portion of the date.
- DD: This returns the day portion of the date.
- WD: This returns the day of the week as an integer, with Sunday as 1.
- HH: This returns the hour portion of the date.
- MI: This returns the minute portion of the date.
- SS: This returns the second portion of the date. This argument is not supported when added inside SPICE-based analyses.

`date`

A date field or a call to another function that outputs a date.

**Return Type**

Integer
Example

The following example extracts the day from a date value.

`extract('DD', {Order Date})`

The following are the given field values.

<table>
<thead>
<tr>
<th>order date</th>
</tr>
</thead>
<tbody>
<tr>
<td>01/01/14</td>
</tr>
<tr>
<td>09/13/16</td>
</tr>
</tbody>
</table>

For these field values, the following values are returned.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>13</td>
</tr>
</tbody>
</table>

floor

`floor` decrements a decimal value to the next lowest integer. For example, `floor(29.08)` returns `29`. `floor` is supported for use with analyses based on SPICE (p. 2) data sets.

Syntax

```
floor(decimal)
```

Arguments

`decimal`

A field that uses the decimal data type, a literal value like `17.62`, or a call to another function that outputs a decimal.

Return Type

Integer

Example

The following example decrements a decimal field to the next lowest integer.

```
floor(sales_amount)
```

The following are the given field values.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>20.13</td>
<td>892.03</td>
<td>57.54</td>
</tr>
</tbody>
</table>
For these field values, the following values are returned.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>20</td>
<td>892</td>
<td>57</td>
</tr>
</tbody>
</table>

**formatDate**

`formatDate` formats a date using a pattern you specify.

**Syntax**

```
formatDate(date, ['format'], ['time_zone'])
```

**Arguments**

*date*

A date field or a call to another function that outputs a date.

*format*

(Optional) A string containing the format pattern to apply. This argument accepts the format patterns specified in Supported Date Formats (p. 55).

If you don't specify a format, this string defaults to `yyyy-MM-ddTkk:mm:ss:SSS`.

*time_zone*

(Optional) A string representing an IANA time zone.

If you don't specify a time zone, UTC is used.

**Return Type**

String

**Example**

The following example formats a UTC date and displays using a specific time zone.

```
formatDate({Order Date}, 'dd MMM yyyy', 'America/Los_Angeles')
```

The following are the given field values.

<table>
<thead>
<tr>
<th>order date</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;2012-12-14T00:00:00.000Z&quot;</td>
</tr>
<tr>
<td>&quot;2013-12-29T00:00:00.000Z&quot;</td>
</tr>
<tr>
<td>&quot;2012-11-15T00:00:00.000Z&quot;</td>
</tr>
</tbody>
</table>

For these field values, the following values are returned.

<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>13 Dec 2012</td>
</tr>
</tbody>
</table>
**ifelse**

`ifelse` evaluates a set of `if, then` expression pairings, and returns the value of the `then` argument for the first `if` argument that evaluates to true. The remaining arguments in the list are not evaluated. If none of the `if` arguments evaluate to true, then the value of the `else` argument is returned.

**Syntax**

```
ifelse(if, then [, if, then ...], else)
```

**Arguments**

`ifelse` takes one or more `if, then` expression pairings plus an expression for the `else` argument.

**if**

The expression to be evaluated as true or not. It can be a field name like `address1`, a literal value like `'Unknown'`, or another function like `toString({Sales Amount})`.

If you use multiple AND and OR operators in the `if` argument, enclose statements in parentheses to identify processing order. For example, the following `if` argument returns records with a month of 1, 2, or 5 and a year of 2000.

```
ifelse((month = 5 OR month < 3) AND year = 2000, 'yes', 'no')
```

The next `if` argument uses the same operators, but returns records with a month of 5 and any year, or with a month of 1 or 2 and a year of 2000.

```
ifelse(month = 5 OR (month < 3 AND year = 2000), 'yes', 'no')
```

**then**

The expression to be returned if its `if` argument is evaluated as true. It can be a field name like `address1`, a literal value like `'Unknown'`, or a call to another function. The expression must have the same data type as the other `then` arguments and the `else` argument.

**else**

The expression to be returned if none of the `if` arguments evaluate as true. It can be a field name like `address1`, a literal value like `'Unknown'`, or another function like `toString({Sales Amount})`. The expression must have the same data type as all of the `then` arguments.

**Return Type**

`ifelse` returns a value of the same data type as the input arguments.

**Example**

The following example assigns a group to a sales record based on the sales total.
intToDecimal

intToDecimal converts an integer value to the decimal data type.

intToDecimal is supported for use with analyses based on SPICE (p. 2) data sets.

Syntax

\[
\text{intToDecimal}(\text{int})
\]

Arguments

\text{int}

A field that uses the integer data type, a literal value like 14, or a call to another function that outputs an integer.

Return Type

Decimal

Example

The following example converts an integer field to a decimal.

\[
\text{intToDecimal(transaction\_count)}
\]

The following are the given field values.

\[
\begin{array}{llll}
20 & 892 & 57 \\
\end{array}
\]

For these field values, the following values are returned.

\[
\begin{array}{llll}
20.0 & 892.0 & 58.0 \\
\end{array}
\]

isNotNull

isNotNull evaluates an expression to see if it is not null. If the expression is not null, isNotNull returns true, and otherwise it returns false.

Syntax

\[
\text{isNull}(\text{expression})
\]
Arguments

*expression*

The expression to be evaluated as null or not. It can be a field name like `address1` or a call to another function that outputs a string.

Return Type

Boolean

Example

The following example evaluates the sales_amount field for null values.

```
isNotNull(sales_amount)
```

The following are the given field values.

```
20.13
(null)
57.54
```

For these field values, the following values are returned.

```
true
false
true
```

**isNull**

`isNull` evaluates an expression to see if it is null. If the expression is null, `isNull` returns true, and otherwise it returns false.

Syntax

```
isNull(expression)
```

Arguments

*expression*

The expression to be evaluated as null or not. It can be a field name like `address1` or a call to another function that outputs a string.

Return Type

Boolean

Example

The following example evaluates the sales_amount field for null values.
isNull(sales_amount)

The following are the given field values.

<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>20.13</td>
</tr>
<tr>
<td>(null)</td>
</tr>
<tr>
<td>57.54</td>
</tr>
</tbody>
</table>

For these field values, the following values are returned.

<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
</tr>
<tr>
<td>true</td>
</tr>
<tr>
<td>false</td>
</tr>
</tbody>
</table>

**left**

left returns the leftmost characters from a string, including spaces. You specify the number of characters to be returned.

**Syntax**

```
left(expression, limit)
```

**Arguments**

*expression*

The expression must be a string. It can be the name of a field that uses the string data type, a literal value like '12 Main Street', or a call to another function that outputs a string.

*limit*

The number of characters to be returned from expression, starting from the first character in the string.

**Return Type**

String

**Example**

The following example returns the first 5 characters from a string.

```
left('Seattle Store#14', 5)
```

The following value is returned.

<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Seatt</td>
</tr>
</tbody>
</table>

**locate**

locate locates a substring that you specify within another string, and returns the number of characters until the first character in the substring. The function returns 0 if it doesn't find the substring.
Syntax

```plaintext
locate(expression, substring, start)
```

Arguments

**expression**

The expression must be a string. It can be the name of a field that uses the string data type, a literal value like '12 Main Street', or a call to another function that outputs a string.

**substring**

The set of characters in expression that you want to locate. The substring can occur one or more times in expression.

**start**

(Optional) If substring occurs more than once, use start to identify where in the string the function should start looking for the substring. For example, suppose that you want to find the second example of a substring and you think it typically occurs after the first 10 characters. You specify a start value of 10.

Return Type

Integer

Examples

The following example returns information about where the first occurrence of the substring 'and' appears in a string.

```plaintext
locate('1 and 2 and 3 and 4', 'and')
```

The following value is returned.

3

The following example returns information about where the first occurrence of the substring 'and' appears in a string after the fourth character.

```plaintext
locate('1 and 2 and 3 and 4', 'and', 4)
```

The following value is returned.

9

**ltrim**

*ltrim* removes preceding whitespace from a string.

Syntax

```plaintext
ltrim(expression)
```
Arguments

expression

The expression must be a string. It can be the name of a field that uses the string data type, a literal value like '12 Main Street', or a call to another function that outputs a string.

Return Type

String

Example

The following example removes the preceding spaces from a string.

```plaintext
ltrim('   Seattle Store#14')
```

The following value is returned.

```
Seattle Store#14
```

**now**

For database data sets that directly query the database, now returns the current date and time using the settings and format specified by the database server. For file and Salesforce data sets, now returns the UTC date and time, in the format `yyyy-MM-ddThh:mm:ss:SSSZ` (for example, `2015-10-15T19:11:51:003Z`). now is not supported for use with database data sets that use SPICE (p. 2).

Syntax

```plaintext
now()
```

Return Type

Date

**nullIf**

nullIf compares two expressions. If they are equal, the function returns null. If they are not equal, the function returns the first expression.

Syntax

```plaintext
nullIf(expression, expression)
```

Arguments

nullIf takes two expressions as arguments.

expression

The expression can be numeric, datetime, or string. It can be a field name, a literal value, or another function.
Return Type

String

Example

The following example returns nulls if the reason for a shipment delay is unknown.

```nullIf({Delay Reason}, 'unknown')```

The following are the given field values.

delay reason
=========
unknown
back ordered
weather delay

For these field values, the following values are returned.

```(null)
  back ordered
  weather delay```

parseDate

parseDate parses a string to determine if it contains a date value, and returns a standard date in the format yyyy-MM-ddTkk:mm:ss.SSSZ (using the format pattern syntax specified in Class DateTimeFormat in the Joda project documentation), for example 2015-10-15T19:11:51.003Z. This function returns all rows that contain a date in a valid format and skips any rows that don't, including rows that contain null values.

Amazon QuickSight supports dates in the range from Jan 1, 1900 00:00:00 UTC to Dec 31, 2037 23:59:59 UTC. See also Supported Date Formats (p. 55).

Note

parseDate is not supported for use with SPICE (p. 2) data sets.

Syntax

```parseDate(expression, ['format'], ['time_zone'])```

Arguments

expression

The expression must be a string. It can be the name of a field that uses the string data type, a literal value like '1/1/2016', or a call to another function that outputs a string.

format

(Optional) A string containing the format pattern that date_string must match. For example, if you are using a field with data like 01/03/2016, you specify the format 'MM/dd/yyyy'. If you don't
specify a format, it defaults to `yyyy-MM-dd`. Rows whose data doesn't conform to format are skipped.

Different date formats are supported based on the type of data set used. Use the following table to see details of supported date formats.

<table>
<thead>
<tr>
<th>Date Source Type</th>
<th>Supported Date Formats</th>
</tr>
</thead>
<tbody>
<tr>
<td>File, Amazon Athena, and Salesforce data sets</td>
<td>All date format patterns specified in Supported Date Formats (p. 55).</td>

</tr>
</tbody>
</table>

*time_zone*

(Optional) A string representing an IANA time zone.

If you don’t specify a time zone, UTC is used.

**Return Type**

Date

**Example**

The following example evaluates Field2 to determine if it contains date values.

```plaintext
parseDate(Field2, 'MM/dd/yyyy')
```

The following are the given field values.

```plaintext
Field2
```
For these field values, the following rows are returned.

<table>
<thead>
<tr>
<th>Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>12-31-2006</td>
</tr>
<tr>
<td>01-18-1982</td>
</tr>
<tr>
<td>07-04-2010</td>
</tr>
</tbody>
</table>

**parseDecimal**

`parseDecimal` parses a string to determine if it contains a decimal value. This function returns all rows that contain a decimal, integer, or null value, and skips any rows that don't. If the row contains an integer value, it is returned as a decimal. For example, a value of '2' is returned as '2.0'.

**Syntax**

`parseDecimal(expression)`

**Arguments**

`expression`

The expression must be a string. It can be the name of a field that uses the string data type, a literal value like '9.62', or a call to another function that outputs a string.

**Return Type**

Decimal

**Example**

The following example evaluates Field2 to determine if it contains decimal values.

`parseDecimal(Field2)`

The following are the given field values.

<table>
<thead>
<tr>
<th>Field2</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>2a</td>
</tr>
<tr>
<td>12.13</td>
<td>3b</td>
</tr>
<tr>
<td>3.9</td>
<td>(null)</td>
</tr>
<tr>
<td>198.353398</td>
<td></td>
</tr>
</tbody>
</table>

For these field values, the following rows are returned.
parseInt

parseInt parses a string to determine if it contains an integer value. This function returns all rows that contain a decimal, integer, or null value, and skips any rows that don't. If the row contains a decimal value, it is returned as the nearest integer, rounded down. For example, a value of '2.99' is returned as '2'.

Syntax

parseInt(expression)

Arguments

expression

The expression must be a string. It can be the name of a field that uses the string data type, a literal value like '3', or a call to another function that outputs a string.

Return Type

Integer

Example

The following example evaluates Field2 to determine if it contains integer values.

```
parseInt(Field2)
```

The following are the given field values.

<table>
<thead>
<tr>
<th>Field2</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>2.1</td>
<td></td>
</tr>
<tr>
<td>2a</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
</tr>
<tr>
<td>3b</td>
<td></td>
</tr>
<tr>
<td>(null)</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
</tr>
</tbody>
</table>

For these field values, the following rows are returned.

<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>3</td>
</tr>
<tr>
<td>(null)</td>
</tr>
<tr>
<td>5</td>
</tr>
</tbody>
</table>
parseJson

After you import a text file that has a JSON object in one or more fields, use parseJson to extract values from the JSON object. You can use parseJson when you are preparing a data set in SPICE (p. 2). parseJson is not currently supported in database queries or in analyses.

Syntax

parseJson(fieldName, path)

Arguments

fieldName

The field containing the JSON object that you want to parse.

path

The path to the data element you want to parse from the JSON object. Valid path syntax includes:

- $ — Root object
- . — Child operator
- [ ] — Subscript operator for array

Return Type

String

Example

The following example evaluates JSONObject1 to extract the first key value pair (KVP), labelled "State", and assign the value to the calculated field you are creating.

parseJson(JSONObject1, "$state")

The following are the given field values.

JSONObject1

-----------

{"State":"New York","Product":"Produce","Date Sold":"1/16/2018","Sales Amount":"$3423.39"}
{"State":"North Carolina","Product":"Bakery Products","Date Sold":"2/1/2018","Sales Amount":"$3226.42"}
{"State":"Utah","Product":"Water","Date Sold":"4/24/2018","Sales Amount":"$7001.52"}

For these field values, the following rows are returned.

New York
North Carolina
Utah

Example

The following example shows a properly formatted JSON object that is embedded in a CSV file.
replace

replace replaces part of a string with another string that you specify.

Syntax

replace(expression, substring, replacement)

Arguments

expression

The expression must be a string. It can be the name of a field that uses the string data type, a literal value like '12 Main Street', or a call to another function that outputs a string.

substring

The set of characters in expression that you want to replace. The substring can occur one or more times in expression.

replacement

The string you want to have substituted for substring.

Return Type

String

Example

The following example replaces the substring 'and' with 'or'.

State, Time of Day, Day, Date, JSON field, Sales Amount
Washington, Evening, W, 1/11/18, "{" "basket": "Beer|Diapers|Cat Food|Crackers|Bread", "StoreID": 253, "CashID": 34 }", 96.69
California, Noon, T, 3/6/18, "{" "basket": "Beer|Diapers|Cat Food|Crackers|Bread", "StoreID": 253, "CashID": 34 }", 52.18
Oregon, Morning, M, 1/9/18, "{" "basket": "Beer|Diapers|Cat Food|Crackers|Bread", "StoreID": 253, "CashID": 34 }", 87.67
California, Night, Su, 3/20/17, "{" "basket": "Beer|Diapers|Cat Food|Crackers|Bread", "StoreID": 253, "CashID": 34 }", 23.83
California, Noon, R, 8/21/17, "{" "basket": "Beer|Diapers|Cat Food|Crackers|Bread", "StoreID": 253, "CashID": 34 }", 56.6
replace('1 and 2 and 3', 'and', 'or')

The following string is returned.

1 or 2 or 3

right

right returns the rightmost characters from a string, including spaces. You specify the number of characters to be returned.

Syntax

right(expression, limit)

Arguments

expression

The expression must be a string. It can be the name of a field that uses the string data type, a literal value like '12 Main Street', or a call to another function that outputs a string.

limit

The number of characters to be returned from expression, starting from the last character in the string.

Return Type

String

Example

The following example returns the last five characters from a string.

right('Seattle Store#14', 12)

The following value is returned.

tle Store#14

round

round rounds a decimal value to the closest integer if no scale is specified, or to the closest decimal place if scale is specified.

round is supported for use with analyses based on SPICE (p. 2) data sets.

Syntax

round(decimal, scale)
Arguments

decimal

A field that uses the decimal data type, a literal value like 17.62, or a call to another function that outputs a decimal.

scale

The number of decimal places to use for the return values.

Return Type

Decimal

Example

The following example rounds a decimal field to the closest second decimal place.

\[
\text{round(sales\_amount, 2)}
\]

The following are the given field values.

<table>
<thead>
<tr>
<th>20.1307</th>
<th>892.0388</th>
<th>57.5447</th>
</tr>
</thead>
</table>

For these field values, the following values are returned.

<table>
<thead>
<tr>
<th>20.13</th>
<th>892.04</th>
<th>58.54</th>
</tr>
</thead>
</table>

rtrim

rtrim removes following whitespace from a string.

Syntax

\[
rtrim(expression)
\]

Arguments

expression

The expression must be a string. It can be the name of a field that uses the string data type, a literal value like '12 Main Street', or a call to another function that outputs a string.

Return Type

String
Example

The following example removes the following spaces from a string.

```rtrim('Seattle Store#14   ')```

For these field values, the following values are returned.

| Seattle Store#14 |

**split**

`split` splits a string into an array of substrings, based on a delimiter that you choose, and returns the item specified by the position.

**Syntax**

```split(expression, delimiter, position)```

**Arguments**

### expression

The expression must be a string. It can be the name of a field that uses the string data type, a literal value like `'12 Main Street;1402 35th Ave;1818 Elm Ct;11 Janes Lane'`, or a call to another function that outputs a string.

### delimiter

The character that delimits where the string is broken into substrings. For example, `split('one|two|three', '|', 2)` becomes the following.

<table>
<thead>
<tr>
<th>one</th>
</tr>
</thead>
<tbody>
<tr>
<td>two</td>
</tr>
<tr>
<td>three</td>
</tr>
</tbody>
</table>

If you choose `position = 2`, `split` returns `'two'`.

### position

(Required) The position of the item to return from the array. The position of the first item in the array is 1.

**Return Type**

String array

**Example**

The following example splits a string into an array, using the semicolon character (`;`) as the delimiter, and returns the third element of the array.

```split('123 Test St;1402 35th Ave;1818 Elm Ct;11 Janes Lane', ';', 3)```
The following item is returned.

```
1818 Elm Ct
```

This function skips items containing null values or empty strings.

**strlen**

`strlen` returns the number of characters in a string, including spaces.

**Syntax**

```
strlen(expression)
```

**Arguments**

`expression`

An expression can be the name of a field that uses the string data type like `address1`, a literal value like `'Unknown'`, or another function like `substring(field_name, 0, 5)`.

**Return Type**

Integer

**Example**

The following example returns the length of the specified string.

```
strlen('1421 Main Street')
```

The following value is returned.

```
16
```

**substring**

`substring` returns the characters in a string, starting at the location specified by the `start` argument and proceeding for the number of characters specified by the `length` arguments.

**Syntax**

```
substring(expression, start, length)
```

**Arguments**

`expression`

An expression can be the name of a field that uses the string data type like `address1`, a literal value like `'Unknown'`, or another function like `substring(field_name, 0, 5)`.
**start**

The character location to start from. *start* is inclusive, so the character at the starting position is the first character in the returned value.

**length**

The number of additional characters to include after *start*. *length* is inclusive of *start*, so the last character returned is *length* - 1 after the starting character.

**Return Type**

String

**Example**

The following example returns the thirteenth through nineteenth characters in a string.

```sql
substring('Fantasy and Science Fiction',13,7)
```

The following value is returned.

```
Science
```

**toLowerCase**

toLower formats a string in all lowercase. toLower skips rows containing null values.

**Syntax**

```sql
toLower(expression)
```

**Arguments**

*expression*

The expression must be a string. It can be the name of a field that uses the string data type, a literal value like '12 Main Street', or a call to another function that outputs a string.

**Return Type**

String

**Example**

The following example converts a string value into lowercase.

```sql
toLower('Seattle Store#14')
```

The following value is returned.
**toString**

`toString` formats the input expression as a string. `toString` skips rows containing null values.

**Syntax**

```
toString(expression)
```

**Arguments**

`expression`

An expression can be a field of any data type, a literal value like `14.62`, or a call to another function that returns any data type.

**Return Type**

String

**Example**

The following example returns the values from Field2 (which uses the date data type) as strings.

```
toString(Field2)
```

The following are the given field values.

```
Field2
-------
1992-11-14T00:00:00.000Z
2012-10-12T00:00:00.000Z
1973-04-08T00:00:00.000Z
```

For these field values, the following rows are returned.

```
1992-11-14T00:00:00.000Z
2012-10-12T00:00:00.000Z
1973-04-08T00:00:00.000Z
```

**toUpperCase**

`toUpperCase` formats a string in all uppercase. `toUpperCase` skips rows containing null values.

**Syntax**

```
toUpperCase(expression)
```

207
Arguments

expression

The expression must be a string. It can be the name of a field that uses the string data type, a literal value like '12 Main Street', or a call to another function that outputs a string.

Return Type

String

Example

The following example converts a string value into uppercase.

toUpper('Seattle Store#14')

The following value is returned.

SEATTLE STORE#14

trim

trim removes both preceding and following whitespace from a string.

Syntax

trim(expression)

Arguments

expression

The expression must be a string. It can be the name of a field that uses the string data type, a literal value like '12 Main Street', or a call to another function that outputs a string.

Return Type

String

Example

The following example removes the following spaces from a string.

trim(' Seattle Store#14 ')

For these field values, the following values are returned.

Seattle Store#14
truncDate

truncDate returns a date value that represents a specified portion of a date. For example, requesting the year portion of the value 2012-09-02T00:00:00.000Z returns 2012-01-01T00:00:00.000Z. Specifying a time-related period for a date that doesn't contain time information returns the initial date value unchanged.

truncDate is supported for use with analyses based on SPICE (p. 2) data sets.

Syntax

truncDate('period', date)

Arguments

period

The period of the date that you want returned. Valid periods are as follows:

- YYYY: This returns the year portion of the date.
- MM: This returns the month portion of the date.
- DD: This returns the day portion of the date.
- WK: This returns the week portion of the date. The week starts on Sunday in Amazon QuickSight.
- HH: This returns the hour portion of the date.
- MI: This returns the minute portion of the date.
- SS: This returns the second portion of the date. (Not supported when added inside SPICE-based analyses.)

date

A date field or a call to another function that outputs a date.

Return Type

Date

Example

The following example returns a date representing the month of the order date.

truncDate('MM', {Order Date})

The following are the given field values.

<table>
<thead>
<tr>
<th>order date</th>
</tr>
</thead>
<tbody>
<tr>
<td>2012-12-14T00:00:00.000Z</td>
</tr>
<tr>
<td>2013-12-29T00:00:00.000Z</td>
</tr>
<tr>
<td>2012-11-15T00:00:00.000Z</td>
</tr>
</tbody>
</table>

For these field values, the following values are returned.

2012-12-01T00:00:00.000Z
<table>
<thead>
<tr>
<th>truncDate</th>
</tr>
</thead>
<tbody>
<tr>
<td>2013-12-01T00:00:00.000Z</td>
</tr>
<tr>
<td>2012-11-01T00:00:00.000Z</td>
</tr>
</tbody>
</table>
Working with Analyses

You use an analysis to create and interact with visuals and stories. You can think of an analysis as a container for a set of related visuals and stories, for example ones that are all applicable to a given business goal or key performance indicator. You can use multiple data sets in an analysis, although any given visual can only use one of those data sets.

After you create an analysis and an initial visual, you can expand the analysis by adding data sets and visuals, and also by creating stories to add narrative to the analysis data.

Amazon QuickSight supports up to 20 data sets in a single analysis, and up to 20 visuals in a single analysis.

Topics
- Creating an Analysis (p. 211)
- Saving Changes to an Analysis (p. 212)
- Renaming an Analysis (p. 213)
- Adding a Title and Description to an Analysis (p. 213)
- Viewing Analysis Details (p. 214)
- Deleting an Analysis (p. 215)
- Export Data from an Analysis to a CSV File (p. 215)
- Adding a Data Set to an Analysis (p. 216)
- Modifying Data Set Fields in an Analysis (p. 220)
- Adding a Calculated Field to an Analysis (p. 243)
- Parameters in Amazon QuickSight (p. 252)
- SPICE Data in an Analysis (p. 261)
- Sharing Analyses (p. 262)

Creating an Analysis

Use the following procedure to create a new analysis.

1. On the All analyses tab of the Amazon QuickSight start page, choose New analysis. You are taken to the Your Data Sets page.
2. Choose a data set and then choose Create analysis.
If you don't have any data sets, create a new one by choosing **New data set**. You can create an analysis as the last step in creating a new data set. For more information about creating a data set, see *Creating Data Sets* (p. 66).

3. Create a visual. For more information about creating visuals, see *Creating an Amazon QuickSight Visual* (p. 265).

After you are done creating the analysis, you can iterate on it by modifying the visual, adding additional visuals, adding scenes to the default story, or adding additional stories.

## Saving Changes to an Analysis

When working on an analysis, you can set Autosave either on (the default) or off. When Autosave is on, your changes are automatically saved every minute or so. When Autosave is off, your changes are not automatically saved, which allows you to make changes and pursue different lines of inquiry without permanently altering the analysis. If you decide that you want to save your results after all, re-enable Autosave. Your changes up to that point are then saved.

In either Autosave mode, you can undo or redo any change you make by choosing **Undo** or **Redo** on the application bar.
Changing the Autosave Mode

To change the Autosave mode for an analysis, choose the Autosave indicator next to the analysis name and then choose **Autosave ON** or **Autosave OFF**.

![Autosave ON/OFF dropdown](image)

When Autosave Can't Save Changes

Suppose that one of the following things occurs:

- Autosave is on and another user makes a conflicting change to the analysis.
- Autosave is on and there is a service failure, such that your most recent changes can't be saved.
- Autosave is off, you turn it on, and one of the backlogged changes now being saved to the server conflicts with another user's changes.

In this case, Amazon QuickSight gives you the option to do one of two things. You can either let Amazon QuickSight turn Autosave off and continue working in unsaved mode, or reload the analysis from the server and then redo your most recent changes.

If your client authentication expires while you are editing an analysis, you are directed to sign in again. On successful sign-in, you are directed back to the analysis where you can continue working normally.

If your permissions on the analysis are revoked while you are editing it, you can't make any further changes.

Renaming an Analysis

Use the following procedure to rename an analysis.

1. Open the analysis you want to rename.
2. In the **Analysis name** field in the application bar, select the current name and then type a new name.

Adding a Title and Description to an Analysis

In addition to the analysis name, you can add a title and description to an analysis. A useful title and description provides context about the information in the analysis.

Add a Title and Description

Use the following procedure to add a title and description to an analysis. Titles and descriptions can contain up to 1024 characters.
1. On the analysis page, choose Add in the application bar and then choose Add title.

2. Type a title in the Sheet title box and press Enter. To remove a title, choose Add in the application bar and then choose Remove title. Alternatively, to remove the title, you can select the title and then choose the x-shaped delete icon.

3. Choose Add in the application bar and then choose Add description.

4. Type a description in the Description box and press Enter. To remove a description, choose Add in the application bar and then choose Remove description. Alternatively, to remove the description, you can select the description and then choose the x-shaped delete icon.

Viewing Analysis Details

To view an analysis, locate the analysis on the All analyses tab of the Amazon QuickSight start page. Then choose the analysis.
Deleting an Analysis

You can delete an analysis by using the All analyses tab of the Amazon QuickSight start page. Deleting an analysis doesn't affect any dashboards that are based on that analysis.

To remove an analysis, choose the details icon (⋮) on the analysis, and choose Delete. Confirm your choice by choosing Delete again.

Export Data from an Analysis to a CSV File

To export data from an analysis or dashboard to a comma-separated values (CSV) file, follow the procedure in Exporting Data from an Amazon QuickSight Visual to a CSV File (p. 269).
Adding a Data Set to an Analysis

After you have created an analysis, you can add more data sets to the analysis. Then, you can use them to create more visuals.

From within the analysis, you can open any data set for editing, for example to add or remove fields, or perform other data preparation. You can also remove, or replace data sets.

The currently selected data set displays at the top of the Fields list pane. This is the data set that is used by the currently selected visual. Each visual can use only one data set. Choosing a different visual changes the selected data set to the one used by that visual.

To change the selected data set manually, choose the data set list at the top of the Fields list pane and then choose a different data set. This deselects the currently selected visual if it doesn’t use this data set; either choose a visual that uses the selected data set, or choose Add Visual to create a new visual using the selected data set.

If you choose X-ray on the tool bar to see suggested visuals, you'll see visuals based on the currently selected data set.

Only filters for the currently selected data set are shown in the Filter pane, and you can only create filters on the currently selected data set.

Add or Edit a Data Set

Use the following procedure to add a data set to an analysis or edit a data set used by an analysis.

1. On the analysis page, choose the pencil-shaped edit icon at the top of the Fields list pane.
Replacing Data Sets

In an analysis, you can add, edit, replace, or remove data sets. Use this section to learn how to replace your data set.

When you replace a data set, the new data set should have similar columns, if you expect the visual to work the way you designed it. Replacing the data set also clears the undo and redo history for the analysis. This means you can't use the undo and redo buttons on the application bar to navigate your changes. So, when you decide to change the data set, your analysis design should be somewhat stable—not in the middle of an editing phase.

Use the following procedure to replace a data set.

1. Inside your analysis, choose the pencil icon near the data set from the top left of the screen.
2. Choose the **Replace this data set with another** icon in the screen that opens.
3. From the list of available data sets that appears, choose one, and then choose **Select**.
4. **Note**
   
   Replacing a data set clears the undo and redo history for this analysis.

   Review your choice, and confirm it by choosing **Replace**.
The data set is replaced with the new one. The field list and visuals are updated with the new data set.

At this point, you can choose to add a new data set, edit the new data set, or replace it with a different one. Choose **Close** to exit.

### If Your New Data Set Doesn't Match

If the selected replacement data set doesn't contain all of the fields and hierarchies used by the visuals, filters, parameters, and calculated fields in your analysis, you receive a warning from Amazon QuickSight. It shows a list of mismatched columns.

If this happens, you can choose **Replace anyway**, which breaks some or all of your visuals, or choose **Back** to cancel. By choosing **Back**, you get the opportunity to note the mismatches and investigate.

The following screenshot shows a mismatch. The *Region* field in the data set is a geographic type, when the analysis expects it to be a text field. Additionally, the new data set is missing the *Monthly Compensation* field, because the field containing this data has a different name in the data set.

In this case, you can choose **Back** and edit the data set to change *Region* to a string. You can then rename the *Compensation* field to *Monthly Compensation*.
Alternatively, if we choose **Replace anyway**, a confirmation notice appears. It warns you that some things in the analysis—visuals, filters, parameters, calculated fields, or some combination of these—don’t work with the new data set. Choose **Confirm** to proceed, or choose **Back** to cancel.

If you change your mind after replacing the data set, you can still recover. Let's say you replace the data set despite the mismatches, and then find that it is too difficult to change your analysis to match the new data set. You can undo any changes you made to your analysis, and replace the new data set with the original one, or with a data set that more closely matches the requirements of the analysis.

### Remove a Data Set From an Analysis

Use the following procedure to delete a data set from an analysis.

1. On the analysis page, choose the data set list at the top of the **Fields list** pane and then choose **Edit analysis data sets**.

2. In the **Data sets in this analysis** dialog box, choose the data set you want to delete, and then choose the delete icon. Note that you can’t delete a data set if it’s the only one in the analysis.
3. Choose Close to close the dialog box.

Modifying Data Set Fields in an Analysis

You can modify the dimension or measure setting of a field by using the Field list pane. You can also change numeric field data types, and numeric or date field formats, by using the Field list pane, visual field wells, or on-visual editors. When you change a field data type or format, it applies to all visuals in the analysis that use that data set.

Topics
- Setting a Field as a Dimension or Measure (p. 220)
- Changing a Field Data Type (p. 221)
- Customizing a Field Format (p. 221)

Setting a Field as a Dimension or Measure

In the Field list pane, dimension fields have blue icons and measure fields have green icons. Dimensions are text or date fields that may be items, like products, or attributes that are related to measures and can be used to partition them, like sales date for sales figures. Measures are numeric values that you use for measurement, comparison, and aggregation. If Amazon QuickSight interpreted a field as a measure and you would rather use it as a dimension (or the other way around), you can change the setting for that field.

Changing a field's measure or dimension setting changes it for all visuals in the analysis that use that data set, but does not change it in the data set itself.

Change a Field's Dimension or Measure Setting

1. In the Field list pane, hover over the field you want to change.
2. Choose the selector icon to the right of the field name, and then choose Convert to dimension or Convert to measure as appropriate.
Changing a Field Data Type

You can use the Field list pane, visual field wells, or on-visual editors to change numeric field data types within the context of an analysis. Numeric fields default to displaying as numbers, but you can choose to have them display as currency or as a percentage instead. You can't change the data types for string or date fields.

Changing a field's data type in an analysis changes it for all visuals in the analysis that use that data set, but does not change it in the data set itself.

Note
If you are working in a pivot table visual, applying a table calculation changes the data type of the cell values if the data type doesn't make sense with the applied calculation. For example, if you apply the Rank function to a numeric field that you modified to use a currency data type, the cell values display as numbers rather than currency. Similarly, if you apply the Percent difference function instead, the cell values display as percentages rather than currency. For more information about applying calculations to a pivot table, see Working with Table Calculations (p. 381).

Change a Numeric Field's Data Type

Use the following procedure to change a field's data type.

1. Choose one of the following options:
   - In the Field list pane, hover over the numeric field you want to change and then choose the selector icon to the right of the field name.
   - On any visual that contains an on-visual editor associated with the numeric field you want to change, choose that on-visual editor.
   - Expand the Field wells pane, then choose the field well associated with the numeric field you want to change.

2. Choose Show as and then choose Number, Currency, or Percent.

Customizing a Field Format

Use the following procedure to customizing the appearance of fields in an analysis.

1. In an analysis, choose a field to format, either by choosing it either in the field well or in the Fields list of the Visualize pane.
2. Choose **Show as** to change how the field shows in the analysis, and choose from the options on the context menu. The list of available options varies based on the field's data type. If you choose a non-numeric field from the fields list, you can change the **count format**, which is the formatting used when the field is counted.

3. Choose **Format** to change the format of the field, and choose from the options on the context menu. If you don't see an option that you want to use, choose **More formatting options** from the context menu.

   The **Format Data** pane opens, presenting options for the type of numeric or date field you chose. The following screenshots show the **Format Data** pane.
The options for **Show as** from the context menu now appear in the dropdown list at the top of the **Format Data** pane. The rest of the options are specific to the data type and how you choose to show the field.

For date and time data, the default format pattern is `YYYY-MM-DDTHH:mm:ssZZ`, for example `2016-09-22T17:00:00-07:00`.

For numbers, you can choose from the following units to display after the number:

- No unit suffix. This is the default.
- Thousands (K)
- Millions (M)
- Billions (B)
- Trillions (T)
- A custom unit prefix or suffix

For currency, you can choose from the following symbols:

- Dollars ($)
- Euros (€)
- Pounds (£)
- Yen (¥)
Changing a Field Format

You can change the format of a field within the context of an analysis. The formatting options available for fields vary based on the field's data type.

Use menu options in the Field list pane or the visual field wells to make simple format changes, or use the Format Data pane to make more extensive formatting changes.

Topics
- Format a Date Field (p. 224)
- Format a Number Field (p. 228)
- Format a Currency Field (p. 233)
- Format a Percent Field (p. 239)
- Return a Field's Format to Default Settings (p. 243)

Format a Date Field

When you format a date field, you can choose a list of common formatting options. Alternatively, you can open the Format Data pane choose from a list of common formats, or specify custom formatting for the date and time values.

Changing a field format changes it for all visuals in the analysis that use that data set, but does not change it in the data set itself.

Format a Date Field Using List Options

If you want to format a date field by choosing from a list of common options, you can access such a list from the Field list pane, a visual on-visual editor, or a visual field well.

Use the following procedure to change a date field's format by choosing a list option.

1. Choose one of the following options:
   - In the Field list pane, choose the selector icon to the right of the date field you want to format.
   - On any visual that contains an on-visual editor associated with the date field you want to format, choose that on-visual editor.
   - Expand the Field wells pane, then choose the field well associated with the date field you want to change.
2. Choose Format, and then choose the format you want. The following quick formatting options are offered for date fields:
   - Show the month, day, year, and time.
   - Show the month, day, and year.
   - Show the month and year.
   - Show the year.

Format a Date Field Manually

Manually formatting the field allows you to choose from a more extensive list of date and time formats to use, or alternatively to specify custom formats for the date and time values.

Use the following procedure to manually change a date field's format.
1. Choose one of the following options:
   - In the Field list pane, choose the selector icon to the right of the date field you want to format.
   - On any visual that contains an on-visual editor associated with the date field you want to format, choose that on-visual editor.
   - Expand the Field wells pane, then choose the field well associated with the date field you want to change.

2. Choose Format and then choose More Formatting Options....

The Format Data pane opens.

3. Expand the Date section. Choose an existing date format, or choose Custom and specify a format pattern in the Custom section lower down in the Format Data pane. If you choose Custom for the Date section, you must also choose Custom for the following Time section, and the pattern you specify in the Custom section must include any date and time formatting that you want.

   The default selection is Custom, with a default format pattern of YYYY-MM-DDTHH:mm:ssZZ, for example 2016-09-22T17:00:00-07:00.
4. Expand the **Time** section. Choose an existing time format, or choose **Custom** and specify a format pattern in the **Custom** section lower down in the **Format Data** pane. If you choose **Custom** for the **Time** section, you must also choose **Custom** for the preceding **Date** section, and the pattern you specify in the **Custom** section must include any date and time formatting that you want.

The default selection is **Custom**, with a default format pattern of `YYYY-MM-DDTHH:mm:ssZ`, for example `2016-09-22T17:00:00-07:00`. 
If you chose Custom in the Date and Time sections, expand the Custom section and specify the format pattern that you want, using the format pattern syntax specified in Class DateTimeFormat in the Joda project documentation.

If you chose something other than Custom in the Date and Time sections, Custom is populated with the format pattern that reflects your selections. For example, if you chose Jun 21, 2016 in the Date section and 17:00:00pm in the Time section, the Custom section shows the format pattern MMM DD, YYYY HH:mm:ssa.
6. (Optional) Expand the **Custom** section and use **Preview** to verify your specified format.

**Format a Number Field**

When you format a number field, you can either choose the decimal place and thousand separator format from a list of common options or you can open the **Format Data** pane and manually format the field. Manually formatting the field allows you to choose what separators to use, the number of decimal places to show, what units to use, and how to display negative numbers.

Changing a field format changes it for all visuals in the analysis, but does not change it in the underlying data set.

**Format a Number Field Using List Options**

If you want to format a number field by choosing from a list of common options, you can access such a list from the **Field list** pane, an on-visual editor, or a visual field well.

Use the following procedure to change a number field's format by choosing a list option.

1. Choose one of the following options:
   - In the **Field list** pane, choose the selector icon to the right of the number field you want to format.
   - On any visual that contains an on-visual editor associated with the number field you want to format, choose that on-visual editor.
• Expand the Field wells pane, then choose the field well associated with the number field you want to change.

2. Choose Format, and then choose the format you want. The following quick formatting options are offered for number fields:

• Use commas to separate groups of thousands and use a decimal point to show the fractional part of the number, for example 1,234.56.
• Use a decimal point to show the fractional part of the number, for example 1234.56.
• Show the number as an integer and use commas to separate groups of thousands, for example 1,234.
• Show the number as an integer, for example 1234.

Format a Number Field Manually

Manually formatting the field allows you to choose what separators to use, the number of decimal places to show, what units to use, and how to display negative numbers.

Use the following procedure to manually change a number field's format.

1. Choose one of the following options:

• In the Field list pane, choose the selector icon to the right of the number field you want to format.
• On any visual that contains an on-visual editor associated with the number field you want to format, choose that on-visual editor.
• Expand the Field wells pane, then choose the field well associated with the number field you want to change.

2. Choose Format and then choose More Formatting Options....

The Format Data pane opens.
3. Expand the **Separators** section and choose from the following options:

- Under **Decimal**, choose a dot or a comma for the decimal separator. A dot is the default. If you choose a comma instead, you must use a dot or a space as the thousands separator.
- Under **Thousands**, select or deselect **Enabled** to indicate whether you want to use a thousands separator. **Enabled** is selected by default.
- If you are using a thousands separator, choose whether to use a comma, dot, or space for the separator. A comma is the default. If you choose a dot instead, you must use a comma as the decimal separator.

4. Expand the **Decimal Places** section and choose from the following options:

- Choose **Auto** to have Amazon QuickSight automatically determine the appropriate number of decimal places, or choose **Custom** to specify a number of decimal places. **Auto** is the default.
- If you chose **Custom**, enter the number of decimal places to use. Field values are rounded to the decimal places specified. For example, if you specify two decimal places, the value 6.728 is rounded to 6.73.
5. Expand the **Units** section and choose from the following options:

- Choose the unit to use. Choosing a unit adds the appropriate suffix to the number value. For example, if you choose **Thousands**, a field value of 1234 displays as 1.234K.

The unit options are as follows:
- No unit suffix. This is the default.
- Thousands (K)
- Millions (M)
- Billions (B)
- Trillions (T)

- If you want to use a custom prefix or suffix, specify it in the **Prefix** or **Suffix** box. You can specify both, and you can also specify a custom prefix in addition to the suffix added by selecting a unit.
6. Expand the **Negatives** section and choose whether to display a negative value by using a minus sign or by enclosing it in parentheses. Using a minus sign is the default.
Format a Currency Field

When you format a currency field, you can either choose the currency symbol from a list of common options, or open the Format Data pane and manually format the field. Manually formatting the field allows you to choose what symbol to use, what separators to use, the number of decimal places to show, what units to use, and how to display negative numbers.

Changing a field format changes it for all visuals in the analysis, but does not change it in the underlying data set.

Format a Currency Field Using List Options

If you want to choose the symbol for a currency field from a list of common options, you can access such a list from the Field list pane, an on-visual editor, or a visual field well.

Use the following procedure to select a currency field's symbol by choosing a list option.

1. Choose one of the following options:
   - In the Field list pane, choose the selector icon to the right of the currency field you want to format.
   - On any visual that contains an on-visual editor associated with the currency field you want to format, choose that on-visual editor.
   - Expand the Field wells pane, then choose the field well associated with the currency field you want to change.
2. Choose **Symbol**, and then choose the symbol you want. The following symbols are offered for currency fields:

   - Display in dollars ($).
   - Display in pounds (£).
   - Display in euros (€).
   - Display in yen (¥).

**Format a Currency Field Manually**

Manually formatting the field allows you to choose what symbol to use, what separators to use, the number of decimal places to show, what units to use, and how to display negative numbers.

Use the following procedure to manually change a currency field's format.

1. Choose one of the following options:
   - In the **Field list** pane, choose the selector icon to the right of the currency field you want to format.
   - On any visual that contains an on-visual editor associated with the currency field you want to format, choose that on-visual editor.
   - Expand the **Field wells** pane, then choose the field well associated with the currency field you want to change.

2. Choose **Format** and then choose **More Formatting options**.

   The **Format Data** pane opens.

   ![Format Data Pane](image)

3. Expand the **Symbol** section and choose from the following options:

   - Display in dollars ($). This is the default.
   - Display in pounds (£).
• Display in euros (€).
• Display in yen (¥).

4. Expand the **Separators** section and choose from the following options:

- Under **Decimal**, choose a dot or a comma for the decimal separator. A dot is the default. If you choose a comma instead, you must use a dot or a space as the thousands separator.
- Under **Thousands**, select or deselect **Enabled** to indicate whether you want to use a thousands separator. **Enabled** is selected by default.
- If you are using a thousands separator, choose whether to use a comma, dot, or space for the separator. A comma is the default. If you choose a dot instead, you must use a comma as the decimal separator.
5. Expand the **Decimal Places** section and choose the number of decimal places to use. The default is 2. Field values are rounded to the decimal places specified. For example, if you specify two decimal places, the value 6.728 is rounded to 6.73.
6. Expand the **Units** section and choose from the following options:

   - Choose the unit to use. Choosing a unit adds the appropriate suffix to the number value. For example, if you choose **Thousands**, a field value of 1234 displays as 1.234K.

   The unit options are as follows:

   - No unit suffix. This is the default.
   - Thousands (K)
   - Millions (M)
   - Billions (B)
   - Trillions (T)

   - If you want to use a custom prefix or suffix, specify it in the **Prefix** or **Suffix** box. Using a custom suffix is a good way to specify a currency suffix outside of those already offered by Amazon QuickSight. You can specify both, and you can also specify a custom prefix in addition to the suffix added by selecting a unit.
7. Expand the **Negatives** section and choose whether to display a negative value by using a minus sign or by enclosing it in parentheses. Using a minus sign is the default.
Format a Percent Field

When you format a percent field, you can either choose the number of decimal places from a list of common options, or open the Format Data pane and manually format the field. Manually formatting the field allows you to choose what separators to use, the number of decimal places to show, and how to display negative numbers.

Changing a field format changes it for all visuals in the analysis, but does not change it in the underlying data set.

Format a Percent Field Using List Options

If you want to choose the number of decimal places for a percent field from a list of common options, you can access such a list from the Field list pane, an on-visual editor, or a visual field well.

Use the following procedure to change a percent field's number of decimal places by choosing a list option.

1. Choose one of the following options:
   - In the Field list pane, choose the selector icon to the right of the percent field you want to format.
   - On any visual that contains an on-visual editor associated with the percent field you want to format, choose that on-visual editor.
   - Expand the Field wells pane, then choose the field well associated with the percent field you want to change.
2. Choose **Decimals**, and then choose the number of decimal places you want. The following quick formats are offered for percent fields:

- Display the value with two decimal places.
- Display the value with one decimal place.
- Display the value with no decimal places.

**Format a Percent Field Manually**

Manually formatting the field allows you to choose what separators to use, the number of decimal places to show, and how to display negative numbers.

Use the following procedure to manually change a percent field's format.

1. Choose one of the following options:
   - In the **Field list** pane, choose the selector icon to the right of the percent field you want to format.
   - On any visual that contains an on-visual editor associated with the percent field you want to format, choose that on-visual editor.
   - Expand the **Field wells** pane, then choose the field well associated with the percent field you want to change.

2. Choose **Format** and then choose **More Formatting options**....

The **Format Data** pane opens.

3. Expand the **Separators** section and choose from the following options:
   - Under **Decimal**, choose a dot or a comma for the decimal separator. A dot is the default. If you choose a comma instead, you must use a dot or a space as the thousands separator.
   - Under **Thousands**, select or deselect **Enabled** to indicate whether you want to use a thousands separator. **Enabled** is selected by default.
   - If you are using a thousands separator, choose whether to use a comma, dot, or space for the separator. A comma is the default. If you choose a dot instead, you must use a comma as the decimal separator.
4. Expand the **Decimal Places** section and choose from the following options:

- Choose **Auto** to have Amazon QuickSight automatically determine the appropriate number of decimal places, or choose **Custom** to specify a number of decimal places. **Auto** is the default.
- If you chose **Custom**, enter the number of decimal places to use. Field values are rounded to the decimal places specified. For example, if you specify two decimal places, the value 6.728 is rounded to 6.73.
5. Expand the **Negatives** section and choose whether to display a negative value by using a minus sign or by enclosing it in parentheses. Using a minus sign is the default.
Return a Field's Format to Default Settings

Use the following procedure to return a field's format to the default settings.

1. Choose one of the following options:
   - In the Field list pane, choose the selector icon to the right of the field you want to reset.
   - On any visual that contains an on-visual editor associated with the field you want to reset, choose that on-visual editor.
   - Expand the Field wells pane, then choose the field well associated with the field you want to change.
2. Choose Format and then choose More Formatting options....
   The Format Data pane opens.
3. Choose Reset to defaults.

Adding a Calculated Field to an Analysis

You create calculated fields to use functions and operators to analyze or transform field data. You can add calculated fields to a data set or to an analysis. You can create a calculated field and add a formula (expression) with aggregate functions only in an analysis.
When you add a calculated field to a data set during data preparation, it's available to all analyses that use that data set. Data sets support only single-row operations. When you add a calculated field to an analysis, it's available only in that analysis. Analyses support both single-row operations and aggregate operations.

Single-row operations are those that supply a (potentially) different result for every row. Aggregate operations supply results that are always the same for entire sets of rows. For example, if you use a simple string function with no conditions, it changes every row. If you use an aggregate function, it applies to all the rows in a group. If you ask for the total sales amount for the US, the same number applies to the entire set. If you ask for data on a particular state, the total sales amount changes to reflect your new grouping. It still provides one result for the entire set.

By creating the aggregated calculated field within the analysis, you can then drill down into the data. The value of that aggregated field is recalculated appropriately for each level. This type of aggregation isn't possible during data set preparation.

For example, let's say that you want to figure out the percentage of profit for each country, region, and state. You can add a calculated field to your analysis, \[
\frac{\text{sum}(\{\text{sales amount} \} - \text{cost})}{\text{sum}(\{\text{sales amount}\})}.
\]
This field is then calculated for each country, region, and state, at the time your analyst drills down into the geography.

The functions available in SPICE (p. 2) data include the following.

- `avg` (p. 245)
- `ceil` (p. 180)
- `count` (p. 246)
- `dateDiff` (p. 183)
- `decimalToInt` (p. 183)
- `distinct_count` (p. 246)
- `epochDate` (p. 184)
- `extract` (p. 185)
- `floor` (p. 186)
- `intToDecimal` (p. 189)
- `max` (p. 247)
- `min` (p. 247)
- `round` (p. 202)
- `sum` (p. 247)
- `truncDate` (p. 209)

**Note**

The date functions `extract` and `truncDate` don't support SS (second) in SPICE.

For information on calculated fields in data sets, see Working with Calculated Fields (p. 143).

**Topics**

- Using Aggregate Functions in Calculated Fields (p. 245)
- Adding a Calculated Field (p. 248)
- Parameters in a Calculated Field in an Analysis (p. 249)
- Editing a Calculated Field (p. 250)
- Deleting a Calculated Field (p. 251)
Using Aggregate Functions in Calculated Fields

You can use the following aggregate functions on calculated fields during analysis and visualization:

- **Average** – Averages the set of numbers in the specified measure, grouped by the chosen dimension or dimensions.
- **Count** – Calculates the number of values in a dimension or measure, grouped by the chosen dimension or dimensions.
- **Distinct Count** – Calculates the number of distinct values in a dimension or measure, grouped by the chosen dimension or dimensions.
- **Max** – Returns the maximum value of the specified measure, grouped by the chosen dimension or dimensions.
- **Min** – Returns the minimum value of the specified measure, grouped by the chosen dimension or dimensions.
- **Sum** – Adds the set of numbers in the specified measure, grouped by the chosen dimension or dimensions.

When a calculated field formula contains an aggregation, it becomes a custom aggregation. To make sure your data is accurately displayed, Amazon QuickSight applies the following rules:

- Custom aggregations can't contain nested aggregate functions. For example, this formula won't work: `sum(avg(x)/avg(y))`. However, nesting nonaggregated functions inside or outside aggregate functions do work. For example, `ceil(avg(x))` works. So does `avg(ceil(x))`.
- Custom aggregations can't contain both aggregated and nonaggregated fields, in any combination. For example, this formula won't work: `Sum(sales)+quantity`.
- Filter groups can't contain both aggregated and nonaggregated fields.
- Custom aggregations can't be converted to a dimension. They also can't be dropped into the field well as a dimension.
- In a pivot table, custom aggregations can't be added to table calculations.
- Scatter plots with custom aggregations need at least one dimension under **Group/Color** in the field wells.

For details about supported functions and operators, see Amazon QuickSight Calculated Field Function and Operator Reference (p. 175).

**Topics**

- `avg` (p. 245)
- `count` (p. 246)
- `distinct_count` (p. 246)
- `max` (p. 247)
- `min` (p. 247)
- `sum` (p. 247)

**avg**

The `avg` function averages the set of numbers in the specified measure, grouped by the chosen dimension or dimensions. For example, `avg(sales amount)` returns the average for that measure grouped by the (optional) chosen dimension.
Using Aggregate Functions in Calculated Fields

Syntax

\[ \text{avg}(\text{decimal}) \]

Arguments

\text{decimal}

The argument must be a measure. Null values are omitted from the results. Literal values don't work. The argument must be a field.

count

The \text{count} function calculates the number of values in a dimension or measure, grouped by the chosen dimension or dimensions. For example, \text{count}(\text{product type}) returns the total number of product types grouped by the (optional) chosen dimension, including any duplicates. The \text{count}(\text{sales}) function returns the total number of sales completed grouped by the (optional) chosen dimension, for example salesperson.

Syntax

\[ \text{count}(\text{dimension or measure}) \]

Arguments

\text{dimension or measure}

The argument must be a measure or a dimension. Null values are omitted from the results. Literal values don't work. The argument must be a field.

distinct_count

The \text{distinct_count} function calculates the number of distinct values in a dimension or measure, grouped by the chosen dimension or dimensions. For example, \text{distinct_count}(\text{product type}) returns the total number of unique product types grouped by the (optional) chosen dimension, without any duplicates. The \text{distinct_count}(\text{ship date}) function returns the total number of dates when products were shipped grouped by the (optional) chosen dimension, for example region.

Syntax

\[ \text{distinct_count}(\text{dimension or measure}) \]

Arguments

\text{dimension or measure}

The argument must be a measure or a dimension. Null values are omitted from the results. Literal values don't work. The argument must be a field.
**max**

The `max` function returns the maximum value of the specified measure, grouped by the chosen dimension or dimensions. For example, `max(sales goal)` returns the maximum sales goals grouped by the (optional) chosen dimension.

**Syntax**

```
max(measure)
```

**Arguments**

`measure`

- The argument must be a measure. Null values are omitted from the results. Literal values don't work.
- The argument must be a field.

**min**

The `min` function returns the minimum value of the specified measure, grouped by the chosen dimension or dimensions. For example, `min(return rate)` returns the minimum rate of returns grouped by the (optional) chosen dimension.

**Syntax**

```
min(measure)
```

**Arguments**

`measure`

- The argument must be a measure. Null values are omitted from the results. Literal values don't work.
- The argument must be a field.

**sum**

The `sum` function adds the set of numbers in the specified measure, grouped by the chosen dimension or dimensions. For example, `sum(profit amount)` returns the total profit amount grouped by the (optional) chosen dimension.

**Syntax**

```
sum(measure)
```

**Arguments**

`measure`

- The argument must be a measure. Null values are omitted from the results. Literal values don't work.
- The argument must be a field.
Adding a Calculated Field

Use the following procedure to add a calculated field.

1. Choose Add on the application bar, and then choose Add calculated field.

2. For Calculated field name, where it says Enter a field name, type a name for the calculated field. This name will be the field label displayed in the analysis, so it should match the existing style of field names.

3. Choose a function from Function list, and choose the fields that you want to use from the Field list. Each field is entered into the formula where your cursor is. You can add user-defined parameters from Parameter list in the same way.
4. In Formula, type any formula parameters needed by the function. Choose any additional fields or parameters to complete your formula.

If you use a field that has a space or a nonalphanumeric character other than an underscore in the name, you must enclose the field name in curly braces when referencing it, for example \( \{ship \ charges \ amount\} \). Curly braces are optional if the field name has no space and no nonalphanumeric character.

5. Choose Create.

If there are no errors in the formula or name, the new calculated field is created. It appears in the Fields list pane.

**Parameters in a Calculated Field in an Analysis**

You can reference parameters in calculated fields that are in an analysis. When you create a calculation, you can choose existing parameters from the list of parameters under Parameter list. Alternatively, you can type in the parameter name, preceded with a \$ and enclosed in curly braces \{\}, for example \$\{parameterName\}. 
Use the following procedure to edit a calculated field.

1. In the Field list pane, hover over the calculated field you want to change.
2. Choose the selector icon to the right of the field name, and then choose Edit calculated field.

3. If the field is a custom aggregation, you can edit it in the field well.

   Hover over the field in the field well and choose the selector icon to the right of the field name. Choose Aggregate: custom, and then choose Custom.
Then choose **Edit formula**.

### Deleting a Calculated Field

Use the following procedure to delete a calculated field.

1. In the **Field list** pane, hover over the calculated field you want to delete.
2. Choose the selector icon to the right of the field name, and then choose **Remove calculated field**.
Parameters in Amazon QuickSight

Parameters are named variables that can provide values to an action or an object. They provide a way to create a connection between the dashboard user and the technical features that make the dashboard interactive.

For example, the dashboard user can use a list control to choose a value for a parameter. That parameter then sets the filter, calculation, or URL action to the chosen value. Then the visuals in the dashboard react to the user’s choices.

In Amazon QuickSight analyses, you can use parameters in any of the following:

- Calculated fields
- Controls (a control can only exist as part of a parameter)
- Filters
- URL actions

Some ways that you can use parameters are the following:

- Using a calculation, you can transform data that is shown in an analysis.
- If you add a control with a filter to an analysis you are publishing, the dashboard users can filter the data without creating their own filters.
- Using controls and URL actions, you can let dashboard users set values for the URL actions.

Setting Up Parameters in Amazon QuickSight

Creating or Editing Parameters in Amazon QuickSight

Use the following procedure to create or edit a basic parameter.

1. Choose an analysis to work with, and decide which field you want to parameterize.
2. Choose the Parameters pane from the left side of the screen.
3. Add a new parameter by choosing the add icon (+) near the top of the pane. Edit an existing parameter by choosing the v-shaped icon near the parameter name and then choosing Edit parameter.
4. The following screen appears.
A parameter consists of the following parts, which you enter on this screen:

**Name**

Type in an alphanumeric value for the parameter **Name**. This name is used as a reference in the consumers of the parameters (for example, calculated field, filter, custom URL action, and so on). For ease of use, you can choose a name that reflects the data type and purpose of the parameter.

**Data type**

Choose a value for **Data type**. This data type can't be altered after you create the parameter.

**Default value**

Type in a value for **Default value** for the parameter. This value is used during the first page load, if a dynamic default value or URL parameter isn't provided.

**Dynamic default value**

Choose **Set a dynamic default** to create such a default. A **dynamic default** is a per-user default value for the first page load of the dashboard. Calculated fields can't be used as dynamic defaults. Dynamic defaults don't prevent a user from selecting a different value. If you want to also secure the data, you can also add row-level locking. For more information, see Restricting Access to a Data Set by Using Row-Level Security (p. 108).

5. **Choose Create or Update** to complete creating or updating the parameter.

After you create a parameter, you can use it in a variety of ways. You can create a control (such as a button) so that you can choose a value for your parameter. For more information, see the following sections.
Using a Control with a Parameter in Amazon QuickSight

In dashboards, parameter controls appear at the top of the data sheet, which contains a set of visuals. Providing a control allows users to choose a value to use in a predefined filter or URL action. Dashboard users can use controls to apply filtering across all visuals data sets on a dashboard, without having to create the filters themselves.

Use the following procedure to create or edit a control for an existing parameter. You need to have an existing parameter to create or edit a control.

1. Choose an existing parameter's context menu, the v icon near the parameter name, and choose Add control.
2. Type a name to give the new control a label. This label displays at the top of the workspace, and later at the top of the sheet that a dashboard displays on.
3. Choose a style for the control from the following:
   - Text box
     A text box lets a user type in their own value. A text box works with numbers and text (strings).
   - Drop-down (single select)
     A drop-down list lets a user select from multiple options, for example, a list of regions or products. A drop-down list works with numbers and text (strings).
   - Slider
     A slider lets a user select a numeric value by sliding the control from one end of the bar to another. A slider works with numbers.
   - Date-picker
     A date-picker lets a user select a date from a calendar control.
4. (Optional) If you choose a drop-down control, the screen expands so you can choose the values to display. You can either specify a list of values, or use a field in a data set. Choose one of the following:
   - Specific values
     To create a list of specific values, type in one per line, with no separating spaces or commas, as shown in the following screenshot.
In the control, the values display in the order you typed them, not alphabetically.

- **Link to a data set field**

  To link to a field, choose the data set that contains your field, then choose the field from the list. It can’t be a calculated field. The values display alphabetically in the control. Using more than 10,000 distinct values for linked data isn’t supported. If you need more than 10,000 values, you can enter them in **Specific values**.

  If you change the default values in the parameter, choose **Reset** on the control to show the new values.

5. When you finish choosing options for your control, choose **Add**.

The finished control appears at the top of the workspace. The context menu, shaped like a v, offers four options:

- **Reset** restores the user’s selection to its default state.
- **Refresh list** applies only to drop-downs that are linked to a field in a data set. Choosing **Refresh list** queries the data to check for changes. Data used in the control is cached.
- **Edit** reopens the control creation screen so that you can change your settings.
- **Delete** removes the control. You can recreate it by choosing the parameter context menu.

In the workspace, you can also resize and rearrange your controls. The dashboard users see them as you do, except without being able to edit or delete them.

**Creating Parameter Defaults in Amazon QuickSight**

Use this section to learn more about the types of parameter defaults that are available, and how to set up each of them. If you set up a dynamic default, the parameter's control automatically uses that user's preselected default. In the absence of a dynamic default, the parameter's control uses the static default.

Use the following procedure to create or edit a static (unchanging) default value for a parameter.
1. Choose the context menu (v) by the parameter you want to edit, or create a new parameter by following the steps in Creating or Editing Parameters in Amazon QuickSight (p. 252).

2. To set a static default, type a value in the **Default value** field. Otherwise, leave this blank. The value you set for a static default can't be changed by the dashboard user.

To create or edit an optional dynamic default value for a parameter, use the following procedure. The data set for dynamic defaults can use a database query or an uploaded file.

1. Create a database table or SQL query similar to the following. For the sake of maintainability, the names of other fields (columns) should closely match those in the data set you are analyzing. It doesn't matter what order the fields are in. It also doesn't matter if there are fields in this data set that aren't in the current analysis.

   ```
   UserID    Region     Segment
   anacarolinasilva NorthEast  SMB
   liujie      SouthEast  SMB
   WestRegionSalesExecs West     Enterprise
   saanvisarkar NorthCentral SMB
   zhangwei    SouthCentral SMB
   ```

   After you finish this procedure, you can use these fields to choose the default settings for each user, based on a filter you create. To learn more about using filters with parameters, see Using Filters with Parameters in Amazon QuickSight (p. 257).

2. Create a data set based on this data, and add it to your analysis.

3. Open the **Parameters** pane, choose a parameter's context (v) menu, and choose **Edit parameter**.

4. Choose **Set a dynamic default**.

5. Choose the data set you put your user ID and dynamic default values in. Then choose the **UserID** column for the **User name column**. Next, choose the relevant value field for the **Default value column**, for example **Region** or **Segment**.

6. Choose **Apply** to save your changes. After you finish this step, each user's dynamic default value is used in the parameter controls. This doesn't stop them from choosing a different value.

   If a dynamic default can't be resolved to a single value, Amazon QuickSight uses the static default value. If a user has no dynamic default value, or the user ID doesn't exist in the data set, then the static default value is used. If there is no static default either, then the user can still choose values from the controls.

### Connecting to Parameters in Amazon QuickSight

Use this section after you have a parameter set up, to connect it and make it work.

After you create a parameter, you can create consumers of the parameters. **Parameter consumers** are components that consume the value of a parameter, such as filters, controls, calculated fields, or URL actions.

You can choose your next step from the shortcuts on this screen. Alternatively, you can navigate to each of these in another way.
Using Filters with Parameters in Amazon QuickSight

Use this section to filter the data in an analysis or dashboard by a parameter value. Before using a filter with a parameter, you should already know how to work with filters.

1. Verify that your analysis has a parameter already created. Choose Edit from either the parameter or the control's menu to find out what settings are in use.

2. Choose the Filter pane from the left side of the screen. If there is already a filter for the field that you want to use, choose it to open its settings. Otherwise, create a filter for the field that you want to filter by parameter.

3. Select Use Parameters.

4. Choose your parameters from the list or lists below Use parameters. For text (string) fields, first choose Custom Filter, and then enable Use Parameters.

   For date fields, choose the Start date and End date parameters, as shown in the following screenshot.
For fields with other data types, choose Select a parameter and then choose your parameter from the list.
5. Choose **Apply** to save your changes.

Test your new filter by choosing the control near the top of the analysis. In this example, we use a basic parameter that has no defaults, and a dynamic control that is linked to the **Region** field in the sample data set named **Sales Pipeline**. The control queries the data, returning all values.

Two context menus appear in the following screenshot. The menu that is highlighted in the screenshot manages the parameter. The menu that is not highlighted manages the control settings. Using the control's menu, you can reset the control by choosing **Reset**, or refresh your data by choosing **Refresh list**.
If you delete or recreate a parameter that you are using in a filter, you can update the filter with the new parameter. To do this, open the filter, choose the new parameter that you want to use, and then choose Apply.

If you rename a parameter, you don't need to update the filter or any other consumers.

**Using Calculated Fields with Parameters in Amazon QuickSight**

You can pass the value of a parameter to a calculated field in an analysis. When you create a calculation, you can choose existing parameters from the list of parameters under **Parameter list**.
Using Custom URL Actions with Parameters in Amazon QuickSight

You can pass or send parameters to custom URL actions. For example, you could add a parameter to a custom URL action so you can send it to another URL. The parameters on both the sending and the receiving end should match in name and data type.

To use a parameter in a custom URL action, select it from the list. Parameters are enclosed in curly braces { }, and preceded by a $, for example: ${parameterName}.

SPICE Data in an Analysis

When you use SPICE (p. 2) data to create an analysis, a data import indicator appears next to the data set list at the top of the Fields list pane. When you first open the analysis and the data set is importing, this icon appears as a spinner.

Once the SPICE import completes, the indicator displays the percentage of rows that were successfully imported. A message also appears at the top of the visualization pane to provide counts of the rows imported and skipped.

If any rows were skipped, you can choose View summary in this message bar to see details about why those rows failed to import. To edit the data set and resolve the issues that led to skipped rows, choose Edit data set. For more information about common causes for skipped rows, see My Rows Were Skipped During Data Preparation (p. 500).
If an import fails altogether, the data import indicator appears as an exclamation point icon, and an Import failed message displays.

Sharing Analyses

You can share an analysis with one or more other users by emailing them a link, making it easy to collaborate and disseminate findings. You can only share an analysis with other users in your Amazon QuickSight account.

Once you share an analysis, you can review the other users that have access to it, and also revoke access from any user.

Topics

• Share an Analysis (p. 262)
• View the Users an Analysis is Shared With (p. 263)
• Revoke Access to an Analysis (p. 264)

Share an Analysis

Use the following procedure to share an analysis.

1. On the analysis page, choose Share on the application bar and then choose Share analysis.
2. You can only share analyses with users or groups who are in your Amazon QuickSight account.

   To add a user or group to share with, in the Type a user name or email box, type the first user or group you want to share this analysis with. Then choose Share. Repeat this step until you have entered information for everyone you want to share the analysis with.

   To edit sharing for this analysis, choose Manage analysis access.
3. On this screen you can edit permissions, and add more users or groups. For Permission, choose the role to assign to each user or group. The role determines the permission level to grant to that user or group.

The users you have shared the analysis with receive emails with a link to the analysis. Groups don’t receive invitation emails.

View the Users an Analysis is Shared With

If you have shared an analysis, you can use the following procedure to see which users or groups have access to it.

1. On the analysis page, choose Share on the application bar and then choose Share analysis.
2. Choose Manage analysis access.
3. Review who this analysis has been shared with. You can search to locate a specific user account by typing a search term. The search will return any user, group, or email address that contains the search term. Searching is case-sensitive and wildcards are not supported. Delete the search term to view all users and groups.

Revoke Access to an Analysis

Use the following procedure to revoke access to an analysis.

1. On the analysis page, choose **Share** on the application bar and then choose **Share analysis**.
2. Choose **Manage analysis access**.
3. Locate the user or group whose access you want to revoke. Then choose the trashcan icon next to the user or group.
4. Choose **Confirm**.
Creating an Amazon QuickSight Visual

You can create a visual in several ways. You can select the fields that you want and use AutoGraph to let Amazon QuickSight determine the most appropriate visual type, or you can choose a specific visual type and choose fields to populate it. Alternatively, if you aren't sure what questions your data can answer for you, you can choose Suggested on the tool bar and choose a visual that Amazon QuickSight suggests for you. Suggested visuals are ones that we think are of interest, based on a preliminary examination of your data. For more information about AutoGraph, see Using AutoGraph (p. 346).

You can add more visuals to the workspace by choosing Add, then Add visual. Visuals created after June-21-2018 are smaller in size, fitting two on each row. You can resize the visuals and drag them to rearrange them.
To create a useful visual, it helps to know what question you are trying to answer as specifically as possible, and to use the smallest data set that can answer that question. Doing so helps you create simpler visuals that are easier to analyze.

## Fields as Dimensions and Measures

In the **Fields list** pane, dimension fields have blue icons and measure fields have green icons. Dimensions are text or date fields that can be items, like products, or attributes that are related to measures and can be used to partition them, like sales date for sales figures. Measures are numeric values that you use for measurement, comparison, and aggregation. You typically use a combination of dimension and measure fields to produce a visual, for example sales totals (a measure) by sales date (a dimension). For more information about the types of fields expected by the different visual types, see the specific visual type topics in the Working with Visual Types in Amazon QuickSight (p. 343) section. For more information about changing a field's measure or dimension setting, see Setting a Field as a Dimension or Measure (p. 220).

### Field Limitations

You can only use one date field per visual. This limitation applies to all visual types.

You can't use the same field for more than one dimension field well or drop target on a visual. For more information about how expected field type is indicated by field wells and drop targets, see Using Visual Field Controls (p. 287).

### Searching for Fields

If you have a long field list in the **Fields list** pane, you can search to locate a specific field by choosing the search icon at the top of the **Fields list** pane and then typing a search term into the search box. Any field whose name contains the search term is shown. Search is case-insensitive and wildcards are not supported. Choose the cancel icon (X) to the right of the search box to return to viewing all fields.

### Creating a Visual

Use the following procedure to create a new visual.

1. On the Amazon QuickSight start page, choose the analysis that you want to add a visual to.
2. On the analysis page, choose the data set that you want to use from the data set list at the top of the **Fields list** pane. For more information, see Adding a Data Set to an Analysis (p. 216).
3. Choose **Add** on the application bar, and then choose **Add visual**.

   A new, blank visual is created and receives focus.

4. Use one of the following options:
   - Choose the fields to use from the **Fields list** pane at left. If the Fields list isn't visible, choose **Visualize** to display it. Amazon QuickSight creates the visual, using the visual type it determines is most compatible with the data you selected.
   - Create a visual by choosing a visual type and then choosing fields to populate it.
       1. Choose the icon of a visual type from the **Visual types** pane.
The field wells display the fields that are visualized.

Click anywhere on the field wells to open them.

2. From the Fields list pane, drag the fields that you want to use to the appropriate field wells. Typically, you want to use dimension or measure fields as indicated by the color of the target field well. If you choose to use a dimension field to populate a Value field well, the Count aggregate function is automatically applied to it to create a numeric value.

Amazon QuickSight creates the visual using the visual type you selected.

- Create a visual using a suggestion.

On the tool bar, choose X-Ray, then choose a suggested visual.
Renaming an Amazon QuickSight Visual

Use the following procedure to rename a visual.

1. On the analysis page, select the visual that you want to rename.
2. Select the visual name at the top left of the visual and type a new name.
3. Press Enter or click outside of the visual name field to save the new name.

Deleting an Amazon QuickSight Visual

Use the following procedure to delete a visual.

1. On the analysis page, select the visual that you want to delete.
2. Choose the on-visual menu at the upper-right corner of the visual, and then choose Delete.

Exporting Data from an Amazon QuickSight Visual to a CSV File

Use the following procedure to export data from a visual to a file with the comma-separated value (CSV) format.

1. Choose or create an analysis or dashboard that contains one or more visuals.
2. Choose the visual that you want to export.
3. Choose the on-visual menu, at the upper right of the visual. Then choose Export to CSV.
4. Depending on your browser settings, one of the following happens:
   • The file automatically goes to your default Download location.
   • A dialog box appears so you can choose a file name and location.
   • A dialog box appears so you can choose to open the file with the default software or to save the file. If you choose to save, you can choose a file name and location.

   By default, the CSV file name is the name of your analysis or dashboard. To make the file name unique, it has a sequential timestamp (a Unix epoch data type) or a date in the format yyyy-MM-dd_THH_mm_ss.SSSZ. You can choose rename the downloaded file, for example to include the name of the visual.

   The CSV contains the fields and filtered data appearing in the visual.

5. To export data from additional visuals in the same analysis or dashboard, repeat this process for each visual.

**Tip**
If you have difficulty getting the download to start, try a different browser.

## Changing Visual Layout in Amazon QuickSight

When you create an analysis, you see a workspace that contains one full-sized visual. You can add more visuals to the workspace by choosing **Add**, then **Add visual**. Visuals created after May 2018 are smaller in size, fitting two on each row. You can resize the visuals and drag them to rearrange them.

If you change a visual to make it considerably smaller, the on-visual editors are hidden so that the chart elements have more room to display. Bar chart visuals can also display fewer data points. To see a resized visual in full pane mode so that on-visual editors and all data points are displayed, use the **Maximize** option on the on-visual menu. Choose **Minimize** to return the visual to its original size when you are done.

If you resize a visual that uses a legend so that it is taller than it is wide, the legend displays on the bottom of the chart if it had been displaying on the right-hand side.

If you reduce the size of the browser window, Amazon QuickSight resizes and if necessary reorders visuals for optimal display. For example, smaller visuals that were side by side might be displayed sequentially. The original layout is restored when the size of the browser window is increased again.

**Note:**
Changing Visual Location

On the analysis page, choose the move handle on the visual that you want to relocate. Drag the visual to where you want it.
Changing Visual Size

To change visual size, on the analysis page choose the resize handle on the visual that you want to resize. Drag to change the visual's dimensions.
Editing a Resized Visual

Use the following procedure to open a resized visual in full pane mode for editing.

1. On the analysis page, choose the visual that you want to edit.
2. Choose the on-visual menu at the upper-right corner of the visual, and then choose Maximize.

The visual opens in full pane mode, displaying the on-visual editors if they were hidden.
3. Edit the visual. When you are done, choose the on-visual menu at the upper-right corner of the visual, and then choose Minimize.

Viewing Visual Data in Amazon QuickSight

Amazon QuickSight offers a variety of ways to see the details of the data being displayed in a visual. The axes or rows and columns of the visual (depending on the visual type) have labels, and hovering over any graphical element in a visual displays the data associated with that element. Some visual types use visual cues to emphasize the element you are hovering over and make it easier to differentiate, for example by changing the color of the element, or highlighting it.

Use the following sections to learn more about viewing data in visuals.

Topics
- Viewing Visual Details (p. 274)
- Scrolling Through Visual Data (p. 275)
- Focusing on Visual Elements (p. 276)
- Excluding Visual Elements (p. 277)

Viewing Visual Details

When viewing a visual, you can hover your cursor over any graphical element to get details on that element. For example, a bar on a bar chart:

Or a bubble on a scatter plot:
Scrolling Through Visual Data

For bar charts, line charts, and pivot tables, creating a visual on a large data set can result in more visual elements than can be fit into the page length or width. In these cases, scroll bars are provided so that you can page through the data. Drag the scroll bar slider to view different areas of the chart.

On bar charts and line charts, you can also adjust the length of the slider to reflect a greater or lesser proportion of the chart. To do this, choose one of the gray handles on either end of the slider and drag it to adjust the slider size.
Focusing on Visual Elements

When viewing visuals, you can choose an element on the visual (like a bar or bubble, or a row or column header in the case of a pivot table), and then choose to focus on the element.

Focusing on the element creates a filter that removes all other elements except for the one you selected:
To see the other elements again, either choose **Undo** on the application bar, or disable or delete the filter.

For more information about filters, see **Filtering Visual Data in Amazon QuickSight (p. 310)**.

**Excluding Visual Elements**

When viewing visuals, you can choose an element (like a bar or bubble, or a row or column header in the case of a pivot table), and then choose to exclude the element. The exception is that you can’t exclude elements that are mapped to date fields. You can exclude multiple elements on a single chart.

Excluding the element creates a filter that removes only that element from the visual:
To see the excluded element again, either choose **Undo** on the application bar, or disable or delete the filter.

For more information about filters, see Filtering Visual Data in Amazon QuickSight (p. 310).

**Formatting a Visual in Amazon QuickSight**

Use visual formatting to choose display options for your data visualization. The following list indicates which visuals support what type of formatting.

- **Bar charts (both horizontal and vertical):**
  - Customize, display, or hide title and labels
  - Customize, display, or hide legend (exception: simple charts without clustering or multiple measures don't show a legend)
  - Specify axis range and steps on x-axis for horizontal bar charts, and on y-axis for vertical bar charts
  - Show or hide the “other” category

- **Combo charts:**
  - Customize, display, or hide title and labels
  - Customize, display, or hide legend (exception: simple charts without clustering, stacking, or multiple measures don't show a legend)
  - Specify axis range on bars and lines
  - Show or hide the “other” category

- **Geospatial charts (maps):**
  - Customize, display, or hide title and legend

- **Heat maps:**
  - Customize, display, or hide title, legend, and labels

- **Key performance indicators (KPIs):**
  - Customize, display, or hide title
  - Display or hide trend arrows and progress bar
  - Customize comparison method as auto, difference, percent (%), or difference as percent (%)
  - Customize primary value displayed to be comparison or actual

- **Line charts:**
  - Customize, display, or hide title and labels
  - Customize, display, or hide legend (exception: simple charts don't show a legend)
  - Specify axis range and steps (on y-axis)
• Show or hide the “other” category, except when the x-axis is a date
• Pie charts:
  • Customize, display, or hide title and legend
  • Customize, display, or hide the labels for group/color and value fields
  • Show or hide the “other” category
• Pivot tables:
  • Customize, display, or hide title
  • Customize, display, or hide the column names for row and value fields
  • Show or hide the “other” category
• Scatter plots:
  • Customize, display, or hide title, legend, and labels
  • Specify axis range (on x-axis and y-axis)
• Tabular reports:
  • Customize, display, or hide title and legend
  • Customize, display, or hide the column names for group-by and value fields
  • Display or hide totals at the top or bottom of the table
• Tree maps:
  • Customize, display, or hide title and legend
  • Customize, display, or hide the labels for group-by, size, and color fields
  • Show or hide the “other” category

Customizing a Visual Title

Use the following procedure to hide or display the title for a visual. The visual title displays by default.

1. On the analysis page, select the visual that you want to format. You can change the title by putting your cursor in the title and editing it directly. To revert to the default name, delete your entry.
2. Choose the on-visual menu at the upper-right corner of the visual, and then choose **Format visual**.

3. On the **Format Visual** pane, enable or disable **Show title**.
4. Close the **Format Visual** pane by choosing the X icon in the upper-right corner of the pane.

**Customizing Visual Labels**

Use the following procedure to customize, display, or hide the labels for a visual.

1. On the analysis page, select the visual that you want to format. You can change the labels by choosing the label directly on the visual, and choosing **Rename**. To revert to the default name, delete your entry.

2. To see more options, choose the on-visual menu at the upper-right corner of the visual, and then choose **Format visual**.
3. On the **Format Visual** pane, enable or disable **Show label**. This option takes its name from the name of the axis, for example **Show X-Axis label**.

4. Close the **Format Visual** pane by choosing the X icon in the upper-right corner of the pane.

**Customizing the Visual Legend**

The visual legend helps you identify what a visual element represents by mapping its value to a color. For example, on a line chart, line color might represent store location.

To hide or display the legend, you can use the visual menu. You can also use the **Format Visual** pane, which provides more options. The visual legend displays to the right of the visual by default.
When you move your cursor over the legend, a handle appears that you can use to adjust the width of the legend pane by dragging it wider or narrower.

![Legend Example]

Use the following procedure to hide or display the visual title. The visual title displays by default.

1. On the analysis page, select the visual that you want to format.
2. Choose the on-visual menu at the upper-right corner of the visual, and choose **Display legend** or **Hide legend**.
3. Choose **Format visual** to see formatting options.
4. On the **Format Visual** pane, expand the **Legend** section.

5. Enable or disable **Show legend** and **Show legend title**.
6. To customize the title of the legend, type a new title in the Legend text box. To revert to the default name, delete your entry.

7. For POSITION, choose Right, Bottom, or Top to determine where on the visual the legend displays.

8. Close the Format Visual pane by choosing the X icon in the upper-right corner of the pane.

## Changing the Visual Scale with the Axis Range

To change the scale of the values shown on the visual, you can use the Format Visual pane to set the range for one or both axes of the visual. This option is available for the value axis on bar charts, combo charts, line charts, and scatter plots.

By default, the axis range starts at 0 and ends with the highest value for the measure being displayed. For the group-by axis, you can use the data zoom tool on the visual to dynamically adjust the scale.
Use the following procedure to set the axis range for a visual.

1. On the analysis page, select the visual that you want to format.
2. Choose the on-visual menu at the upper-right corner of the visual, and then choose **Format visual**.

3. On the **Format Visual** pane, choose **X-Axis** or **Y-axis**, depending on what type of visual you are customizing. This is the **X-Axis** section for horizontal bar charts, the **Y-Axis** section for vertical bar charts and line charts, and both axes are available for scatter plots. On combo charts, use **Bars** and **Lines** instead.

4. Type a new name in the box to rename the axis. To revert to the default name, delete your entry.
5. Set the range for the axis by choosing one of the following options:

- Choose **Auto (starting at 0)** to have the range start at 0 and end around the highest value for the measure being displayed.
- Choose **Auto (based on data range)** to have the range start at the lowest value for the measure being displayed and end around the highest value for the measure being displayed.
- Choose **Custom range** to have the range start and end at values that you specify.

If you choose **Custom range**, type the start and end values in the fields in that section. Typically, you use integers for the range values. For stacked 100 percent bar charts, use a decimal value to
indicating the percentage that you want. For example, if you want the range to be 0–30 percent instead of 0–100 percent, type 0 for the start value and .3 for the end value.

6. To customize the number of values to show on the axis, type in an integer between 1 and 50.

7. Close the **Format Visual** pane by choosing the X icon in the upper-right corner of the pane.

---

**Changing the Fields Used by a Visual in Amazon QuickSight**

You can add or modify fields for a visual by using the **Fields list** pane, the field wells, or the on-visual editors or drop targets on the visual.

The field wells, on-visual editors, and drop targets available for a specific visual depends on the visual type selected. Refer to the appropriate visual type topic in the *Working with Visual Types in Amazon QuickSight* (p. 343) section for details.

**Important**

You can also change the data type and format of numeric fields by using field wells and on-visual editors. If you change a field in this way, it changes it for all visuals in the analysis, not just for the selected visual. For more information about changing numeric field data types and formats, see *Modifying Data Set Fields in an Analysis* (p. 220).

Use the following topics to learn more about adding, removing, and modifying fields on a visual.

**Topics**

- Using Visual Field Controls (p. 287)
- Adding or Removing a Field (p. 292)
- Changing the Field Associated with a Visual Element (p. 293)
- Changing Field Aggregation (p. 296)
- Changing Date Field Granularity (p. 298)

**Using Visual Field Controls**

You can edit the fields used by a visual by using the following user interface (UI) controls:

- The **Fields list** pane.
• The field wells.

• The on-visual editors.
• The drop targets on the visual.
You can use these controls as follows:

- You can create a visual and assign fields to different elements on it by selecting fields in the **Fields list** pane, or dragging fields to field wells or drop targets.
- You can change the field associated with a visual element by dragging a field to a drop target or field well, or selecting a different field in a field well or on-visual editor.
- You can change field aggregation or date granularity by using the field wells or the on-visual editors.

The field wells, on-visual editors, and drop targets available on a specific visual depends on the visual type selected.

### Dragging Fields to Drop Targets or Field Wells

When you drag a field to either a drop target or field well, Amazon QuickSight provides you with information about whether the target element expects a measure or a dimension. Amazon QuickSight also provides you with information about whether that element is available for field assignment.

For example, when you drag a measure to the value drop target on a new single-measure line chart, you see the drop target color-coded green. That green color coding indicates that the drop target expects a measure. The drag label indicates that the target is available to add a field.
When you drag a dimension to the X axis or color drop target on a new line chart, you see a label color-coded blue. That blue color coding indicates that the drop target expects a dimension. The drag label indicates that the target is available to add a field.

You can also drag a measure or dimension to a drop target on a line chart where the element is already associated with a field. In this case, the drag label indicates that you are replacing the field currently associated with the drop target.
Adding or Removing a Field

You can add a field to a visual by choosing it on the Fields list pane, dragging it to a drop target on the visual, or dragging it to a field well. There is a 1:1 correspondence of drop targets to field wells for each visual type, so you can use whichever method you prefer.

To remove a field from a visual, deselect it in the Fields list pane, or choose an on-visual editor or field well that uses that field, and then choose Remove from the pop-up menu.

Adding a Field by Selecting It in the Fields List Pane

You can also let Amazon QuickSight map the field to the most appropriate visual element. To do so, simply choose the field in the Fields list pane. Amazon QuickSight adds the field to the visual by populating the first empty field well that corresponds with that field type (either measure or dimension). If all of the visual elements are already populated, Amazon QuickSight determines the most appropriate field well and replaces the field in it with the field you selected.

Adding a Field by Using a Drop Target

To add a field to a visual by using a drop target, choose a field in the Fields list pane and then drag the field to your chosen drop target on the visual, making sure the drop indicator shows that the field is being added.
Adding a Field by Using a Field Well

To add a field to a visual by using a field well, choose a field in the Fields list pane. Then drag the field to the target field well, making sure that the drop indicator shows that the field is being added.

1. Expand the Field wells pane by choosing the expand icon.

2. Drag the field that you want to add from the Fields list pane to the appropriate field well.

Changing the Field Associated with a Visual Element

You can change the field assigned to an element in a visual by using the field wells, drop targets, or the on-visual editors on the visual. For pivot tables, you must use field wells or drop targets as this visual type does not provide on-visual editors.
Change a Field Mapping by Using an On-Visual Editor

Use the following procedure to modify the mapping of a field to a visual element.

1. On the visual, choose the on-visual editor for the visual element for which you want to change the field.

2. On the on-visual editor menu, choose the field that you want to associate with that visual element.
Changing a Field Mapping by Using a Drop Target

To modify the mapping of a field to a visual element by using a drop target, choose a field in the Fields list pane. Then drag the field to a drop target on the visual, making sure that the drop indicator shows that the field is being replaced.

Changing a Field Mapping by Using a Field Well

Use the following procedure to modify the mapping of a field to a visual element.

1. Expand the Field wells pane by choosing the expand icon.

2. Choose the field well that represents the element that you want to remap, and then choose a new field from the menu that displays.
You can apply functions to fields to display aggregate information, like the sum of the sales for a given product. You can apply an aggregate function by using the options in either an on-visual editor or a field well. The following aggregate functions are available in Amazon QuickSight:

- **Average** – Calculates the average value for the selected field.
- **Count** – Provides a count of the number of records containing the selected measure for a given dimension. An example is a count of Order ID by State.
- **Distinct Count** – Provides a count of how many different values are in the selected measure, for the selected dimension or dimensions. An example is a count of Product by Region. A simple count can show how many products are sold for each region. A distinct count can show how many different products are sold for each region. You might have sold 2000 items, but only two different types of items.
- **Max** – Calculates the maximum value for the selected field.
- **Min** – Calculates the minimum value for the selected field.
- **Sum** – Totals all of the values for the selected field.

All aggregate functions can be applied to numeric fields. Count is automatically applied to a dimension if you choose to use it in a field well that expects a measure. If you have used a dimension in that way, you can also change the aggregate function applied to it. You can't apply aggregate functions to fields in dimension field wells.

The visual elements that support aggregated fields varies by visual type.

### Changing or Adding Aggregation on a Field by Using an On-Visual Editor

Use the following procedure to change or add aggregation on a field.

1. On the visual, choose the on-visual editor for the field that you want to apply aggregation to.
2. On the on-visual editor menu, choose **Aggregate**, then choose the aggregate function that you want to apply.

Changing or Adding Aggregation to a Field by Using a Field Well

Use the following procedure to add aggregation to a field for a pivot table visual.

1. Expand the **Field wells** pane by choosing the expand icon.
Changing Date Field Granularity

You can change the granularity for a date field on a visual to determine the intervals for which item values are shown. You can set the date field granularity to one of the following values:

- Year (this is the default).
- Month
- Week
- Day
- Hour. This is only supported when the date data includes time information.

Changing Date Field Granularity by Using an On-Visual Editor

Use the following procedure to change date field granularity by using an on-visual editor.

1. On the visual, choose the field well for the date field whose granularity you want to change.
2. On the field well menu, choose **Aggregate**, then choose the time interval that you want to apply, as shown following:

### Changing Date Field Granularity by Using a Field Well

Use the following procedure to change date field granularity by using a field well.

1. Expand the **Field wells** pane by choosing the expand icon.
2. Choose the field well containing the date field.
3. On the field well menu, choose **Aggregate**, then choose the date granularity that you want to use.

---

**Changing Visual Colors in Amazon QuickSight**

You can change the color of one, some, or all elements on visuals that use scatter plot, pie chart, or any of the bar chart or line chart visual types. You can change the chart color used by all elements on
the chart, and also change the color of individual elements. When you set the color for an individual element, it overrides the chart color. For example, suppose that you set the color for the Arts bar to blue.

Then you change the chart color to green. The Arts bar remains blue.

When you change the color of an element that is grouped, for example a bar in a clustered bar chart, the color for that element is changed in all of the groups. For example, if you have the following visual and you modify the color for the West region from purple to red:

It is modified in all of the clusters:
Setting New Colors for a Visual

Use the following procedure to change the colors for a visual.

1. On the analysis page, select the visual that you want to modify.
2. To change the chart color, choose any element on the visual, and then choose Chart Color.

   To select elements, do the following:
   - On a bar chart, choose any bar.
   - On a line chart, choose the end of a line.
   - On a scatter plot, choose an element. The field must be in the Group/Color section of Field wells.
3. Choose the color that you want. All elements on the visual are changed to use this color, except for any that have previously had their color individually set. In that case, the element color overrides the chart color.
4. To change the color for a single element on the visual, choose that element, choose **Color** `<fieldname>`, and then choose the color that you want.
Repeat this step until you have set the color on all elements that you want to modify.
Setting Visual Colors Back to Defaults

Use the following procedure to return to using the default colors on a visual.

1. On the analysis page, select the visual that you want to modify.
2. To change the chart color back to the default color for that visual type, choose any element on the visual, choose Chart Color, and then choose Reset to Default. All elements on the visual are changed to the default color for the visual type, except for any that have previously had their color individually set. In that case, the element color setting overrides the chart color setting.
To change the color for a single element back to the default, choose that element, choose **Color <fieldname>**, and then choose **Reset to Default**. The default color for individual elements is the chart color if you have specified one, or the default color for the visual type otherwise.
Sorting Visual Data in Amazon QuickSight

Most visual types offer the ability to change data sort order. Whether sorting is supported and what visual element you can sort by depends on the visual type.

Important
Sorting by text fields (those with a string data type) isn't supported for visuals based on SPICE (p. 2) data sets. In this case, sorting options don't appear for those fields.
Use the following table to identify the field wells or on-visual editors that support sorting for each visual type.

<table>
<thead>
<tr>
<th>Visual Type</th>
<th>Field Well or On-Visual Editor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bar charts (all Horizontal)</td>
<td>Y axis and Value</td>
</tr>
<tr>
<td>Bar charts (all Vertical)</td>
<td>X axis and Value</td>
</tr>
<tr>
<td>Combo charts (all)</td>
<td>X axis, Bars, and Lines</td>
</tr>
<tr>
<td>Geospatial charts</td>
<td>Sorting not supported</td>
</tr>
<tr>
<td>Heat map</td>
<td>Columns and Values</td>
</tr>
<tr>
<td>KPIs</td>
<td>Sorting not supported</td>
</tr>
<tr>
<td>Line charts (all)</td>
<td>X axis and Value for numeric measures only</td>
</tr>
<tr>
<td>Pie chart</td>
<td>Value and Group/Color</td>
</tr>
<tr>
<td>Pivot table</td>
<td>Column</td>
</tr>
<tr>
<td>Scatter plot</td>
<td>Sorting not supported</td>
</tr>
<tr>
<td>Tabular Reports</td>
<td>Group by and Value</td>
</tr>
<tr>
<td>Tree map</td>
<td>Size, Group by, and Color</td>
</tr>
</tbody>
</table>

**Sorting a Visual**

For most visual types, you can use either a field well or an on-visual editor to choose the sort order. Pivot tables behave differently; you specify the sort order by using the column sort icon on the visual. For more information about sorting pivot tables, see Sorting Pivot Tables (p. 380).

Use the procedures below to sort any non-pivot table visual type by using either a field well or an on-visual editor.

**Quick Sorting on a Visual Axis**

To quickly sort dimensions and measures on bar, stacked, combo charts, hover over the field name on either axis, and choose the sort icon that appears.

![Quick Sorting Example](image)

This shortcut to sorting is available for any data type in direct queries. In SPICE, it is available only for datetime, numeric, and decimal data types.
Sorting by Using an On-Visual Editor

1. On the visual, choose an on-visual editor that supports sorting.
2. On the on-visual editor menu, choose Sort, and then choose the ascending or descending sort order icon.

Sorting by Using a Field Well

1. Expand the Field wells pane by choosing the expand icon.

2. Choose a field well that supports sorting.
Filtering Visual Data in Amazon QuickSight

You can use filters to refine the data displayed in a visual. Filters are applied to the data before any aggregate functions that you specify.

A filter is associated with a single data set in an analysis. It can be scoped to one, several, or all visuals in the analysis that use that data set. By default, a filter applies only to the visual that was selected when the filter was created. You can change the scope of a filter after you create it.

Each filter applies only to a single field. You can apply filters to both regular and calculated fields.

If you create multiple filters, all top-level filters apply together using AND. If you group filters by adding them inside a top-level filter, the filters in the group apply using OR.

Amazon QuickSight applies all of the enabled filters to the field. For example, if there is one filter of state = WA and another filter of sales >= 500, then the data set only contains records that meet both of those criteria. If you disable one of these, only one filter applies.

Take care that multiple filters applied to the same field aren’t mutually exclusive.

Amazon QuickSight uses filters to focus on or exclude a visual element representing a particular value. For more information about focusing on a visual element, see Focusing on Visual Elements (p. 276). For more information about excluding a visual element, see Excluding Visual Elements (p. 277).

Topics
- Viewing Filters (p. 310)
- Adding a Filter (p. 312)
- Editing a Filter (p. 332)
- Deleting a Filter (p. 334)
- Parameterize a Filter (p. 335)

Viewing Filters

To see the filters for a visual, choose Filter on the tool bar. Only the filters that apply to the selected visual display. They appear in the Applied filters pane in order of creation, with the oldest filter on top.
If multiple filters are specified on a single field, they are grouped together. They are shown in order of creation, with the oldest filter on top.

Understanding Filter Icons

Filters in the **Applied filters** pane display icons to indicate how they are scoped, and whether or not they are enabled.

A disabled filter displays the disabled icon to the right of the filter name.

One of several scope icons displays to the left of the filter name to indicate the scope set on that filter.

These scope icons match those displayed on the filter menu when you are choosing the scope for the filter.
Adding a Filter

You can create a filter on any field from the data set associated with the currently selected visual. If you want to create a filter for a different data set, choose a visual that uses that data set. When you create a filter, it applies by default to just the currently selected visual. You can apply the filter to additional visual that use that data set after you create it.

Once you apply a filter to a visual, a filter icon appears on the visual so you can identify at a glance that the data is filtered.

Viewing Filter Details

Choose the filter to open the Edit Filter view and see filter details.

Choose the Edit filter selector to close that view and return to the Filters view.
You can create filters on text (string data type), numeric (int or decimal data types) and date fields. Depending on the data type of the field you choose, you are offered different filtering options, as described in the following topics.

Topics
- Adding a Text Filter (p. 313)
- Adding a Numeric Filter (p. 322)
- Adding a Date Filter (p. 325)
- Adding a compound filter with And/Or operators (p. 331)

Adding a Text Filter

You can filter text fields by either choosing field values from a list or by specifying field values.

Use the Filter list filter type to filter by choosing field values. Using this filter type, Amazon QuickSight retrieves a list of the field values for the selected field. You choose the values that you want to filter on, and whether you want to include or exclude records with those values.

Important
You are only offered this option in cases where Amazon QuickSight can quickly retrieve the full set of field values. In cases where the data set is very large or there's a very high number of unique values, this is not possible, and you must filter by specifying field values instead.

You can filter by specifying field values by using either the Custom filter list filter type or the Custom filter filter type.

With the Custom filter list filter type, you specify one or more field values to filter on, and whether you want to include or exclude records that contain those values. The specified value and actual field value must match exactly in order for the filter to be applied to a given record.

With the Custom filter filter type, you specify a single value that the field value must equal or not equal. If you choose an equal comparison, the specified value and actual field value must match exactly in order for the filter to be applied to a given record.

For any type of text filter, you can refresh the list of field values by choosing the refresh icon. This is helpful when you have created a filter before Amazon QuickSight has retrieved the entire data set and so does not initially have a complete list to display.
Details on how to create each type of text field filter are provided in the following sections.

**Adding a Text Filter by Choosing Field Values**

Use the following procedure to create a text field filter for by selecting field values.

**Important**

You can only filter by choosing field values in cases where Amazon QuickSight can quickly retrieve the full set of values. In cases where you are working with very large record sets and this is not possible, you must filter by specifying field values instead. For more information about filtering with specified field values, see Adding a Text Filter by Specifying Multiple Field Values (p. 317) and Adding a Text Filter by Specifying a Single Field Value (p. 320).

1. Choose **Filter** on the tool bar.
2. On the **Applied filters** pane, choose the new filter icon, and then choose a text field to filter on.

   This creates a new filter with no criteria.

3. Choose the new filter to expand it.

4. Choose **Filter list** for the filter type.
5. Choose whether to include or exclude records that contain the field values you will select in the next step.

6. Select the field values that you want to filter on.

   Scroll through the checklist and select or clear values, or toggle the ALL check box to select or deselect all of the values at once.
Toggle the sort icon to change the sort order of the field values from ascending (the default) to descending and back.
To narrow down the values displayed, type a search term into the box above the checklist and choose **Search**. Search terms are case-insensitive and wildcards are not supported. Any field value that contains the search term is returned. For example, searching on L returns al, AL, la, and LA.

To return to viewing the full set of field values rather than just those that match the search term, choose **Search** again.

**Note**

The filter list can display up to 10,000 values. If you have more than 10,000 values in your list, use a custom filter. For information about custom filters, see *Adding a Text Filter by Specifying Multiple Field Values* (p. 317).

**Adding a Text Filter by Specifying Multiple Field Values**

You can use the **Custom filter list** filter type to specify one or more field values to filter on, and choose whether you want to include or exclude records that contain those values. The specified value and actual field value must match exactly in order for the filter to be applied to a given record.

Use the following procedure to create a text field filter by specifying exact field values.
1. Choose **Filter** on the tool bar.
2. On the **Applied filters** pane, choose the new filter icon, and then choose a text field to filter on.

   This creates a new filter with no criteria.

3. Choose the new filter to expand it.

4. Choose **Custom filter list** for the filter type.

5. Type a field value in **Enter a value to add**, and then choose the add icon.
To remove a field value from the criteria, choose its delete icon.

6. (Optional) Repeat Step 5 until you have added all of the field values that you want to filter on.
7. Choose whether to include or exclude records that contain the field values you selected.
8. Choose **Apply**.

**Adding a Text Filter by Specifying a Single Field Value**

With the **Custom filter** filter type, you specify a single value that the field value must equal or not equal. If you choose an equal comparison, the specified value and actual field value must match exactly in order for the filter to be applied to a given record.

Use the following procedure to create a text field filter by specifying one field value.

1. Choose **Filter** on the tool bar.
2. On the **Applied filters** pane, choose the new filter icon, and then choose a text field to filter on.

   This creates a new filter with no criteria.
3. Choose the new filter to expand it.

4. Choose **Custom filter** for the filter type.

5. Choose a comparison type.
6. Type a field value in the **value** field.

7. Choose **Apply**.

**Adding a Numeric Filter**

Fields with decimal or int data types are considered numeric fields. You create filters on numeric fields by specifying a comparison type, for example **Greater than** or **Between**, and a comparison value or values as appropriate to the comparison type. Comparison values must be positive integers and should not contain commas.

You can use the following comparison types in numeric filters:

- Equals
- Does not equal
- Greater than
- Less than
- Greater than or equal to
- Less than or equal to
- Between
For data sets based on database queries, you can also optionally apply an aggregate function to the comparison value or values, for example `Sum` or `Average`.

You can use the following aggregate functions in numeric filters:
- Average
- Count
- Max
- Min
- Sum

**Creating a Numeric Filter**

Use the following procedure to create a numeric field filter.

1. Choose **Filter** on the tool bar.
2. On the **Applied filters** pane, choose the new filter icon, and then choose a numeric field to filter on.

   This creates a new filter with no criteria.

3. Choose the new filter to expand it.

4. Choose a comparison type.
5. (Optional) If you are using a query-based data set, choose an aggregate function if you want to use one.

6. If you have chosen a comparison type other than Between, type a comparison value.
Adding a Filter

If you have chosen a comparison type of Between, type the beginning of the value range in Minimum value and the end of the value range in Maximum value.

7. Choose Apply.

Adding a Date Filter

You create filters on date fields by selecting the filter conditions and date values that you want to use. There are two filter types for dates:

- **Range** – A series of dates based on a time range and comparison type. You can filter records based on whether the date field value is before or after a specified date, or within a date range. You enter date values in the format MM/DD/YYYY. You can use the following comparison types:
  - **Between** – Between a start date and an end date
  - **After** – After a specified date
  - **Before** – Before a specified date
- **Relative** – A series of date/time elements based on the current date. You can filter records based on the current date and your selected unit of measure (UOM). Date filter UOMs include years, quarters, months, weeks, days, and hours. You can use the following comparison types:
  - **Previous** – The previous UOM—for example, the previous year.
  - **This** – This UOM, which includes all dates and times that fall within the select UOM, even if they occur in the future.
  - **to date or up to now** – UOM to date, or UOM up to now. The displayed phrase adapts to the UOM you choose. However, in all cases this option filters out data that is not between the beginning of the current UOM and the current moment.
  - **Last n** – The last specified number of the given UOM, which includes all of this UOM and all of the last \( n - 1 \) UOM. For example, let's say today is May 10, 2017. You choose to use years as your UOM, and set Last \( n \) years to 3. The filtered data includes data for all of 2017, plus all of 2016, and all of 2015. If you have any data for the future dates of the current year (2017 in this example), these records are included in your data set.

Comparisons are applied inclusive to the date specified. For example, if you apply the filter \(<\text{date}>\) Before 1/1/16, the records returned include all rows with date values through 1/1/16 23:59:59.

**Note**

If a column or attribute has no time zone information, then the client query engine sets the default interpretation of that datetime data. For example, suppose that a column contains a timestamp, rather than a timestamptz, and you are in a different time zone than the data’s origin. In this case, the engine can render the timestamp differently than you expect. Amazon QuickSight and SPICE (p. 2) both use Universal Coordinated Time (UTC) times.

**Creating a Date Filter**

Use the following procedure to create a filter for a date field.

1. Choose **Filter** on the tool bar.
2. On the **Applied filters** pane, choose **Create one**, and then choose a date field to filter on.

   Doing this creates a new filter with no criteria.

3. If the filter does not expand to show options, choose the new filter to expand it.
4. Choose a filter type.

5. Do the following to create a date filter on a time range:
   a. To create a date filter on a time range, choose a comparison type.
b. Type date values.

If you choose a Between comparison, type a start and end date, or select the Start date or End date field to bring up the date picker control and select dates.
If you choose a **Before** or **After** comparison, type a date, or choose the date field to bring up the date picker control and select a date instead.

6. Do the following to create a date filter on relative dates:
a. Choose a unit of measure (UOM).

b. Choose one option. If you choose Last n UOM, specify a number for your range—for example, last 3 years, or last 2 hours.

For more information about date filter options, see Adding a Date Filter (p. 156).
7. Choose Apply.

Adding a compound filter with And/Or operators

When you add multiple filters to a visual, Amazon QuickSight uses the AND operator to combine them.

To add multiple filters using the OR operator, you must create a filter group. This lets you combine multiple conditions in a single filter with the OR operator. You can think of this as grouping filters in parentheses. Filter grouping is available for all types of filters.

When you filter on multiple measures (green fields marked with #), you can apply the filter conditions to an aggregate of that field. Filters in a group can contain either aggregated or non-aggregated fields, but not both.

To create a filter group, follow these steps.

1. Edit or create a filter.
2. Scroll to the bottom of the filter, where there is a dividing line labeled OR. Choose Add filter condition.
3. A new blank filter appears below the first one. Choose the next field and the conditions to filter on.

4. (Optional) You can add additional filter conditions to the filter group.

5. (Optional) To remove a filter from the filter group, choose X near the field name.

6. When you are finished, choose Apply.

**Editing a Filter**

You can edit a filter by enabling or disabling the filter, changing the filter criteria, or changing the filter scope to include or exclude other visuals in the analysis that use the same data set.

You can't change the field a filter applies to. To apply a filter to a different field, create a new filter instead.

**Enabling or Disabling a Filter**

You can use the filter menu to enable or disable a filter. When you create a filter, it is enabled by default.

1. On the analysis page, choose Filter on the tool bar.

2. On the Applied filters pane, choose the selector to the right of the filter name.

3. On the filter menu, choose Enable filter or Disable filter.
Changing Filter Criteria

Use the following procedure to modify a filter.

1. On the analysis page, choose **Filter** on the tool bar.
2. On the **Applied filters** pane, choose the filter that you want to modify to see the filter details.
3. Change the comparison type or values.
4. If the filter type has an **Apply** button, choose **Apply**.

Changing Filter Scope

You can use the filter menu to set the scope of a filter to one, several, or all visuals in the analysis that use the data set that filter is based on. By default, a filter applies only to the visual that was selected when the filter was created.

1. On the analysis page, choose **Filter** on the tool bar.
2. On the **Applied filters** pane, choose the selector to the right of the filter name.
3. On the filter menu, choose **All visuals for this data set**, **Some visuals for this data set** or **Only this visual**.
Deleting a Filter

Use the following procedures to delete a filter.

1. On the analysis page, choose Filter on the tool bar.
2. On the Applied filters pane, choose the selector to the right of the filter name.

3. (Optional) To delete one filter from a filter group, scroll to the filter that you want to delete. Then choose the X near the appropriate field name. Doing this removes a single filter condition.

To delete all filters from a filter group, choose **Delete all**.

**Parameterize a Filter**

To use an existing parameter in a filter on your analysis, you select **Use parameters**, and choose the parameter or parameters that you want to use. If you are filtering a text field (string), you need to choose a filter for **Custom filter**.

Before you can add a parameter to a filter, the parameter must exist already. If you need to create one, use the **Parameters** pane at left. For more information, see Parameters in Amazon QuickSight (p. 252).

Use the following procedure to use a parameter with a new or existing filter.

1. Choose the visual that you want to work with, and then choose the **Filter** pane on the left side of the screen.
2. Choose the filter that you want work with, so that you see the options that belong to that filter.
3. (Optional) For a text field or string, choose **Custom filter**.
4. Choose **Use parameters**
5. Choose the parameter or parameters that you want to use.
6. Choose **Apply** to save your changes.

**Adding Drill-Downs to Visual Data in Amazon QuickSight**

All visual types except pivot tables offer the ability to create a hierarchy of fields for a visual element. The hierarchy lets you drill down to see data at different levels of the hierarchy. For example, you could associate the country, state, and city fields with the X axis on a bar chart. Then, you could drill down or up to see data at each of those levels. As you drill down each level, the data displayed is refined by the value in the field you drill down on. For example, if you drill down on the state of California, you see data on all of the cities in California.

The field wells you can use to create drill-downs varies by visual type. Refer to the topic on each visual type to learn more about its drill-down support.
Drill-down functionality is added automatically for dates when you associate a date field with the drill-down field well of a visual. In this case, you can always drill up and down through the levels of date granularity (year, month, week, day, and hour). Drill-down functionality is also added automatically for geospatial groupings, after you define these in the data set.

Use the following table to identify the field wells/on-visual editors that support drill-down for each visual type.

<table>
<thead>
<tr>
<th>Visual type</th>
<th>Field well or on-visual editor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bar charts (all Horizontal)</td>
<td>Y axis and Group/Color</td>
</tr>
<tr>
<td>Bar charts (all Vertical)</td>
<td>X axis and Group/Color</td>
</tr>
<tr>
<td>Combo charts (all)</td>
<td>X axis and Group/Color</td>
</tr>
<tr>
<td>Geospatial charts</td>
<td>Geospatial and Color</td>
</tr>
<tr>
<td>Heat map</td>
<td>Rows and Columns</td>
</tr>
<tr>
<td>KPIs</td>
<td>Trend Group</td>
</tr>
<tr>
<td>Line charts (all)</td>
<td>X axis and Color</td>
</tr>
<tr>
<td>Pie chart</td>
<td>Group/Color</td>
</tr>
<tr>
<td>Pivot table</td>
<td>Drill-down not supported</td>
</tr>
<tr>
<td>Scatter plot</td>
<td>Group/Color</td>
</tr>
<tr>
<td>Tabular Reports</td>
<td>Drill-down not supported</td>
</tr>
<tr>
<td>Tree map</td>
<td>Group by</td>
</tr>
</tbody>
</table>

**Adding a Drill-Down**

Use the following procedure to add drill-down levels to a visual.

1. On the analysis page, choose the visual that you want to add drill-downs to.

   **Note**
   You can’t add drill-downs to pivot tables.

2. Expand the **Field wells** pane.

3. If your data set has a defined hierarchy, for example for geospatial or coordinate data, you can drag the entire hierarchy into the field well as one. In this case, you don’t need to follow the remaining steps.
If you don't have a predefined hierarchy, you can create one in your analysis, as described in the remaining steps.

4. Drag a field that you want to use in the drill-down hierarchy to an appropriate field well, depending on the visual type. Make sure that the label for the dragged field says **Add drill-down layer**. Position the dragged field above or below the existing field based on where you want it to be in the hierarchy you're creating.
5. Continue until you have added all of the levels of hierarchy that you want. To remove a field from the hierarchy, choose the field, and then choose Remove.
6. To drill down or up to see data at a different level of the hierarchy, choose an element on the visual (like a line or bar), and then choose **Drill down to <lower level>** or **Drill up to <higher level>**. In this example, from the car-make level you can drill down to car-model to see data at that level. If you drill down to car-model from the **Ford** car-make, you see only car-models in that car-make.

![Count of Total-sales by Car-make](image)

After you drill down to the car-model level, you can then drill down further to see make-year data, or go back up to car-make. If you drill down to make-year from the bar representing **Ranger**, you see only years for that model of car.
Adding Custom URL Actions to Visuals in Amazon QuickSight

You can use URL schemes to perform an action, based on a URL, from within your dashboard. In some cases, you might want to create a link to another URL from your visual, or you might want to create an email directly from a visual. A URL action can send data points in parameter values to other URLs by using the data point context menu. Use the + button to add fields and parameters from the visual. For more information on using parameters, see Parameters in Amazon QuickSight (p. 252).

To use an existing URL action, choose a data point on a visual. When you hover over the data point, a notification appears regarding that data point. To get the URL action menu, choose the data point to bring up the context menu. You can find URL actions listed in the middle of the context menu, just above Color options.
Adding Custom URL Actions to Visuals

You can create URL actions on all visual types except pivot tables and KPIs. However, if you create a URL action, then change your visual type to one of these, your URL action isn't deleted. It's simply not accessible from these visual types.

URL actions can be deep links into another application, so long as each can be accessed by a valid URL in the URL scheme `https`, `http`, or `mailto`. You can create a maximum of 100 URL actions per visual.

Create or edit a URL action by using the following procedure.

1. Open a visual. Choose the v-shaped on-visual menu at the top right of the visual. Choose URL actions.

   ![Chart with v-shaped menu open]

   If this is the first action for this visual, the URL action screen opens. If one or more actions already exist, the URL actions for this visual screen appears, which lists all existing actions.

2. Do the following to name and define a URL for your URL action:

   - For **Action name**, type a custom name for your URL action. This name appears in the context menu when you choose a data point in the visual.
   - Define the URL that you want to open as part of the URL action. The URL must be part of one of the following schemes:
• https://
• http://
• mailto:

• You can also parameterize the URL. The parameters on both the sending and the receiving end should match in name and data type. To use a parameter in a custom URL action, use the name of the parameter enclosed in curly braces { }, and preceded by a $, for example $\{\text{parameterName}\}$. Select a value from the current visual by choosing +.

3. Edit the action name and URL by choosing the pencil icon near the name of the URL action.
Working with Visual Types in Amazon QuickSight

Amazon QuickSight offers a range of visual types that you can use to display your data. Use the topics in this section to learn more about the capabilities of each visual type.

Topics
- Measures and Dimensions in Visuals (p. 343)
- Display Limits in Visuals (p. 344)
- Using AutoGraph (p. 346)
- Using Bar Charts (p. 347)
- Using Combo Charts (p. 358)
- Using Geospatial Charts (Maps) (p. 363)
- Using Heat Maps (p. 365)
- Using KPIs (p. 367)
- Using Line Charts (p. 368)
- Using Pie Charts (p. 373)
- Using Pivot Table (p. 375)
- Using Scatter Plots (p. 395)
- Using Tabular Reports (p. 396)
- Using Tree Maps (p. 399)

Measures and Dimensions in Visuals

When we describe how to use the different visual types, we use the term measure to refer to numeric values that you use for measurement, comparison, and aggregation in visuals. A measure can be either
a numeric field, like product cost, or a numeric aggregate on a field of any data type, like count of transaction IDs.

We use the term *dimension* to refer to text or date fields that can be items, like products, or attributes that are related to measures and can be used to partition them. Examples are sales date for sales figures or product manufacturer for customer satisfaction numbers. Amazon QuickSight automatically identifies a field as a measure or a dimension based on its data type.

Numeric fields can act as dimensions, for example ZIP codes and most ID numbers. It's helpful to give such fields a string data type during data preparation, so that Amazon QuickSight understands that they are to be treated as dimensions and are not useful for performing mathematical calculations.

You can change whether a field is displayed as a dimension or measure on an analysis-by-analysis basis instead. For more information, see *Fields as Dimensions and Measures (p. 266).*

### Display Limits in Visuals

All visual types limit the number of data points they display, so that the visual elements (like lines, bars, or bubbles) are still easy to view and analyze. The visual selects the first *n* number of rows for display up to the limit for that visual type. The selection is either according to sort order, if one has been applied, or in default order otherwise.

The number of data points supported varies by visual type. To learn more about display limits for a particular visual type, see the topic for that type.

The visual title identifies the number of data points displayed if you have reached the display limit for that visual type. If you have a large data set and want to avoid running into the visual display limit, use one or more filters to reduce the amount of data displayed. For more information about using filters with visuals, see *Filtering Visual Data in Amazon QuickSight (p. 310).*

Amazon QuickSight supports up to 20 data sets in a single analysis, and up to 20 visuals in a single analysis.

An *other* category also shows on some visuals. It contains the aggregated data for all the data beyond the cutoff limit for the visual type you are using. You can use the on-visual menu to choose whether or not to display the *other* category. The *other* category doesn't show on scatter plots, heat maps, maps, tables (tabular reports), or KPIs. It also doesn't show on line charts when the X axis is a date. Drilling down into the *other* category is not supported.

The following image shows the *other* category on a bar chart.
The following image shows the other category on a pivot table.

**Hiding or Displaying the other Category**

Use the following procedure to hide or display the other category.

1. On the analysis page, select the visual that you want to modify.
Using AutoGraph

AutoGraph isn't a visual type itself, but instead lets you tell Amazon QuickSight to choose the visual type for you. When you create a visual by choosing AutoGraph and then selecting fields, Amazon QuickSight uses the most appropriate visual type for the number and data types of the fields you select.

The icon for AutoGraph is as follows:
Creating a Visual Using AutoGraph

Use the following procedure to create a visual using AutoGraph.

1. On the analysis page, choose Visualize on the tool bar.
2. Choose Add on the application bar, and then choose Add visual.
3. On the Visual types pane, choose the AutoGraph icon.
4. On the Fields list pane, choose the fields that you want to use.

Using Bar Charts

Amazon QuickSight supports the following types of bar charts, with either horizontal or vertical orientation:

- Single-measure
- Multi-measure
- Clustered
- Stacked
- Stacked 100 percent

You use these as follows:

- Use the horizontal or vertical bar chart visual types to create single-measure, multi-measure, or clustered bar charts.
- Use a single-measure bar chart to show values for a single measure for a dimension.
- Use a multi-measure bar chart to show values for a two or more measures for a dimension.
- Use a clustered bar chart to show values for a single measure for a dimension that is then grouped by another dimension, for example sales total by state, grouped by region.
- Use any of the stacked bar chart visual types to create stacked bar charts. A stacked bar chart is similar to a clustered bar chart in that it displays a measure for two dimensions. However, instead of clustering bars for each child dimension by the parent dimension, it displays one bar per parent dimension. It uses color blocks within the bars to show the relative values of each item in the child dimension.

Amazon QuickSight offers both regular stacked bar charts and stacked 100 percent bar charts. A regular stacked bar chart differs from a stacked 100 percent bar chart in that the color blocks reflect the value of each item in the child dimension relative to the total for the measure. In contrast, a stacked 100 percent bar chart shows them by their percentage.

For example, the following stacked bar chart shows that total sales in the southern region were $2735.51, with $1474.96 from Texas and $1260.55 from Florida.
The following stacked 100 percent bar chart shows this same data by percentage, which is 100 percent for the southern region. The color block for Florida represents the approximately 46 percent of revenue from that state. The color block for Texas represents the remaining 54 percent.
Topics

- Working with Horizontal Bar Charts (p. 350)
- Working with Horizontal Stacked Bar Charts (p. 351)
- Working with a Horizontal Stacked 100 Percent Bar Chart (p. 353)
- Working with Vertical Bar Charts (p. 354)
- Working with Vertical Stacked Bar Charts (p. 356)
- Working with Vertical Stacked 100 Percent Bar Charts (p. 357)
Working with Horizontal Bar Charts

You can use the horizontal bar chart visual type to create a single-measure, multi-measure, or clustered horizontal bar chart. A single-measure bar chart shows one measure for one dimension, for example average delay time by flight number. A multi-measure bar chart shows two or more measures for one dimension, for example sales total and profit total by automobile mode. A clustered bar chart shows values for a dimension grouped by a related dimension, for example sales totals by automobile model, grouped by car maker.

To create a horizontal bar chart, use a dimension for the Y axis and a measure for the value. The dimension is typically a text field that is related to the measure in some way. You can use the dimension to segment the measure to see more detailed information. You can also use a date field in this way, but we recommend using a line chart for that because they are better suited to showing changes in a measure over time. Each horizontal bar in the chart represents a measure value for an item in the dimension you chose.

Horizontal bar charts show up to 2500 data points on the Y axis for visuals that don’t use group/color. For visuals that do use group/color, they show up to 50 data points on the Y axis and up to 50 data points for group/color. For more information about how we handle data that falls outside display limits, see Display Limits in Visuals (p. 344).

The icon for a horizontal bar chart is as follows:

</tbody>
</table>
Creating a Horizontal Bar Chart

Use the following procedure to create a horizontal bar chart.

1. On the analysis page, choose Visualize on the tool bar.
2. Choose Add on the application bar, and then choose Add visual.
3. On the Visual types pane, choose the horizontal bar chart icon.
4. From the Fields list pane, drag the fields that you want to use to the appropriate field wells. Typically, you want to use dimension or measure fields as indicated by the target field well. If you choose to use a dimension field as a measure, the Count aggregate function is automatically applied to it to create a numeric value.
   - To create a single-measure horizontal bar chart, drag a dimension to the Y axis field well and a measure to the Value field well.
   - To create a multi-measure horizontal bar chart, drag a dimension to the Y axis field well and two or more measures to the Value field well. Leave the Group/Color field well empty.
   - To create a clustered horizontal bar chart, drag a dimension to the Y axis field well, a measure to the Value field well, and another dimension to the Group/Color field well.
5. (Optional) Add drill-down layers by dragging one or more additional fields to the Y axis or Group/Color field wells. For more information about adding drill-downs, see Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335).

Working with Horizontal Stacked Bar Charts

Use a horizontal stacked bar chart to show values for hierarchical data, for example sales total by car model, stacked by car maker. A horizontal stacked bar chart uses a scale based on the maximum value for the selected measure. To create a chart that uses a scale based on 100 percent instead, use the Working with a Horizontal Stacked 100 Percent Bar Chart (p. 353).

Horizontal stacked bar charts show up to 50 data points on the Y axis and up to 50 data points for group/color. For more information about how we handle data that falls outside display limits, see Display Limits in Visuals (p. 344).

The icon for a horizontal stacked bar chart is as follows:

### Horizontal Stacked Bar Chart Features

</tr>
</tbody>
</table>
Creating a Horizontal Stacked Bar Chart

Use the following procedure to create a horizontal stacked bar chart.

1. On the analysis page, choose Visualize on the tool bar.
2. Choose Add on the application bar, and then choose Add visual.
3. On the Visual types pane, choose the horizontal stacked bar chart icon.
4. From the Fields list pane, drag the fields that you want to use to the appropriate field wells. Typically, you want to use dimension or measure fields as indicated by the target field well. If you choose to use a dimension field as a measure, the Count aggregate function is automatically applied to it to create a numeric value.

   To create a horizontal stacked bar chart, drag a dimension to the Y axis field well, one measure to the Value field well, and one dimension to the Group/Color field well.

5. (Optional) Add drill-down layers by dragging one or more additional fields to the Y axis or Group/Color field wells. For more information about adding drill-downs, see Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335).
Working with a Horizontal Stacked 100 Percent Bar Chart

Use a horizontal stacked 100 percent bar chart to show values for hierarchical data, for example sales total by car model, stacked by car maker. A horizontal stacked 100 percent bar chart uses a scale of 100 percent. To create a chart that uses a scale based on the maximum value of the selected measure instead, use the Working with Horizontal Stacked Bar Charts (p. 351).

Horizontal stacked 100 percent bar charts show up to 50 data points on the Y axis and up to 50 data points for group/color. For more information about how we handle data that falls outside display limits, see Display Limits in Visuals (p. 344).

Creating a Horizontal Stacked 100 Percent Bar Chart

Use the following procedure to create a horizontal stacked 100 percent bar chart.

1. On the analysis page, choose Visualize on the tool bar.
2. Choose Add on the application bar, and then choose Add visual.
3. On the Visual types pane, choose the horizontal stacked 100 percent bar chart icon.
4. From the Fields list pane, drag the fields that you want to use to the appropriate field wells. Typically, you want to use dimension or measure fields as indicated by the target field well. If you choose to use a dimension field as a measure, the Count aggregate function is automatically applied to it to create a numeric value.

To create a horizontal stacked 100 percent bar chart, drag a dimension to the Y axis field well, one measure to the Value field well, and one dimension to the Group/Color field well.
5. (Optional) Add drill-down layers by dragging one or more additional fields to the Y axis or Group/Color field wells. For more information about adding drill-downs, see Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335).

Working with Vertical Bar Charts

You can use the vertical bar chart visual type to create a single-measure, multi-measure, or clustered vertical bar chart. A single-measure bar chart shows one measure for one dimension, for example average delay time by flight number. A multi-measure bar chart shows two or more measures for one dimension, for example sales total and profit total by automobile mode. A clustered bar chart shows values for a dimension grouped by a related dimension, for example sales totals by automobile model, grouped by car maker.

To create a vertical bar chart, use a dimension for the X axis and a measure for the value. The dimension is typically a text field that is related to the measure in some way. You can use the dimension to segment the measure to see more detailed information. You can also use a date field in this way, but we recommend using a line chart for that because they are better suited to showing changes in a measure over time. Each vertical bar in the chart represents a measure value for an item in the dimension you chose.

Vertical bar charts show up to 2500 data points on the Y axis for visuals that don't use group/color. For visuals that do use group/color, they show up to 50 data points on the Y axis and up to 50 data points for group/color. For more information about how we handle data that falls outside display limits, see Display Limits in Visuals (p. 344).

Creating a Vertical Stacked 100 Percent Bar Chart

Use the following procedure to create a vertical stacked 100 percent bar chart.

1. On the analysis page, choose Visualize on the tool bar.
2. Choose Add on the application bar, and then choose Add visual.
3. On the Visual types pane, choose the vertical stacked 100 percent bar chart icon.
4. From the Fields list pane, drag the fields that you want to use to the appropriate field wells. Typically, you want to use dimension or measure fields as indicated by the target field well. If you choose to use a dimension field as a measure, the Count aggregate function is automatically applied to it to create a numeric value.

To create a vertical stacked 100 percent bar chart, drag a dimension to the X axis field well, one measure to the Value field well, and one dimension to the Group/Color field well.
5. (Optional) Add drill-down layers by dragging one or more additional fields to the X axis or Group/Color field wells. For more information about adding drill-downs, see Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335).

Using Combo Charts

Amazon QuickSight supports the following types of combo charts:

- Clustered bar combo chart
- Stacked bar combo chart

These are also known as line and column charts.

Use the combo chart visual types to create a single visualization that shows two different types of data. These two types are individually best suited to a line chart and a bar chart. The difference between these two types can work well for comparing two sets of data, for example trends and categorical data.

On the clustered bar combo chart, bars display for each child dimension, grouped by the parent dimension. On the stacked bar combo chart, one bar displays per parent dimension. Inside each bar,
colors show the relative values of each item in the child dimension. Both types of combo chart require only one dimension on the X axis, but are usually more effective when also displaying at least one measure under Lines.

Topics
- Working with Clustered Bar Combo Charts (p. 359)
- Working with Stacked Bar Combo Charts (p. 361)

**Working with Clustered Bar Combo Charts**

The combo chart is like using two different types of visualization at the same time. You should make sure the data in the bars (or columns) directly relates to the data in the line or lines. This relationship is not technically enforced by the tool, so it's essential that you determine this relationship yourself. Without some relation between the lines and bars, the visual loses meaning.

You can use the combo chart visual type to create a single-measure or single-line chart. A single-measure combo chart shows one measure for one dimension.

To create a multi-measure chart, you can choose to add multiple lines, or multiple bars. A multi-measure bar chart shows two or more measures for one dimension. You can group the bars in clusters, or stack them.

A clustered bar chart shows values for a dimension grouped by a parent dimension.

To create a vertical bar chart, use a dimension for the X axis and a measure for the value. The dimension is typically a text field that is related to the measure in some way and can be used to segment it in order to see more detailed information. You can also use a date field in this way, but we recommend using a line chart because it's better suited to showing changes in a measure over time. Each vertical bar in the chart represents a measure value for an item in the dimension you chose.

Vertical bar charts show up to 2500 data points on the Y axis for visuals that don't use group/color. Visuals that do use group/color show up to 50 data points on the Y axis and up to 50 data points for group/color. For more information about how Amazon QuickSight handles data that falls outside display limits, see Display Limits in Visuals (p. 344).
The icon for a clustered bar combo chart is as follows.

</tr>
<tr>
<td>Adding drill-downs</td>
<td>Yes</td>
<td>You can add drill-down levels to the X axis and Group/Color field wells.</td>
<td>Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335)</td>
</tr>
</tbody>
</table>

**Creating a Clustered Bar Combo Chart**

Use the following procedure to create a clustered bar combo chart.

1. On the analysis page, choose **Visualize** on the tool bar.
2. Choose **Add** on the application bar, and then choose **Add visual**.
3. On the **Visual types** pane, choose the clustered bar combo chart icon.
4. From the **Fields list** pane, drag the fields that you want to use to the appropriate field wells. Typically, you want to use dimension or measure fields as indicated by the target field well. If you choose to use a dimension field as a measure, the **Count** aggregate function is automatically applied to it to create a numeric value. You can create combo charts as follows:

- To create a single-measure clustered bar combo chart, drag a dimension to the **X axis** field well. Then drag one measure to either the **Bars** or **Lines** field well.
- To create a multi-measure clustered bar combo chart, drag a dimension or dimensions to the **X axis** field well. Then drag two or more measures to the **Bars** or **Lines** field well.

Optionally, add a dimension to the **Group/Color** field well. If you have a field in **Group/Color**, you can't have more than one field under **Bars**.

5. (Optional) Add drill-down layers by dragging one or more additional fields to the **X axis** or **Group/Color** field wells. For more information about adding drill-downs, see Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335).

### Working with Stacked Bar Combo Charts

The combo chart is like using two different types of visualization at the same time. You should make sure the data in the bars (or columns) directly relates to the data in the line or lines. This relationship is not technically enforced by the tool, so it's essential that you determine this relationship yourself. Without some relation between the lines and bars, the visual loses meaning.

You can use the combo chart visual type to create a single-measure or single-line chart. A single-measure combo chart shows one measure for one dimension.

To create a multi-measure chart, you can choose to add multiple lines, or multiple bars. A multi-measure bar chart shows two or more measures for one dimension. You can group the bars in clusters, or stack them.

Use a stacked bar combo chart to show values for hierarchical data, for example sales total by car model, stacked by car maker. A stacked bar combo chart uses a scale based on the maximum value for the selected measure.
Stacked bar combo charts show up to 50 data points on the Y axis and up to 50 data points for group/color. For more information about how Amazon QuickSight handles data that falls outside display limits, see Display Limits in Visuals (p. 344).

The icon for a stacked bar combo chart is as follows.

| Focusing on or excluding elements | Yes, with exceptions | You can focus on or exclude any bar or color block within a bar, except when you are using a date field as one of the dimensions. In that case, you can only focus on the bar or color block that uses the date dimension, not exclude it. | Focusing on Visual Elements (p. 276)  
  Excluding Visual Elements (p. 277) |
| Sorting                      | Yes        | You can sort on the fields you choose for the X axis and the values.     | Sorting Visual Data in Amazon QuickSight (p. 307)          |
| Field aggregation            | Yes        | You must apply aggregation to the fields you choose for the value and group/color, and can't apply aggregation to the field you choose for the X axis. | Changing Field Aggregation (p. 296)                        |
| Adding drill-downs          | Yes        | You can add drill-down levels to the X axis and Group/Color field wells. | Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335) |

### Creating a Stacked Bar Combo Chart

Use the following procedure to create a stacked bar combo chart.
1. On the analysis page, choose Visualize on the tool bar.
2. Choose Add on the application bar, and then choose Add visual.
3. On the Visual types pane, choose the stacked bar combo chart icon.
4. From the Fields list pane, drag the fields that you want to use to the appropriate field wells. Typically, you want to use dimension or measure fields as indicated by the target field well. If you choose to use a dimension field as a measure, the Count aggregate function is automatically applied to it to create a numeric value.

To create a stacked bar combo chart, drag a dimension or dimensions to the X axis field well, and a measure or measures to the Bars field well, the Lines field well, or both. Measures in the Bars field well display as stacked bars.

Optionally, add a dimension to the Group/Color field well. If you have a field in Group/Color, you can't have more than one field under Bars.

5. (Optional) Add drill-down layers by dragging one or more additional fields to the X axis or Group/Color field wells. For more information about adding drill-downs, see Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335).

Using Geospatial Charts (Maps)

Use geospatial charts to show differences in data values across a geographical map. The map allows you to zoom in and out. As you zoom in closer, you can see more geographical features. The map retains the chosen zoom level and size.

Each circle represents a geographical location on the map chart. This can be latitude and longitude, or geographical components such as state or city. The size of the circles represents the magnitude of the field in the Size well, in relation to other values in the same field. The color of the circles represents the values in the Color well. The field in the Color well displays in the legend, if you choose to display one.

Here is a sample of a map chart. The latitude, longitude, country, state, and city are identified by a place marker icon, showing that they are a geospatial data type. State and city are inside of a hierarchy named Geo. Data types must be correctly configured in the data set before geospatial mapping can work. Predefined hierarchies, called geospatial groupings, are optional. They allow Amazon QuickSight to
resolve locations on the map, in case of any ambiguities. If the data types are correct, the mapping can work for supported geographies without geospatial groupings.

For more information about setting up geospatial data types and hierarchies, see Adding Geospatial Data (p. 165).

**Important**
Geospatial charts in Amazon QuickSight currently aren’t supported in some geographies, including India and China. We are working on adding support for more regions. For now, automatic geocoding works only for US locations. However, you can add latitude and longitude coordinates to your data to make geospatial charts. For help with geospatial issues, see Geospatial Troubleshooting (p. 171).

Use the following table to understand the features supported by geospatial maps.

<table>
<thead>
<tr>

<tr>
<td>Adding drill-downs</td>
<td>Yes</td>
<td>You can add drill-down levels to the Geospatial and Color field wells.</td>
<td>Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335)</td>
</tr>
</tbody>
</table>
Using Heat Maps

Use heat maps to show a measure for the intersection of two dimensions, with color-coding to easily differentiate where values fall in the range. Heat maps can also be used to show the count of values for the intersection of the two dimensions.

Each rectangle on a heat map represents the value for the specified measure for the intersection of the selected dimensions. Rectangle color represents where the value falls in the range for the measure, with darker colors indicating higher values and lighter colors indicating lower ones.

Heat maps and pivot tables display data in a similar tabular fashion. Use a heat map if you want to identify trends and outliers, as the use of color makes these easier to spot. Use a pivot table if you want to further analyze data on the visual, for example by changing column sort order or applying aggregate functions across rows or columns.

To create a heat map, choose at least two fields of any data type. Amazon QuickSight populates the rectangle values with the count of the X axis value for the intersecting Y axis value. Typically, you would choose a measure and two dimensions.

For example, the following heat map shows which products are most used by the customers in these countries, measured by a simple count.

Heat maps show up to 50 data points for rows and up to 50 data points for columns. For more information about how we handle data that falls outside display limits, see Display Limits in Visuals (p. 344).

The icon for a heat map is as follows:

Heat Map Features

Use the following table to understand the features supported by heat maps.
<table>
<thead>
<tr>

<td>You can add drill-down levels to the Rows and Columns field wells.</td>
<td>Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335)</td>
</tr>
</tbody>
</table>

Create a Heat Map

Use the following procedure to create a heat map.

1. On the analysis page, choose **Visualize** on the tool bar.
2. Choose **Add** on the application bar, and then choose **Add visual**.
3. On the **Visual types** pane, choose the heat map icon.
4. From the **Fields list** pane, drag the fields that you want to use to the appropriate field wells. Typically, you want to use dimension or measure fields as indicated by the target field well. If you choose to use a dimension field as a measure, the **Count** aggregate function is automatically applied to it to create a numeric value.

   To create a heat map, drag a dimension to the **Rows** field well, a dimension to the **Columns** field well, and a measure to the **Values** field well.

5. (Optional) Add drill-down layers by dragging one or more additional fields to the **Rows** or **Columns** field wells. For more information about adding drill-downs, see Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335).
Using KPIs

Use a KPI to visualize a comparison between a key value and its target value.

A KPI displays a value comparison, the two values being compared, and a progress bar. For example, the following KPI shows how closely revenue is meeting its forecast.

![KPI Example](image)

The icon for a KPI is as follows:

![KPI Icon]

KPI Features

Use the following table to understand the features supported by the KPI visual type in Amazon QuickSight.

<table>
<thead>
<tr>
<th>Feature</th>

<th>Comments</th>
<th>For More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changing the title display</td>
<td>Yes</td>
<td></td>
<td>Customizing a Visual Title (p. 279)</td>
</tr>
<tr>
<td>Removing the title</td>
<td>Yes</td>
<td>You can choose not to display a title.</td>
<td></td>
</tr>
<tr>
<td>Changing comparison method</td>
<td>Yes</td>
<td>By default, Amazon QuickSight automatically chooses a method. The settings are auto, difference, percent, and difference as percent.</td>
<td></td>
</tr>
</tbody>
</table>
Using Line Charts

Use line charts to compare changes in measure values over period of time, for the following scenarios:

- One measure over a period of time, for example gross sales by month.
- Multiple measures over a period of time, for example gross sales and net sales by month.
- One measure for a dimension over a period of time, for example number of flight delays per day by airline.

Line charts show the individual values of a set of measures or dimensions against the range displayed by the Y axis. Area line charts differ from regular line charts in that each value is represented by a colored area of the chart instead of just a line, to make it easier to evaluate item values relative to each other.

For example, discount amount by year by region looks like the following in a line chart.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Supported?</th>
<th>Comments</th>
<th>For More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changing the primary value</td>
<td>Yes</td>
<td>You can choose comparison (default) or actual.</td>
<td></td>
</tr>
<tr>
<td>displayed</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Display or remove the progress</td>
<td>Yes</td>
<td>You can format the visual to either display (default) or not display a progress bar.</td>
<td></td>
</tr>
<tr>
<td>bar</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Each line on the chart represents a measure value across a period of time. When you have a chart with multiple lines, hover over any line to see a pop-up legend that shows the values for each line for that point in time.
Using Line Charts

Topics

- Working with a Line Chart (p. 370)
- Working with an Area Line Chart (p. 372)

Working with a Line Chart

Use line charts to compare changes in values for one or more measures or dimensions over a period of time. Line charts differ from area line charts in that each value is represented by a line instead of a colored area of the chart.

Line charts show up to 2500 data points on the X axis when no color field is selected. When color is populated, line charts show up to 200 data points on the X axis and up to 25 data points for color. For more information about how data that falls outside the display limit for this visual type, see Display Limits in Visuals (p. 344).

The icon for a line chart is as follows:

Line Chart Features

Use the following table to understand the features supported by line charts.

</table>

### Creating a Line Chart

Use the following procedure to create a line chart.

1. On the analysis page, choose **Visualize** on the tool bar.
2. Choose **Add** on the application bar, and then choose **Add visual**.
3. On the **Visual types** pane, choose the line chart icon.
4. From the **Fields list** pane, drag the fields that you want to use to the appropriate field wells. Typically, you want to use dimension or measure fields as indicated by the target field well. If you choose to use a dimension field as a measure, the **Count** aggregate function is automatically applied to it to create a numeric value.
• To create a single-measure line chart, drag a dimension to the X axis field well and one measure to the Value field well.
• To create a multi-measure line chart, drag a dimension to the X axis field well and two or more measures to the Value field well. Leave the Color field well empty.
• To create a multi-dimension line chart, drag a dimension to the X axis field well, one measure to the Value field well, and one dimension to the Color field well.
5. (Optional) Add drill-down layers by dragging one or more additional fields to the X axis or Color field wells. For more information about adding drill-downs, see Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335).

Working with an Area Line Chart

Use area line charts to compare changes in values for one or more measures or dimensions over a period of time. Area line charts differ from regular line charts in that each value is represented by a colored area of the chart instead of just a line. This makes it easier to evaluate item values relative to each other.

Area line charts show up to 2500 data points on the X axis when no color field is selected. When color is populated, area line charts show up to 200 data points on the X axis and up to 25 data points for color. For more information about how data that falls outside the display limit for this visual type, see Display Limits in Visuals (p. 344).

The icon for an area line chart is as follows:

Area Line Chart Features

Use the following table to understand the features supported by area line charts.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Supported?</th>
<th>Comments</th>

<tr>
<td>Focusing on or excluding elements</td>
<td>Yes, with exceptions</td>
<td>You can focus on or exclude any line on the chart, except in the following cases:</td>
<td>Focusing on Visual Elements (p. 276)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• You create a multi-dimension line chart and use a date field as the dimension for the line color.</td>
<td>Excluding Visual Elements (p. 277)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• You create a measure or multi-measure line chart and use a date field as the dimension for the X axis.</td>
<td></td>
</tr>
</tbody>
</table>
Creating an Area Line Chart

Use the following procedure to create an area line chart.

1. On the analysis page, choose **Visualize** on the tool bar.
2. Choose **Add** on the application bar, and then choose **Add visual**.
3. On the **Visual types** pane, choose the area line chart icon.
4. From the **Fields list** pane, drag the fields that you want to use to the appropriate field wells. Typically, you want to use dimension or measure fields as indicated by the target field well. If you choose to use a dimension field as a measure, the **Count** aggregate function is automatically applied to it to create a numeric value.
   - To create a single-measure area line chart, drag a dimension to the **X axis** field well and one measure to the **Value** field well.
   - To create a multi-measure area line chart, drag a dimension to the **X axis** field well and two or more measures to the **Value** field well. Leave the **Color** field well empty.
   - To create a multi-dimension area line chart, drag a dimension to the **X axis** field well, one measure to the **Value** field well, and one dimension to the **Color** field well.
5. (Optional) Add drill-down layers by dragging one or more additional fields to the **X axis** or **Color** field wells. For more information about adding drill-downs, see **Adding Drill-Downs to Visual Data in Amazon QuickSight** (p. 335).

Using Pie Charts

Use pie charts to compare values for items in a dimension.

Each wedge in a pie chart represents one item in the dimension. Wedge size represents the proportion of the value for the selected measure that the item represents compared to the whole for the dimension. Pie charts are best when precision isn't important and there are few items in the dimension.

Pie charts show up to 20 data points for group/color. For more information about how we handle data that falls outside display limits, see **Display Limits in Visuals** (p. 344).

The icon for a pie chart is as follows:
Pie Chart Features

Use the following table to understand the features supported by pie charts.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Supported?</th>

<td>You must apply aggregation to the field you choose for the value, and can't apply aggregation to the field you choose for group/color.</td>
<td>Changing Field Aggregation (p. 296)</td>
</tr>
<tr>
<td>Adding drill-downs</td>
<td>Yes</td>
<td>You can add drill-down levels to the Group/Color field well.</td>
<td>Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335)</td>
</tr>
</tbody>
</table>

Create a Pie Chart

Use the following procedure to create a pie chart.

1. On the analysis page, choose **Visualize** on the tool bar.
2. Choose **Add** on the application bar, and then choose **Add visual**.
3. On the **Visual types** pane, choose the pie chart icon.
4. From the **Fields list** pane, drag the fields that you want to use to the appropriate field wells. Typically, you want to use dimension or measure fields as indicated by the target field well. If you choose to use a dimension field as a measure, the **Count** aggregate function is automatically applied to it to create a numeric value.

   To create a pie chart, drag a measure to the **Value** field well and a dimension to the **Group/Color** field well.
5. (Optional) Add drill-down layers by dragging one or more additional fields to the **Group/Color** field well. For more information about adding drill-downs, see Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335).

**Using Pivot Table**

Use pivot tables to show measure values for the intersection of two dimensions.

After you populate a pivot table, you can change row sort order and also apply statistical functions for further analysis. You can cluster pivot table columns and rows to show values for subcategories grouped by related dimension. You can also specify multiple measures to populate the cell values of the table, so that you can see a range of data in a single table.

Heat maps and pivot tables display data in a similar tabular fashion. Use a heat map if you want to identify trends and outliers, as the use of color makes these easier to spot. Use a pivot table if you want to analyze data on the visual.

To create a pivot table, choose at least two fields of any data type. Amazon QuickSight creates the table and populates the cell values with the count of the column value for the intersecting row value. Typically, you would choose a measure and two dimensions measurable by that measure.

Pivot tables show up to 1000 data points for rows and up to 200 data points for columns. For more information about how we handle data that falls outside display limits, see Display Limits in Visuals (p. 344).

To easily transpose the fields used by the rows and columns of the pivot table, choose the orientation icon:

![Pivot Table Icon](image)

The icon for a pivot table is as follows:

**Pivot Table Features**

Pivot tables don't display a legend.

You can't hide or display the title on a pivot table visual.

Use the following table to understand the features supported by pivot tables.

<table>
<thead>
<tr>
<th>Feature</th>

<td>Yes</td>
<td>You must apply aggregation to the field or fields you choose for the value, and can't apply aggregation to the fields you choose for the rows or columns. If you choose to create a multi-measure pivot table, you can apply different types of aggregation to the different measures. For example, you could show the sum of the sales amount and the maximum discount amount.</td>
<td>Changing Field Aggregation (p. 296)</td>
</tr>
<tr>
<td>Adding drill-downs</td>
<td>No</td>
<td></td>
<td>Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335)</td>
</tr>
</tbody>
</table>

**Creating a Pivot Table**

Use the following procedure to create a pivot table.

1. On the analysis page, choose **Visualize** on the tool bar.
2. Choose **Add** on the application bar, and then choose **Add visual**.
3. On the **Visual types** pane, choose the pivot table icon.
4. From the **Fields list** pane, drag the fields that you want to use to the appropriate field wells.
   Typically, you want to use dimension or measure fields as indicated by the target field well. If you choose to use a dimension field as a measure, the **Count** aggregate function is automatically applied to it to create a numeric value.
   - To create a single-measure pivot table, drag a dimension to the **Rows** field well, a dimension to the **Columns** field well, and a measure to the **Values** field well.
   - To create a multi-measure pivot table, drag a dimension to the **Rows** field well, a dimension to the **Columns** field well, and two or more measures to the **Values** field well.
• To create a clustered pivot table, drag one or more dimensions to the **Rows** field well, one or more dimensions to the **Columns** field well, and a measure to the **Values** field well.

You can also select multiple fields for all of the pivot table field wells if you want to, to combine the multi-measure and clustered pivot table approaches.

### Modifying Pivot Table Visuals

When you work with a pivot table, you can modify it in a number of ways to customize the visual to your needs. As with all visual types, you can add and remove fields, change the field associated with a visual element, change field aggregation, change date field granularity, and focus on or exclude rows or columns. For more information about how to make these changes to a pivot table, see the topics under Changing the Fields Used by a Visual in Amazon QuickSight (p. 287).

There are also some ways to modify pivot tables that are exclusive to this visual type, as follows:

- Change the pivot table format to display by rows or by columns.
- Expand or collapse clustered rows or columns to show or hide subcategories.
- Sort the rows in the pivot table by the values in a selected column.
- Add table calculations (like rank or difference) to cell values.

Use the following topics to learn more about how to make these changes to pivot table visuals.

**Topics**

- Changing the Pivot Table Format (p. 377)
- Expanding and Collapsing Pivot Table Clusters (p. 378)
- Sorting Pivot Tables (p. 380)
- Working with Table Calculations (p. 381)

### Changing the Pivot Table Format

You can choose to display a pivot table in a columnar or row-based format. Columnar is the default. When you change to a row-based format, a column with the value name is added to the right of the row header column.

Use the following procedure to change a pivot table format.

1. On the analysis page, choose the pivot table visual that you want to edit.
2. Expand the **Field wells** pane by choosing the expand icon.
3. On the **Values** field well, choose one of the following options:
   - Choose **Column** for a columnar format.
• Choose **Row** for a row format.

### Expanding and Collapsing Pivot Table Clusters

If you are using grouped columns or rows in a pivot table, you can expand or collapse a group to show or hide its data in the table.

Use the following procedure to expand or collapse a pivot table group.

1. On the analysis page, choose the pivot table visual that you want to edit.
2. On the group that you want to collapse, choose the collapse icon, as shown following:
The group collapses and the data for the related group is summarized in the row or column, as shown following:

<table>
<thead>
<tr>
<th></th>
<th>AZ</th>
<th>CA</th>
<th>Bakersfield, CA</th>
<th>Burbank, CA</th>
</tr>
</thead>

<td>719534</td>
<td>9145</td>
<td></td>
<td></td>
</tr>
<tr>
<td>17</td>
<td>1795500</td>
<td>3983</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Sorting Pivot Tables

In a pivot table, you can change the sort order on any column to sort all rows in the table according to the values in that column. You can only sort by one column at a time.

On the visual, choose the sort icon on the subheader of the column that you want to sort by and choose either Sort ascending or Sort descending:

The rows are re-ordered based on the values in the selected column:

To remove sorting from a column, choose the sort icon on the subheader of the sorted column and choose Clear sort.
Working with Table Calculations

You can use table calculations to apply statistical functions to pivot table cells that contain measures (numeric values). Use the following sections to understand which functions you can use in calculations, and how to apply or remove them.

If the data type doesn't work properly for the calculation you create, then the data type of the cell values is changed. For example, let's say you apply the Rank function to a currency data type. The values display as integers rather than currency, because rank isn't measured as currency. Similarly, if you apply the Percent difference function instead, the cell values display as percentages.

Table calculations can be added only to non-aggregated fields. For example, if you create a calculated field that is a sum of a measure, you can't add a table calculation to it.

Adding and Removing Table Calculations

Use the following procedures to add, modify, and remove table calculation on a pivot table.

Adding a Table Calculation

Use the following procedure to add a table calculation to a pivot table.

1. Expand the Field wells pane by choosing the expand icon.
2. Choose the field in the Values well that you want to apply a table calculation to, choose Add table calculation, and then choose the function to apply.

Changing How a Calculation Is Applied

Use the following procedure to change the way a table calculation is applied to a pivot table.
1. Expand the **Field well** pane by choosing the expand icon.

2. Choose the field in the **Values** well that has the table calculation that you want to change, choose **Calculate as**, and then choose the way that you want the calculation applied.

**Removing a Calculation**

Use the following procedure to remove a table calculation from a pivot table.

1. Expand the **Field well** pane by choosing the expand icon.

2. Choose the field in the **Values** well that you want to remove the table calculation from, and then choose **Remove calculation**.
You can use the following functions in pivot table calculations.

Topics

- Running Total (p. 383)
- Difference (p. 384)
- Percent Difference (p. 384)
- Percent of Total (p. 385)
- Rank (p. 385)
- Percentile (p. 386)

Running Total

The running total function calculates the sum of a given cell value and the values of all cells prior to it. This is calculated as \( \text{Cell}_1 = \text{Cell}_1 \), \( \text{Cell}_2 = \text{Cell}_1 + \text{Cell}_2 \), \( \text{Cell}_3 = \text{Cell}_1 + \text{Cell}_2 + \text{Cell}_3 \), and so on. For example, suppose that you have the following data.

Applying the running total function across the table rows gives you the following results.
Difference

The difference function calculates the difference between a cell value and value of the cell prior to it. This is calculated as $Cell1 = Cell1 - null$, $Cell2 = Cell2 - Cell1$, $Cell3 = Cell3 - Cell2$, and so on. Because $Cell1 - null = null$, the $Cell1$ value is always empty. For example, suppose that you have the following data.

Applying the difference function across the table rows gives you the following results.

Percent Difference

The percent difference function calculates the difference between a cell value and the value of the cell prior to it, divided by the value of the cell prior to it. This is calculated as $Cell1 = (Cell1 - null)/null$, $Cell2 = (Cell2 - Cell1)/Cell1$, $Cell3 = (Cell3 - Cell2)/Cell2$, and so on. Because $(Cell1 - null)/null = null$, the $Cell1$ value is always empty. For example, take the following rows.

Applying the percent difference function across the table rows gives you the following results.
Percent of Total

The percent of total function calculates the percentage the given cell represents of the sum of all of the cells included in the calculation. This is calculated as $\text{Cell1} = \text{Cell1}/(\text{sum of all cells})$, $\text{Cell2} = \text{Cell2}/(\text{sum of all cells})$, and so on. For example, suppose that you have the following data.

![Table with ranks and values](image)

Applying the percent of total function across the table rows gives you the following results.

![Percent of Total Results](image)

Rank

The rank function calculates the rank of the cell value compared to the values of the other cells included in the calculation. Rank always shows the highest value equal to 1 and lowest value equal to the count of cells included in the calculation. If there are two or more cells with equal values, they receive the same rank but are considered to take up their own spots in the ranking. Thus, the next highest value is pushed down in rank by the number of cells at the rank above it, minus one. For example, if you rank the values 5,3,3,4,3,2, their ranks would be 1,3,3,2,3,6.

Given the following data:

![Rank Example Table](image)

Applying the rank function across the table rows gives you the following results.

![Rank Results Table](image)
If you applied rank using table across down instead, so that the initial ranks are determined across the rows and then those ranks are in turn ranked down the columns, you get the following results. The last column has two equal values sharing the top rank of 1, so the remaining value has a rank of 3.

<table>
<thead>
<tr>
<th>customer_region</th>
<th>BILLING</th>
<th>HR</th>
<th>MARKETING</th>
</tr>
</thead>
<tbody>
<tr>
<td>US</td>
<td>2</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>EMEA</td>
<td>1</td>
<td>3</td>
<td>1</td>
</tr>
<tr>
<td>AP</td>
<td>2</td>
<td>1</td>
<td>3</td>
</tr>
</tbody>
</table>

Percentile

The percentile function calculates the percent of the values of the cells included in the calculation that are at or below the value for the given cell. This is calculated as the count of cell values that is less than (current cell value + (.05 * count of cell values equal to the current cell value)) / count of all cells. For example, suppose that you have the following data.

<table>
<thead>
<tr>
<th>customer_region</th>
<th>timestamp</th>
<th>API</th>
<th>MOBILE</th>
<th>API</th>
<th>MOBILE</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2012</td>
<td>67.25</td>
<td>127.15</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>2013</td>
<td>316.18</td>
<td>492.25</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>2014</td>
<td>250.47</td>
<td>1,054.08</td>
<td></td>
<td>566.96</td>
</tr>
</tbody>
</table>

Applying the percentile function across the table rows gives you the following results.

Ways to Apply Table Calculations

You can apply table calculations in the ways described following. Table calculations are applied to only one field at a time, so if you have a pivot table with multiple values, calculations are only applied to the cells representing the field you applied the calculation to.

Topics

- Table Across (p. 387)
- Table Down (p. 387)
- Table Across Down (p. 388)
- Table Down Across (p. 389)
- Group Across (p. 390)
- Group Down (p. 391)
- Group Across Down (p. 392)
- Group Down Across (p. 393)
Table Across

Using table across applies the calculation across the rows of the pivot table, regardless of any grouping. This is the default. For example, take the following pivot table.

<table>
<thead>
<tr>
<th>customer_region</th>
<th>timestamp</th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>AP</td>
<td>2012</td>
<td>67.25</td>
<td>117.15</td>
<td></td>
</tr>
<tr>
<td></td>
<td>2013</td>
<td>216.28</td>
<td>492.25</td>
<td></td>
</tr>
<tr>
<td></td>
<td>2014</td>
<td>250.47</td>
<td>1,054.08</td>
<td></td>
</tr>
<tr>
<td>EMEA</td>
<td>2014</td>
<td>135.44</td>
<td>401.04</td>
<td></td>
</tr>
<tr>
<td></td>
<td>2013</td>
<td>128.14</td>
<td>68.47</td>
<td></td>
</tr>
<tr>
<td></td>
<td>2012</td>
<td>107.68</td>
<td>66.01</td>
<td></td>
</tr>
<tr>
<td>US</td>
<td>2013</td>
<td>480.11</td>
<td>1,210.86</td>
<td></td>
</tr>
<tr>
<td></td>
<td>2012</td>
<td>202.04</td>
<td>371.89</td>
<td></td>
</tr>
<tr>
<td></td>
<td>2014</td>
<td>905.78</td>
<td>1,315.25</td>
<td></td>
</tr>
</tbody>
</table>

Applying the running total function using table across gives you the following results, with row totals in the last column.

<table>
<thead>
<tr>
<th>customer_region</th>
<th>timestamp</th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>AP</td>
<td>2012</td>
<td>67.25</td>
<td>184.4</td>
<td>184.4</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>2013</td>
<td>216.28</td>
<td>808.33</td>
<td>909.73</td>
<td>1,120.61</td>
<td></td>
</tr>
<tr>
<td></td>
<td>2014</td>
<td>250.47</td>
<td>1,304.55</td>
<td>1,891.51</td>
<td>3,231.14</td>
<td></td>
</tr>
<tr>
<td>EMEA</td>
<td>2014</td>
<td>135.44</td>
<td>536.48</td>
<td>886.68</td>
<td>1,548.48</td>
<td></td>
</tr>
<tr>
<td></td>
<td>2013</td>
<td>128.14</td>
<td>216.01</td>
<td>225.45</td>
<td>281.25</td>
<td></td>
</tr>
<tr>
<td></td>
<td>2012</td>
<td>107.68</td>
<td>173.69</td>
<td>173.69</td>
<td>173.69</td>
<td></td>
</tr>
<tr>
<td>US</td>
<td>2013</td>
<td>480.11</td>
<td>1,090.97</td>
<td>1,084.21</td>
<td>2,013.04</td>
<td></td>
</tr>
<tr>
<td></td>
<td>2012</td>
<td>202.04</td>
<td>573.93</td>
<td>573.93</td>
<td>573.93</td>
<td></td>
</tr>
<tr>
<td></td>
<td>2014</td>
<td>905.78</td>
<td>2,221.03</td>
<td>2,002.22</td>
<td>4,125.89</td>
<td></td>
</tr>
</tbody>
</table>

Table Down

Using table down applies the calculation down the columns of the pivot table, regardless of any grouping. For example, take the following pivot table.

<table>
<thead>
<tr>
<th>customer_region</th>
<th>timestamp</th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>AP</td>
<td>2012</td>
<td>67.25</td>
<td>117.15</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>2013</td>
<td>216.28</td>
<td>492.25</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>2014</td>
<td>250.47</td>
<td>1,054.08</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EMEA</td>
<td>2014</td>
<td>135.44</td>
<td>401.04</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>2013</td>
<td>128.14</td>
<td>68.47</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>2012</td>
<td>107.68</td>
<td>66.01</td>
<td></td>
<td></td>
</tr>
<tr>
<td>US</td>
<td>2013</td>
<td>480.11</td>
<td>1,210.86</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>2012</td>
<td>202.04</td>
<td>371.89</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>2014</td>
<td>905.78</td>
<td>1,315.25</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Applying the running total function using table down gives you the following results, with column totals in the last row.
Using table across down applies the calculation across the rows of the pivot table, and then takes the results and reapplies the calculation down the columns of the pivot table.

For the running total and difference functions, you get the same results whether you apply the function using table across down or table down across, because of the way those functions are calculated. For all other functions, the results are different depending on whether you apply the function using table across down or table down across.

For example, take the following pivot table.

Applying the running total function using table across down or table down across gives you the following results, where totals are summed both down and across, with the grand total in the bottom right cell.

Applying the rank function using table across down, so that the initial ranks are determined across the table rows and then those ranks are in turn ranked down the columns, gives you the following results.
While applying the rank function using table down across, so that the initial ranks are determined down the table columns and then those ranks are in turn ranked across the rows, gives you the following results instead.

### Table Down Across

Using table down across applies the calculation down the columns of the pivot table, then takes the results and re-applies the calculation across the rows of the pivot table.

For the running total and difference functions, you get the same results whether you apply the function using table down across or table across down, because of the way those functions are calculated. For all other functions, the results are different depending on whether you apply the function using table down across or table across down.

For example, take the following pivot table.

Applying the running total function using table down across or table across down gives you the following results, where totals are summed both down and across, with the grand total in the bottom right cell.
Group Across

Using group across applies the calculation across the rows of the pivot table within group boundaries, as determined by the second level of grouping applied to the columns. For example, if you group by state and then by city, grouping is applied at the state level. If you group by region, state, and city, grouping is again applied at the state level. When there is no grouping, group across returns the same results as table across.

For example, take the following pivot table where columns are grouped by service category and then by consumption channel.
Applying the running total function using group across gives you the following results, where the function is applied across the rows, bounded by the columns for each service category group. The Mobile columns display the total for both consumption channels for the given service category, for the customer region and year represented by the given row. For example, the highlighted cell represents the total for the AP region for 2012, for all consumption channels in the Billing service category.

Group Down

Using group down applies the calculation down the columns of the pivot table within group boundaries, as determined by the second level of grouping applied to the rows. For example, if you group by state and then by city, grouping is applied at the state level. If you group by region, state, and city, grouping is again applied at the state level. When there is no grouping, group down returns the same results as table down.

For example, take the following pivot table where rows are grouped by region and then by year.

Applying the running total function using group down gives you the following results, where the function is applied down the columns, bounded by the rows for each region group. The 2014 rows...
display the total for all years for the given region, for the service category and consumption channel represented by the given column. For example, the highlighted cell represents the total for the Billing service category for the Mobile consumption channel, for all years in the AP region.

<table>
<thead>
<tr>

</tbody>
</table>

**Group Across Down**

Using group across down applies the calculation across the rows within group boundaries, as determined by the second level of grouping applied to the columns. Then the function takes the results and re-applies the calculation down the columns of the pivot table, within group boundaries as determined by the second level of grouping applied to the rows. For example, if you group a row or column by state and then by city, grouping is applied at the state level. If you group by region, state, and city, grouping is again applied at the state level. When there is no grouping, group across down returns the same results as table across down.

For the running total and difference functions, you get the same results whether you apply the function using group across down or group down across, because of the way those functions are calculated. For all other functions, the results are different depending on whether you apply the function using group across down or group down across.

For example, take the following pivot table where columns are grouped by service category and then by consumption channel, and rows are grouped by region and then by year.

<table>
<thead>
<tr>
<th>customer_region</th>
<th>timestamp</th>
<th>API</th>
<th>MOBILE</th>
<th>API</th>
<th>MOBILE</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2012</td>
<td>6725</td>
<td>11715</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>2013</td>
<td>31628</td>
<td>49225</td>
<td>1012</td>
<td>2108</td>
</tr>
<tr>
<td></td>
<td>2014</td>
<td>25047</td>
<td>105408</td>
<td>58696</td>
<td>138943</td>
</tr>
<tr>
<td>EMEA</td>
<td>2014</td>
<td>15544</td>
<td>40104</td>
<td>3502</td>
<td>5518</td>
</tr>
<tr>
<td></td>
<td>2012</td>
<td>12814</td>
<td>6847</td>
<td>807</td>
<td>558</td>
</tr>
<tr>
<td></td>
<td>2013</td>
<td>10764</td>
<td>6601</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>2013</td>
<td>46011</td>
<td>122086</td>
<td>19124</td>
<td>13083</td>
</tr>
<tr>
<td></td>
<td>2012</td>
<td>20204</td>
<td>37189</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>2014</td>
<td>90578</td>
<td>121525</td>
<td>68119</td>
<td>123867</td>
</tr>
</tbody>
</table>

Applying the running total function using group across down or group down across gives you the following results, where totals are summed both down and across within the group boundaries. In this case, these are service category for the columns and customer region for the rows. The grand total appears in the bottom right cell for the group.
Applying the rank function using group across down gives you the following results, where the function is first applied across the rows bounded by each service category group. The function is then applied again to the results of that first calculation, this time applied down the columns bounded by each region group.

Applying the rank function using group down across gives you the following results instead, where the function is first applied down the columns bounded by each region group. The function is then applied again to the results of that first calculation, this time applied across the rows bounded by each service category group.

**Group Down Across**

Using group down across applies the calculation down the columns within group boundaries, as determined by the second level of grouping applied to the rows. Then Amazon QuickSight takes the results and reapplies the calculation across the rows of the pivot table. Again, it reapplies the calculation within group boundaries as determined by the second level of grouping applied to the columns. For example, if you group a row or column by state and then by city, grouping is applied at the state level. If you group by region, state, and city, grouping is again applied at the state level. When there is no grouping, group down across returns the same results as table down across.
For the running total and difference functions, you get the same results whether you apply the function using group down across or group across down, because of the way those functions are calculated. For all other functions, the results are different depending on whether you apply the function using group down across or group across down.

For example, take the following pivot table where columns are grouped by service category and then by consumption channel, and rows are grouped by region and then by year.

Applying the running total function using group down across or group across down gives you the following results. Here, totals are summed both down and across within the group boundaries, in this case service category for the columns and customer region for the rows. The grand total is in the bottom right cell for the group.

Applying the rank function using group down across gives you the following results, where the function is first applied down the columns bounded by each region group. The function is then applied again to the results of that first calculation, this time applied across the rows bounded by each service category group.

Applying the rank function using group across down gives you the following results instead, where the function is first applied across the rows bounded by each service category group. The function is then...
applied again to the results of that first calculation, this time applied down the columns bounded by each region group.

Using Scatter Plots

Use scatter plots to visualize two or three measures for a dimension.

Each bubble on the scatter plot represents one item in the dimension. The X and Y axes represent two different measures that apply to the dimension. A bubble appears on the chart at the point where the values for the two measures for an item in the dimension intersect. Optionally, you can also use bubble size to represent an additional measure.

Scatter plots show up to 50 data points for the intersection of the X and Y axis values for visuals that don't use group/color. For visuals that do use group/color, scatter plots show up to 2500 data points. For more information about how we handle data that falls outside display limits, see Display Limits in Visuals (p. 344).

The icon for a scatter plot is as follows:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Supported?</th>
<th>Comments</th>
<th>For More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changing the legend display</td>
<td>Yes, with exceptions</td>
<td>Scatter plots display a legend if you have the Group/Color field well populated.</td>
<td>Customizing the Visual Legend (p. 281)</td>
</tr>
<tr>
<td>Changing the title display</td>
<td>Yes</td>

</tr>
<tr>
<td>Focusing on or excluding elements</td>
<td>Yes, with exceptions</td>
<td>You can focus on or exclude a bubble in a scatter plot, except when you are using a date field</td>
<td>Focusing on Visual Elements (p. 276)</td>
</tr>
</tbody>
</table>
Creating a Scatter Plot

Use the following procedure to create a scatter plot.

1. On the analysis page, choose Visualize on the tool bar.
2. Choose Add on the application bar, and then choose Add visual.
3. On the Visual types pane, choose the scatter plot icon.
4. From the Fields list pane, drag the fields that you want to use to the appropriate field wells. Typically, you want to use dimension or measure fields as indicated by the target field well. If you choose to use a dimension field as a measure, the Count aggregate function is automatically applied to it to create a numeric value.

   To create a scatter plot, drag a measure to the X axis field well, a measure to the Y axis field well, and a dimension to the Group/Color field well. To represent another measure with bubble size, drag that measure to the Size field well.

5. (Optional) Add drill-down layers by dragging one or more additional fields to the Group/Color field well. For more information about adding drill-downs, see Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335).

Using Tabular Reports

Use tabular reports to see a customized table view of your data.

To create a table visual, choose at least one field of any data type. You can add as many columns as you need. Plus, you can add calculated columns.

The icon for a table is as follows.
Tabular Report Features

Tabular reports don't display a legend. You can hide or display the title on a tabular report. You can also hide or display totals, and choose to show totals at the top or the bottom of the table.

Use the following table to understand the features supported by tabular reports.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Supported?</th>
<th>For More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changing the legend display</td>
<td>No</td>
<td>Customizing the Visual Legend (p. 281)</td>
</tr>
<tr>
<td>Changing the title display</td>
<td>Yes</td>
<td>Customizing a Visual Title (p. 279)</td>
</tr>
<tr>
<td>Sorting</td>
<td>Yes</td>
<td>Sorting Visual Data in Amazon QuickSight (p. 307)</td>
</tr>
<tr>
<td>Calculated fields and aggregations</td>
<td>Yes</td>
<td>Changing Field Aggregation (p. 296)</td>
</tr>
<tr>
<td>Adding drill-downs</td>
<td>No</td>
<td>Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335)</td>
</tr>
<tr>
<td>Show/hide total</td>
<td>Yes</td>
<td>Use Totals on a Tabular Report (p. 397)</td>
</tr>
</tbody>
</table>

Use Totals on a Tabular Report

You can show or hide totals on a tabular report. Use the on-visual menu on the top right of the visual to access the option to Show Totals or Hide Totals.
You can show totals at the top or the bottom of the visual. Use the on-visual menu to access the option for **Format visual**. If you enable **Show Totals**, you will see the options for **Top** and **Bottom** locations.
Tabular reports can display up to 200 columns.

**Creating a Tabular Report**

Use the following procedure to create a tabular report (a table visual).

1. On the analysis page, choose **Visualize** on the tool bar.
2. Choose **Add** on the application bar, and then choose **Add visual**.
3. On the **Visual types** pane, choose the table icon.
4. From the **Fields list** pane, choose the fields that you want to use. If you want to add a calculated field, choose **Add** on the application bar, and then choose **Add calculated field**.

   To create a non-aggregated view of the data, add fields only to the **Value** field well. This shows data without any aggregations.

   To create an aggregated view of the data, choose the fields that you want to aggregate by, and then add them to the **Group by** field well.

**Using Tree Maps**

Use tree maps to visualize one or two measures for a dimension.

Each rectangle on the tree map represents one item in the dimension. Rectangle size represents the proportion of the value for the selected measure that the item represents compared to the whole for the
dimension. You can optionally use rectangle color to represent another measure for the item. Rectangle color represents where the value for the item falls in the range for the measure, with darker colors indicating higher values and lighter colors indicating lower ones.

Tree maps show up to 100 data points for the group by field. For more information about how we handle data that falls outside display limits, see Display Limits in Visuals (p. 344).

The icon for a tree map is as follows:

![Tree Map Icon]

## Tree Map Features

Use the following table to understand the features supported by tree maps.

<table>
<thead>
<tr>

<td>Yes</td>
<td>You must apply aggregation to the fields you choose for size and color, and can't apply aggregation to the field you choose to group by.</td>
<td>Changing Field Aggregation (p. 296)</td>
</tr>
<tr>
<td>Adding drill-downs</td>
<td>Yes</td>
<td>You can add drill-down levels to the Group by field well.</td>
<td>Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335)</td>
</tr>
</tbody>
</table>

## Create a Tree Map

Use the following procedure to create a tree map.

1. On the analysis page, choose **Visualize** on the tool bar.
2. Choose **Add** on the application bar, and then choose **Add visual**.
3. On the **Visual types** pane, choose the tree map icon.

4. From the **Fields list** pane, drag the fields that you want to use to the appropriate field wells. Typically, you want to use dimension or measure fields as indicated by the target field well. If you choose to use a dimension field as a measure, the **Count** aggregate function is automatically applied to it to create a numeric value.

   To create a tree map, drag a measure to the **Size** field well and a dimension to the **Group by** field well. Optionally, drag another measure to the **Color** field well.

5. (Optional) Add drill-down layers by dragging one or more additional fields to the **Group by** field well. For more information about adding drill-downs, see Adding Drill-Downs to Visual Data in Amazon QuickSight (p. 335).
Working with Stories

You can use a story to preserve multiple iterations of an analysis and then play them sequentially to provide a narrative about the analysis data. For example, you might want to see several versions of the analysis, all with the same charts but with different filters applied.

A captured iteration of an analysis is called a scene. A scene preserves the visuals that are in the analysis at the time you create it, including such things as filtering and sort order. The data in the visuals is not captured as part of the scene. When you play the story, visuals will reflect the current data in the data set.

Every analysis comes with a default story called Storyboard 1. When working in an analysis, you can add scenes to Storyboard 1 by choosing Capture on the application bar. You can rename Storyboard 1 by using the procedure in Rename a Story or Scene (p. 403).

You can create additional stories as needed. If you have added other stories to the analysis, choosing Capture adds a scene to whichever story is currently selected.

View a Story

You can view the currently selected story for an analysis by choosing Story on the tool bar. To see or select other stories, choose the expand icon next to the currently selected story.
Create a Story

Use the following procedure to create a new story.

1. On the analysis page, choose **Story** on the tool bar.

2. Choose the add icon (+) at the top of the **Story** pane.

3. Type a story name and then choose **OK**. The new story is set as the current selected story.

Choose **Visualize** on the tool bar to return to viewing visuals again. Whenever you want to capture the current state of the analysis as a scene in the story, choose **Capture** on the application bar.

Rename a Story or Scene

You can rename stories, and also scenes within stories. Use the following procedure to rename a story or a scene.

1. On the analysis page, choose **Story** on the tool bar.

2. Select and drag to highlight the story or scene name you want to change.
3. Type a new name and then press Enter.

### Play a Story

Use the following procedure to play a story.

1. On the analysis page, choose **Story** on the tool bar.
2. Choose the play icon on the scene you want to start playing from. The story plays, opening on the scene you selected.
3. Choose **PREVIOUS** or **NEXT** to step through the scenes in the story.

4. To stop playing the story, choose **STOP STORY**.
Delete a Story

You can delete the currently selected story by choosing the expand icon next to the story and then choosing Delete.
Working with Dashboards

A dashboard is a read-only snapshot of an analysis that you can share with other Amazon QuickSight users for reporting purposes. A dashboard preserves the configuration of the analysis at the time you publish it, including such things as filtering, parameters, controls, and sort order. The data used for the analysis isn’t captured as part of the dashboard. When you view the dashboard, it reflects the current data in the data sets used by the analysis.

When you share a dashboard, you specify which users have access to it. Users who are dashboard viewers can view and filter the dashboard data. Any selections to filters, controls, or sorting that users apply while viewing the dashboard exist only while the user is viewing the dashboard, and aren’t saved once it’s closed. Users who are dashboard owners can edit and share the dashboard, and optionally can edit and share the analysis. If you want them to also edit and share the data set, you can set that up in the analysis.

Use the following sections to learn how to publish, share, and view dashboards.

Topics
- Publishing a Dashboard (p. 407)
- Copying a Dashboard (p. 408)
- Deleting a Dashboard (p. 409)
- Sharing Dashboards (p. 409)

Publishing a Dashboard

Use the following procedure to publish and optionally share a dashboard.

1. On the analysis page, choose Share on the application bar, and then choose Publish dashboard.

2. Do one of the following:
   - Choose Publish new dashboard as, and then type a dashboard name.
   - Choose Replace an existing dashboard, and then choose the dashboard to replace.
3. Choose **Publish dashboard**.
4. Do one of the following:
   - To publish a dashboard without sharing, choose x on top right of the **Share dashboard with users** screen. You can always share the dashboard later by choosing **Share** from the application bar.
   - To share the dashboard, follow the procedure in **Sharing Dashboards** (p. 409).

After you complete these steps, you complete creating and sharing the dashboard. The new dashboard users now receive email with a link to the dashboard. Groups don't receive invitation emails.

### Copying a Dashboard

To create a new analysis or dashboard from an existing dashboard, choose **Save As** from the top menu. Doing so creates a new analysis. To create a new dashboard, share the new analysis as a dashboard. You must have co-owner access to the dashboard, or have **Save as** privileges on it.

After you save the original dashboard as a new analysis, you can collaborate on it by sharing the new analysis with other users. You can use this workflow to preserve a production version of the dashboard, while also developing or testing a new version of it.

Use the following procedure to copy a dashboard to a new one.

1. Open the dashboard you want to duplicate.
2. Choose **Save As**, and then type a name for the new analysis. When you save an existing dashboard using the **Save As** option, it creates an analysis based on the dashboard.
3. (Optional) Make changes to the new analysis.
   
   At this point, you can share the analysis with other users so you can collaborate on changes. All users who have access can make changes to the new analysis.
4. (Optional) To create a new dashboard with your changes to the new analysis, choose **Share**, and then **Publish Dashboard**.
5. (Optional) To save the new dashboard without sharing it, close the **Share dashboard with users** screen. Alternatively, you can enter users to share with. You can always share later by choosing **Share** from the application bar.

For more information, see the following:
- Sharing Dashboards (p. 409)
- Sharing Analyses (p. 262)

**Deleting a Dashboard**

You can only delete dashboards that you own or co-own. Use the following procedure to delete a dashboard.

1. On the **All dashboards** tab of the Amazon QuickSight start page, choose the details icon (vertical dots ⋮) on the dashboard that you want to delete.

2. Choose **Delete**. Then choose **Delete** again to confirm that you want to delete it.

**Sharing Dashboards**

After you publish a dashboard, you can share it with other users or groups, and choose the level of access to grant them. You can also choose to share with all users in your Amazon QuickSight subscription.

After you share a dashboard, you can review the other users or groups that have access to it. You can also revoke access to the dashboard, or remove yourself from it.

**Topics**
- View the Users Sharing the Dashboard (p. 410)
- Share an Existing Dashboard (p. 410)
- Revoke Access to a Dashboard (p. 412)
View the Users Sharing the Dashboard

Use the following procedure to see which users or groups have access to the dashboard.

1. Open the dashboard and choose **Share** from the application bar. Then choose **Manage dashboard access**.
2. Review the users and groups, and their roles and settings.

You can search to locate a specific user or group by typing in their name, or any part of their name. Searching is case-sensitive, and wildcards are not supported. Delete the search term to return view all user accounts.

![Manage dashboard sharing](image)

Share an Existing Dashboard

Use the following procedure to share a dashboard. You can use the same procedure to reshare a dashboard to send a new notification email. However, confirmation emails are not sent to groups.

1. On the dashboard page, choose **Share** on the application bar.
2. Do one of the following:

   - Before adding any users, you can check what permissions already exist by choosing **Manage dashboard access**. Then choose **Add users** to return to this screen.
   - You have the option to share with all the users in your QS; subscription. To do this, select the option **Share with all users in this account**. When you manage dashboard access through the **Managed dashboard sharing** screen, you see that the option **Share with all users in this account** is enabled. The individual users aren't listed in this screen.
   - To share with an individual user or group, type the user or group into the search box. Then choose the user or group from the list that appears. Only active users and groups appear in the list.

   **Important**
   Users who have access to the dashboard can also see the data used in the analysis.
To add more users, type in another user or group. You can remove users or groups by choosing the delete icon near the user that you want to remove.

3. After you have entered everyone that you want to share with, choose **Share** to confirm your choices. In the next screen, you can see the user name, email, permission level, user role, and privileges. You can also remove a user by using the delete icon.

4. Choose permissions for each user. Users in the reader role don’t have any options for permissions or **Save as** privileges.

   - **Viewer**

     Viewers can view, filter, and sort the dashboard data. They can also use any controls or custom URL actions that are on the dashboard. Any changes they make to the dashboard exist only while they are viewing it, and aren’t saved once they close the dashboard.

   - **Co-owner**

     Co-owners can edit and share the dashboard. You have the option to provide them with the same permissions to the analysis. If you want them to also edit and share the data set, you can set that up inside the analysis.

Choose whether to enable a user’s privilege to **Save as** to create a new dashboard from a copy of this one. This privilege grants read-only access to the data sets, so the user or group can create new analyses from it.
Revoke Access to a Dashboard

Use the following procedure to revoke user access to a dashboard.

1. On the dashboard page, choose Share on the application bar.
2. Choose Manage dashboard sharing.
3. Locate the user you want to remove. Under Action, choose the delete icon for that user.
Administration

Use the following section to learn about Amazon QuickSight administrative tasks. This section contains information about controlling access, managing accounts, and choosing AWS Regions.

Topics
- Different Editions of Amazon QuickSight (p. 413)
- AWS Regions and IP Address Ranges (p. 416)
- Supported Browsers (p. 417)
- Signing Up for Amazon QuickSight (p. 417)
- Access and Authentication in Amazon QuickSight (p. 422)
- Managing User Access Inside Amazon QuickSight (p. 436)
- Managing Amazon QuickSight Usage (p. 441)
- Working with AWS Services (p. 458)

Different Editions of Amazon QuickSight

Amazon QuickSight offers Standard and Enterprise editions. To learn more about the differences in availability, user management, permissions, and security between the two versions, see the following topic.

Both editions offer a full set of features for creating and sharing data visualizations. Enterprise edition additionally offers encryption at rest and Microsoft Active Directory (Microsoft Active Directory) integration. In Enterprise edition, you select a Microsoft Active Directory directory in AWS Directory Service. You use that active directory to identify and manage your Amazon QuickSight users and administrators.

For more information about the features offered by the Amazon QuickSight editions and about pricing, see the Amazon QuickSight website.

Comparing Editions

To help you decide which edition is for you, take a look at the following table to compare features between editions.

<table>
<thead>
<tr>
<th>Features</th>
<th>Standard Edition</th>
<th>Enterprise Edition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upload .csv files, flat files, and Excel files</td>
<td>#</td>
<td>#</td>
</tr>
<tr>
<td>Connect to supported AWS data sources</td>
<td>#</td>
<td>#</td>
</tr>
<tr>
<td>Connect to third-party data sources</td>
<td>#</td>
<td>#</td>
</tr>
<tr>
<td>Connect to on-premises or hosted databases</td>
<td>#</td>
<td>#</td>
</tr>
<tr>
<td>Data preparation tools</td>
<td>#</td>
<td>#</td>
</tr>
<tr>
<td>Build visualizations and share dashboards</td>
<td>#</td>
<td>#</td>
</tr>
</tbody>
</table>
### Availability of Editions

If you want to use Amazon QuickSight Enterprise edition, currently you must choose the US East (N. Virginia) Region as your Amazon QuickSight capacity region. The Microsoft Active Directory directory that you select to integrate with Amazon QuickSight must also reside in US East (N. Virginia) Region. This AWS Region is also where default SPICE (p. 2) capacity for your account is allocated. However, you can purchase additional SPICE capacity in any AWS Region supported by Amazon QuickSight. You can access other AWS resources in any AWS Region.

### User Management Between Editions

User management is different between the Amazon QuickSight Standard and Enterprise editions. However, both editions support identity federation, or Federated Single Sign-On (SSO), through Security Assertion Markup Language 2.0 (SAML 2.0).

#### User Management for Standard Edition

In Standard edition, you can invite an AWS Identity and Access Management (IAM) user and allow that user to use their credentials to access Amazon QuickSight. Alternatively, you can invite any person with an email address to create an Amazon QuickSight–only user account. When you create a user account, Amazon QuickSight sends email to that user inviting them to activate their account.

When you create a user account, you also choose to assign it either an administrative or a user role. This role assignment determines the user’s permissions in Amazon QuickSight. You perform all management of users by adding, changing, and deleting user accounts in Amazon QuickSight.

For more information about managing Standard edition user accounts, see Managing User Access Inside Amazon QuickSight (p. 436).

#### User Management for Enterprise Edition

In Enterprise edition, you can select one or more Microsoft Active Directory active directory groups in AWS Directory Service for administrative access. All users in these groups are authorized to sign in to
Amazon QuickSight as administrators. You can also select one or more Microsoft Active Directory active directory groups in AWS Directory Service for user access. All users in these groups are authorized to sign in to Amazon QuickSight as users.

**Important**

Amazon QuickSight administrators and users added in this way aren't automatically notified of their access to Amazon QuickSight. You must email users with the sign-in URL, the account name, and their credentials.

You can only add or remove Enterprise edition user accounts by adding or removing a person from a Microsoft Active Directory group that you associated with Amazon QuickSight. When you add a user account, the permissions it gets rely on whether the Microsoft Active Directory group is an administrative group or a user group in Amazon QuickSight.

You can also bulk add or remove user accounts by integrating Microsoft Active Directory groups with, or removing Microsoft Active Directory groups from, Amazon QuickSight.

Deactivating a user by removing the user from a Microsoft Active Directory group, or by removing their Microsoft Active Directory group from integration with Amazon QuickSight, doesn't delete the associated Amazon QuickSight user account for that person.

For more information about managing Enterprise edition user accounts, see Access and Authentication in Amazon QuickSight (p. 422).

**Permissions for the Different Editions**

In Standard edition, all Amazon QuickSight administrators can manage subscriptions and SPICE capacity. They can also add, modify, and delete user accounts.

Additional AWS permissions are required to manage Amazon QuickSight permissions to AWS resources and to unsubscribe from Amazon QuickSight. These tasks can only be performed by an IAM user who also has administrative permissions in Amazon QuickSight, or by the IAM user or AWS account that created the Amazon QuickSight account.

To manage access to AWS resources from Amazon QuickSight, you must be logged in as one of the following:

- Any IAM user who is an Amazon QuickSight administrator
- The IAM user or AWS root account that created the Amazon QuickSight account

In Enterprise edition, you must add AD users or groups to an IAM role that has QuickSight permissions, rather than adding IAM users individually. All Microsoft Active Directory users that are Amazon QuickSight administrators can to manage subscriptions and SPICE capacity.

Additional AWS permissions are required to manage Microsoft Active Directory groups, manage access to AWS resources, or unsubscribe from Amazon QuickSight. Administrators are prompted for AWS or IAM credentials to perform these tasks.

For more information about the permissions needed for specific tasks, see Setting Your IAM Policy (p. 477).

**Secure Transmission and Storage Between Editions**

In both editions of Amazon QuickSight, all transfers of data (for example, from the data source to SPICE, or from SPICE to the user interface) are encrypted. Database connections are secured using Secure Sockets Layer (SSL), and all other transfers are secured using Transport Layer Security (TLS).
In Enterprise edition, data at rest in SPICE is also encrypted using block-level encryption with AWS-managed keys.

**AWS Regions and IP Address Ranges**

AWS cloud computing resources are housed in highly available data center facilities in different areas of the world (for example, North America, Europe, or Asia). Each data center is part of an AWS Region. Each AWS Region contains two or more data centers, which are called Availability Zones (AZs). For more information about AWS Regions and AZs, see Global Infrastructure.

Amazon QuickSight is currently supported in the following AWS Regions and IP address ranges.

<table>
<thead>
<tr>
<th>AWS Region</th>
<th>IP Address Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>US East (Ohio) (us-east-2)</td>
<td>52.15.247.160/27</td>
</tr>
<tr>
<td>US East (N. Virginia) (us-east-1)</td>
<td>52.23.63.224/27</td>
</tr>
<tr>
<td>US West (Oregon) (us-west-2)</td>
<td>54.70.204.128/27</td>
</tr>
<tr>
<td>EU (Ireland) (eu-west-1)</td>
<td>52.210.255.224/27</td>
</tr>
<tr>
<td>Asia Pacific (Singapore)</td>
<td>13.229.254.0/27</td>
</tr>
<tr>
<td>Asia Pacific (Sydney)</td>
<td>54.153.249.96/27</td>
</tr>
<tr>
<td>Asia Pacific (Tokyo)</td>
<td>13.113.244.32/27</td>
</tr>
</tbody>
</table>

When you sign up for Amazon QuickSight, you select a home AWS Region. This is the AWS Region where you want Amazon QuickSight to allocate the initial SPICE capacity associated with any user accounts you create. Typically, this will be the AWS Region closest to your physical location, and the same AWS Region where you have the majority of your other AWS resources (like Amazon RDS instances). For more information about how SPICE capacity is allocated, see Managing SPICE Capacity (p. 451).

When you sign in to Amazon QuickSight using the default URL of aws.amazon.com/quicksight, the US East (N. Virginia) (us-east-1) region is selected by default. If you sign in using a URL that specifies a supported AWS Region, for example us-west-2.quicksight.aws.amazon.com, the AWS Region specified in the URL is selected. You can change to other supported AWS Regions by using the region selector on the right side of the application bar.

You can autodiscover your Amazon RDS instances and Amazon Redshift clusters that run in any of the AWS Regions that Amazon QuickSight supports. If you enable autodiscovery, the autodiscovered resources displayed reflect whatever AWS Region you currently have selected. You can still use AWS resources in other AWS Regions by manually creating connections to them. For more information about
enabling autodiscovery of AWS data stores, see Authorizing Connections from Amazon QuickSight to AWS Data Stores (p. 459).

It is important to remember that each AWS Region is completely independent. Any Amazon QuickSight resources you create, like data sets and analyses, exist only in the AWS Region in which you create them, and can't be moved to other AWS Regions.

## Supported Browsers

Before you start working with Amazon QuickSight, use the following table to verify that your browser is supported for Amazon QuickSight access.

<table>
<thead>
<tr>
<th>Browser</th>
<th>Version</th>
<th>Check Your Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apple Safari</td>
<td>7 or later</td>
<td>Open Safari. On the menu, choose Safari, and then choose About Safari. The version number is shown in the dialog box that displays.</td>
</tr>
<tr>
<td>Google Chrome</td>
<td>Last three versions</td>
<td>Open Chrome and type chrome://version in your address bar. The version is in the Google Chrome field at the top of the results.</td>
</tr>
<tr>
<td>Microsoft Edge</td>
<td>Latest version</td>
<td>Not applicable.</td>
</tr>
<tr>
<td>Microsoft Internet Explorer</td>
<td>11 or later</td>
<td>Open Internet Explorer, choose the Tools icon, and then choose About Internet Explorer.</td>
</tr>
<tr>
<td>Mozilla Firefox</td>
<td>Last three versions</td>
<td>Open Firefox. On the menu, choose the Help icon, and then choose About Firefox. The version number is listed underneath the Firefox name.</td>
</tr>
</tbody>
</table>

## Signing Up for Amazon QuickSight

If you are new to AWS, see Setting Up Amazon QuickSight (p. 9) to create an Amazon QuickSight account.

If you have an existing AWS account, see Subscribe to Amazon QuickSight (p. 418) to create an Amazon QuickSight account.

If your organization has an existing Amazon QuickSight account and you want to request access to it, follow the procedure in Request Access to an Existing Amazon QuickSight Account (p. 419).

**Note**

To avoid confusion with AWS users and AWS administrators, we refer to all Amazon QuickSight users as Amazon QuickSight users or Amazon QuickSight administrators.

For information on supported browsers, see Supported Browsers (p. 417).
Subscribe to Amazon QuickSight

Use this topic to subscribe to Amazon QuickSight using an existing AWS account. If you don't have an AWS account, see Setting Up Amazon QuickSight (p. 9) for streamlined sign-up.

You can have only one Amazon QuickSight account per AWS account. The Amazon QuickSight account contains all the users who use Amazon QuickSight. Users can sign in directly, through an IAM user or role, or through Single Sign-On. For details on using IAM, see Working with AWS Identity and Access Management (IAM) Users, Roles, and Policies (p. 476). For details on using Single Sign-On, see Enabling Single Sign-On Access to Amazon QuickSight Using SAML 2.0 (p. 426).

Before you begin, you must be able connect to an existing AWS account. If your company already has an AWS account, contact your AWS account administrator for assistance.

To subscribe to Amazon QuickSight

1. Sign in to your AWS account and open Amazon QuickSight from the AWS Management Console. It is located under Analytics, and you can find it by searching for "QuickSight".
2. Your AWS account number is displayed for verification purposes. Choose Sign up for QuickSight.
3. Choose Standard or Enterprise. To confirm, choose Continue. A screen titled Create your QuickSight account appears.
4. If you choose Standard, skip this step and proceed to the next one.
   If you choose Enterprise, you first choose the method you want to connect with. Choose one of the following.
   - Use Role Based Federation (SSO)
   - Use Active Directory
5. For both Standard and Enterprise editions, make choices for the following items:
   - Type in a unique account name for Amazon QuickSight. Your account name can only contain characters (A–Z and a–z), digits (0–9), and hyphens (-). If you use AD, and it has a default alias, this alias is used for the account name.
   - Type in a notification email address for the Amazon QuickSight account owner or group. This email receives service and usage notifications.
   - (Optional) Choose the AWS region you want to utilize for your default SPICE (p. 2) capacity. This is where your account's free SPICE capacity is allocated after signing up. Note that you aren't able to change the default capacity region later, but you can always purchase additional SPICE capacity in different regions as needed. See AWS Regions and IP Address Ranges (p. 416) for information on regions.
   - (Optional) Choose whether to allow autodiscovery of your AWS resources. You can change these options later in Manage Account. For more information, see Allowing Autodiscovery of AWS Resources (p. 459).
6. Review the choices you made, then choose Finish.
7. (Optional) If you are using Standard edition, skip this step. To open Amazon QuickSight, choose Go to Amazon QuickSight. To manage user groups, choose Manage access to QuickSight.
   Otherwise, close the browser and notify your users how to connect.

For Enterprise edition, there are a few more steps to complete: configuring users and groups to access Amazon QuickSight.
After you sign up for Amazon QuickSight, users can start to sign in, connect to data, and create analyses.

To set up data sources for your users, see Working with Data Sources in Amazon QuickSight (p. 49).

To enable self-provisioning for Amazon QuickSight by setting an IAM policy on a role with permissions for CreateUser or CreateAdmin, see Working with AWS Identity and Access Management (IAM) Users, Roles, and Policies (p. 476).

To start creating analyses, see Getting Started with Data Analysis in Amazon QuickSight (p. 9).

For more information about managing users in Amazon QuickSight Standard edition, see Managing User Accounts in Amazon QuickSight Standard Edition (p. 436).

For more information about managing users in Amazon QuickSight Enterprise edition, see Managing User Accounts in Amazon QuickSight Enterprise Edition (p. 422).

Request Access to an Existing Amazon QuickSight Account

If your organization has already signed up for Amazon QuickSight, you can ask your Amazon QuickSight administrator to add you as a user.

For Standard edition accounts, your Amazon QuickSight administrator can give you access through your IAM credentials, through Single Sign-On (SSO), or through your email address. For more information for Standard edition users, see Getting Access as a New Amazon QuickSight Standard Edition User (p. 419).

For more information for Enterprise edition users, see Getting Access as a New Amazon QuickSight Enterprise Edition User (p. 421).

After you sign in for the first time, you can connect to data and creating analyses. For more information about creating your first analysis, see Getting Started with Data Analysis in Amazon QuickSight (p. 9).

Topics
- Getting Access as a New Amazon QuickSight Standard Edition User (p. 419)
- Getting Access as a New Amazon QuickSight Enterprise Edition User (p. 421)

Getting Access as a New Amazon QuickSight Standard Edition User

Your Amazon QuickSight administrator uses either your IAM credentials, your Single Sign-On (SSO) service, or your email address to create your Amazon QuickSight user account. Then Amazon QuickSight sends you an email inviting you to activate it. The invitation email you receive indicates what type of credentials you should use.

Note
If your company uses a Single Sign-On (SSO) service with Amazon QuickSight, your administrator must provide instructions on how to sign in. For more information on how this is set up, see Enabling Single Sign-On Access to Amazon QuickSight Using SAML 2.0 (p. 426).

Signing In as a New User Using Credentials Based on Your Email Address

Use the following procedure to sign in as a new user who has an Amazon QuickSight–only account based on an email address.

To sign in as a new user who has an account based on an email address

1. In your invitation email, choose the link in the body of the email to open the Amazon QuickSight sign-up page.
2. Complete your user account by typing a password.

Passwords are case-sensitive, must be between 8 and 64 characters in length, and must contain at least one character from three of the following four categories:

- Lowercase letters (a–z)
- Uppercase letters (A–Z)
- Numbers (0–9)
- Nonalphanumeric characters (~!#$%^&*_-+=`|(){}[]:;"'<>,.?/)

3. Choose Create account and sign in.
4. Choose Continue. Doing this takes you to the Amazon QuickSight start page.

Signing In as a New User Using Your IAM Credentials

Use the following procedure to sign in to Amazon QuickSight as a new user who has IAM credentials.

To sign in as a new user with IAM credentials
1. When you receive the invitation email, go to the Amazon QuickSight sign in page, https://quicksight.aws.amazon.com/.
2. For Account name, type the account name in your invitation email, and then choose Continue.
3. Type your IAM user name in Email address or username.
4. Type your IAM password in Password.
5. Choose Sign in.

Self-Provisioning an Amazon QuickSight user

Use the following procedure to sign in to Amazon QuickSight as a new user who has access to Amazon QuickSight, but has not yet created a login. For this process to work, the AWS administrator must have granted permissions, using an AWS user or group policy in IAM. For more information, see Working with AWS Identity and Access Management (IAM) Users, Roles, and Policies (p. 476).

To sign in as a new user with access but no login
1. When you are invited to do so, go to the Amazon QuickSight sign in page, https://quicksight.aws.amazon.com/.
2. For Account name, type the Amazon QuickSight account name (not the AWS account number). Your administrator or manager might provide this name. Then choose Continue.
3. Type your new Amazon QuickSight user name in Email address or username.
4. Type your new Amazon QuickSight password in Password.
5. Choose Sign in.

Self-Provisioning an Amazon QuickSight administrator

Use the following procedure to set or create the administrator for Amazon QuickSight. This procedure does not require using an alias for your account or your directory.

To make a user the Amazon QuickSight administrator
1. Create the AWS user
• Use IAM to create the user you want to be the administrator of Amazon QuickSight. Or, identify an existing user in IAM for the administrator role. If you prefer, you can put the user inside a new group, for manageability.
• Grant the user (or group) sufficient permissions, as described in Setting Your IAM Policy (p. 477).
• For more information on working with IAM, see Working with AWS Identity and Access Management (IAM) Users, Roles, and Policies (p. 476).

2. Log in to your AWS console with the target user's credentials.
4. Type in your email, and choose Continue
5. On success, the target IAM user is now an Amazon QuickSight administrator.

Getting Access as a New Amazon QuickSight Enterprise Edition User

Before you begin, your Amazon QuickSight administrator must add your network user account to an active directory group associated with Amazon QuickSight. Then, the administrator must provide you with the information that you need to activate your Amazon QuickSight user account, including the Amazon QuickSight account name.

Use the following procedure to sign in to Amazon QuickSight as a new Enterprise edition user.

To sign in as a new Enterprise edition user

1. Choose Standard or Enterprise. To confirm, choose Continue. A screen titled Create your QuickSight account appears.
2. (Optional) If you choose Standard, skip this step and proceed to the next one.
   If you choose Enterprise, you can choose the method you want to use to connect. You can choose one of the following.
   • Use Role Based Federation (SSO)
   • Use Active Directory

   Note
   If you want to use IAM to manage your users, choose Use Role Based Federation (SSO).

   If you choose Active Directory, you will have the chance to add groups and users at this point. However, you can do this later.
3. For all editions, make choices for the following items.
   • Type in a unique account name for QuickSight. Your account name can only contain characters (A–Z and a–z), digits (0–9), and hyphens (-). If you use AD and it has a default alias, the alias becomes the account name.
   • Type in a notification email address for the QuickSight account owner or group. This email receives service and usage notifications
   • (Optional) Choose a capacity region for SPICE (p. 2). New Enterprise accounts must start in US East (N. Virginia). Users can change their region any time. See AWS Regions and IP Address Ranges (p. 416) for information on regions.
   • (Optional) Choose whether to allow autodiscovery of your AWS resources. You can change these options later in Manage Account. For more information, see Allowing Autodiscovery of AWS Resources (p. 459).
4. Before you choose Finish, make sure you chose the correct edition (Standard or Enterprise). 
Currently, to change editions you must either to unsubscribe and create a new Amazon QuickSight account or contact the product team for migration assistance.

Verify the choices you made, then choose Finish.

5. (Optional) If you are using Standard edition, skip this step. For Enterprise edition, to open Amazon QuickSight choose Go to Amazon QuickSight. To manage Microsoft Active Directory user groups, choose Manage access to QuickSight.

Otherwise, close the browser and notify your users how to connect.

After you sign up for Amazon QuickSight, users can log in, connect to data, and create analyses. You can send them a link to Amazon QuickSight Quick Start Guide (p. 7) to provide them with information to get started.

To enable self-provisioning for Amazon QuickSight by setting an IAM policy on a role with permissions for CreateUser or CreateAdmin, see Working with AWS Identity and Access Management (IAM) Users, Roles, and Policies (p. 476).

To set up data sources for your users, see Working with Data Sources in Amazon QuickSight (p. 49).

For more information about managing users for Amazon QuickSight administrators, see Managing User Access Inside Amazon QuickSight (p. 436).

Access and Authentication in Amazon QuickSight

Use the following topics to manage access and authentication to Amazon QuickSight. This topic is for AWS administrators.

Topics
- Managing User Accounts in Amazon QuickSight Enterprise Edition (p. 422)
- Enabling Single Sign-On Access to Amazon QuickSight Using SAML 2.0 (p. 426)
- Provisioning Users for Amazon QuickSight (p. 430)
- Using Multi-Factor Authentication (MFA) with Amazon QuickSight (p. 431)
- Upgrading Your Amazon QuickSight Subscription from Standard Edition to Enterprise Edition (p. 432)
- Canceling Your Amazon QuickSight Subscription and Closing the Account (p. 434)

Managing User Accounts in Amazon QuickSight Enterprise Edition

AWS administrators can use this topic to learn more about managing user accounts in Amazon QuickSight Enterprise edition. For information about managing user accounts in Amazon QuickSight Standard edition, see Managing User Accounts in Amazon QuickSight Standard Edition (p. 436).

In Enterprise edition, you can manage users through any of the following:
- Active Directory. You can add and remove Microsoft Active Directory directory groups to create and deactivate user accounts. You can access the directory groups directly or by using the AD Connector.
- Federated logins.
- Inviting users by email.
To do this, you must have both administrative privileges in Amazon QuickSight and also appropriate AWS permissions. For more information on the necessary AWS permissions, see Setting Your IAM Policy (p. 477). If you are using directory groups, you need to be a network administrator.

Each Amazon QuickSight Enterprise edition account can have an unlimited number of user accounts. User names that contain a semicolon (:) aren't supported.

Use the following procedures to add, view, and deactivate Amazon QuickSight Enterprise edition user accounts.

**Important**

You can't remap Amazon QuickSight users or groups from one identity store to another. For example, if you are migrating from an on-premises Active Directory to AWS Directory Service, or the other way around, you have to unsubscribe and resubscribe to Amazon QuickSight. This functionality applies because even if the user's aliases remain the same, the underlying identity data changes. To make the transition easier, request in advance that your users document all their Amazon QuickSight assets and settings before the migration.

**Adding User Accounts**

Whether you are using federated logins or inviting users by email or using Active Directory, an Amazon QuickSight administrator can directly add users to Amazon QuickSight. If you are using Microsoft Active Directory, you can also manage users through groups. You can create multiple user accounts at once by choosing one or more Active Directory groups to integrate with Amazon QuickSight. All users in the selected groups are authorized to sign in to Amazon QuickSight. You can also add user accounts individually by adding those users to Active Directory groups that are already integrated with Amazon QuickSight.

To see what groups are integrated with your Amazon QuickSight account, use the procedure in Viewing User Account Details (p. 423). For more information about adding a user to a Microsoft Active Directory directory group, see Add Users and Groups (Simple AD and Microsoft Active Directory). Or you can read more about how to connect to a directory using AD Connector.

Users who are invited by email are notified how to sign in. Other users aren't automatically notified of their access to Amazon QuickSight. You or your assigned Amazon QuickSight administrator must provide users with your Amazon QuickSight account name, the sign-in URL (https://quicksight.aws.amazon.com), and instructions to sign in.

**Note**

Although you can manage users through Active Directory groups or as AWS Identity and Access Management (IAM) users, you don't have to do it this way. You can instead choose to invite Amazon QuickSight-only users by email. Choose the Manage Users feature of the Manage QuickSight page, and enter an email address to invite someone to join your Amazon QuickSight account. Each user gets an email containing a link to Amazon QuickSight. Using the invitation link, the user can then set up a user name and password in Amazon QuickSight. Users can also request access through self-provisioning. For more information on requesting access, see Provisioning Users for Amazon QuickSight (p. 430).

Amazon QuickSight subscriptions based on Active Directory can only have users provisioned in Active Directory.

**Viewing User Account Details**

Use the following procedure to view the users or groups that are integrated with Amazon QuickSight.

1. Choose your user name on the application bar and then choose Manage QuickSight.
2. Choose Manage Users. On this screen, you can see which users were active this month. You can also see deleted users.

3. (Optional) If you are using Microsoft Active Directory and you have the correct administrative permissions, you can view the directory groups integrated with Amazon QuickSight.

   Choose Manage groups.

4. (Optional) If you are managing groups, then enter your AWS or IAM credentials on the AWS sign-in page that appears.

---

**Deactivating Active Directory User Accounts**

Deactivating a group or user account removes that group or user's access to Amazon QuickSight resources, like analyses or data sets. However, it doesn't delete resources they own and it doesn't release their SPICE (p. 2) capacity. After deactivating a user, you can delete the user from your Amazon QuickSight account. When you delete a user, Amazon QuickSight gives you the option to either delete the user's resources or transfer their resources to another user.

To deactivate a user account individually, remove that user from all Microsoft Active Directory directory groups that are integrated with Amazon QuickSight. To view the groups integrated with your Amazon QuickSight account, use the procedure in Viewing User Account Details (p. 423).

If you later need to reactivate a user account, put the user into a group with access to Amazon QuickSight. This restores their access to Amazon QuickSight and to any existing resources that are still associated with that user account.

**Note**

You can't upgrade or downgrade a user by transferring them between groups. For more information, see Updating Enterprise User Accounts (p. 426).

You can activate or deactivate multiple user accounts at once by adding or removing one or more Microsoft Active Directory directory groups from integration with Amazon QuickSight.

**Important**

Removing all groups and users doesn't remove any resources and doesn't cancel your subscription to Amazon QuickSight.

Use the following procedure to remove a Microsoft Active Directory directory group from Amazon QuickSight.

1. Choose your user name on the application bar and then choose Manage QuickSight.
2. Choose Manage Users.
3. Choose Manage groups.
4. On the AWS sign-in page, enter your AWS or IAM credentials.
5. Locate the group that you want to remove under either the Administrator groups or the User groups section, and then choose the x-shaped delete icon.

6. In the Manage users screen, you can view each deactivated user in the Deleted user section. This is located beneath the Active users this month section.

To transfer the user's resources, click on the Action "x" button beside that user's name. You are prompted to decide what to do with resources owned solely by that user.

Choose one of the following:
• Transfer ownership of all orphaned resources to a different user in this account.
• Delete all orphaned resources. (This frees the user's SPICE (p. 2) capacity.)

**Warning**
You can't undo this action.

Whichever action you choose applies to all resources owned solely by that user. If you transfer the user's resources, Amazon QuickSight reassigns them to the user you choose. It doesn't make unnecessary duplicates of those resources.

### Updating Enterprise User Accounts

You can upgrade or downgrade between author and admin users in the Manage users tab of the Manage QuickSight screen. If you are using directory groups, you can instead move a user into the appropriate group. To do this, you need both administrative privileges in Amazon QuickSight and also appropriate AWS permissions. Some limitations apply on upgrading or downgrading user access in this automated way.

To downgrade authors to the readers, you delete the users and then recreate them as readers. After you choose to remove a user, you are prompted to transfer or delete their assets. If you are using directory groups, also move that user into the appropriate group. Just moving them into another group doesn't change their access the way it does for transfers between admin and author.

You can change a user's name by first creating a new user and then deleting the original user. By using this approach, you can transfer their assets directly back to them. If you are using a directory service, you can temporarily transfer their assets to a different user. Then, make your changes in Active Directory. The next time the user signs in to Amazon QuickSight, they are asked to create a new account. After they create the new account, the user possessing their assets can transfer all assets back to them.

### Deleting Enterprise User Accounts

Deleting a user account works the same way in both the Standard and Enterprise editions of Amazon QuickSight. User accounts can be deleted by an Amazon QuickSight administrator. To delete a user account, use the procedure in Deleting a User Account (p. 439).

### Enabling Single Sign-On Access to Amazon QuickSight Using SAML 2.0

Amazon QuickSight supports identity federation through Security Assertion Markup Language 2.0 (SAML 2.0) in both Standard and Enterprise editions. You can use an identity provider that supports SAML 2.0
to provide a simple on-boarding flow for your Amazon QuickSight users. Such identity providers include Microsoft Active Directory Federation Services, Ping One Federation Server, and Okta.

With identity federation, your users get one-click access to their Amazon QuickSight applications using their existing identity credentials. You also have the security benefit of identity authentication by your identity provider. You can control which users have access to Amazon QuickSight using your existing identity provider.

**Example Authentication Workflow**

In the following diagram, you can see a typical authentication flow between Amazon QuickSight and a third-party identity provider. In this example, the administrator has set up a sign-in page to access Amazon QuickSight, called applications.exampleco.com. The web page uses a federation service that complies with SAML 2.0 to trigger a sign-on request. The administrator has also set up a user to allow access to Amazon QuickSight.

In this authentication flow, the following happens:

1. The user browses to https://applications.exampleco.com. The sign-on page requests authentication for the user.
2. The federation service requests authentication from the organization's identity store.
3. The identity store authenticates the user and returns the authentication response to the federation service.
4. When authentication is successful, the federation service posts the SAML assertion to the user's browser.
5. The user's browser posts the SAML assertion to the AWS Sign-In SAML endpoint (https://signin.aws.amazon.com/saml). AWS Sign-In receives the SAML request, processes the request, authenticates the user, and forwards the authentication token to the Amazon QuickSight service.
6. Using the authentication token from AWS, Amazon QuickSight authorizes the user and presents applications to the browser.
From the user’s perspective, the process happens transparently. The user starts at your organization’s internal portal and lands at an Amazon QuickSight application portal, without ever having to supply any AWS credentials.

**Setting Up SAML**

You can use an AWS Identity and Access Management (IAM) role and a relay state URL to configure an identity provider (IdP) that is compliant with SAML 2.0. The role grants users permissions to access Amazon QuickSight. The relay state is the portal that the user is forwarded to, after successful authentication by AWS.

**Topics**

- Prerequisites (p. 428)
- Step 1: Create a SAML Provider in AWS (p. 428)
- Step 2: Configure Permissions in AWS for Your Federated Users (p. 429)
- Step 3: Configure the SAML IdP (p. 430)
- Step 4: Create Assertions for the SAML Authentication Response (p. 430)
- Step 5: Configure the Relay State of Your Federation (p. 430)

**Prerequisites**

Before configuring your SAML 2.0 connection, do the following:

- Configure your IdP to establish a trust relationship with AWS:
  - Inside your organization’s network, configure your identity store, such as Windows Active Directory, to work with a SAML-based IdP. SAML-based IdPs include Microsoft Windows Active Directory Federation Services, Shibboleth, and so on.
  - Using your IdP, generate a metadata document that describes your organization as an identity provider.
  - Set up SAML 2.0 authentication, using the same steps as for the AWS Management Console. When this process is complete, you can configure your relay state to match the relay state of Amazon QuickSight (See Step 5: Configure the Relay State of Your Federation (p. 430)).
  - Create an Amazon QuickSight account and note the name to use when you configure your IAM policy and IdP. For more information on creating an Amazon QuickSight account, see Signing Up for Amazon QuickSight (p. 417).

After you create the setup to federate to the AWS Management Console as outlined in the tutorial, you can edit the relay state provided in the tutorial. You do so with the relay state of Amazon QuickSight, described in step 5 following. For more information about integrating with your IdP or using SSO in AWS, see Integrating Third-Party SAML Solution Providers with AWS in the IAM User Guide.

**Step 1: Create a SAML Provider in AWS**

Your SAML identity provider defines your organization’s IdP to AWS. It does so by using the metadata document you previously generated using your IdP.

**To create a SAML provider in AWS**

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. Create a new SAML provider, which is an entity in IAM that holds information about your organization’s identity provider. For more information, see Creating SAML Identity Providers in the IAM User Guide.
3. As part of this process, upload the metadata document produced by the IdP software in your organization noted in the previous section.

**Step 2: Configure Permissions in AWS for Your Federated Users**

Next, create an IAM role that establishes a trust relationship between IAM and your organization's IdP. This role identifies your IdP as a principal (trusted entity) for the purposes of federation. The role also defines which users authenticated by your organization's IdP are allowed to access Amazon QuickSight. For more information about creating a role for a SAML IdP, review Creating a Role for SAML 2.0 Federation in the IAM User Guide.

After you have created the role, you can limit the role to have permissions only to Amazon QuickSight by attaching an inline policy to the role. The following sample policy document provides access to Amazon QuickSight. This policy allows the user access to Amazon QuickSight and allows them to create both author accounts and user accounts.

**Note**

In the following example, replace `<YOUR_AWS_ACCOUNT_ID>` with your 12-digit AWS account ID (with no hyphens '-').

```json
{
  "Statement": [
    {
      "Action": [
        "quicksight:CreateUser"
      ],
      "Effect": "Allow",
      "Resource": [
        "arn:aws:quicksight::<YOUR_AWS_ACCOUNT_ID>:user/${aws:userid}"
      ]
    },
    "Version": "2012-10-17"
  ]
}
```

If you want to provide access to Amazon QuickSight and also the ability to create Amazon QuickSight admins, authors (standard users), and readers, you can use the following policy example.

```json
{
  "Statement": [
    {
      "Action": [
        "quicksight:CreateAdmin"
      ],
      "Effect": "Allow",
      "Resource": [
        "arn:aws:quicksight::<YOUR_AWS_ACCOUNT_ID>:user/${aws:userid}"
      ]
    },
    "Version": "2012-10-17"
  ]
}
```

You can view account details in the AWS Management Console.

Once you have set up SAML and the IAM policy or policies, you don't need to invite users manually. The first time that users open Amazon QuickSight, they are provisioned automatically. If they have
permissions for the quicksight:CreateUser action, they are added as Amazon QuickSight users. If they have permissions for the quicksight:CreateAdmin action, they are added as Amazon QuickSight administrators.

**Step 3: Configure the SAML IdP**

After you create the IAM role, update your SAML IdP about AWS as a service provider. To do so, install the saml-metadata.xml file found at https://signin.aws.amazon.com/static/saml-metadata.xml.

To update the IdP metadata, see the instructions provided by your IdP. Some providers give you the option to type the URL, after which the IdP gets and installs the file for you. Others require you to download the file from the URL and then provide it as a local file.

For more information, see your IdP documentation.

**Step 4: Create Assertions for the SAML Authentication Response**

Next, configure the information that the IdP passes as SAML attributes to AWS as part of the authentication response. For more information, see Configuring SAML Assertions for the Authentication Response in the *IAM User Guide*.

**Step 5: Configure the Relay State of Your Federation**

Finally, you can configure the relay state of your federation to point to the Amazon QuickSight relay state URL. After successful authentication by AWS, the user is directed to Amazon QuickSight, defined as the relay state in the SAML authentication response.

The relay state URL for Amazon QuickSight is:

https://quicksight.aws.amazon.com

---

**Provisioning Users for Amazon QuickSight**

**Self-Provisioning an Amazon QuickSight Administrator**

Amazon QuickSight administrators are users who can also manage Amazon QuickSight features such as account settings and user accounts. They can also purchase additional Amazon QuickSight user subscriptions, purchase SPICE (p. 2) capacity, and cancel the subscription to Amazon QuickSight for your AWS account.

You can use an AWS user or group policy to give users the ability to add themselves as administrators of Amazon QuickSight. Their accounts become active and billable the first time that they open Amazon QuickSight. To set up self-provisioning, you need to give them permission to use the quicksight:CreateAdmin action. For more information about using AWS Identity and Access Management (IAM), see Working with AWS Identity and Access Management (IAM) Users, Roles, and Policies (p. 476).

Alternatively, you can use the following procedure to use the console to set or create the administrator for Amazon QuickSight.

**To make a user the Amazon QuickSight administrator**

1. Create the AWS user:

   - Use IAM to create the user that you want to be the administrator of Amazon QuickSight. Alternatively, identify an existing user in IAM for the administrator role. You can also put the user inside a new group, for manageability.
• Grant the user (or group) sufficient permissions, as described in Setting Your IAM Policy (p. 477).

For more information on working with IAM, see Working with AWS Identity and Access Management (IAM) Users, Roles, and Policies (p. 476).

2. Sign in to your AWS Management Console with the target user’s credentials.

On success, the target IAM user is now an administrator in Amazon QuickSight.

Self-Provisioning an Amazon QuickSight User

Amazon QuickSight users can create data sources, data sets, analyses, and dashboards. They can share analyses and dashboards with other Amazon QuickSight users in your Amazon QuickSight account. However, they don't have access to the Manage QuickSight menu. They can't change account settings, manage user accounts, purchase additional Amazon QuickSight user subscriptions or SPICE (p. 2) capacity, or cancel the subscription to Amazon QuickSight for your AWS account.

You can use an AWS user or group policy to give users the ability to create an Amazon QuickSight user account for themselves. Their accounts become active and billable the first time they open Amazon QuickSight. To set up self-provisioning, you need to give them permission to use the quicksight:CreateUser action. For more information about using IAM, see Working with AWS Identity and Access Management (IAM) Users, Roles, and Policies (p. 476).

Self-Provisioning an Amazon QuickSight Read-Only User

Amazon QuickSight read-only users can view and manipulate dashboards that are shared with them, but they can't make any changes or save a dashboard for further analysis. Amazon QuickSight readers can't create data sources, data sets, analyses, or visuals. They can't do any administrative tasks. Choose this role for people who are consumers of the dashboards but don't author their own analysis, for example, executives.

If you are using Microsoft Active Directory with Amazon QuickSight, you can manage read-only permissions by using a group. Otherwise, you can bulk-invite users to use Amazon QuickSight. You can also use an AWS user or group policy to give users the ability to create an Amazon QuickSight user account for themselves.

Their accounts become active and billable the first time that they open Amazon QuickSight. If you decide to upgrade or downgrade a user, billing for that user is pro-rated for the month.

Using Multi-Factor Authentication (MFA) with Amazon QuickSight

You can use multi-factor authentication (MFA) with Amazon QuickSight by using your AWS Directory Service for Microsoft Active Directory, also known as AWS Microsoft Active Directory or AWS Managed Microsoft Active Directory.

For more information on how to set this up, see How to Enable Multi-Factor Authentication for AWS Services by Using AWS Microsoft Active Directory and On-Premises Credentials.

For more information on multi-factor authentication, see Multi-Factor Authentication in the AWS Directory Service Administration Guide.
Upgrading Your Amazon QuickSight Subscription from Standard Edition to Enterprise Edition

You can upgrade from Amazon QuickSight Standard edition to Amazon QuickSight Enterprise edition. In Enterprise edition, Amazon QuickSight supports the following additional features:

- Active directory integration
- Encryption for data at REST
- Pay-per-session pricing for users in the reader role
- Row-level security
- Hourly refresh of datasets
- Private connections to data in a VPC with a private subnet

To see a full comparison of Standard edition with Enterprise edition, see Amazon QuickSight Editions.

When you upgrade your account, your admins and authors are billed at the Amazon QuickSight Enterprise edition rates. For up-to-date information on rates, see Pricing. To enjoy pay-per-session pricing, you can add additional users as readers. Before you reprovision existing users as readers, transfer or delete their resources, and then delete the users from your subscription.

Users who are in the reader role can view and manipulate shared dashboards, and receive emailed updates. However, readers can't add or change data sources, data sets, analyses, visuals, or administrative settings. Billing for readers is significantly lower in cost than regular user pricing. It's based on 30-minute sessions, and it's capped at a maximum amount per month for each reader. Billing for upgrades is pro-rated for the month of the upgrade. Upgrades to users are also pro-rated. If you have an annual subscription to Standard edition, it's converted to Enterprise edition and stays in place for the remaining term.

**Warning**

Downgrading from Enterprise edition to Standard edition isn't currently possible due to the enhanced feature set available in Enterprise edition. To perform this downgrade, unsubscribe from Amazon QuickSight, and then start a new subscription. It isn't possible to transfer users or assets between subscriptions.

Upgrading to Enterprise edition to use Active Directory connectivity isn't supported due to differences in the user identity mechanisms between Amazon QuickSight password-based users and existing Active Directory users. However, you can upgrade to Enterprise, and still use password-based users. If you want to upgrade, and change how users sign in, you can unsubscribe and start a new subscription.

Use the following procedure to upgrade to Enterprise edition. To perform the upgrade, you need administrative access to Amazon QuickSight, with security permissions to subscribe. The person performing the upgrade is usually an AWS administrator who is also an Amazon QuickSight administrator.

1. Open the administrative settings page by clicking on your profile icon at top right.
2. At top left, choose **Upgrade now**.
3. Be sure that you want to upgrade.

The following screen appears. For the latest prices, see https://aws.amazon.com/quicksight/.

- Readers with Pay-per-Session pricing: Provide read-only access to everyone
- Role-level security: Control exactly what data each user can see
- Private VPC access: Connect to your databases in private VPCs
- Hourly refresh: Refresh your datasets more frequently

Existing users will be charged at $11/user/month (w/annual commitment) or $15/user/month (month-to-month). SPICE capacity will be charged at $0.01/GB/month. Readers are charged at $0.019/session (max charge of $10 reader/month). More details
Important
You can't undo this action.

Choose Upgrade to upgrade. The upgrade is instantaneous.

Billing for the upgrade to your subscription is pro-rated for the month of upgrade. Upgrades to Amazon QuickSight users are also pro-rated.

4. When you upgrade to Enterprise edition, your admin and author users retain their roles. You can downgrade users to readers. First make sure to transfer any assets they own that you want to keep. Then, delete them and add them back to your subscription as readers. If you are using Active Directory, delete the authors, move them to the new reader group, then recreate them as readers in Amazon QuickSight.

Canceling Your Amazon QuickSight Subscription and Closing the Account

If you want to close your Amazon QuickSight account, you can unsubscribe from the service. To unsubscribe, you must be signed in using the IAM account or AWS root account that was used to create your Amazon QuickSight account.

Use the following procedure to unsubscribe from Amazon QuickSight.

1. Choose your user name on the application bar and then choose Manage QuickSight.
2. Choose Account settings.
3. Choose Unsubscribe.
4. (For Amazon QuickSight Enterprise edition accounts only) On the AWS sign-in page, enter your AWS or IAM credentials.
5. Note
   This step applies only to early adopters of Amazon QuickSight. Amazon QuickSight accounts created after the preview period don’t see these options.

   (Optional) If you prefer to use the AWS Management Console to manually delete the Simple AD directory or VPC that Amazon QuickSight used for user management, deselect to uncheck Delete Simple AD directory or Delete VPC.

   However, we strongly recommend leaving these selected (checked) so that these resources are automatically removed.
6. Choose **Unsubscribe**.

**Note**
If you need to delete your Amazon QuickSight account, even when you can't access Amazon QuickSight to unsubscribe, sign in to AWS and use the following link to open the unsubscribe screen: https://us-east-1.quicksight.aws.amazon.com/sn/console/unsubscribe. This approach works no matter what AWS Regions you use. It deletes all data, analyses, Amazon
Managing User Access Inside Amazon QuickSight

Amazon QuickSight administrators can use the following topics to manage user access to Amazon QuickSight and Amazon QuickSight access to AWS resources.

Topics

- Managing User Accounts in Amazon QuickSight Standard Edition (p. 436)
- Managing User Accounts in Amazon QuickSight Enterprise Edition (p. 436)
- Inviting Users to Access Amazon QuickSight (p. 437)
- Viewing Amazon QuickSight User Account Details (p. 439)
- Deleting a User Account (p. 439)

Managing User Accounts in Amazon QuickSight Standard Edition

Use this topic to learn more about managing user accounts in Amazon QuickSight Standard edition. For information on users in Enterprise edition, see Managing User Accounts in Amazon QuickSight Enterprise Edition (p. 422).

If you have administrative privileges in Amazon QuickSight, you can create and delete user accounts. You can create user accounts based on AWS Identity and Access Management (IAM) credentials, or you can create Amazon QuickSight–only user accounts using the email address of the user.

You can't create Amazon QuickSight user accounts using AWS credentials that aren't IAM credentials. Federated logins work through IAM roles. User names that contain a semicolon (;) aren't supported.

Each Amazon QuickSight Standard edition account can have up to 100 user accounts, including the AWS root account or IAM account that created the Amazon QuickSight account. If you need an exception to this limit, follow the instructions in AWS Service Limits in the AWS General Reference to submit a limit increase request.

Managing User Accounts in Amazon QuickSight Enterprise Edition

Use this topic to learn more about managing user accounts in Amazon QuickSight Enterprise edition. For information about users in Standard edition, see Managing User Accounts in Amazon QuickSight Standard Edition (p. 436).

In Enterprise edition, you can manage users through any one of the following:

- Active Directory users and groups
- Federated logins
- Inviting users by email
In Active Directory, individual users are created or deactivated when a network administrator adds or removes them from the directory group. If you are downgrading users to the reader role, you can delete and recreate them in Amazon QuickSight. Deactivating groups or users removes their access to Amazon QuickSight resources. However, it doesn't delete the user's subscription or any resources they own. Note that removing all groups from Amazon QuickSight doesn't remove any resources and doesn't unsubscribe you from Amazon QuickSight.

For instructions on managing user access in Enterprise edition, see Managing User Accounts in Amazon QuickSight Enterprise Edition (p. 422).

Inviting Users to Access Amazon QuickSight

You can invite any person with a valid email address to use Amazon QuickSight. When they sign up, a new Amazon QuickSight-only user account is created for them. You can also invite IAM users in your AWS account to use Amazon QuickSight. In this case, they can use their IAM credentials to sign in to Amazon QuickSight. Any IAM user you invite must have a password associated with their IAM credentials, and you must also have an email address for them.

User accounts are created in two steps. First, you invite a user to join Amazon QuickSight. Doing this creates an inactive user account in Amazon QuickSight, and sends an invitation email to the user. When the user accepts the invitation and signs in for the first time, the user creates a password to activate the user account.

For information about signing in for the first time, see Signing In to Amazon QuickSight (p. 11).

Use the following procedure to invite a user to access Amazon QuickSight.

1. Choose your user name on the application bar and then choose **Manage QuickSight**.

2. Choose **Manage Users**.

3. Choose **Invite users**.
4. In the **Type an IAM user name or email** box, type the IAM user name or the email address of a person to whom you want to grant access to Amazon QuickSight and then press **Enter**. A user's IAM user name may be the same as their email address, and this is fine.

Repeat this step until you have entered information for everyone you want to invite.

5. For **Email**, type an email address for the user account. If your company uses single sign-on (SSO), the user's email domain must match yours.

6. For **IAM User**, verify that it says **Yes** for accounts that are associated with IAM users, and **No** for those that are Amazon QuickSight-only.

7. For **Role**, choose the role to assign to each person you are inviting. A role determines the permission level to grant to that user account.

   - Choose **USER** if you want the user to author analyses and dashboards in Amazon QuickSight but not perform any administrative tasks, like managing users or purchasing SPICE (p. 2) capacity.
   - Choose **ADMIN** if you want the user to be able to both use Amazon QuickSight for authoring and for performing administrative tasks.

   There are some differences in what administrative tasks that IAM admin users and that Amazon QuickSight admin users can perform, because some administrative tasks require permissions in AWS, which Amazon QuickSight-only users lack.

   - Amazon QuickSight admin users can manage users, SPICE (p. 2) capacity, and subscriptions.
   - IAM admin users can manage users, SPICE capacity, and subscriptions as well. They can also manage Amazon QuickSight permissions to AWS resources, and unsubscribe from Amazon QuickSight.

   If you are creating an IAM admin user, check with your AWS administrator and make sure that user has the all necessary statements in their IAM permissions policy to work with Amazon QuickSight resources. For more information about what statements are required, see Setting Your IAM Policy (p. 477).

8. Choose **Invite**.

**Resend an Invitation to a User**

The sign-up URL in the invitation email expires after 24 hours. Use the following procedure if you need to resend an invitation to someone.

1. Choose your user name on the application bar and then choose **Manage QuickSight**.

2. Choose **Manage Users**.

3. Find the entry for the person you want to re-invite, and choose **Resend invitation**.
4. Choose Confirm.

Viewing Amazon QuickSight User Account Details

You can view Amazon QuickSight user accounts on the Manage Users page. Use the following procedure to view a user account.

1. Choose your user name on the application bar and then choose Manage QuickSight.

2. Choose Manage Users.

3. Type a search term for Search for a user to search for a specific user account. Any user name or email address that starts with the search term is shown. Search is case-insensitive and wildcards aren't supported. To clear the search results and view all user accounts, delete the search term.

4. Review the user name, email, assigned role, and status. The status field shows either ACTIVE or INACTIVE to indicate whether or not the user has responded to the invitation email and activated an account.

Deleting a User Account

User accounts can be deleted by either an AWS administrator or an Amazon QuickSight administrator. Deleting a user account works the same in both the Standard and Enterprise editions of Amazon QuickSight.

Deleting a user account removes or transfers their resources. In Enterprise edition, the network administrator can temporarily deactivate a user account by removing it from the network group that has access to Amazon QuickSight. If a user is deleted, but not deactivated, that user can still access Amazon QuickSight as a new user. For more information about deactivating an Enterprise user account, see Deactivating Active Directory User Accounts (p. 424).

Use the following procedure to delete a user account.

1. Choose your user name on the application bar and then choose Manage QuickSight.
2. Choose Manage Users.
3. Locate the user account you want to delete and then choose the delete icon.
4. Choose to either delete or transfer any resources owned by the user and then choose OK.
5. Do one of the following:
   - If you chose to transfer user resources, type the user name of the account to transfer them to and then choose Delete and transfer resources.
Managing Amazon QuickSight Usage

If your Amazon QuickSight user account has administrative privileges, you can manage user account subscriptions and SPICE (p. 2) capacity.

Use the following topics to manage subscriptions and SPICE capacity.

Topics
- Managing Subscriptions (p. 441)
- Managing SPICE Capacity (p. 451)

Managing Subscriptions

You can purchase standard user subscriptions to get discounted pricing on Amazon QuickSight. When you create an Amazon QuickSight account, you automatically get one free user account. When you invite additional users to Amazon QuickSight, you are charged for those user accounts on a month-by-month basis. If you have Enterprise edition, you have the option to take advantage of pay-per-session pricing for reader accounts. These are users who only view data dashboards, and don't need author or admin access.
When you purchase a subscription, you pay for a user account on an annual rather than monthly basis, and receive a discounted price in return for the extended time commitment. For more information about pricing, see Amazon QuickSight.

When you purchase a set of standard user subscriptions, you choose the number of user accounts you want to cover. You also choose when the subscriptions should start (any time from the month following the current month, to one year in the future) and whether the subscriptions autorenew. All subscriptions that you purchase together must use the same values for these settings.

You can edit an existing set of user subscriptions to change whether it autorenews. If the set is not yet active, you can also change the number of subscriptions it covers, or delete it entirely.

**View Current Subscriptions**

Use the following procedure to view your current user subscriptions.

1. Choose your user name on the application bar and then choose **Manage QuickSight**.

2. Choose **Your Subscriptions**.

3. Use the subscription meter to see how many user accounts you have and how they are billed. The types of user accounts shown are as follows:
   - Free users: This is the free user you receive as a standard part of your Amazon QuickSight account.
• Purchased annual subscriptions: These are users covered by purchased subscriptions rather than billed month-to-month.
• Monthly billed users: These are users that are billed month-to-month.

In the following example, the account has 21 users total:
• 1 free user.
• 7 users with annual subscriptions. Only currently active subscriptions are shown here.
• 13 month-to-month users.

Hover over any section of the meter to get details on that user segment.

4. Use the information in the subscriptions table to see what current and future subscriptions you have.
Purchase Subscriptions

Use the following procedure to purchase subscriptions.

1. Choose your user name on the application bar and then choose **Manage QuickSight**.

2. Choose **Your Subscriptions**.
3. Choose **Purchase subscription**.

4. Choose or enter the number of subscriptions you want.

5. Choose the month and year when the subscriptions will start.
6. Choose whether the subscriptions autorenew.

7. Choose **Purchase subscription**.
Edit Subscriptions

Use the following procedure to edit subscriptions.

1. Choose your user name on the application bar and then choose **Manage QuickSight**.

2. Choose **Your Subscriptions**.
3. Next to the set of subscriptions you want to change, choose Edit.

4. (Optional) If the subscriptions haven't started yet, change the number of subscriptions you want.

5. Choose whether the subscriptions autorenew.
Delete Subscriptions

Use the following procedure to delete subscriptions. You can only delete subscriptions that haven't started yet.

1. Choose your user name on the application bar and then choose Manage QuickSight.
2. Choose Your Subscriptions.

3. Next to the set of subscriptions you want to delete, choose Edit.

4. Choose Delete Subscription.
Managing SPICE Capacity

You can use the admin page to see how much SPICE (p. 2) capacity you have overall, and how much of that you are using. SPICE capacity is allocated by AWS Region, so the information displayed is for the currently selected AWS Region.

SPICE stores your data until you choose to delete it. You can improve performance by importing the data into SPICE instead of using a direct query to the database. All nondatabase data sets must use SPICE.

SPICE capacity is pooled across users for the Amazon QuickSight account. All of your default SPICE capacity is allocated to your home AWS Region. The other AWS Regions have no SPICE capacity unless you choose to purchase some.

To free up SPICE capacity, delete unused data sets from SPICE. For more information about deleting a data set, see Deleting a Data Set (p. 113).

You can purchase additional SPICE capacity if you want to, up to a limit of 1 TB total capacity per QuickSight account. If you need an exception to this limit, follow the instructions at AWS Service Limits to submit a limit increase request. You can also release purchased SPICE capacity that you aren’t using. Purchasing or releasing SPICE capacity only affects the capacity for the currently selected AWS Region. For information about additional SPICE pricing, see Amazon QuickSight.

Capacity Planning for SPICE

The amount of SPICE capacity a data set uses isn't the same as the size of its source file or table. The logical size computation occurs after all the data type transformations and calculated columns you define during data preparation. These fields are materialized in SPICE in a way that enhances query performance. Any changes you make in an analysis have no effect on the logical size of the data in SPICE. Only changes that are saved in the data set apply to SPICE capacity.

In capacity planning for SPICE, consider what data types will be defined in the data set. For example, the file you want to import may contain all strings (text). But in order for these to be used in a meaningful way in an analysis, you prepare the data by changing the data types to their proper form. For example, fields containing prices are changed from strings to decimals, and fields containing dates are changed...
from strings to dates. If you create a calculation to make the conversion, you can remove the original field from the data set and substitute the formatted calculated field. In that case, you don't need to include the size of the original field in your capacity planning. Only included fields are stored in SPICE.

**Note**
Geospatial data types use metadata to interpret the physical data type. Latitude and longitude are numeric. All other geospatial categories are strings.

To calculate how much SPICE capacity your data set needs, multiply the number of rows by the number of bytes SPICE uses per row. Currently, SPICE needs 8 bytes per field for decimal, int, and date fields. For each string field (text), SPICE needs 8 bytes plus the UTF-8 encoded character length. The formula looks like this:

\[
\text{Total logical row size in bytes} = \\
(\text{Number of Numeric Fields} \times 8 \text{ bytes per field}) \\
+ (\text{Number of Date Fields} \times 8 \text{ bytes per field}) \\
+ (\text{Number of Text Fields} \times (8 \text{ bytes + UTF-8 encoded character length per field}))
\]

\[
\text{Total bytes of data} = \text{Number of rows} \times \text{Total logical row size in bytes}
\]

\[
\text{GB of SPICE Capacity Needed} = \frac{\text{Total bytes of data}}{1,073,741,824}
\]

For example, let's say you have a table with 5,000,000 rows that you want to import into SPICE. It has 30 numeric fields, 20 date fields, and 10 string fields of 100 bytes each. Your formula looks like this:

\[
\text{Total logical row size in bytes} = \\
1480 \text{ bytes} = \\
(30 \times 8) \\
+ (20 \times 8) \\
+ (10 \times (8 + 100))
\]

\[
\text{Total bytes of data} = \\
5,000,000 \text{ rows} \times 1480 \text{ bytes} = \\
7,400,000,000 \text{ bytes}
\]

\[
\text{GB of SPICE Capacity Needed} = \frac{7,400,000,000}{1,073,741,824} = 7 \text{ GB}
\]

**View SPICE Capacity and Usage**

Use the following procedure to review your SPICE capacity and usage.

1. Choose your user name on the application bar, and then choose **Manage QuickSight**.

**Note**
If you are low on SPICE capacity, you can also choose the **Buy SPICE** alert that appears on the **Your Data Sets** and **Create a Data Set** pages.
2. Choose **SPICE Capacity**.

3. Use the **Total SPICE Capacity** meter to see your SPICE capacity, broken out by type. Capacity types are as follows:

   - Free tier: This is the 1 GB of capacity associated with the free user that you get with every Amazon QuickSight account.
   - Free bundled: This is the total default capacity associated with your paid users. You get 10 GB of default SPICE capacity per paid user.
   - Purchased: This is the additional SPICE capacity you have purchased.
Hover over any section of the meter to see details on that capacity type.

4. Use the **SPICE Usage** meter to see your SPICE usage, broken out by type. Usage types are as follows:
   - Used capacity: This is used portion of the default SPICE capacity you get per user.
   - Unused capacity: This is unused portion of the default SPICE capacity you get per user.
   - Releasable unused capacity: This is purchased capacity that isn't in use, and so can be released to reduce costs.

Hover over any section of the meter to see details on that usage type.

**Purchase SPICE Capacity**

Use the following procedure to purchase additional **SPICE** capacity.

1. Choose your user name on the application bar and then choose **Manage QuickSight**.
Note
If you are low on SPICE capacity, you can also choose the Buy SPICE alert that appears on the Your Data Sets and Create a Data Set pages.

2. Choose SPICE Capacity.

3. Choose Purchase more capacity.
4. For **How much SPICE capacity do you need?**, type the number of gigabytes (GBs) you want to purchase.

5. Choose **Purchase SPICE capacity**.

---

**Release SPICE Capacity**

Use the following procedure to release unused purchased SPICE (p. 2) capacity.

1. Before you begin, delete data sets that are using the SPICE capacity you want to release. To learn more about deleting data sets, see Deleting a Data Set (p. 113).

2. Choose your user name on the application bar and then choose **Manage QuickSight**.
3. Choose **SPICE Capacity**.

4. Choose **Release unused purchased capacity**.

5. For **How much SPICE capacity do you need to release?**, choose **Release all** if you want to release all unused purchased capacity, or choose **Release <amount> GB** and type the number of gigabytes (GBs) that you want to release.

Working with AWS Services

Use this section to help you set up Amazon QuickSight to work with other AWS services, such as AWS Identity and Access Management (IAM) and AWS CloudTrail.

Topics
- Working with AWS Data Sources (p. 458)
- Working with AWS Identity and Access Management (IAM) Users, Roles, and Policies (p. 476)
- Working with Amazon VPC (p. 482)
- Logging Operations with AWS CloudTrail (p. 489)

Working with AWS Data Sources

Use this section to help you configure autodiscovery, manage permissions, and authorize connections.

Topics
- Allowing Autodiscovery of AWS Resources (p. 459)
- Authorizing Connections from Amazon QuickSight to AWS Data Stores (p. 459)
Allowing Autodiscovery of AWS Resources

Configuring AWS Resources

Use the following sections to help you configure your AWS resources to work with Amazon QuickSight.

Configuring Your AWS Data Sources for Amazon QuickSight Access

You can have Amazon QuickSight autodiscover Amazon RDS DB instances or Amazon Redshift clusters that are associated with your AWS account. These resources must be located in the same AWS Region as your Amazon QuickSight account.

If you choose to enable autodiscovery, choose one of the following options to make the AWS resource accessible:

• For Amazon RDS DB instances that you created in a default VPC and didn't choose to make private, or that aren't in a VPC (are EC2-Classic instances), see Authorizing Connections from Amazon QuickSight to Amazon RDS DB Instances (p. 460). In this topic, you can find information on creating a security group to allow connections from Amazon QuickSight servers.
• For Amazon Redshift clusters that you created in a default VPC and didn't choose to make private, or that aren't in a VPC (are EC2-Classic instances), see Authorizing Connections from Amazon QuickSight to Amazon Redshift Clusters (p. 464). In this topic, you can find information on creating a security group to allow connections from Amazon QuickSight servers.
• For an Amazon RDS DB instance or Amazon Redshift cluster that is in a nondefault VPC, see Authorizing Connections from Amazon QuickSight to Amazon RDS DB Instances (p. 460) or Authorizing Connections from Amazon QuickSight to Amazon Redshift Clusters (p. 464). In these topics, you can find information on creating a security group to allow connections from Amazon QuickSight servers, and then verifying that the VPC meets the requirements described in Network Configuration for an AWS Instance in a Non-Default VPC (p. 83).
• The Amazon RDS instance must be available for access to the public IP of the Amazon QuickSight region.

Enabling autodiscovery is the easiest way to make this data available in Amazon QuickSight. You can still manually create data connections whether or not you enable autodiscovery.

Confirming the Availability of AWS Identity and Access Management (IAM) Roles

If you choose to enable autodiscovery of AWS resources for your Amazon QuickSight account, Amazon QuickSight creates an AWS Identity and Access Management (IAM) role in your AWS account. This IAM role that grants your account permission to identify and retrieve data from your AWS data sources.

Because AWS limits you to 250 IAM roles, be sure that you have at least one free role for Amazon QuickSight to use if you want Amazon QuickSight to autodiscover your AWS resources.

Authorizing Connections from Amazon QuickSight to AWS Data Stores

For Amazon QuickSight to access your AWS resources, you must create security groups for them that authorize connections from the IP address ranges used by Amazon QuickSight servers. You must have AWS credentials that permit you to access these AWS resources to modify their security groups.
Use the procedures in the following sections to enable Amazon QuickSight connections.

**Topics**
- Authorizing Connections from Amazon QuickSight to Amazon RDS DB Instances (p. 460)
- Authorizing Connections from Amazon QuickSight to Amazon Redshift Clusters (p. 464)
- Authorizing Connections from Amazon QuickSight to Amazon EC2 Instances (p. 471)

**Authorizing Connections from Amazon QuickSight to Amazon RDS DB Instances**

For Amazon QuickSight to connect to an Amazon RDS DB instance, you must create a new security group for that DB instance. This security group contains an inbound rule authorizing access from the appropriate IP address range for the Amazon QuickSight servers in that region. To learn more about authorizing Amazon QuickSight connections, see Manually Enabling Access to an Amazon RDS Instance in a VPC (p. 460) or Manually Enabling Access to an Amazon RDS Instance That Is Not in a VPC (p. 463).

To create and assign a security group for an Amazon RDS DB instance, you must have AWS credentials that permit access to that DB instance.

Enabling connection from Amazon QuickSight servers to your instance is just one of several prerequisites for creating a data set based on an AWS database data source. For more information about what is required, see Creating Data Sets from New Database Data Sources (p. 81).

**Manually Enabling Access to an Amazon RDS Instance in a VPC**

Use the following procedure to enable Amazon QuickSight access to an Amazon RDS DB instance in a VPC.

**To enable Amazon QuickSight access to an Amazon RDS DB instance in a VPC**

1. Sign in to the AWS Management Console and open the Amazon RDS console at [https://console.aws.amazon.com/rds/](https://console.aws.amazon.com/rds/).
2. On the **Instances** page, select the instance to which you want to grant access, and then choose the details page icon, as shown following.
3. Locate Port in the Cluster Database Properties section. Note the Port value.
4. Locate VPC in the Security and Network section, and note the VPC value. Choose the VPC value to open the VPC console.
5. On the Amazon VPC Management Console, choose Security Groups in the navigation pane.
7. On the Create Security Group page, enter the security group information as follows:
   - For Name tag and Group name, type Amazon-QuickSight-access.
   - For Description, type Amazon-QuickSight-access.
   - For VPC, choose the VPC for your instance. This VPC is the one with the VPC ID that you noted.
8. Choose Yes, Create.

9. Your new security group should be displayed on the screen. Choose the security group, and then choose Inbound Rules from the tab list.

Choose Edit to create a new rule. Use the following values:

- For Type, choose Custom TCP Rule.
- For Protocol, choose TCP (6).
- For Port Range, type the port number of the Amazon RDS cluster to which you are providing access. This port number is the one that you noted in an earlier step.
- For Source, type the CIDR address block for the region where you'll be using QuickSight. For example, here is the CIDR address block for EU (Ireland): 52.210.255.224/27. For more information on the IP address ranges for Amazon QuickSight in supported regions, see AWS Regions and IP Address Ranges (p. 416).

Note
If you have activated Amazon QuickSight in multiple regions, you can create inbound rules for each Amazon QuickSight endpoint CIDR. Doing this allows Amazon QuickSight to have access to the Amazon RDS DB instance from any region defined in the inbound rules.
An Amazon QuickSight user or administrator who uses Amazon QuickSight in multiple regions is treated as a single user. In other words, even if you are using Amazon QuickSight in every region, both your Amazon QuickSight account and your users are global.
10. Choose **Save** to save your new inbound rule.

11. Return to the **Instances** page of the Amazon RDS console.

   Choose the instance that you want to enable access to.

   Choose **Instance Actions**, and then choose **Modify**.

12. In the **Network & Security** section, the currently assigned security group or groups are already chosen for **Security Group**. Press CTRL and choose **Amazon-QuickSight-access** in addition to the other selected groups.

13. Choose **Continue**, and then choose **Modify DB Instance**.

**Manually Enabling Access to an Amazon RDS Instance That Is Not in a VPC**

Use the following procedure to access an Amazon RDS DB instance that is not in a VPC.

**To access an Amazon RDS DB instance that is not in a VPC**

1. Sign in to the Amazon RDS console.
2. Choose **Security Groups** in the navigation pane.
3. Choose **Create DB Security Group**.
4. Type **Amazon-QuickSight-access** for the **Name** and **Description** values, and then choose **Create**.
5. The new security group is selected by default.

   Select the details icon next to the security group, as shown following.
6. For **Connection Type**, choose **CIDR/IP**.
7. For **CIDR/IP to Authorize**, type the appropriate CIDR address block. For more information on the IP address ranges for Amazon QuickSight in supported regions, see [AWS Regions and IP Address Ranges](p. 416).

8. Choose **Authorize**.
9. Return to the **Instances** page of the Amazon RDS Management Console, choose the instance that you want to enable access to, choose **Instance Actions**, and then choose **Modify**.
10. In the **Network & Security** section, the currently assigned security group or groups already is chosen for **Security Group**. Press CTRL and choose **Amazon-QuickSight-access** in addition to the other selected groups.
11. Choose **Continue**, and then choose **Modify DB Instance**.

**Authorizing Connections from Amazon QuickSight to Amazon Redshift Clusters**

For Amazon QuickSight to connect to an Amazon Redshift instance, you must create a new security group for that instance. This security group contains an inbound rule authorizing access from the appropriate IP address range for the Amazon QuickSight servers in that region. To learn more about authorizing Amazon QuickSight connections, see [Manually Enabling Access to an Amazon Redshift Cluster in a VPC](p. 464) or [Manually Enabling Access to an Amazon Redshift Cluster That Is Not in a VPC](p. 469).

To create and assign a security group for an Amazon Redshift cluster, you must have AWS credentials that permit access to that cluster.

Enabling connection from Amazon QuickSight servers to your cluster is just one of several prerequisites for creating a data set based on an AWS database data source. For more information about what is required, see [Creating Data Sets from New Database Data Sources](p. 81).

**Manually Enabling Access to an Amazon Redshift Cluster in a VPC**

Use the following procedure to enable Amazon QuickSight access to an Amazon Redshift cluster in a VPC.
To enable Amazon QuickSight access to an Amazon Redshift cluster in a VPC

1. Sign in to the AWS Management Console and open the Amazon Redshift console at https://console.aws.amazon.com/redshift/.
2. Choose the details page icon next to the cluster you want to make available, as shown following.

3. Locate Port in the Cluster Database Properties section. Note the Port value.
4. Locate VPC ID in the Cluster Properties section, note the VPC ID value. Choose View VPCs to open the Amazon VPC Management Console.
5. On the Amazon VPC Management Console, choose Security Groups in the navigation pane.
7. On the Create Security Group page, enter the security group information as follows:
   - For Name tag and Group name, type Amazon-QuickSight-access.
   - For Description, type Amazon-QuickSight-access.
   - For VPC, choose the VPC for your instance. This is the VPC with the VPC ID that you noted.
8. Choose **Yes, Create**.

9. Your new security group should be displayed on the screen. Choose the security group. Then, choose **Inbound Rules** from the tab list.

Choose **Edit** to create a new rule. Use the following values:

- For **Type**, choose **Custom TCP Rule**.
- For **Protocol**, choose **TCP (6)**.
- For **Port Range**, enter the port number of the Amazon Redshift cluster to which you are providing access. This is the port number you noted in an earlier step.
- For **Source**, type the CIDR address block for the region where you'll be using QuickSight. For example, here is the CIDR address block for EU (Ireland): 52.210.255.224/27. For more information on the IP address ranges for Amazon QuickSight in supported regions, see **AWS Regions and IP Address Ranges** (p. 416).

**Note**

If you have activated Amazon QuickSight in multiple regions, you can create inbound rules for each Amazon QuickSight endpoint CIDR. Doing this allows Amazon QuickSight to have access to the Amazon RDS DB instance from any region defined in the inbound rules.

An Amazon QuickSight user or administrator who uses Amazon QuickSight in multiple regions is treated as a single user. In other words, even if you are using Amazon QuickSight in every region, both your Amazon QuickSight account and your users are global.
10. Choose **Save** to save your new inbound rule.

11. Return to the **Clusters** page of the Amazon Redshift Management Console, and then open the details page for the cluster that you want to enable access to.

Choose **Cluster**, and then choose **Modify**.
12. The currently assigned security groups are already chosen for VPC Security Groups. Press CTRL and choose Amazon-QuickSight-access in addition to the other selected groups.

13. Choose Modify.

**Manually Enabling Access to an Amazon Redshift Cluster That Is Not in a VPC**

Use the following procedure to access an Amazon Redshift cluster that is not in a VPC.

**To access an Amazon Redshift cluster that is not in a VPC**

1. Sign in to the AWS Management Console and open the Amazon Redshift console at https://console.aws.amazon.com/redshift/.
2. Choose Security in the navigation pane.
4. Type Amazon-QuickSight-access for the Cluster Security Group Name and Description values, and then choose Create.
5. Select the details icon next to the security group, as shown following.

![Security Groups](image)

6. Choose Add Connection Type.
7. Enter the connection information.
   
   - For Connection Type, choose CIDR/IP.
   - For CIDR/IP to Authorize, type the appropriate CIDR address block. The supported IP address ranges for Amazon QuickSight regions, see AWS Regions and IP Address Ranges (p. 416).
8. Choose **Authorize**.
9. Return to the **Clusters** page of the Amazon Redshift console, open the details page for the cluster that you want to enable access to, choose **Cluster**, and then choose **Modify**.
10. The currently assigned security groups are already chosen for **Cluster Security Group**. Press CTRL and choose **Amazon-QuickSight-access** in addition to the other selected groups.
11. Choose **Modify**.

**Enabling Access to Amazon Redshift Spectrum**

Using Amazon Redshift Spectrum, you can connect Amazon QuickSight to an external catalog with Amazon Redshift. For example, you can access the Athena catalog and query unstructured data on your Amazon S3 data lake using an Amazon Redshift cluster instead of the Athena query engine.

You can also combine data sets that include data stored in Amazon Redshift and in S3. Then you can access them using the SQL syntax in Amazon Redshift.

After you've registered your data catalog (for Athena) or external schema (for a Hive metastore), you can use Amazon QuickSight to select the external schema and the Amazon Redshift Spectrum tables. This process works just as for any other Amazon Redshift tables in your cluster. You don't need to load or transform your data.

For more information on using Amazon Redshift Spectrum, see Using Amazon Redshift Spectrum to Query External Data in the Amazon Redshift Database Developer Guide.

To connect using Redshift Spectrum, you need to do the following:

- Create or identify an IAM role associated with the Amazon Redshift cluster.
- Add the IAM policies `AmazonS3ReadOnlyAccess` and `AmazonAthenaFullAccess` to the IAM role.
- Register an external schema or data catalog for the tables that you plan to use.

Redshift Spectrum lets you separate storage from compute, so you can scale them separately. You only pay for the queries that you run.

To connect to Redshift Spectrum tables, you don't need to grant Amazon QuickSight access to Amazon S3 or Athena. Amazon QuickSight only needs access to the Amazon Redshift cluster. For full details on
configuring Redshift Spectrum, see Getting Started with Amazon Redshift Spectrum in the Amazon Redshift Database Developer Guide.

Authorizing Connections from Amazon QuickSight to Amazon EC2 Instances

For Amazon QuickSight to connect to an Amazon EC2 instance, you must create a new security group for that instance. This security group contains an inbound rule authorizing access from the appropriate IP address range for the Amazon QuickSight servers in that region.

To modify the security groups for these Amazon EC2 instances, you must have AWS credentials that permit you to access to the instances.

Enabling connection from Amazon QuickSight servers to your instance is just one of several prerequisites for creating a data set based on an AWS database data source. For more information about what is required, see Creating Data Sets from New Database Data Sources (p. 81).

To enable Amazon QuickSight access to an Amazon EC2 instance

1. Sign in to the AWS Management Console and open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. If your EC2 instance is in a VPC, select the instance to view the instance details pane. Locate its VPC ID and make note of it for later use.
3. Choose Security Groups in the NETWORK & SECURITY section of the navigation pane on the left. Then choose Create Security Group, as shown following.

4. Enter the security group information as follows:
   - For Security group name, type Amazon-QuickSight-access.
• For **Description**, type **Amazon-QuickSight-access**.
• For **VPC**, choose the VPC ID that you noted in step 2 if your Amazon EC2 instance is in a VPC. Otherwise, choose **No VPC**.

5. Choose **Add Rule** on the **Inbound** tab.

6. Create a new rule with the following values:

• For **Type**, choose **Custom TCP Rule**.
• For **Protocol**, choose **TCP**.
• (Optional) For **Port Range**, enter the port number used by the instance on this Amazon EC2 instance to which you are providing access.
• For **Source**, type the CIDR address block for the region where you'll be using QuickSight. For example, here is the CIDR address block for EU (Ireland): 52.210.255.224/27. For more information on the IP address ranges for Amazon QuickSight in supported regions, see **AWS Regions and IP Address Ranges** (p. 416).

**Note**
If you have activated Amazon QuickSight in multiple regions, you can create inbound rules for each Amazon QuickSight endpoint CIDR. Doing this allows Amazon QuickSight to have access to the Amazon RDS DB instance from any region defined in the inbound rules.
An Amazon QuickSight user or administrator who uses Amazon QuickSight in multiple regions is treated as a single user. In other words, even if you are using Amazon QuickSight in every region, both your Amazon QuickSight account and your users are global.

7. Choose **Create**.

8. Choose **Instances** in the **INSTANCES** section of the navigation pane, and then choose the instance that you want to enable access to.

9. Choose **Actions**, then **Networking**, and then **Change Security Groups**.

10. In **Change Security Groups**, select the **Amazon-QuickSight-access** security group.

Then choose **Assign Security Groups**, as shown following.
Exploring Your AWS Data in Amazon QuickSight

Use this section to learn how to explore AWS data in Amazon QuickSight using the AWS Management Console. Using the Explore in QuickSight shortcut, you can access a customizable dashboard template showing your data. Just as with any Amazon QuickSight dashboard, this dashboard can be refreshed on a schedule, published, and shared with other users in your organization.

Topics

- Exploring Amazon S3 Analytics Data (p. 473)

Exploring Amazon S3 Analytics Data

Amazon QuickSight contains a dashboard designed to provide insight into your Amazon S3 analytics data. To use this feature, you must first enable S3 analytics storage class analysis for your S3 buckets. For more on enabling storage class analysis in S3, see Amazon S3 Analytics – Storage Class Analysis in the Amazon S3 Developer Guide.

After you have enabled storage class analysis, you can use Amazon QuickSight to explore your S3 analytics data.

To explore S3 analytics data in Amazon QuickSight

1. Open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. Choose a bucket to explore. The bucket must have storage class analysis enabled, with at least one filter.
3. Choose the Management tab.
4. Then Choose Analytics.
5. Choose Explore in QuickSight.

Note
If you don’t have an Amazon QuickSight account, you’re prompted to create one before you can use the dashboard.
When you choose the option to explore in Amazon QuickSight, your S3 analytics data is automatically loaded into the dashboard template. The dashboard contains multiple visualizations to help you to understand the storage access pattern of your bucket.

Use the template as is, or customize it to suit your needs. For example, one visual on the default template helps you identify infrequently accessed data. It compares the amount of data retrieved to the amount of storage consumed, for objects of different ages.

You can also add your own visualizations to the dashboard. For example, you can break down the data access patterns, using filters for storage class analysis that you already have defined in S3 analytics.

To learn more about using S3 analytics and storage class analysis, see Amazon S3 Analytics – Storage Class Analysis in the Amazon S3 Developer Guide.
Managing Amazon QuickSight Permissions to AWS Resources

As part of signing up for Amazon QuickSight, you set Amazon QuickSight permissions to your AWS resources. You can edit those permissions to change the level of access that Amazon QuickSight has to these resources. To edit these permissions, you must be signed in using the IAM account or AWS root account used to create your Amazon QuickSight account. Alternatively, you can be signed in as an IAM user with administrative privileges and the permissions described in the Set Amazon QuickSight permissions to AWS resources row of the table shown in Setting Your IAM Policy (p. 477).

**Important**
You should only edit Amazon QuickSight permissions to your AWS resources from within Amazon QuickSight. If you edit these permissions directly using the IAM Management Console, you can't edit them from Amazon QuickSight.

**To edit Amazon QuickSight permissions to your AWS resources**

1. Choose your user name on the application bar, and then choose Manage QuickSight.

2. Choose Account settings.

3. Under Account permissions, choose Edit AWS Permissions.

4. (For Amazon QuickSight Enterprise edition accounts only) On the AWS sign-in page, enter your AWS or IAM credentials.

5. On the Edit QuickSight read-only access to AWS resources page, select Enable autodiscovery of your data and users in your AWS Redshift, RDS, and IAM services. Doing this allows Amazon QuickSight to autodiscover any of these types of resources associated with your AWS account. Alternatively, expand this section and choose the individual options for the resources that you want to use with Amazon QuickSight.

6. If you have one or more Amazon S3 buckets, select the Amazon S3 (all buckets) check box to edit Amazon QuickSight access to them. For Choose Amazon S3 buckets, choose the buckets you want to make available to Amazon QuickSight, and then choose Select buckets.

7. If you have Amazon Athena databases, choose Athena to allow Amazon QuickSight to access them.

8. Choose Apply.

**Note**
The QuickSight Athena managed policy contains the necessary permissions for Amazon QuickSight to interact with Athena. However, it doesn't have permissions for input buckets. Managed policies can't be changed. So, even if you are using this policy you still need to enable access to the S3 buckets.

If you have difficulties accessing Athena, see Troubleshooting Issues When Using Athena with Amazon QuickSight (p. 502).
Working with AWS Identity and Access Management (IAM) Users, Roles, and Policies

Amazon QuickSight is fully integrated with AWS Identity and Access Management (IAM). Use this section to find how to configure IAM identities and policies for use with Amazon QuickSight:

- For information on creating IAM users, groups, and roles, see IAM Identities.
- For information on creating policies in IAM, see Creating a New Policy.
- To start work directly with IAM, sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.

Topics
- Working with IAM Actions and Permissions for Amazon QuickSight Users (p. 476)
- Setting Your IAM Policy (p. 477)

Working with IAM Actions and Permissions for Amazon QuickSight Users

Amazon QuickSight provides a number of AWS Identity and Access Management (IAM) actions that you can use for creating or removing an Amazon QuickSight account. All Amazon QuickSight actions are prefixed with quicksight:, such as quicksight:Subscribe. For information about using Amazon QuickSight actions in an IAM policy, see Setting Your IAM Policy (p. 477).

The following list shows the supported Amazon QuickSight actions:

- "quicksight:CreateAdmin"
  CreateAdmin enables the user to provision Amazon QuickSight administrators, authors, and readers.

- "quicksight:CreateUser"
  CreateUser enables the user to provision Amazon QuickSight authors and readers.

- "quicksight:CreateReader"
  CreateReader enables the user to provision Amazon QuickSight readers.

- "quicksight:GetGroupMapping"
  GetGroupMapping is used only in Amazon QuickSight Enterprise edition accounts. It enables the user to use Amazon QuickSight to identify and display the Microsoft Active Directory (Microsoft Active Directory) directory groups that are mapped to roles in Amazon QuickSight.

- "quicksight:SearchDirectoryGroups"
  SearchDirectoryGroups is used only in Amazon QuickSight Enterprise edition accounts. It enables the user to use Amazon QuickSight to display your Microsoft Active Directory directory groups so that you can choose which ones to map to roles in Amazon QuickSight.

- "quicksight:SetGroupMapping"
  SetGroupMapping is used only in Amazon QuickSight Enterprise edition accounts. It enables the user to use Amazon QuickSight to map the Microsoft Active Directory directory groups that you select to roles in Amazon QuickSight.

- "quicksight:Subscribe"
Subscribe enables the user to subscribe to Amazon QuickSight. Enabling this action also allows the user to upgrade the subscription to Enterprise edition.

- "quicksight:Unsubscribe"

Unsubscribe enables the user to unsubscribe from Amazon QuickSight, which permanently deletes all users and their resources from Amazon QuickSight.

Setting Your IAM Policy

You can use AWS root credentials or IAM user credentials to create an Amazon QuickSight account. AWS root and administrator credentials already have all of the required permissions for managing Amazon QuickSight access to AWS resources.

However, we recommend that you protect your root credentials, and instead use IAM user credentials. To do this, you can create a policy and attach it to the IAM user and roles that you plan to use for Amazon QuickSight. The policy must include the appropriate statements for the Amazon QuickSight administrative tasks you need to perform, as described in the following sections.

Important
Be aware of the following when working with Amazon QuickSight and IAM policies:

- Avoid directly modifying a policy that was created by Amazon QuickSight. When you modify it yourself, Amazon QuickSight can’t edit it. This inability can cause an issue with the policy. To fix this issue, delete the previously modified policy.
- If you get an error on permissions when you try to create an Amazon QuickSight account, see IAM Policy Actions for Creating Users in Amazon QuickSight (p. 478).
- In some cases, you might have an Amazon QuickSight account that you can’t access even from the root account (for example, if you accidentally deleted its directory service). In this case, you can delete your old Amazon QuickSight account, then recreate it. For more information, see Canceling Your Amazon QuickSight Subscription and Closing the Account (p. 434).

IAM Policy Actions for Signing Up for Amazon QuickSight

To allow a user to sign up and set permissions to AWS resources for Amazon QuickSight, allow the following actions in an IAM policy. For more information, see Managing Amazon QuickSight Permissions to AWS Resources (p. 475).

The permissions for signing up don’t allow you to fully use Amazon QuickSight. However, a user with the AWS root and administrator credentials can subscribe to Amazon QuickSight with no additional actions needed.

IAM Policy Actions for Managing Directory Group Associations to Microsoft Active Directory or AD Connector from Amazon QuickSight

For Enterprise edition only, to allow a user to manage directory group associations to Microsoft Active Directory or AD Connector from Amazon QuickSight, allow the following actions in an IAM policy. For more information, see Managing User Accounts in Amazon QuickSight Enterprise Edition (p. 422).

<table>
<thead>
<tr>
<th>Standard Edition</th>
<th>Enterprise Edition</th>
</tr>
</thead>
<tbody>
<tr>
<td>• N/A</td>
<td>• ds:DescribeTrusts</td>

<td>• quicksight:SearchDirectoryGroups</td>
</tr>
<tr>
<td></td>
<td>• quicksight:SetGroupMapping</td>
</tr>
</tbody>
</table>

IAM Policy Actions for Unsubscribing from Amazon QuickSight

To allow a user to unsubscribe from Amazon QuickSight, allow the following actions in an IAM policy. Unsubscribing removes all users and data, and you can't undo this operation. For more information, see Canceling Your Amazon QuickSight Subscription and Closing the Account (p. 434).

To prevent Amazon QuickSight administrators from unsubscribing from Amazon QuickSight and deleting all users and data, you can deny all users the quicksight:Unsubscribe action. Then, if users try to unsubscribe, they get a message to contact their AWS administrator.

<table>

IAM Policy Examples for Amazon QuickSight

Following, you can find several IAM policy examples for Amazon QuickSight.

The following example shows an IAM policy that enables Active Directory group management for an Amazon QuickSight Enterprise edition account.

```json
{
    "Statement": [
        {
            "Action": [
                "ds:DescribeTrusts",
                "quicksight:GetGroupMapping",
                "quicksight:SearchDirectoryGroups",
                "quicksight:SetGroupMapping"
            ],
            "Effect": "Allow",
            "Resource": "*"
        }
    ],
    "Version": "2012-10-17"
}
```

The following example shows a policy that enables creating Amazon QuickSight users only. For quicksight:CreateReader, quicksight:CreateUser, and quicksight:CreateAdmin, you can
limit the permissions to "Resource": "arn:aws:quicksight::<YOUR_AWS_ACCOUNTID>:user/${aws:userid}". For all other permissions described in this guide, use "Resource": "*". The resource represents the scope of the permissions.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Action": [
            "quicksight:CreateUser"
         ],
         "Effect": "Allow",
         "Resource": "arn:aws:quicksight::<YOUR_AWS_ACCOUNTID>:user/${aws:userid}"
      }
   ]
}
```

The following example for Amazon QuickSight Enterprise edition shows a policy that enables subscribing, creating users, managing Active Directory, and setting permissions to AWS resources. This example explicitly denies permission to unsubscribe from Amazon QuickSight.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "ds:AuthorizeApplication",
            "ds:UnauthorizeApplication",
            "ds:CheckAlias",
            "ds:CreateAlias",
            "ds:DescribeDirectories",
            "ds:DescribeTrustedEntities",
            "ds:DeleteDirectory",
            "ds:CreateIdentityPoolDirectory",
            "iam:CreatePolicy",
            "iam:CreateRole",
            "iam:ListAccountAliases",
            "quicksight:CreateAdmin",
            "quicksight:Subscribe",
            "quicksight:GetGroupMapping",
            "quicksight:SearchDirectoryGroups",
            "quicksight:SetGroupMapping"
         ],
         "Resource": "*"
      },
      {
         "Effect": "Allow",
         "Action": [
            "iam:AttachRolePolicy",
            "iam:DetachRolePolicy",
            "iam:ListAttachedRolePolicies",
            "iam:CreatePolicy",
            "iam:GetPolicy",
            "iam:CreatePolicyVersion",
            "iam:DeletePolicyVersion",
            "iam:GetPolicyVersion",
            "iam:ListPolicyVersions",
            "iam:CreateRole",
            "iam:DeleteRole",
            "iam:GetRole",
            "iam:ListRoles",
            "iam:ListEntitiesForPolicy",
```
The following example for Amazon QuickSight Standard Edition shows a policy that enables subscribing, creating authors and readers, and setting permissions to AWS resources. This example explicitly denies permission to unsubscribe from Amazon QuickSight.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ds:AuthorizeApplication",
        "ds:UnauthorizeApplication",
        "ds:CheckAlias",
        "ds:CreateAlias",
        "ds:DescribeDirectories",
        "ds:DescribeTrusts",
        "ds:DeleteDirectory",
        "ds:CreateIdentityPoolDirectory",
        "iam:CreatePolicy",
        "iam:CreateRole",
        "iam:ListAccountAliases",
        "quicksight:CreateUser",
        "quicksight:Subscribe"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "iam:AttachRolePolicy",
        "iam:DetachRolePolicy",
        "iam:ListAttachedRolePolicies",
        "iam:CreatePolicy",
        "iam:GetPolicy",
        "iam:CreatePolicyVersion",
        "iam:DeletePolicyVersion",
        "iam:GetPolicyVersion",
        "iam:ListPolicyVersions",
        "iam:CreateRole",
        "iam:DeleteRole",
        "iam:GetRole",
        "iam:ListRoles",
        "iam:ListEntitiesForPolicy",
        "s3:ListAllMyBuckets"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Deny",
      "Action": "quicksight:Unsubscribe",
      "Resource": "*"
    }
  ]
}
```
For information about Amazon QuickSight actions like `quicksight:GetGroupMapping`, see Working with IAM Actions and Permissions for Amazon QuickSight Users (p. 476).

## Working with Amazon VPC

Amazon QuickSight is fully integrated with the Amazon Virtual Private Cloud (Amazon VPC) service. Use this section to find how to configure Amazon QuickSight to access data in your VPC.

In Amazon QuickSight Enterprise edition, you can create connections to your VPCs from your AWS account's Amazon QuickSight subscription. Each connection creates an elastic network interface in your VPC for Amazon QuickSight to send traffic to instances in your VPC. When creating a data set, an Amazon QuickSight user uses a VPC connection using only private IP addresses to connect to an instance that is not reachable from the public internet.

### Create a Private Connection to Amazon VPC Using Amazon QuickSight

Use the following procedure to create a connection to a VPC. Before you begin, you should understand your deployment of Amazon VPC, its subnets, and security groups, in relation to the destinations (databases) you want to reach from Amazon QuickSight.

1. In Amazon QuickSight, choose your profile icon at the top right of the screen, then choose Manage QuickSight. From the menu at left, choose Manage VPC connections.

   The Account Settings page appears. Any existing private connections to VPCs display on this page.

2. Choose Add VPC connection to add a new VPC connection.

   On this page, you can also delete a VPC connection by using the delete icon. You can change a VPC connection on this page by creating a new VPC connection and deleting the old one.

3. For VPC connection name, type a unique descriptive name. This name doesn't need to be an actual VPC ID or name.

4. Type the subnet ID for Subnet ID, and type the group ID for Security group ID. Make sure that the subnet and the security group are in the same VPC. More detailed requirements are provided in the following steps, and in How Amazon QuickSight Connects to Your VPC (p. 487).
If you need to locate information about the subnet and security group, do the following:

a. On the Amazon VPC console, find the **VPC ID** that you want to use.
b. On the Amazon VPC subnet console page, see which subnets are in that VPC by locating the VPC ID. Choose a subnet, and copy its **Subnet ID** value. The subnet you choose is the one where you plan to create an elastic network interface. It must be possible to route from this subnet to any destinations you want to reach. For more information, see **VPCs and Subnets**.
c. On the Adding VPC connection screen, enter the Subnet ID value that you copied in the previous step for Subnet ID.

d. On the Amazon VPC security group console page, see which security groups are in that VPC by locating the VPC ID. Choose a group, and copy its Group ID value.

Create a new security group for use only with the elastic network interface created by Amazon QuickSight. The group must allow inbound traffic on all ports from the security groups of the destinations you want to reach.

The group must also allow outbound traffic to the database on the port that the database is listening on.

Additionally, you must update your database's security group to allow inbound traffic from your new security group.

For more information, see Security Group Rules for Amazon QuickSight's Elastic Network Interface (p. 488).

**Note**

The database server's security group must allow inbound traffic from the security group you choose.
e. On the **Adding VPC connection** screen, enter the **Group ID** value that you copied in the previous step for **Security group ID**.

5. **Important**
You can't change the settings for a VPC connection.

Review your choices, then choose **Create**.
Note
Creating a VPC connection requires permission for the quicksight:CreateVPCConnection and ec2:CreateNetworkInterface actions.

For best practices when using Amazon VPC, see the following:

- AWS Single VPC Design on the AWS website
- Recommended Network ACL Rules for Your VPC in the Amazon VPC User Guide
- VPC Scenarios and Examples in the Amazon VPC User Guide

What Is Amazon VPC?

Amazon Virtual Private Cloud (Amazon VPC) enables you to define a virtual network in your own logically isolated area within the AWS cloud, known as a virtual private cloud (VPC). You can launch your AWS resources, such as instances, into your VPC. Your VPC closely resembles a traditional network that you might operate in your own data center, with the benefits of using AWS's scalable infrastructure. You can configure your VPC; you can select its IP address range, create subnets, and configure route tables, network gateways, and security settings. You can connect instances in your VPC to the internet. You can connect your VPC to your own corporate data center, making the AWS cloud an extension of your data center. To protect the resources in each subnet, you can use multiple layers of security, including security groups and network access control lists. For more information, see the Amazon VPC User Guide.

How Amazon QuickSight Connects to Your VPC

When you create a VPC connection from Amazon QuickSight to your VPC, Amazon QuickSight creates an elastic network interface in the subnet that you choose. It must be possible to route from this subnet to any destinations you want to reach.

Network traffic from Amazon QuickSight then originates from this network interface when Amazon QuickSight connects to a database or other instance within your VPC using a VPC connection. Because
this network interface exists inside your VPC, traffic originating from it can reach destinations within your VPC using their private IP addresses.

**Controlling the Resources That Amazon QuickSight Can Reach in Your VPC**

Network traffic sent from Amazon QuickSight to an instance within your VPC through a VPC connection is subject to all of the standard security controls, just as other traffic in your VPC is. Route tables, network ACLs, and security groups all apply to network traffic from Amazon QuickSight in the same way they apply to traffic between other instances in your VPC.

**Configuring Security Group Rules for Use with Amazon QuickSight**

For Amazon QuickSight to successfully connect to an instance in your VPC, you must configure your security group rules to allow traffic between the Amazon QuickSight network interface and your instance.

**Security Group Rules for the Instance in Your VPC**

The security group attached to your data source's instance must allow inbound traffic from Amazon QuickSight on the port that Amazon QuickSight is connecting to.

You can do this by adding a rule to your security group that allows traffic from the security group ID that is associated with the Amazon QuickSight (recommended). Alternatively, you can use a rule that allows traffic from the private IP address assigned to Amazon QuickSight.

For more information, see Security Groups for Your VPC and VPCs and Subnets.

**Security Group Rules for Amazon QuickSight's Elastic Network Interface**

When using a VPC Connection, traffic comes from the elastic network interface that we create in your VPC. Each elastic network interface gets its own private IP address that's chosen from the subnet you configure. The private IP address is unique for each AWS account, unlike the public IP range.

The security group attached to the Amazon QuickSight elastic network interface should have outbound rules allowing traffic to all of the data source instances in your VPC that you want Amazon QuickSight to connect to. If you don't want to restrict which instances Amazon QuickSight can connect to, you can configure your security group with an outbound rule to allow traffic to 0.0.0.0/0 on all ports. If you want to restrict Amazon QuickSight to connect only to certain instances, you can specify the security group ID (recommended) or private IP address of the instances you want to allow. You specify these, along with the appropriate port numbers for your instances, in your outbound security group rule.

The security group attached to the Amazon QuickSight elastic network interface behaves differently than most security groups. Security groups are usually stateful, meaning that when an outbound connection is established the return traffic from the destination host is automatically allowed. However, the security group attached to the Amazon QuickSight network interface isn't stateful. This means that your return traffic from the destination host isn't automatically allowed. In this case, adding an egress rule to the network interface security group doesn't work. Therefore, you must add inbound rules to your security group to explicitly authorize it.

Because the destination port number of any inbound return packets is set to a randomly allocated port number, the inbound rule in your security group must allow traffic on all ports (0–65535). If you don't want to restrict which instances Amazon QuickSight can connect to, then you can configure this security group with an inbound rule to allow traffic on 0.0.0.0/0 on all ports. If you want to restrict Amazon QuickSight to connect only to certain instances, you can specify the security group ID (recommended). Alternatively, you can specify the private IP address of the instances you want to allow in your inbound security group rule. In this case, your inbound security group rule still needs to allow traffic on all ports.
Limitations on Data Sources Using a VPC Connection

The following data source types can use a VPC connection:

- Amazon Redshift
- Amazon RDS
- Amazon Aurora
- PostgreSQL
- MySQL
- MariaDB
- Microsoft SQL Server

The instance you are connecting to must either reside within your VPC or be reachable by using an AWS Direct Connect gateway. Amazon QuickSight can't send traffic through a VPC connection to instances that are only reachable by a VPN gateway, NAT gateway, or VPC peering connection.

Amazon QuickSight can't connect to a network load balancer by using a VPC connection.

Other Requirements for Data Sources Using a VPC Connection

The DNS name of the database or instance you are connecting to through a VPC connection must be resolvable from outside of your VPC. Also, the connection must return the private IP address of your instance. Databases hosted by Amazon Redshift, Amazon RDS, and Aurora automatically meet this requirement.

Logging Operations with AWS CloudTrail

Amazon QuickSight is integrated with AWS CloudTrail. This service captures specific API calls and delivers log files to your Amazon S3 bucket. Amazon QuickSight doesn't currently have public API operations. However, you can use CloudTrail to capture non-API events made from the Amazon QuickSight console. CloudTrail logs show user request information: who made the request, the IP address the request was made from, when it happened, and more.

To learn about CloudTrail, including how to configure and enable it, see the AWS CloudTrail User Guide.

When CloudTrail logging is enabled in your AWS account, Amazon QuickSight operations are tracked in CloudTrail log files. Amazon QuickSight actions are written with other AWS service records. CloudTrail determines when to create and write to a new file based on a time period and file size.

**Note**

AWS CloudTrail logging for Amazon QuickSight is available for both Standard and Enterprise Editions, across all supported Amazon QuickSight regions. For more information, read AWS Regions and IP Address Ranges (p. 416).

**Topics**

- Working with Amazon QuickSight Log Files (p. 490)
- Understanding Amazon QuickSight Log File Contents (p. 490)
- Tracking Non-API Events by Using CloudTrail Logs (p. 490)
- Understanding Amazon QuickSight Log File Entries (p. 492)
Working with Amazon QuickSight Log Files

You can store your log files in your Amazon S3 bucket for as long as you want. Alternatively, you can also define Amazon S3 lifecycle rules to automatically archive or delete log files. By default, your log files are encrypted with Amazon S3 server-side encryption (SSE).

If you want to be notified when log files are delivered, you can configure CloudTrail to publish Amazon SNS notifications on log file delivery. For more information, see Configuring Amazon SNS Notifications for CloudTrail.

You can also aggregate Amazon QuickSight log files from multiple AWS regions and multiple AWS accounts into a single Amazon S3 bucket. For more information, see Receiving CloudTrail Log Files from Multiple Regions and Receiving CloudTrail Log Files from Multiple Accounts.

Understanding Amazon QuickSight Log File Contents

Every log entry contains information about who generated the request. The user identity information in the log entry helps you determine the following:

- Whether the request was made with root or AWS Identity and Access Management (IAM) user credentials
- Whether the request was made with temporary security credentials for an IAM role or federated user
- Whether the request was made by another AWS service

For more information on user identity, see the CloudTrail userIdentity Element.

By default, each Amazon QuickSight log entry contains the following information:

- userIdentity
- eventTime
- eventId
- readOnly
- awsRegion
- eventSource (quicksight)
- eventType (AwsServiceEvent)
- recipientAccountId (customer AWS account)

Note
CloudTrail displays users as unknown if they were provisioned by Amazon QuickSight. This display is because these users aren't a known IAM identity type.

Tracking Non-API Events by Using CloudTrail Logs

Following is a list of the non-API events you can track.

User Management

- CreateAccount – Create Account
- BatchCreateUser – Create User
- BatchResendUserInvite – Invite User
- UpdateGroups – Update Groups

This event works with Enterprise edition only.
• **UpdateSpiceCapacity** – Update SPICE Capacity
• **DeleteUser** – Delete User
• **Unsubscribe** – Unsubscribe User

**Subscription**
• **CreateSubscription** – Create Subscription
• **UpdateSubscription** – Update Subscription
• **DeleteSubscription** – Delete Subscription

**Dashboard**
• **GetDashboard** – Get Dashboard
• **CreateDashboard** – Create Dashboard
• **UpdateDashboard** – Update Dashboard
• **UpdateDashboardAccess** – Update Dashboard Access
• **DeleteDashboard** – Delete Dashboard

**Analysis**
• **GetAnalysis** – Get Analysis
• **CreateAnalysis** – Create Analysis
• **UpdateAnalysisAccess** – Update Analysis Access
• **UpdateAnalysis** – Update Analysis
  • **RenameAnalysis** – Rename Analysis
  • **CreateVisual** – Create Visual
  • **RenameVisual** – Rename Visual
  • **DeleteVisual** – Delete Visual
  • **DeleteAnalysis** – Delete Analysis

**Data Source**
• **CreateDataSource** – Create Data Source
  • **FlatFile** – Flat file
  • **External** – External
  • **S3** – S3
  • **ImportS3ManifestFile** – S3 Manifest File
  • **Presto** – Presto
  • **RDS** – RDS
  • **Redshift** – Redshift (manual)
• **UpdateDataSource** – Update Data Source
• **DeleteDataSource** – Delete Data Source

**Data Set**
• **CreateDataSet** – Create Data Set
  • **CustomSQL** – Custom SQL
• **SQLTable** – SQL Table
• **File** – CSV or XLSX
• **UpdateDataSet** – Update SQL Join Dataset
• **UpdateDatasetAccess** – Update Dataset Access
• **DeleteDataSet** – Delete Dataset

### Understanding Amazon QuickSight Log File Entries

CloudTrail log files contain one or more log entries. Each entry lists multiple JSON-formatted events. A log entry represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. The log entries are not an ordered stack trace of the public API calls, so they don't appear in any specific order.

The following example shows a CloudTrail log entry.

**BatchCreateUser**

```
{
  ".eventVersion": "1.05",
  "userIdentity": {
    "type": "Root",
    "principalId": "123456789012",
    "arn": "arn:aws:iam::123456789012:root",
    "accountId": "123456789012",
    "userName": "test-username"
  },
  "eventTime": "2017-04-19T03:16:13Z",
  "eventSource": "quicksight.amazonaws.com",
  "eventName": "BatchCreateUser",
  "awsRegion": "us-west-2",
  "requestParameters": null,
  "responseElements": null,
  "eventID": "e7d2382e-70a0-3fb7-9d41-a7a913422240",
  "readOnly": false,
  "eventType": "AwsServiceEvent",
  "recipientAccountId": "123456789012",
  "serviceEventDetails": {
    "eventRequestDetails": {
      "users": {
        "test-user-11": {
          "role": "USER"
        },
        "test-user-22": {
          "role": "ADMIN"
        }
      },
      "eventResponseDetails": {
        "validUsers": [],
        "InvalidUsers": [
          "test-user-11",
          "test-user-22"
        ]
      }
    }
  }
}
```
Troubleshooting Amazon QuickSight

Use this information to help you diagnose and fix common issues that you can encounter when using Amazon QuickSight.

Note
Need more help? You can visit the Amazon QuickSight User Community or the AWS forums. See also the Amazon QuickSight Resource Library.

Topics
• I Can't Connect to My Data Source (p. 494)

I Can't Connect to My Data Source

Use this section to help you troubleshoot connections to data sources. Before you continue, verify that the database is currently available. Also, verify that you have the correct connection information and valid credentials.

Topics
• I Need to Validate the Connection to My Data Source, or Change Data Source Settings (p. 494)
• I Can't Connect to Amazon Athena (p. 495)
• I Can't Connect Although My Data Source Connection Options Look Right (SSL) (p. 496)
• I Can't Connect to MySQL (Issues with SSL and Authorization) (p. 498)
• I Can't Connect to Amazon S3 (p. 499)
• I Can't Connect to RDS (p. 500)

I Need to Validate the Connection to My Data Source, or Change Data Source Settings

If you need to update your data source, or you got a connection error and need to check your settings, follow these steps and validate your connection to the data source.

1. From the QuickSight home screen, choose Manage data.
I Can't Connect to Amazon Athena

You get an insufficient permissions error when your run a query and the permissions aren't configured. To verify that you can connect Amazon QuickSight to Amazon Athena, check these settings:

- AWS resource permissions inside of Amazon QuickSight
- IAM (IAM) policies
- Amazon S3 location
- Query results location
- AWS KMS key policy (for encrypted data sets only)

Use the following procedure to make sure that you authorized Amazon QuickSight to use Athena. Permissions to AWS resources apply to all Amazon QuickSight users.

To authorize Amazon QuickSight to access Athena

1. In the AWS Region list at top right, choose the US East (N. Virginia) Region. You use this AWS Region temporarily while you edit your account permissions.
2. Open Amazon QuickSight, choose your profile name at top right, and then choose Manage QuickSight.
3. Choose Account Settings, on the left.
4. On the Account Settings page, choose Edit AWS permissions. If Athena is not enabled (selected), select it now.
5. Verify that you enabled access to the Amazon S3 buckets for your Athena query:
   a. On the Edit QuickSight read-only access to AWS resources page, find Amazon S3.
      If Amazon S3 is not enabled (selected), select it now.
   b. Choose Choose S3 buckets to choose individual buckets.
   c. Choose the buckets that you want to access from your Athena query, and then choose Select buckets to confirm.
6. On the Edit QuickSight read-only access to AWS resources page, choose Apply.
7. If you changed your AWS Region during the first step of this process, change it back to the AWS Region that you want to use.

Your AWS Identity and Access Management (IAM) policies must grant permissions to specific actions. Your IAM user or role must be able to read and write both the input and the output of the S3 buckets that Athena uses for your query.

To verify that your IAM policies have permission to use S3 buckets for your query

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. Locate the IAM user or role you are using. Choose the user or role name to see the associated policies.

3. Verify that the policy has the correct permissions. Choose a policy you want to verify, then choose **Edit policy**. Use the visual editor, which opens by default. If you have the JSON editor open instead, choose the **Visual editor** tab.

4. Choose the S3 entry in the list to see its contents. The policy needs to grant permissions to list, read, and write. If S3 is not in the list, or it doesn't have the correct permissions, you can add them here.

The IAM user needs access to read and write to the results location in S3. By default, Athena stores query results in `aws-athena-query-results-<ACCOUNTID>-<REGION>`. However, you might be using a different S3 bucket. Also, if the data set is encrypted, the IAM user needs to be a key user in the specified KMS key's policy.

**Important**

Do not put the endpoint in the S3 URL.

This format is correct: `s3://bucket/path`

This format generates an "Access Denied" error: `s3://us-east-1.amazonaws.com/bucket/path`

**To set permissions to your Athena query results location**

2. Choose **Settings** and get the value in **Query result location**. If **Encrypt query results** is enabled (selected), check whether it uses SSE-KMS or CSE-KMS, and note the key.
3. Make sure that your IAM user has access to the correct bucket by opening the S3 console at [https://console.aws.amazon.com/s3/](https://console.aws.amazon.com/s3/). Alternatively, if you are managing access with an access control list (ACL), check the ACLs.
4. If your data set is encrypted (**Encrypt query results** is enabled), make sure that the IAM user or role is added as a key user in that AWS KMS key's policy. You can access KMS settings in IAM.

**To grant access to the S3 bucket used by Athena**

1. Open the Amazon S3 console at [https://console.aws.amazon.com/s3/](https://console.aws.amazon.com/s3/).
2. Choose the S3 bucket used by Athena in the **Query result location**.
3. On the **Permissions** tab, verify the permissions.

---

**I Can't Connect Although My Data Source Connection Options Look Right (SSL)**

Problems connecting can occur when Secure Sockets Layer (SSL) is incorrectly configured. The symptoms can include the following:

- You can connect to your database in other ways or from other locations but not in this case.
- You can connect to a similar database but not this one.

Rule out the following circumstances:

- Permissions issues
- Availability issues
- An expired or invalid certificate
I Can’t Connect Although My Data Source Connection Options Look Right (SSL)

- A self-signed certificate
- Certificate chain in the wrong order
- Ports not enabled
- Firewall blocking an IP address
- A VPC or security group not configured correctly.

To help find issues with SSL, you can use an online SSL checker, or a tool like OpenSSL.

The following steps walk through troubleshooting a connection where SSL is suspect. The administrator in this example has already installed OpenSSL.

**Example**

1. The user finds an issue connecting to the database. The user verifies that he can connect a different database in another AWS Region. He checks other versions of the same database and he can connect easily.

2. The administrator reviews the issue and decides to verify that the certificates are working correctly. She searches online for an article on using OpenSSL to troubleshoot or debug SSL connections.

3. Using OpenSSL, the administrator verifies the SSL configuration in the terminal.

   ```bash
   echo quit
   openssl s_client -connect <host>:port
   ```

   The result shows that the certificate is not working:

   ```
   ...
   CONNECTED(00000003)
   012345678901234:error:140770FC:SSL routines:SSL23_GET_SERVER_HELLO:unknown protocol:s23_clnt.c:782:
   ---
   no peer certificate available
   ---
   No client certificate CA names sent
   ---
   SSL handshake has read 7 bytes and written 278 bytes
   ---
   New, (NONE), Cipher is (NONE)
   Secure Renegotiation IS NOT supported
   SSL-Session:
   Protocol : TLSv1.2
   Cipher : 0000
   Session-ID:  
   Session-ID-ctx:  
   Master-Key:  
   Key-Arg : None
   PSK identity: None
   PSK identity hint: None
   Start Time: 1497569068
   Timeout : 300 (sec)
   Verify return code: 0 (ok)
   ---
   ```

4. The administrator corrects the problem by installing the SSL certificate on the user’s database server.
For more detail on the solution in this example, see Using SSL to Encrypt a Connection to a DB Instance in the Amazon RDS User Guide.

I Can't Connect to MySQL (Issues with SSL and Authorization)

To check on some common connection issues in MySQL, use the following steps. This procedure helps you find out if you have enabled SSL and granted usage rights.

1. Check /etc/my.cnf to make sure SSL is enabled for MySQL.
2. In MySQL, run the following command.

\[
\text{show status like 'Ssl%';}
\]

If SSL is working, you see results like the following.

<table>
<thead>
<tr>
<th>Variable_name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ssl_accept_renegotiates</td>
<td>0</td>
</tr>
<tr>
<td>Ssl_accepts</td>
<td>1</td>
</tr>
<tr>
<td>Ssl_callback_cache_hits</td>
<td>0</td>
</tr>
<tr>
<td>Ssl_cipher</td>
<td></td>
</tr>
<tr>
<td>Ssl_cipher_list</td>
<td></td>
</tr>
<tr>
<td>Ssl_client_connects</td>
<td>0</td>
</tr>
<tr>
<td>Ssl_connect_renegotiates</td>
<td>0</td>
</tr>
<tr>
<td>Ssl_ctx_verify_depth</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Ssl_ctx_verify_mode</td>
<td>5</td>
</tr>
<tr>
<td>Ssl_default_timeout</td>
<td>0</td>
</tr>
<tr>
<td>Ssl_finished_accepts</td>
<td>0</td>

</tbody>
</table>
I Can't Connect to Amazon S3

To successfully connect to Amazon S3, you must configure authentication and create a valid manifest file inside the bucket you are trying to access. You also need to make sure that the file described by the manifest is available.

To verify authentication, make sure that you authorized Amazon QuickSight to access the S3 account. It's not enough that you, the user, are authorized. Amazon QuickSight must be authorized separately.

To authorize Amazon QuickSight to access your Amazon S3 bucket

1. In the AWS Region list at top right, choose the US East (N. Virginia) Region. You use this AWS Region temporarily while you edit your account permissions.
2. Inside of Amazon QuickSight, choose your profile name (top right). Choose Manage QuickSight, and then choose Account Settings, on the left.
4. If Amazon S3 is selected, see how many buckets are authorized.
5. To select individual buckets, choose Choose S3 buckets. Select the buckets you want to access from Amazon QuickSight. Then choose Select buckets.
6. Choose Apply.
7. If you changed your AWS Region during the first step of this process, change it back to the AWS Region you want to use.

<table>
<thead>
<tr>
<th>Ssl_client_connects</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ssl_connect_renegotiates</td>
<td>0</td>

<td></td>
</tr>
</tbody>
</table>

3. Make sure that you have installed a supported SSL certificate on the database server.
4. Grant usage for the specific user to connect using SSL.

GRANT USAGE ON *.* TO 'encrypted_user'@'%' REQUIRE SSL;

For more detail on the solution in this example, see the following:

- SSL Support for MySQL DB Instances in the Amazon RDS User Guide.
- Using SSL to Encrypt a Connection to a DB Instance in the Amazon RDS User Guide.
- MySQL documentation
We strongly recommend that you make sure that your manifest file is valid. If Amazon QuickSight can't parse your file, it gives you an error similar to "We can't parse the manifest file as a valid JSON" or "We can't connect to the S3 bucket."

To verify your manifest file

1. Open your manifest file. You can do this directly from the Amazon S3 console at https://console.aws.amazon.com/s3/. Navigate to your manifest file and choose Open.
2. Make sure that the URI or URLs provided inside the manifest file indicate the file or files that you want connect to.
3. Make sure that your manifest file is formed correctly, if you use a link to the manifest file rather than uploading the file. The link shouldn't have any additional phrases after the word .json. You can get the correct link to an S3 file by viewing its Link value in the details on the S3 console.
4. Make sure that the content of the manifest file is valid by using a JSON validator, like the one at https://jsonlint.com.
5. Verify permissions on your bucket or file. In the https://console.aws.amazon.com/s3/, navigate to your Amazon S3 bucket, choose the Permissions tab, and add the appropriate permissions. Make sure that the permissions are at the right level, either on the bucket or on the file or files.
6. If you are using the s3:// protocol, rather than https://, make sure that you reference your bucket directly. For example, use s3://mybucket/myfile.csv instead of s3://s3-us-west-2.amazonaws.com/mybucket/myfile.csv. Doubly specifying Amazon S3, by using s3:// and also s3-us-west-2.amazonaws.com, causes an error.

For more information on manifest files and connecting to Amazon S3, see Supported Formats for Amazon S3 Manifest Files (p. 72).

In addition, verify that your Amazon S3 data set was created according to the steps in Creating a Data Set Using Amazon S3 Files (p. 68).

If you use Athena to connect to Amazon S3, see I Can't Connect to Amazon Athena (p. 495).

I Can't Connect to RDS

For details on troubleshooting connections to Amazon RDS, see Creating Data Sets from New Database Data Sources (p. 81).

You can also refer to the Amazon RDS documentation on troubleshooting connections, Cannot Connect to Amazon RDS DB Instance.

My Rows Were Skipped During Data Preparation

When you prepare data, Amazon QuickSight previews a portion of your data for you to work with. If it can't interpret a row for any reason, it skips this row. Then it displays a message to say how many rows are skipped.

Here is a list of things to check:

- Inconsistency between the field data type and the field data, for example text data in a field with a numeric data type.
- Having a file that contains a header but having the Contains header upload setting deselected.
- Having the data source data violate one or more Data Source Limits (p. 52).
- Field data that is incompatible with or excluded by the function used in a calculated field. For example, if you have a calculated field that uses parseDate (p. 194), rows with data that doesn't evaluate to a valid date are skipped.
My SPICE Data Doesn't Sort Alphabetically

SPICE (p. 2) doesn't yet support sorting text. To work around this issue, use a direct query instead of SPICE. If you are using text files, you need to import them through another data source.

I Can't Add a Visual to My Analysis

If you are editing an analysis for a selected data source, and the connection to the data source terminates unexpectedly, this error state can prevent further changes to the analysis. In this case, you can't add more visuals to the analysis.

To fix this issue, do the following:

• Verify that you still have access to the data source.

• If you are using a proxy server, verify that *.quicksight.aws.amazon.com is added to the list of whitelisted (safe) domains.

I Get a Feedback Bar Across My Printed Docs

The browser sometimes prints the document feedback bar across the page, blocking some printed content.

To avoid this problem, use the twirl-down icon on the bottom left of the screen to minimize the feedback bar. Then print your document.

We always welcome your feedback on our documentation!

How Do I Delete My Amazon QuickSight Account?

If you need to delete your Amazon QuickSight account, even when you can't access Amazon QuickSight to unsubscribe, sign in to AWS and use the following link to open the unsubscribe screen: https://us-east-1.quicksight.aws.amazon.com/sn/console/unsubscribe. This approach works no matter what AWS Regions you use. It deletes all data, analyses, Amazon QuickSight users, and Amazon QuickSight administrators. If you have further difficulty, contact support.

My Map Charts Don't Show Locations

For automatic mapping, called geocoding, to work on map charts, your data must be prepared following specific rules. For help with geospatial issues, see Geospatial Troubleshooting (p. 171). For help with preparing data for geospatial charts, see Adding Geospatial Data (p. 165).
Amazon QuickSight Isn't Working in My Browser

If you can't view Amazon QuickSight correctly in your Chrome browser, follow these steps to fix the problem:

1. Open Chrome and navigate to `chrome://flags/#touch-events`.
2. If the option is set to `Automatic`, change it to `Disabled`.
3. Close and reopen Chrome.

Troubleshooting Issues When Using Athena with Amazon QuickSight

This section covers troubleshooting various issues you might encounter when using Athena with Amazon QuickSight. This list came from support calls frequently made by Amazon QuickSight customers.

Topics
- Insufficient Permissions When Using Athena with Amazon QuickSight (p. 502)
- Table Not Found When Using Athena with Amazon QuickSight (p. 503)
- Column Not Found When Using Athena with Amazon QuickSight (p. 503)
- Staging Bucket No Longer Exists When Using Athena with Amazon QuickSight (p. 503)
- Query Timeout When Using Athena with Amazon QuickSight (p. 504)
- Invalid Data When Using Athena with Amazon QuickSight (p. 504)
- Table Incompatible When Using AWS Glue with Athena in Amazon QuickSight (p. 504)

Insufficient Permissions When Using Athena with Amazon QuickSight

If you receive an "insufficient permissions" error, try these steps to resolve your problem:

1. Make sure that you granted Amazon QuickSight read-only access to the S3 buckets used by Athena.
   a. To do this, choose Manage QuickSight from your profile icon in the top right of the screen.
   b. Next, choose Account Settings and then Edit AWS permissions.
   c. On the Edit QuickSight read-only-access to AWS resources screen, choose Choose S3 buckets. Verify that the appropriate S3 buckets are listed and that their checkboxes are selected.
   d. If your bucket isn't listed under S3 buckets linked to QuickSight account, choose the S3 buckets you can access across AWS tab. To add your bucket, type in your bucket's name and choose Add S3 bucket.
2. If your data file is encrypted with an AWS KMS key, grant permissions to the Amazon QuickSight IAM role to decrypt the key. The easiest way to do this is to use the AWS CLI. If you don't have the AWS CLI set up and configured, see Configuring the AWS CLI in the AWS Command Line Interface User Guide.

You can run the `create-grant` command in AWS CLI to do this.

```
aws kms create-grant --key-id <KMS key ARN> --grantee-principal <Your Amazon QuickSight Role ARN> --operations Decrypt
```
The Amazon Resource Name (ARN) for the Amazon QuickSight role has the format:

```
arn:aws:iam::<account id>:role/service-role/aws-quicksight-serviceroleservice-role-
```v<version no.>

and can be accessed from the IAM console. To find your KMS key ARN, use the S3 console. Go to the bucket that contains your data file and choose the Overview tab. The key is located near KMS key ID.

**Table Not Found When Using Athena with Amazon QuickSight**

If you receive a "table not found" error, this can happen if the tables in an analysis are missing from the Athena data source.

In the Athena console, check for your table under the corresponding schema. You can recreate the table in Athena and then create a new data set in Amazon QuickSight on that table. To investigate how the table was lost in the first place, you can use the Athena console to check the query history. This helps you locate the queries that dropped the table.

If this error happened when you were editing a custom SQL query in preview, verify the name of the table in the query, and check for any other syntax errors. Amazon QuickSight can't infer the schema from the query. The schema must be specified in the query.

For example, the following statement works.

```
select from my_schema.my_table
```

The following statement fails because it's missing the schema.

```
select from my_table
```

**Column Not Found When Using Athena with Amazon QuickSight**

If you receive a "column not found" error, this can happen if the columns in an analysis are missing from the Athena data source.

In Amazon QuickSight, open your analysis in the Visualize tab, Choose Choose data set..., then Edit analysis data sets.

In the Data sets in this analysis screen, choose Edit near your data set to refresh the data set. Amazon QuickSight caches the schema for 2 minutes. So it can take 2 minutes before the latest changes display.

To investigate how the column was lost in the first place, you can go to Athena console and check the query history to find queries that edited the table.

If this error happened when you were editing a custom SQL query in preview, verify the name of the column in the query, and check for any other syntax errors. For example, check that the column name isn't enclosed in single quotes, which are reserved for strings.

**Staging Bucket No Longer Exists When Using Athena with Amazon QuickSight**

Use this section to help solve this error: "The staging bucket for this query result no longer exists in the underlying data source."
When you create a data set using Athena, Amazon QuickSight creates an S3 bucket. By default, this bucket has a name similar to "aws-athena-query-results-->region-->account-id". If you remove this bucket, then your next Athena query might fail with an error saying the staging bucket no longer exists.

To fix this error, create a new bucket with the same name in the correct AWS Region.

**Query Timeout When Using Athena with Amazon QuickSight**

If your query times out, you can try these options to resolve your problem.

If the failure was generated while working on an analysis, remember that Amazon QuickSight's timeout for generating any visual is 2 minutes.

If you're using a custom SQL query, you can simplify your query to optimize execution time. If you have already optimized it as much as possible, you can go to the AWS Support Center site, and create a request for a Service Limit Increase.

If you are in direct query mode (not using SPICE), you can try importing your data to SPICE. However, if your query exceeds the Athena 30-minute timeout, you might get another timeout while importing data into SPICE. For the most current information on Athena limits, see Amazon Athena Limits.

**Invalid Data When Using Athena with Amazon QuickSight**

An "Invalid Data" error can occur when you use any operator or function in a calculated field. Verify that the data in the table is consistent with the format you supplied to the function.

For example, if you are using the function parseDate(expression, ['format'], ['time_zone']) as parseDate(date_column, 'MM/dd/yyyy'), all values in date_column must conform to 'MM/dd/yyyy' format('05/12/2016'). Any value that isn't in this format ('2016/12/05') can cause an error.

**Table Incompatible When Using AWS Glue with Athena in Amazon QuickSight**

If you are getting errors when using AWS Glue tables in Athena with Amazon QuickSight, it might be because you're missing some metadata. Follow these steps to find out if your tables don't have the TableType attribute that Amazon QuickSight needs for the Athena connector to work. Usually, the metadata for these tables wasn't migrated to the AWS Glue Data Catalog. For more information, see Upgrading to the AWS Glue Data Catalog Step-by-Step in the AWS Glue Developer Guide.

If you don't want to migrate to the AWS Glue data catalog at this time, you have two options. You can recreate each AWS Glue table through the AWS Glue Management Console. Alternatively, you can use the AWS CLI scripts listed in the following procedure to identify and update tables with missing TableType attributes.

If you prefer to use the CLI to do this, use the following procedure to help you design your scripts.

1. Use the CLI to learn which AWS Glue tables have no TableType attributes.

```
aws glue get-tables --database-name <your_database_name>;
```

For example, you can run the following command in the CLI.
Glue Table Incompatible with Athena

Following is a sample of what the output looks like. You can see that the table "table_missing_table_type" doesn't have the TableType attribute declared.

```json
{
    "TableList": [
        {
            "Retention": 0,
            "UpdateTime": 1522368588.0,
            "PartitionKeys": [
                {
                    "Name": "year",
                    "Type": "string"
                },
                {
                    "Name": "month",
                    "Type": "string"
                },
                {
                    "Name": "day",
                    "Type": "string"
                }
            ],
            "LastAccessTime": 1513804142.0,
            "Owner": "owner",
            "Name": "table_missing_table_type",
            "Parameters": {
                "delimiter": ",",
                "compressionType": "none",
                "skip.header.line.count": "1",
                "sizeKey": "75",
                "averageRecordSize": "7",
                "classification": "csv",
                "objectCount": "1",
                "typeOfData": "file",
                "CrawlerSchemaDeserializerVersion": "1.0",
                "CrawlerSchemaSerializerVersion": "1.0",
                "UPDATED_BY_CRAWLER": "crawl_date_table",
                "recordCount": "9",
                "columnsOrdered": "true"
            },
            "StorageDescriptor": {
                "OutputFormat": "org.apache.hadoop.hive.ql.io.HiveIgnoreKeyTextOutputFormat",
                "SortColumns": [],
                "StoredAsSubDirectories": false,
                "Columns": [
                    {
                        "Name": "col1",
                        "Type": "string"
                    },
                    {
                        "Name": "col2",
                        "Type": "bigint"
                    }
                ],
                "Location": "s3://myAthenatest/test_dataset/",
                "NumberOfBuckets": -1,
                "Parameters": {
                    "delimiter": ",",
                    "compressionType": "none",
                    "skip.header.line.count": "1",
```
2. Edit the table definition in your editor to add "TableType": "EXTERNAL_TABLE" to the table definition, as shown in the following example.

```json
{
  "Table": {
    "Retention": 0,
    "TableType": "EXTERNAL_TABLE",
    "PartitionKeys": [
      {
        "Name": "year",
        "Type": "string"
      },
      {
        "Name": "month",
        "Type": "string"
      },
      {
        "Name": "day",
        "Type": "string"
      }
    ],
    "UpdateTime": 1522368588.0,
    "Name": "table_missing_table_type",
    "StorageDescriptor": {
      "BucketColumns": [],
      "SortColumns": [],
      "StoredAsSubDirectories": false,
      "OutputFormat": "org.apache.hadoop.hive.ql.io.HiveIgnoreKeyTextOutputFormat",
      "SerdeInfo": {
        "SerializationLibrary": "org.apache.hadoop.hive.serde2.lazy.LazySimpleSerDe",
        "Parameters": {
          "field.delim": ","
        }
      }
    },
    "Parameters": {
      "classification": "csv",
      "CrawlerSchemaDeserializerVersion": "1.0",
      "UPDATED_BY_CRAWLER": "crawl_date_table",
      "recordCount": "9"
    }
  }
}
```
3. You can adapt the following script to update the table input, so that it includes the `TableType` attribute.

```bash
aws glue update-table --database-name <your_database_name> --table-input <updated_table_input>
```

The following shows an example.

```bash
aws glue update-table --database-name test_database --table-input '
{
    "Retention": 0,
    "TableType": "EXTERNAL_TABLE",
    "PartitionKeys": [
    {
        "Name": "year",
        "Type": "string"
    }
}
```
"Name": "month",
"Type": "string"
},

{ "Name": "day",
"Type": "string" }
],
"Name": "table_missing_table_type",
"StorageDescriptor": {
"BucketColumns": [],
"SortColumns": [],
"StoredAsSubDirectories": false,
"OutputFormat":
"org.apache.hadoop.hive.ql.io.HiveIgnoreKeyTextOutputFormat",
"SerdeInfo": {
"SerializationLibrary":
"org.apache.hadoop.hive.serde2.lazy.LazySimpleSerDe",
"Parameters": {
"field.delim": ","
} 
},
"Parameters": {
"classification": "csv",
"CrawlerSchemaSerializerVersion": "1.0",
"UPDATED_BY_CRAWLER": "crawl_date_table",
"columnsOrdered": "true",
"averageRecordSize": "7",
"objectCount": "1",
"sizeKey": "75",
"delimiter": ",",
"compressionType": "none",
"recordCount": "9",
"CrawlerSchemaDeserializerVersion": "1.0",
"typeOfData": "file",
"skip.header.line.count": "1"
},
"Columns": [

{ "Name": "col1",
"Type": "string"
},

{ "Name": "col2",
"Type": "bigint"
} 
],
"Compressed": false,
"InputFormat": "org.apache.hadoop.mapred.TextInputFormat",
"NumberOfBuckets": -1,
"Location": "s3://myAthenatest/test_date_part/"
},
"Owner": "owner",
"Parameters": {
"classification": "csv",
"CrawlerSchemaSerializerVersion": "1.0",
"UPDATED_BY_CRAWLER": "crawl_date_table",
"columnsOrdered": "true",
"averageRecordSize": "7",
"objectCount": "1",
"sizeKey": "75",
"delimiter": ",",
"compressionType": "none",
"recordCount": "9",
"CrawlerSchemaDeserializerVersion": "1.0",
"typeOfData": "file",
"skip.header.line.count": "1"}
"typeOfData": "file",
"skip.header.line.count": "1"
},
"LastAccessTime": 1513804142.0
}
AWS Glossary

For the latest AWS terminology, see the AWS Glossary in the AWS General Reference.
## Document History

**Latest documentation update:** June 21, 2018

**Note**
In a Kindle publication, you can find the last change date above the table of contents. However, on the Kindle website, the original publication date is unchanged.

The following table describes the important changes to the *Amazon QuickSight User Guide*.

<table>
<thead>
<tr>
<th>Change</th>
<th>Description</th>
<th>Date Changed</th>
</tr>
</thead>
<tbody>
<tr>
<td>New features</td>
<td>You can replace data sets, customize labels, and format dimensions that are aggregated with count and count distinct. Also, new visuals start out smaller in size. For more information on these features, see the following sections:</td>
<td>June 21, 2018</td>
</tr>
<tr>
<td></td>
<td>• Replacing Data Sets (p. 217)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Customizing Visual Labels (p. 280)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Customizing a Field Format (p. 221)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Working with Amazon QuickSight Visuals (p. 265)</td>
<td></td>
</tr>
<tr>
<td>New features and a new AWS Region</td>
<td>You can upgrade your Amazon QuickSight subscription from Standard edition to Enterprise edition. In Enterprise edition, Amazon QuickSight supports usage-based pricing for users in the reader role, sharing dashboards with all users in the reader role, and hourly refresh of data sets. Amazon QuickSight supports also supports private connections to data in a VPC with a private subnet in Enterprise edition. In both editions, Amazon QuickSight supports parameters with on-sheet controls, dashboard co-ownership, custom URL actions, and 25-GB SPICE data sets. Also, Amazon QuickSight is available in Asia Pacific (Tokyo). For more information on these features, see the following sections:</td>
<td>May 30, 2018</td>
</tr>
<tr>
<td></td>
<td>• Upgrading Your Amazon QuickSight Subscription from Standard Edition to Enterprise Edition (p. 432)</td>
<td></td>

<td></td>
</tr>
<tr>
<td></td>
<td>• Creating a Custom SQL Query (p. 133)</td>
<td></td>
</tr>
<tr>
<td>New features</td>
<td>You can use Amazon QuickSight to connect to Software as a Service (SaaS) providers. For more information, see Software as a Service (SaaS) Data Sources (p. 51). You can import JSON files to Amazon QuickSight. For more information, see JSON Data Sources (p. 50). You can also parse JSON fields in a CSV file. For more information, see parseJson (p. 200).</td>
<td>April 9, 2018</td>
</tr>
<tr>
<td>New feature</td>
<td>You can use Amazon QuickSight with Amazon S3 files that are in a different AWS account. For more information, see Data Sets Using S3 Files in Another AWS Account (p. 70).</td>
<td>November 20, 2017</td>
</tr>
<tr>
<td>New visual types</td>
<td>You can create visuals using maps. You can also view tabular data in a visual. For more information on preparing geospatial data for use in a visual, see Adding Geospatial Data (p. 165). For more information on creating a geospatial visual, see Using Geospatial Charts (Maps) (p. 363). For more information on using tabular reports, see Using Tabular Reports (p. 396).</td>
<td>November 20, 2017</td>
</tr>
<tr>
<td>New features</td>
<td>Amazon QuickSight can support 1000 columns in a data set. For more information, see Data Source Limits (p. 52). Calculated fields are supported in SPICE data sets. For more information, see Adding a Calculated Field to an Analysis (p. 243). Also, high cardinality values, which often display as a long tail on a visual, are placed into a category called other. For more information, see Working with Visual Types in Amazon QuickSight (p. 343).</td>
<td>November 20, 2017</td>
</tr>
<tr>
<td>New feature</td>
<td>In Enterprise edition, you can restrict access to a data set by adding row-level security. To learn more, see Restricting Access to a Data Set by Using Row-Level Security (p. 108).</td>
<td>October 20, 2017</td>
</tr>

<tr>
<td>New visual type</td>
<td>You can create visuals using combo charts. To learn more about combo charts, see Using Combo Charts (p. 358).</td>
<td>October 20, 2017</td>
</tr>
<tr>
<td>New features</td>
<td>Amazon QuickSight supports creating custom aggregations for calculated fields in analyses, custom date formats, and copies of dashboards. For more information on aggregating calculated fields, see Using Aggregate Functions in Calculated Fields (p. 245). For more information on using unsupported dates by creating a custom date format, see Using Unsupported or Custom Dates (p. 142). For more information on duplicating dashboards, see Copying a Dashboard (p. 408).</td>
<td>September 25, 2017</td>
</tr>
<tr>
<td>New feature</td>
<td>You can combine multiple filters using the And/Or operators. To learn more about filter groups, see Adding a compound filter with And/Or operators (p. 331).</td>
<td>August 31, 2017</td>
</tr>
<tr>
<td>New data source</td>
<td>Amazon QuickSight supports Amazon S3 Analytics.</td>
<td>August 31, 2017</td>
</tr>
<tr>
<td>New Features</td>
<td>Amazon QuickSight supports importing ZIP files from Amazon S3. There is also a new search feature, to simplify finding analyses, data sets, and dashboards. For more information on the search feature, see Navigating the User Interface (p. 44).</td>
<td>August 31, 2017</td>
</tr>
<tr>
<td>New regions</td>
<td>Amazon QuickSight is now available in Asia Pacific (Singapore) and Asia Pacific (Sydney).</td>
<td>August 8, 2017</td>
</tr>
<tr>
<td>New feature</td>
<td>Amazon QuickSight supports Snowflake cloud data warehouse.</td>
<td>July 31, 2017</td>
</tr>
<tr>
<td>New feature</td>
<td>Amazon QuickSight added a new aggregation: Count Distinct. To learn more, see Changing Field Aggregation (p. 296).</td>
<td>July 19, 2017</td>
</tr>
<tr>
<td>New feature</td>
<td>Amazon QuickSight supports exploring Amazon S3 analytics data from an Amazon QuickSight dashboard that you reach from the AWS Management Console. To learn more, see Exploring Your AWS Data in Amazon QuickSight (p. 473).</td>
<td>July 5, 2017</td>
</tr>
<tr>
<td>New feature</td>
<td>Amazon QuickSight supports Amazon Redshift Spectrum. To learn more, see Enabling Access to Amazon Redshift Spectrum (p. 470).</td>

<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td>New feature</td>
<td>Amazon QuickSight supports just-in-time (JIT) user provisioning through the following policy actions: quicksight: CreateUser and quicksight: CreateAdmin. To learn more, see Setting Your IAM Policy (p. 477).</td>
<td>May 25, 2017</td>
</tr>
<tr>
<td>New feature</td>
<td>Amazon QuickSight supports direct connections to Teradata 14.0 and later.</td>
<td>May 25, 2017</td>
</tr>
<tr>
<td>New feature</td>
<td>Amazon QuickSight added relative date filters for data sets and visuals. To learn more, see Adding a Date Filter (p. 156).</td>
<td>May 25, 2017</td>
</tr>
<tr>
<td>New feature</td>
<td>Amazon QuickSight supports connecting to Apache Spark and Presto. To learn more, see Creating a Data Source Using Apache Spark (p. 62) and Creating a Data Source Using Presto (p. 62).</td>
<td>May 3, 2017</td>
</tr>
<tr>
<td>New feature</td>
<td>Amazon QuickSight supports operational logging with AWS CloudTrail. To learn more, see Logging Operations with AWS CloudTrail (p. 489).</td>
<td>April 28, 2017</td>
</tr>
<tr>
<td>New feature</td>
<td>Amazon QuickSight is available in US East (Ohio). To learn more about regions, see AWS Regions and IP Address Ranges (p. 416).</td>
<td>April 11, 2017</td>
</tr>
<tr>
<td>New feature</td>
<td>• You can use the AD Connector with Amazon QuickSight. To learn more about managing Enterprise users, see Access and Authentication in Amazon QuickSight (p. 422).</td>
<td>April 6, 2017</td>
</tr>
<tr>
<td></td>
<td>• You can add Key Performance Indicators (KPIs) to your visualizations. To learn more, see Using KPIs (p. 367).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• And you can import .xlsx files with headers and footers, comments, formatting, filter header, sort, frozen panel/header, hidden columns, groups, and formulas / references. You can also limit your import to a specific range. To learn more about importing ranges, see Choosing File Upload Settings (p. 125).</td>
<td></td>
</tr>
<tr>
<td>New feature</td>
<td>You can now export to a comma-separated value (CSV) format file using Amazon QuickSight. To learn more, see Exporting Data from an Amazon QuickSight Visual to a CSV File (p. 269).</td>
<td>March 21, 2017</td>
</tr>
<tr>
<td>New feature</td>
<td>You can now schedule data refreshes for SPICE data sets. To learn more, see Refreshing Data (p. 97).</td>
<td>February 14, 2017</td>
</tr>
<tr>
<td>New feature</td>
<td>You can now connect to Amazon Athena databases and use them as data sources in Amazon QuickSight. To learn more, see Creating a Data Set Using Amazon Athena Data (p. 76).</td>
<td>December 22, 2016</td>
</tr>
<tr>
<td>Change</td>
<td>Description</td>
<td>Date Changed</td>
</tr>
<tr>
<td>--------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td>New edition</td>
<td>Amazon QuickSight now offers an Enterprise edition as well as a Standard edition. Both editions offer a full set of features for creating and sharing data visualizations, and Enterprise edition additionally offers encryption at rest and Active Directory integration. When you choose to use Enterprise edition, you select a Microsoft Active Directory directory in AWS Directory Service and use that active directory to identify and manage your Amazon QuickSight users and administrators. To learn more, see Different Editions of Amazon QuickSight (p. 413).</td>
<td>December 15, 2016</td>
</tr>
<tr>
<td>New guide</td>
<td>This is the first release of <em>Amazon QuickSight User Guide</em>.</td>
<td>November 15, 2016</td>
</tr>

Data from Who's On First. http://whosonfirst.mapzen.com#License

CC0 1.0 Universal

CREATIVE COMMONS CORPORATION IS NOT A LAW FIRM AND DOES NOT PROVIDE LEGAL SERVICES. DISTRIBUTION OF THIS DOCUMENT DOES NOT CREATE AN ATTORNEY-CLIENT RELATIONSHIP. CREATIVE COMMONS PROVIDES THIS INFORMATION ON AN "AS-IS" BASIS. CREATIVE COMMONS MAKES NO WARRANTIES REGARDING THE USE OF THIS DOCUMENT OR THE INFORMATION OR WORKS PROVIDED HEREUNDER, AND DISCLAIMS LIABILITY FOR DAMAGES RESULTING FROM THE USE OF THIS DOCUMENT OR THE INFORMATION OR WORKS PROVIDED HEREUNDER.

Statement of Purpose

The laws of most jurisdictions throughout the world automatically confer exclusive Copyright and Related Rights (defined below) upon the creator and subsequent owner(s) (each and all, an "owner") of an original work of authorship and/or a database (each, a "Work").

Certain owners wish to permanently relinquish those rights to a Work for the purpose of contributing to a commons of creative, cultural and scientific works ("Commons") that the public can reliably and without fear of later claims of infringement build upon, modify, incorporate in other works, reuse and redistribute as freely as possible in any form whatsoever and for any purposes, including without limitation commercial purposes. These owners may contribute to the Commons to promote the ideal of a free culture and the further production of creative, cultural and scientific works, or to gain reputation or greater distribution for their Work in part through the use and efforts of others.

For these and/or other purposes and motivations, and without any expectation of additional consideration or compensation, the person associating CC0 with a Work (the "Affirmer"), to the extent that he or she is an owner of Copyright and Related Rights in the Work, voluntarily elects to apply CC0 to the Work and publicly distribute the Work under its terms, with knowledge of his or her Copyright and Related Rights in the Work and the meaning and intended legal effect of CC0 on those rights.

1. Copyright and Related Rights. A Work made available under CC0 may be protected by copyright and related or neighboring rights ("Copyright and Related Rights"). Copyright and Related Rights include, but are not limited to, the following:

i. the right to reproduce, adapt, distribute, perform, display, communicate, and translate a Work;

ii. moral rights retained by the original author(s) and/or performer(s);

iii. publicity and privacy rights pertaining to a person's image or likeness depicted in a Work;

iv. rights protecting against unfair competition in regards to a Work, subject to the limitations in paragraph 4(a), below;

v. rights protecting the extraction, dissemination, use and reuse of data in a Work;

vi. database rights (such as those arising under Directive 96/9/EC of the European Parliament and of the Council of 11 March 1996 on the legal protection of databases, and under any national implementation thereof, including any amended or successor version of such directive); and
vii. other similar, equivalent or corresponding rights throughout the world based on applicable law or treaty, and any national implementations thereof.

2. Waiver. To the greatest extent permitted by, but not in contravention of, applicable law, Affirmer hereby overtly, fully, permanently, irrevocably and unconditionally waives, abandons, and surrenders all of Affirmer's Copyright and Related Rights and associated claims and causes of action, whether now known or unknown (including existing as well as future claims and causes of action), in the Work (i) in all territories worldwide, (ii) for the maximum duration provided by applicable law or treaty (including future time extensions), (iii) in any current or future medium and for any number of copies, and (iv) for any purpose whatsoever, including without limitation commercial, advertising or promotional purposes (the "Waiver"). Affirmer makes the Waiver for the benefit of each member of the public at large and to the detriment of Affirmer's heirs and successors, fully intending that such Waiver shall not be subject to revocation, rescission, cancellation, termination, or any other legal or equitable action to disrupt the quiet enjoyment of the Work by the public as contemplated by Affirmer's express Statement of Purpose.

3. Public License Fallback. Should any part of the Waiver for any reason be judged legally invalid or ineffective under applicable law, then the Waiver shall be preserved to the maximum extent permitted taking into account Affirmer's express Statement of Purpose. In addition, to the extent the Waiver is so judged Affirmer hereby grants to each affected person a royalty-free, non transferable, non sublicensable, non exclusive, irrevocable and unconditional license to exercise Affirmer's Copyright and Related Rights in the Work (i) in all territories worldwide, (ii) for the maximum duration provided by applicable law or treaty (including future time extensions), (iii) in any current or future medium and for any number of copies, and (iv) for any purpose whatsoever, including without limitation commercial, advertising or promotional purposes (the "License"). The License shall be deemed effective as of the date CC0 was applied by Affirmer to the Work. Should any part of the License for any reason be judged legally invalid or ineffective under applicable law, such partial invalidity or ineffectiveness shall not invalidate the remainder of the License, and in such case Affirmer hereby affirms that he or she will not (i) exercise any of his or her remaining Copyright and Related Rights in the Work or (ii) assert any associated claims and causes of action with respect to the Work, in either case contrary to Affirmer's express Statement of Purpose.

4. Limitations and Disclaimers.

a. No trademark or patent rights held by Affirmer are waived, abandoned, surrendered, licensed or otherwise affected by this document.

b. Affirmer offers the Work as-is and makes no representations or warranties of any kind concerning the Work, express, implied, statutory or otherwise, including without limitation warranties of title, merchantability, fitness for a particular purpose, non infringement, or the absence of latent or other defects, accuracy, or the present or absence of errors, whether or not discoverable, all to the greatest extent permissible under applicable law.

c. Affirmer disclaims responsibility for clearing rights of other persons that may apply to the Work or any use thereof, including without limitation any person's Copyright and Related Rights in the Work. Further, Affirmer disclaims responsibility for obtaining any necessary consents, permissions or other rights required for any use of the Work.

d. Affirmer understands and acknowledges that Creative Commons is not a party to this document and has no duty or obligation with respect to this CC0 or use of the Work.

CREATIVE COMMONS CORPORATION IS NOT A LAW FIRM AND DOES NOT PROVIDE LEGAL SERVICES. DISTRIBUTION OF THIS LICENSE DOES NOT CREATE AN ATTORNEY-CLIENT RELATIONSHIP. CREATIVE COMMONS PROVIDES THIS INFORMATION ON AN "AS-IS" BASIS. CREATIVE COMMONS MAKES NO WARRANTIES REGARDING THE INFORMATION PROVIDED, AND DISCLAIMS LIABILITY FOR DAMAGES RESULTING FROM ITS USE.

License

THE WORK (AS DEFINED BELOW) IS PROVIDED UNDER THE TERMS OF THIS CREATIVE COMMONS PUBLIC LICENSE ("CCPL" OR "LICENSE"). THE WORK IS PROTECTED BY COPYRIGHT AND/OR OTHER APPLICABLE LAW. ANY USE OF THE WORK OTHER THAN AS AUTHORIZED UNDER THIS LICENSE OR COPYRIGHT LAW IS PROHIBITED.

BY EXERCISING ANY RIGHTS TO THE WORK PROVIDED HERE, YOU ACCEPT AND AGREE TO BE BOUND BY THE TERMS OF THIS LICENSE. THE LICENSOR GRANTS YOU THE RIGHTS CONTAINED HERE IN CONSIDERATION OF YOUR ACCEPTANCE OF SUCH TERMS AND CONDITIONS.

1. Definitions

a. "Collective Work" means a work, such as a periodical issue, anthology or encyclopedia, in which the Work in its entirety in unmodified form, along with a number of other contributions, constituting separate and independent works in themselves, are assembled into a collective whole. A work that constitutes a Collective Work will not be considered a Derivative Work (as defined below) for the purposes of this License.

b. "Derivative Work" means a work based upon the Work or upon the Work and other pre-existing works, such as a translation, musical arrangement, dramatization, fictionalization, motion picture version, sound recording, art reproduction, abridgment, condensation, or any other form in which the Work may be recast, transformed, or adapted, except that a work that constitutes a Collective Work will not be considered a Derivative Work for the purpose of this License. For the avoidance of doubt, where the Work is a musical composition or sound recording, the synchronization of the Work in timed-relation with a moving image ("synching") will be considered a Derivative Work for the purpose of this License.

c. "Licensor" means the individual or entity that offers the Work under the terms of this License.

d. "Original Author" means the individual or entity who created the Work.

e. "Work" means the copyrightable work of authorship offered under the terms of this License.

f. "You" means an individual or entity exercising rights under this License who has not previously violated the terms of this License with respect to the Work, or who has received express permission from the Licensor to exercise rights under this License despite a previous violation.

2. Fair Use Rights. Nothing in this license is intended to reduce, limit, or restrict any rights arising from fair use, first sale or other limitations on the exclusive rights of the copyright owner under copyright law or other applicable laws.

3. License Grant. Subject to the terms and conditions of this License, Licensor hereby grants You a worldwide, royalty-free, non-exclusive, perpetual (for the duration of the applicable copyright) license to exercise the rights in the Work as stated below:

a. to reproduce the Work, to incorporate the Work into one or more Collective Works, and to reproduce the Work as incorporated in the Collective Works;
b. to create and reproduce Derivative Works;

c. to distribute copies or phonorecords of, display publicly, perform publicly, and perform publicly by means of a digital audio transmission the Work including as incorporated in Collective Works;

d. to distribute copies or phonorecords of, display publicly, perform publicly, and perform publicly by means of a digital audio transmission Derivative Works.

e. For the avoidance of doubt, where the work is a musical composition:

i. Performance Royalties Under Blanket Licenses. Licensor waives the exclusive right to collect, whether individually or via a performance rights society (e.g. ASCAP, BMI, SESAC), royalties for the public performance or public digital performance (e.g. webcast) of the Work.

ii. Mechanical Rights and Statutory Royalties. Licensor waives the exclusive right to collect, whether individually or via a music rights agency or designated agent (e.g. Harry Fox Agency), royalties for any phonorecord You create from the Work ("cover version") and distribute, subject to the compulsory license created by 17 USC Section 115 of the US Copyright Act (or the equivalent in other jurisdictions).

f. Webcasting Rights and Statutory Royalties. For the avoidance of doubt, where the Work is a sound recording, Licensor waives the exclusive right to collect, whether individually or via a performance rights society (e.g. SoundExchange), royalties for the public digital performance (e.g. webcast) of the Work, subject to the compulsory license created by 17 USC Section 114 of the US Copyright Act (or the equivalent in other jurisdictions).

The above rights may be exercised in all media and formats whether now known or hereafter devised. The above rights include the right to make such modifications as are technically necessary to exercise the rights in other media and formats. All rights not expressly granted by Licensor are hereby reserved.

4. Restrictions. The license granted in Section 3 above is expressly made subject to and limited by the following restrictions:

a. You may distribute, publicly display, publicly perform, or publicly digitally perform the Work only under the terms of this License, and You must include a copy of, or the Uniform Resource Identifier for, this License with every copy or phonorecord of the Work You distribute, publicly display, publicly perform, or publicly digitally perform. You may not offer or impose any terms on the Work that alter or restrict the terms of this License or the recipients' exercise of the rights granted hereunder. You may not sublicense the Work. You must keep intact all notices that refer to this License and to the disclaimer of warranties. You may not distribute, publicly display, publicly perform, or publicly digitally perform the Work with any technological measures that control access or use of the Work in a manner inconsistent with the terms of this License Agreement. The above applies to the Work as incorporated in a Collective Work, but this does not require the Collective Work apart from the Work itself to be made subject to the terms of this License. If You create a Collective Work, upon notice from any Licensor You must, to the extent practicable, remove from the Collective Work any reference to such Licensor or the Original Author, as requested. If You create a Derivative Work, upon notice from any Licensor You must, to the extent practicable, remove from the Derivative Work any reference to such Licensor or the Original Author, as requested.

b. If you distribute, publicly display, publicly perform, or publicly digitally perform the Work or any Derivative Works or Collective Works, You must keep intact all copyright notices for the Work and give the Original Author credit reasonable to the medium or means You are utilizing by conveying the name (or pseudonym if applicable) of the Original Author if supplied; the title of the Work if supplied; to the extent reasonably practicable, the Uniform Resource Identifier, if any, that Licensor specifies to be associated with the Work, unless such URI does not refer to the copyright notice or licensing information for the Work; and in the case of a Derivative Work, a credit identifying the use of the Work in the Derivative Work (e.g., "French translation of the Work by Original Author," or "Screenplay based on original Work by Original Author"). Such credit may be implemented in any reasonable manner; provided, however, that in the case of a Derivative Work or Collective Work, at a minimum such credit will appear where any other comparable authorship credit appears and in a manner at least as prominent as such other comparable authorship credit.
UNLESS OTHERWISE MUTUALLY AGREED TO BY THE PARTIES IN WRITING, LICENSOR OFFERS THE WORK AS-IS AND MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND CONCERNING THE WORK, EXPRESS, IMPLIED, STATUTORY OR OTHERWISE, INCLUDING, WITHOUT LIMITATION, WARRANTIES OF TITLE, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, NONINFRINGEMENT, OR THE ABSENCE OF LATENT OR OTHER DEFECTS, ACCURACY, OR THE PRESENCE OF ABSENCE OF ERRORS, WHETHER OR NOT DISCOVERABLE. SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES, SO SUCH EXCLUSION MAY NOT APPLY TO YOU.

6. Limitation on Liability. EXCEPT TO THE EXTENT REQUIRED BY APPLICABLE LAW, IN NO EVENT WILL LICENSOR BE LIABLE TO YOU ON ANY LEGAL THEORY FOR ANY SPECIAL, INCIDENTAL, CONSEQUENTIAL, PUNITIVE OR EXEMPLARY DAMAGES ARISING OUT OF THIS LICENSE OR THE USE OF THE WORK, EVEN IF LICENSOR HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7. Termination

a. This License and the rights granted hereunder will terminate automatically upon any breach by You of the terms of this License. Individuals or entities who have received Derivative Works or Collective Works from You under this License, however, will not have their licenses terminated provided such individuals or entities remain in full compliance with those licenses. Sections 1, 2, 5, 6, 7, and 8 will survive any termination of this License.

b. Subject to the above terms and conditions, the license granted here is perpetual (for the duration of the applicable copyright in the Work). Notwithstanding the above, Licensor reserves the right to release the Work under different license terms or to stop distributing the Work at any time; provided, however that any such election will not serve to withdraw this License (or any other license that has been, or is required to be, granted under the terms of this License), and this License will continue in full force and effect unless terminated as stated above.

8. Miscellaneous

a. Each time You distribute or publicly digitally perform the Work or a Collective Work, the Licensor offers to the recipient a license to the Work on the same terms and conditions as the license granted to You under this License.

b. Each time You distribute or publicly digitally perform a Derivative Work, Licensor offers to the recipient a license to the original Work on the same terms and conditions as the license granted to You under this License.

c. If any provision of this License is invalid or unenforceable under applicable law, it shall not affect the validity or enforceability of the remainder of the terms of this License, and without further action by the parties to this agreement, such provision shall be reformed to the minimum extent necessary to make such provision valid and enforceable.

d. No term or provision of this License shall be deemed waived and no breach consented to unless such waiver or consent shall be in writing and signed by the party to be charged with such waiver or consent.

e. This License constitutes the entire agreement between the parties with respect to the Work licensed here. There are no understandings, agreements or representations with respect to the Work not specified here. Licensor shall not be bound by any additional provisions that may appear in any communication from You. This License may not be modified without the mutual written agreement of the Licensor and You.

License

THE WORK (AS DEFINED BELOW) IS PROVIDED UNDER THE TERMS OF THIS CREATIVE COMMONS PUBLIC LICENSE ("CCPL" OR "LICENSE"). THE WORK IS PROTECTED BY COPYRIGHT AND/OR OTHER APPLICABLE LAW. ANY USE OF THE WORK OTHER THAN AS AUTHORIZED UNDER THIS LICENSE OR COPYRIGHT LAW IS PROHIBITED.

BY EXERCISING ANY RIGHTS TO THE WORK PROVIDED HERE, YOU ACCEPT AND AGREE TO BE BOUND BY THE TERMS OF THIS LICENSE. TO THE EXTENT THIS LICENSE MAY BE CONSIDERED TO BE A CONTRACT, THE LICENSOR GRANTS YOU THE RIGHTS CONTAINED HERE IN CONSIDERATION OF YOUR ACCEPTANCE OF SUCH TERMS AND CONDITIONS.

1. Definitions

"Adaptation" means a work based upon the Work, or upon the Work and other pre-existing works, such as a translation, adaptation, derivative work, arrangement of music or other alterations of a literary or artistic work, or phonogram or performance and includes cinematographic adaptations or any other form in which the Work may be recast, transformed, or adapted including in any form recognizably derived from the original, except that a work that constitutes a Collection will not be considered an Adaptation for the purpose of this License. For the avoidance of doubt, where the Work is a musical work, performance or phonogram, the synchronization of the Work in timed-relation with a moving image ("synching") will be considered an Adaptation for the purpose of this License.

"Collection" means a collection of literary or artistic works, such as encyclopedias and anthologies, or performances, phonograms or broadcasts, or other works or subject matter other than works listed in Section 1(f) below, which, by reason of the selection and arrangement of their contents, constitute intellectual creations, in which the Work is included in its entirety in unmodified form along with one or more other contributions, each constituting separate and independent works in themselves, which together are assembled into a collective whole. A work that constitutes a Collection will not be considered an Adaptation (as defined above) for the purposes of this License.

"Distribute" means to make available to the public the original and copies of the Work or Adaptation, as appropriate, through sale or other transfer of ownership.

"Licensor" means the individual, individuals, entity or entities that offer(s) the Work under the terms of this License.

"Original Author" means, in the case of a literary or artistic work, the individual, individuals, entity or entities who created the Work or if no individual or entity can be identified, the publisher; and in addition (i) in the case of a performance the actors, singers, musicians, dancers, and other persons who act, sing, deliver, declaim, play in, interpret or otherwise perform literary or artistic works or expressions of folklore; (ii) in the case of a phonogram the producer being the person or legal entity who first fixes the sounds of a performance or other sounds; and, (iii) in the case of broadcasts, the organization that transmits the broadcast.

"Work" means the literary and/or artistic work offered under the terms of this License including without limitation any production in the literary, scientific and artistic domain, whatever may be the mode or form of its expression including digital form, such as a book, pamphlet and other writing; a lecture, address, sermon or other work of the same nature; a dramatic or dramatico-musical work; a choreographic work or entertainment in dumb show; a musical composition with or without words; a cinematographic work to which are assimilated works expressed by a process analogous to cinematography; a work of drawing, painting, architecture, sculpture, engraving or lithography; a photographic work to which are assimilated works expressed by a process analogous to photography; a work of applied art; an illustration, map, plan, sketch or three-dimensional work relative to geography, topography, architecture or science; a performance; a broadcast; a phonogram; a compilation of data to the extent it is protected as a copyrightable work; or a work performed by a variety or circus performer to the extent it is not otherwise considered a literary or artistic work.
"You" means an individual or entity exercising rights under this License who has not previously violated the terms of this License with respect to the Work, or who has received express permission from the Licensor to exercise rights under this License despite a previous violation.

"Publicly Perform" means to perform public recitations of the Work and to communicate to the public those public recitations, by any means or process, including by wire or wireless means or public digital performances; to make available to the public Works in such a way that members of the public may access these Works from a place and at a place individually chosen by them; to perform the Work to the public by any means or process and the communication to the public of the performances of the Work, including by public digital performance; to broadcast and rebroadcast the Work by any means including signs, sounds or images.

"Reproduce" means to make copies of the Work by any means including without limitation by sound or visual recordings and the right of fixation and reproducing fixations of the Work, including storage of a protected performance or phonogram in digital form or other electronic medium.

2. Fair Dealing Rights. Nothing in this License is intended to reduce, limit, or restrict any uses free from copyright or rights arising from limitations or exceptions that are provided for in connection with the copyright protection under copyright law or other applicable laws.

3. License Grant. Subject to the terms and conditions of this License, Licensor hereby grants You a worldwide, royalty-free, non-exclusive, perpetual (for the duration of the applicable copyright) license to exercise the rights in the Work as stated below:

- to Reproduce the Work, to incorporate the Work into one or more Collections, and to Reproduce the Work as incorporated in the Collections;
- to create and Reproduce Adaptations provided that any such Adaptation, including any translation in any medium, takes reasonable steps to clearly label, demarcate or otherwise identify that changes were made to the original Work. For example, a translation could be marked "The original work was translated from English to Spanish," or a modification could indicate "The original work has been modified.;
- to Distribute and Publicly Perform the Work including as incorporated in Collections; and,
- to Distribute and Publicly Perform Adaptations.

For the avoidance of doubt:

- Non-waivable Compulsory License Schemes. In those jurisdictions in which the right to collect royalties through any statutory or compulsory licensing scheme cannot be waived, the Licensor reserves the exclusive right to collect such royalties for any exercise by You of the rights granted under this License;
- Waivable Compulsory License Schemes. In those jurisdictions in which the right to collect royalties through any statutory or compulsory licensing scheme can be waived, the Licensor waives the exclusive right to collect such royalties for any exercise by You of the rights granted under this License; and,
- Voluntary License Schemes. The Licensor waives the right to collect royalties, whether individually or, in the event that the Licensor is a member of a collecting society that administers voluntary licensing schemes, via that society, from any exercise by You of the rights granted under this License.

The above rights may be exercised in all media and formats whether now known or hereafter devised. The above rights include the right to make such modifications as are technically necessary to exercise the rights in other media and formats. Subject to Section 8(f), all rights not expressly granted by Licensor are hereby reserved.

4. Restrictions. The license granted in Section 3 above is expressly made subject to and limited by the following restrictions:

You may Distribute or Publicly Perform the Work only under the terms of this License. You must include a copy of, or the Uniform Resource Identifier (URI) for, this License with every copy of the Work You Distribute or Publicly Perform. You may not offer or impose any terms on the Work that restrict the
terms of this License or the ability of the recipient of the Work to exercise the rights granted to that recipient under the terms of the License. You may not sublicense the Work. You must keep intact all notices that refer to this License and to the disclaimer of warranties with every copy of the Work You Distribute or Publicly Perform. When You Distribute or Publicly Perform the Work, You may not impose any effective technological measures on the Work that restrict the ability of a recipient of the Work from You to exercise the rights granted to that recipient under the terms of the License. This Section 4(a) applies to the Work as incorporated in a Collection, but this does not require the Collection apart from the Work itself to be made subject to the terms of this License. If You create a Collection, upon notice from any Licensor You must, to the extent practicable, remove from the Collection any credit as required by Section 4(b), as requested. If You create an Adaptation, upon notice from any Licensor You must, to the extent practicable, remove from the Adaptation any credit as required by Section 4(b), as requested.

If You Distribute, or Publicly Perform the Work or any Adaptations or Collections, You must, unless a request has been made pursuant to Section 4(a), keep intact all copyright notices for the Work and provide, reasonable to the medium or means You are utilizing: (i) the name of the Original Author (or pseudonym, if applicable) if supplied, and/or if the Original Author and/or Licensor designate another party or parties (e.g., a sponsor institute, publishing entity, journal) for attribution ("Attribution Parties") in Licensor's copyright notice, terms of service or by other reasonable means, the name of such party or parties; (ii) the title of the Work if supplied; (iii) to the extent reasonably practicable, the URI, if any, that Licensor specifies to be associated with the Work, unless such URI does not refer to the copyright notice or licensing information for the Work; and (iv) , consistent with Section 3(b), in the case of an Adaptation, a credit identifying the use of the Work in the Adaptation (e.g., "French translation of the Work by Original Author," or "Screenplay based on original Work by Original Author"). The credit required by this Section 4(b) may be implemented in any reasonable manner; provided, however, that in the case of a Adaptation or Collection, at a minimum such credit will appear, if a credit for all contributing authors of the Adaptation or Collection appears, then as part of these credits and in a manner at least as prominent as the credits for the other contributing authors. For the avoidance of doubt, You may only use the credit required by this Section for the purpose of attribution in the manner set out above and, by exercising Your rights under this License, You may not implicitly or explicitly assert or imply any connection with, sponsorship or endorsement by the Original Author, Licensor and/or Attribution Parties, as appropriate, of You or Your use of the Work, without the separate, express prior written permission of the Original Author, Licensor and/or Attribution Parties.

Except as otherwise agreed in writing by the Licensor or as may be otherwise permitted by applicable law, if You Reproduce, Distribute or Publicly Perform the Work either by itself or as part of any Adaptations or Collections, You must not distort, mutilate, modify or take other derogatory action in relation to the Work which would be prejudicial to the Original Author's honor or reputation. Licensor agrees that in those jurisdictions (e.g. Japan), in which any exercise of the right granted in Section 3(b) of this License (the right to make Adaptations) would be deemed to be a distortion, mutilation, modification or other derogatory action prejudicial to the Original Author's honor and reputation, the Licensor will waive or not assert, as appropriate, this Section, to the fullest extent permitted by the applicable national law, to enable You to reasonably exercise Your right under Section 3(b) of this License (right to make Adaptations) but not otherwise.

5. Representations, Warranties and Disclaimer

UNLESS OTHERWISE MUTUALLY AGREED TO BY THE PARTIES IN WRITING, LICENSOR OFFERS THE WORK AS-IS AND MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND CONCERNING THE WORK, EXPRESS, IMPLIED, STATUTORY OR OTHERWISE, INCLUDING, WITHOUT LIMITATION, WARRANTIES OF TITLE, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, NONINFRINGEMENT, OR THE ABSENCE OF LATENT OR OTHER DEFECTS, ACCURACY, OR THE PRESENCE OF ABSENCE OF ERRORS, WHETHER OR NOT DISCOVERABLE. SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES, SO SUCH EXCLUSION MAY NOT APPLY TO YOU.

6. Limitation on Liability. EXCEPT TO THE EXTENT REQUIRED BY APPLICABLE LAW, IN NO EVENT WILL LICENSOR BE LIABLE TO YOU ON ANY LEGAL THEORY FOR ANY SPECIAL, INCIDENTAL, CONSEQUENTIAL, PUNITIVE OR EXEMPLARY DAMAGES ARISING OUT OF THIS LICENSE OR THE USE OF THE WORK, EVEN IF LICENSOR HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.
7. Termination

This License and the rights granted hereunder will terminate automatically upon any breach by You of the terms of this License. Individuals or entities who have received Adaptations or Collections from You under this License, however, will not have their licenses terminated provided such individuals or entities remain in full compliance with those licenses. Sections 1, 2, 5, 6, 7, and 8 will survive any termination of this License.

Subject to the above terms and conditions, the license granted here is perpetual (for the duration of the applicable copyright in the Work). Notwithstanding the above, Licensor reserves the right to release the Work under different license terms or to stop distributing the Work at any time; provided, however that any such election will not serve to withdraw this License (or any other license that has been, or is required to be, granted under the terms of this License), and this License will continue in full force and effect unless terminated as stated above.

8. Miscellaneous

Each time You Distribute or Publicly Perform the Work or a Collection, the Licensor offers to the recipient a license to the Work on the same terms and conditions as the license granted to You under this License.

Each time You Distribute or Publicly Perform an Adaptation, Licensor offers to the recipient a license to the original Work on the same terms and conditions as the license granted to You under this License.

If any provision of this License is invalid or unenforceable under applicable law, it shall not affect the validity or enforceability of the remainder of the terms of this License, and without further action by the parties to this agreement, such provision shall be reformed to the minimum extent necessary to make such provision valid and enforceable.

No term or provision of this License shall be deemed waived and no breach consented to unless such waiver or consent shall be in writing and signed by the party to be charged with such waiver or consent.

This License constitutes the entire agreement between the parties with respect to the Work licensed here. There are no understandings, agreements or representations with respect to the Work not specified here. Licensor shall not be bound by any additional provisions that may appear in any communication from You. This License may not be modified without the mutual written agreement of the Licensor and You.

The rights granted under, and the subject matter referenced, in this License were drafted utilizing the terminology of the Berne Convention for the Protection of Literary and Artistic Works (as amended on September 28, 1979), the Rome Convention of 1961, the WIPO Copyright Treaty of 1996, the WIPO Performances and Phonograms Treaty of 1996 and the Universal Copyright Convention (as revised on July 24, 1971). These rights and subject matter take effect in the relevant jurisdiction in which the License terms are sought to be enforced according to the corresponding provisions of the implementation of those treaty provisions in the applicable national law. If the standard suite of rights granted under applicable copyright law includes additional rights not granted under this License, such additional rights are deemed to be included in the License; this License is not intended to restrict the license of any rights under applicable law.

Creative Commons Attribution 4.0 International Public License

By exercising the Licensed Rights (defined below), You accept and agree to be bound by the terms and conditions of this Creative Commons Attribution 4.0 International Public License ("Public License"). To the extent this Public License may be interpreted as a contract, You are granted the Licensed Rights in consideration of Your acceptance of these terms and conditions, and the Licensor grants You such rights in consideration of benefits the Licensor receives from making the Licensed Material available under these terms and conditions.

Section 1 – Definitions.

a. Adapted Material means material subject to Copyright and Similar Rights that is derived from or based upon the Licensed Material and in which the Licensed Material is translated, altered, arranged, transformed, or otherwise modified in a manner requiring permission under the Copyright and Similar Rights held by the Licensor. For purposes of this Public License, where the Licensed Material is a musical work, performance, or sound recording, Adapted Material is always produced where the Licensed Material is synched in timed relation with a moving image.

b. Adapter's License means the license You apply to Your Copyright and Similar Rights in Your contributions to Adapted Material in accordance with the terms and conditions of this Public License.

c. Copyright and Similar Rights means copyright and/or similar rights closely related to copyright including, without limitation, performance, broadcast, sound recording, and Sui Generis Database Rights, without regard to how the rights are labeled or categorized. For purposes of this Public License, the rights specified in Section 2(b)(1)-(2) are not Copyright and Similar Rights.

d. Effective Technological Measures means those measures that, in the absence of proper authority, may not be circumvented under laws fulfilling obligations under Article 11 of the WIPO Copyright Treaty adopted on December 20, 1996, and/or similar international agreements.

e. Exceptions and Limitations means fair use, fair dealing, and/or any other exception or limitation to Copyright and Similar Rights that applies to Your use of the Licensed Material.

f. Licensed Material means the artistic or literary work, database, or other material to which the Licensor applied this Public License.

g. Licensed Rights means the rights granted to You subject to the terms and conditions of this Public License, which are limited to all Copyright and Similar Rights that apply to Your use of the Licensed Material and that the Licensor has authority to license.

h. Licensor means the individual(s) or entity(ies) granting rights under this Public License.

i. Share means to provide material to the public by any means or process that requires permission under the Licensed Rights, such as reproduction, public display, public performance, distribution, dissemination, communication, or importation, and to make material available to the public including in ways that members of the public may access the material from a place and at a time individually chosen by them.

j. Sui Generis Database Rights means rights other than copyright resulting from Directive 96/9/EC of the European Parliament and of the Council of 11 March 1996 on the legal protection of databases, as amended and/or succeeded, as well as other essentially equivalent rights anywhere in the world.

k. You means the individual or entity exercising the Licensed Rights under this Public License. Your has a corresponding meaning.

Section 2 – Scope.

a. License grant.
1. Subject to the terms and conditions of this Public License, the Licensor hereby grants You a worldwide, royalty-free, non-sublicensable, non-exclusive, irrevocable license to exercise the Licensed Rights in the Licensed Material to:

A. reproduce and Share the Licensed Material, in whole or in part; and

B. produce, reproduce, and Share Adapted Material.

2. Exceptions and Limitations. For the avoidance of doubt, where Exceptions and Limitations apply to Your use, this Public License does not apply, and You do not need to comply with its terms and conditions.

3. Term. The term of this Public License is specified in Section 6(a).

4. Media and formats; technical modifications allowed. The Licensor authorizes You to exercise the Licensed Rights in all media and formats whether now known or hereafter created, and to make technical modifications necessary to do so. The Licensor waives and/or agrees not to assert any right or authority to forbid You from making technical modifications necessary to exercise the Licensed Rights, including technical modifications necessary to circumvent Effective Technological Measures. For purposes of this Public License, simply making modifications authorized by this Section 2(a)(4) never produces Adapted Material.

5. Downstream recipients.

A. Offer from the Licensor – Licensed Material. Every recipient of the Licensed Material automatically receives an offer from the Licensor to exercise the Licensed Rights under the terms and conditions of this Public License.

B. No downstream restrictions. You may not offer or impose any additional or different terms or conditions on, or apply any Effective Technological Measures to, the Licensed Material if doing so restricts exercise of the Licensed Rights by any recipient of the Licensed Material.

6. No endorsement. Nothing in this Public License constitutes or may be construed as permission to assert or imply that You are, or that Your use of the Licensed Material is, connected with, or sponsored, endorsed, or granted official status by, the Licensor or others designated to receive attribution as provided in Section 3(a)(1)(A)(i).

b. Other rights.

1. Moral rights, such as the right of integrity, are not licensed under this Public License, nor are publicity, privacy, and/or other similar personality rights; however, to the extent possible, the Licensor waives and/or agrees not to assert any such rights held by the Licensor to the limited extent necessary to allow You to exercise the Licensed Rights, but not otherwise.

2. Patent and trademark rights are not licensed under this Public License.

3. To the extent possible, the Licensor waives any right to collect royalties from You for the exercise of the Licensed Rights, whether directly or through a collecting society under any voluntary or waivable statutory or compulsory licensing scheme. In all other cases the Licensor expressly reserves any right to collect such royalties.

Section 3 – License Conditions.

Your exercise of the Licensed Rights is expressly made subject to the following conditions.

a. Attribution.

1. If You Share the Licensed Material (including in modified form), You must:

A. retain the following if it is supplied by the Licensor with the Licensed Material:
i. identification of the creator(s) of the Licensed Material and any others designated to receive attribution, in any reasonable manner requested by the Licensor (including by pseudonym if designated);

ii. a copyright notice;

iii. a notice that refers to this Public License;

iv. a notice that refers to the disclaimer of warranties;

v. a URI or hyperlink to the Licensed Material to the extent reasonably practicable;

B. indicate if You modified the Licensed Material and retain an indication of any previous modifications; and

C. indicate the Licensed Material is licensed under this Public License, and include the text of, or the URI or hyperlink to, this Public License.

2. You may satisfy the conditions in Section 3(a)(1) in any reasonable manner based on the medium, means, and context in which You Share the Licensed Material. For example, it may be reasonable to satisfy the conditions by providing a URI or hyperlink to a resource that includes the required information.

3. If requested by the Licensor, You must remove any of the information required by Section 3(a)(1)(A) to the extent reasonably practicable.

4. If You Share Adapted Material You produce, the Adapter's License You apply must not prevent recipients of the Adapted Material from complying with this Public License.

Section 4 – Sui Generis Database Rights.

Where the Licensed Rights include Sui Generis Database Rights that apply to Your use of the Licensed Material:

a. for the avoidance of doubt, Section 2(a)(1) grants You the right to extract, reuse, reproduce, and Share all or a substantial portion of the contents of the database;

b. if You include all or a substantial portion of the database contents in a database in which You have Sui Generis Database Rights, then the database in which You have Sui Generis Database Rights (but not its individual contents) is Adapted Material; and

c. You must comply with the conditions in Section 3(a) if You Share all or a substantial portion of the contents of the database.

For the avoidance of doubt, this Section 4 supplements and does not replace Your obligations under this Public License where the Licensed Rights include other Copyright and Similar Rights.

Section 5 – Disclaimer of Warranties and Limitation of Liability.

a. Unless otherwise separately undertaken by the Licensor, to the extent possible, the Licensor offers the Licensed Material as-is and as-available, and makes no representations or warranties of any kind concerning the Licensed Material, whether express, implied, statutory, or other. This includes, without limitation, warranties of title, merchantability, fitness for a particular purpose, non-infringement, absence of latent or other defects, accuracy, or the presence or absence of errors, whether or not known or discoverable. Where disclaimers of warranties are not allowed in full or in part, this disclaimer may not apply to You.

b. To the extent possible, in no event will the Licensor be liable to You on any legal theory (including, without limitation, negligence) or otherwise for any direct, special, indirect, incidental, consequential, punitive, exemplary, or other losses, costs, expenses, or damages arising out of this Public License or use of the Licensed Material, even if the Licensor has been advised of the possibility of such losses, costs,
expenses, or damages. Where a limitation of liability is not allowed in full or in part, this limitation may
not apply to You.

c. The disclaimer of warranties and limitation of liability provided above shall be interpreted in a manner
that, to the extent possible, most closely approximates an absolute disclaimer and waiver of all liability.

Section 6 – Term and Termination.

a. This Public License applies for the term of the Copyright and Similar Rights licensed here. However,
if You fail to comply with this Public License, then Your rights under this Public License terminate
automatically.

b. Where Your right to use the Licensed Material has terminated under Section 6(a), it reinstates:

1. automatically as of the date the violation is cured, provided it is cured within 30 days of Your discovery
of the violation; or

2. upon express reinstatement by the Licensor.

For the avoidance of doubt, this Section 6(b) does not affect any right the Licensor may have to seek
remedies for Your violations of this Public License.

c. For the avoidance of doubt, the Licensor may also offer the Licensed Material under separate terms or
conditions or stop distributing the Licensed Material at any time; however, doing so will not terminate
this Public License.

d. Sections 1, 5, 6, 7, and 8 survive termination of this Public License.

Section 7 – Other Terms and Conditions.

a. The Licensor shall not be bound by any additional or different terms or conditions communicated by
You unless expressly agreed.

b. Any arrangements, understandings, or agreements regarding the Licensed Material not stated herein
are separate from and independent of the terms and conditions of this Public License.

Section 8 – Interpretation.

a. For the avoidance of doubt, this Public License does not, and shall not be interpreted to, reduce, limit,
restrict, or impose conditions on any use of the Licensed Material that could lawfully be made without
permission under this Public License.

b. To the extent possible, if any provision of this Public License is deemed unenforceable, it shall be
automatically reformed to the minimum extent necessary to make it enforceable. If the provision cannot
be reformed, it shall be severed from this Public License without affecting the enforceability of the
remaining terms and conditions.

c. No term or condition of this Public License will be waived and no failure to comply consented to unless
expressly agreed to by the Licensor.

d. Nothing in this Public License constitutes or may be interpreted as a limitation upon, or waiver of, any
privileges and immunities that apply to the Licensor or You, including from the legal processes of any
jurisdiction or authority.

All rights reserved.

Microsoft Public License (Ms-PL)

This license governs use of the accompanying software. If you use the software, you accept this license. If
you do not accept the license, do not use the software.

1. Definitions

The terms "reproduce," "reproduction," "derivative works," and "distribution" have the same meaning here
as under U.S. copyright law.

A "contribution" is the original software, or any additions or changes to the software.

A "contributor" is any person that distributes its contribution under this license.

"Licensed patents" are a contributor's patent claims that read directly on its contribution.
2. Grant of Rights

(A) Copyright Grant- Subject to the terms of this license, including the license conditions and limitations in section 3, each contributor grants you a non-exclusive, worldwide, royalty-free copyright license to reproduce its contribution, prepare derivative works of its contribution, and distribute its contribution or any derivative works that you create.

(B) Patent Grant- Subject to the terms of this license, including the license conditions and limitations in section 3, each contributor grants you a non-exclusive, worldwide, royalty-free license under its licensed patents to make, have made, use, sell, offer for sale, import, and/or otherwise dispose of its contribution in the software or derivative works of the contribution in the software.

3. Conditions and Limitations

(A) No Trademark License- This license does not grant you rights to use any contributors' name, logo, or trademarks.

(B) If you bring a patent claim against any contributor over patents that you claim are infringed by the software, your patent license from such contributor to the software ends automatically.

(C) If you distribute any portion of the software, you must retain all copyright, patent, trademark, and attribution notices that are present in the software.

(D) If you distribute any portion of the software in source code form, you may do so only under this license by including a complete copy of this license with your distribution. If you distribute any portion of the software in compiled or object code form, you may only do so under a license that complies with this license.

(E) The software is licensed "as-is." You bear the risk of using it. The contributors give no express warranties, guarantees or conditions. You may have additional consumer rights under your local laws which this license cannot change. To the extent permitted under your local laws, the contributors exclude the implied warranties of merchantability, fitness for a particular purpose and non-infringement.
