    testset=torchvision.datasets.CIFAR10(root=data_dir, train=False,
                                          download=True, transform=transform)
    return torch.utils.data.DataLoader(testset, batch_size=4,
                                         shuffle=False, num_workers=2)

trainloader=get_train_data_loader('/tmp/pytorch-example/cifar-10-data')
testloader=get_test_data_loader('/tmp/pytorch-example/cifar-10-data')

3. Set role to the role used to create your Jupyter notebook. This is used to configure your SageMaker Estimator.

    from sagemaker import get_execution_role
    role=get_execution_role()

4. Paste the following example script into the notebook code cell to configure a SageMaker Estimator using your extended container.

    from sagemaker.estimator import Estimator
    hyperparameters={'epochs': 1}
    estimator=Estimator(
        image_uri='pytorch-extended-container-test',
        role=role,
        instance_count=1,
        instance_type='local',
        hyperparameters=hyperparameters
    )
    estimator.fit('file:///tmp/pytorch-example/cifar-10-data')

5. Run the code cell. This test outputs the training environment configuration, the values used for the environmental variables, the source of the data, and the loss and accuracy obtained during training.

**Step 5: Push the Container to Amazon Elastic Container Registry (Amazon ECR)**

1. After you successfully run the local mode test, you can push the Docker container to Amazon ECR and use it to run training jobs.

    Run the following command lines in a notebook cell.
%%sh

# Specify an algorithm name
algorithm_name=pytorch-extended-container-test

account=$(aws sts get-caller-identity --query Account --output text)

# Get the region defined in the current configuration (default to us-west-2 if none defined)
region=$(aws configure get region)

fullname="${account}.dkr.ecr.${region}.amazonaws.com/${algorithm_name}:latest"

# If the repository doesn't exist in ECR, create it.
aws ecr describe-repositories --repository-names "${algorithm_name}" > /dev/null 2>&1
if [ $? -ne 0 ];
then
    aws ecr create-repository --repository-name ${algorithm_name} > /dev/null
fi

# Log into Docker
aws ecr get-login-password --region ${region}|docker login --username AWS --password-stdin ${fullname}

# Build the docker image locally with the image name and then push it to ECR with the full name.
docker build -t ${algorithm_name} .
docker tag ${algorithm_name} ${fullname}
docker push ${fullname}

2. After you push the container, you can call the Amazon ECR image from anywhere in the SageMaker environment. Run the following code example in the next notebook cell.

If you want to use this training container with SageMaker Studio to use its visualization features, you can also run the following code in a Studio notebook cell to call the Amazon ECR image of your training container.

```python
import boto3

client=boto3.client('sts')
account=client.get_caller_identity()['Account']

my_session=boto3.session.Session()
region=my_session.region_name

algorithm_name="pytorch-extended-container-test"
ecr_image='{}.dkr.ecr.{}.amazonaws.com/{}:latest'.format(account, region, algorithm_name)

ecr_image
# This should return something like
# 12-digits-of-your-account.dkr.ecr.us-east-2.amazonaws.com/tf-2.2-test:latest
```

3. Use the `ecr_image` retrieved from the previous step to configure a SageMaker estimator object. The following code sample configures a SageMaker PyTorch estimator.

```python
import sagemaker

from sagemaker import get_execution_role
```
from sagemaker.estimator import Estimator

estimator=Estimator(
    image_uri=ecr_image,
    role=get_execution_role(),
    base_job_name='pytorch-extended-container-test',
    instance_count=1,
    instance_type='ml.p2.xlarge'
)

# start training
estimator.fit()

# deploy the trained model
predictor=estimator.deploy(1, instance_type)

Step 6: Clean up Resources

To clean up resources when done with the Get Started example

1. Open the SageMaker console, choose the notebook instance RunScriptNotebookInstance, choose Actions, and choose Stop. It can take a few minutes for the instance to stop.

2. After the instance Status changes to Stopped, choose Actions, choose Delete, and then choose Delete in the dialog box. It can take a few minutes for the instance to be deleted. The notebook instance disappears from the table when it has been deleted.

3. Open the Amazon S3 console and delete the bucket that you created for storing model artifacts and the training dataset.

4. Open the IAM console and delete the IAM role. If you created permission policies, you can delete them, too.

    Note
    The Docker container shuts down automatically after it has run. You don't need to delete it.

Adapting Your Own Docker Container to Work with SageMaker

You can adapt an existing Docker image to work with SageMaker. You may need to use an existing, external Docker image with SageMaker when you have a container that satisfies feature or safety requirements that are not currently supported by a prebuilt SageMaker image. There are two toolkits that allow you to bring your own container and adapt it to work with SageMaker:

- SageMaker Training Toolkit
- SageMaker Inference Toolkit

The following topics show how to adapt your existing image using the SageMaker Training and Inference toolkits:

Topics

- Individual Framework Libraries (p. 3015)
- Using the SageMaker Training and Inference Toolkits (p. 3015)
- Adapting Your Own Training Container (p. 3016)
- Adapting Your Own Inference Container (p. 3027)
Individual Framework Libraries

In addition to the SageMaker Training Toolkit and SageMaker Inference Toolkit, SageMaker also provides toolkits specialized for TensorFlow, MXNet, PyTorch, and Chainer. The following table provides links to the GitHub repositories that contain the source code for each framework and their respective serving toolkits. The instructions linked are for using the Python SDK to run training algorithms and host models on SageMaker. The functionality for these individual libraries is included in the SageMaker Training Toolkit and SageMaker Inference Toolkit.

<table>
<thead>
<tr>
<th>Framework</th>
<th>Toolkit Source Code</th>
</tr>
</thead>
<tbody>

<tr>
<td>Chainer</td>
<td>SageMaker Chainer SageMaker Containers</td>
</tr>
</tbody>
</table>

Using the SageMaker Training and Inference Toolkits

The SageMaker Training and SageMaker Inference toolkits implement the functionality that you need to adapt your containers to run scripts, train algorithms, and deploy models on SageMaker. When installed, the library defines the following for users:

- The locations for storing code and other resources.
- The entry point that contains the code to run when the container is started. Your Dockerfile must copy the code that needs to be run into the location expected by a container that is compatible with SageMaker.
- Other information that a container needs to manage deployments for training and inference.

SageMaker Toolkits Containers Structure

When SageMaker trains a model, it creates the following file folder structure in the container’s /opt/ml directory.

```
/opt/ml
### input
#   ### config
#   #   ### hyperparameters.json
#   #   ### resourceConfig.json
#   ### data
#   #   ### <channel_name>
#          ### <input data>
### model
#   ### code
#   ### output
```
When you run a model training job, the SageMaker container uses the /opt/ml/input/ directory, which contains the JSON files that configure the hyperparameters for the algorithm and the network layout used for distributed training. The /opt/ml/input/ directory also contains files that specify the channels through which SageMaker accesses the data, which is stored in Amazon Simple Storage Service (Amazon S3). The SageMaker containers library places the scripts that the container will run in the /opt/ml/code/ directory. Your script should write the model generated by your algorithm to the /opt/ml/model/ directory. For more information, see Use Your Own Training Algorithms (p. 3030).

When you host a trained model on SageMaker to make inferences, you deploy the model to an HTTP endpoint. The model makes real-time predictions in response to inference requests. The container must contain a serving stack to process these requests.

In a hosting or batch transform container, the model files are located in the same folder to which they were written during training.

```
/opt/ml/model
```

For more information, see Use Your Own Inference Code (p. 3037).

### Single Versus Multiple Containers

You can either provide separate Docker images for the training algorithm and inference code or you can use a single Docker image for both. When creating Docker images for use with SageMaker, consider the following:

- Providing two Docker images can increase storage requirements and cost because common libraries might be duplicated.
- In general, smaller containers start faster for both training and hosting. Models train faster and the hosting service can react to increases in traffic by automatically scaling more quickly.
- You might be able to write an inference container that is significantly smaller than the training container. This is especially common when you use GPUs for training, but your inference code is optimized for CPUs.
- SageMaker requires that Docker containers run without privileged access.
- Both Docker containers that you build and those provided by SageMaker can send messages to the Stdout and Stderr files. SageMaker sends these messages to Amazon CloudWatch logs in your AWS account.

For more information about how to create SageMaker containers and how scripts are executed inside them, see the SageMaker Training Toolkit and SageMaker Inference Toolkit repositories on GitHub. They also provide lists of important environmental variables and the environmental variables provided by SageMaker containers.

### Adapting Your Own Training Container

To run your own training model, build a Docker container using the Amazon SageMaker Training Toolkit through an Amazon SageMaker notebook instance.

#### Step 1: Create a SageMaker notebook instance

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the left navigation pane, choose Notebook, choose Notebook instances, and then choose Create notebook instance.

3. On the Create notebook instance page, provide the following information:
   a. For Notebook instance name, enter RunScriptNotebookInstance.
   b. For Notebook Instance type, choose ml.t2.medium.
   c. In the Permissions and encryption section, do the following:
      i. For IAM role, choose Create a new role.
      ii. On the Create an IAM role page, choose Specific S3 buckets, specify an Amazon S3 bucket named sagemaker-run-script, and then choose Create role.

      SageMaker creates an IAM role named AmazonSageMaker-ExecutionRole-YYYYMMDDTHH.mmSS. For example, AmazonSageMaker-ExecutionRole-20190429T110788. Note that the execution role naming convention uses the date and time at which the role was created, separated by a T.

   d. For Root Access, choose Enable.
   e. Choose Create notebook instance.

4. On the Notebook instances page, the Status is Pending. It can take a few minutes for Amazon SageMaker to launch a machine learning compute instance—in this case, it launches a notebook instance—and attach an ML storage volume to it. The notebook instance has a preconfigured Jupyter notebook server and a set of Anaconda libraries. For more information, see CreateNotebookInstance.

5. In the Permissions and encryption section, copy the IAM role ARN number, and paste it into a notepad file to save it temporarily. You use this IAM role ARN number later to configure a local training estimator in the notebook instance. The IAM role ARN number looks like the following: 'arn:aws:iam::111122223333:role/service-role/AmazonSageMaker-ExecutionRole-20190429T110788'

6. After the status of the notebook instance changes to InService, choose Open JupyterLab.

Step 2: Create and upload the Dockerfile and Python training scripts

1. After JupyterLab opens, create a new folder in the home directory of your JupyterLab. In the upper-left corner, choose the New Folder icon, and then enter the folder name docker_test_folder.

2. Create a Dockerfile text file in the docker_test_folder directory.
   a. Choose the New Launcher icon (+) in the upper-left corner.
   b. In the right pane under the Other section, choose Text File.
   c. Paste the following Dockerfile sample code into your text file.

```
FROM tensorflow/tensorflow:2.2.0rc2-gpu-py3-jupyter

# Install sagemaker-training toolkit that contains the common functionality necessary to create a container compatible with SageMaker and the Python SDK.
RUN pip3 install sagemaker-training

# Copies the training code inside the container
COPY train.py /opt/ml/code/train.py

# Defines train.py as script entrypoint
ENV SAGEMAKER_PROGRAM train.py
```
The Dockerfile script performs the following tasks:

- **FROM tensorflow/tensorflow:2.2.0rc2-gpu-py3-jupyter** – Downloads the TensorFlow Docker base image. You can replace this with any Docker base image you want to bring to build containers, as well as with AWS pre-built container base images.
- **RUN pip install sagemaker-training** – Installs SageMaker Training Toolkit that contains the common functionality necessary to create a container compatible with SageMaker.
- **COPY train.py /opt/ml/code/train.py** – Copies the script to the location inside the container that is expected by SageMaker. The script must be located in this folder.
- **ENV SAGEMAKER_PROGRAM train.py** – Takes your training script train.py as the entrypoint script copied in the /opt/ml/code folder of the container. This is the only environmental variable that you must specify when you build your own container.

**d.** On the left directory navigation pane, the text file name might automatically be named untitled.txt. To rename the file, right-click the file, choose Rename, rename the file as Dockerfile without the .txt extension, and then press Ctrl+s or Command+s to save the file.

3. **Create or upload a training script train.py in the docker_test_folder.** You can use the following example script for this exercise.

```python
import tensorflow as tf

mnist = tf.keras.datasets.mnist

(x_train, y_train), (x_test, y_test) = mnist.load_data()
x_train, x_test = x_train / 255.0, x_test / 255.0

model = tf.keras.models.Sequential([tf.keras.layers.Flatten(input_shape=(28, 28)),
                                     tf.keras.layers.Dense(128, activation='relu'),
                                     tf.keras.layers.Dropout(0.2),
                                     tf.keras.layers.Dense(10, activation='softmax')])

model.compile(optimizer='adam',
               loss='sparse_categorical_crossentropy',
               metrics=['accuracy'])

model.fit(x_train, y_train, epochs=1)

model.evaluate(x_test, y_test)
```

**Step 3: Build the container**

1. In the JupyterLab home directory, open a Jupyter notebook. To open a new notebook, choose the New Launch icon and then choose conda_tensorflow2_p36 in the Notebook section.
2. Run the following command in the first notebook cell to change to the docker_test_folder directory:

   ```bash
   % cd ~/SageMaker/docker_test_folder
   ```

   This returns your current directory as follows:

   ```bash
   ! pwd
   ```
output: /home/ec2-user/SageMaker/docker_test_folder

3. To build the Docker container, run the following Docker build command, including the space followed by a period at the end:

```
! docker build -t tf-custom-container-test .
```

The Docker build command must be run from the Docker directory you created, in this case `docker_test_folder`.

**Note**

If you get the following error message that Docker cannot find the Dockerfile, make sure the Dockerfile has the correct name and has been saved to the directory.

```
unable to prepare context: unable to evaluate symlinks in Dockerfile path: lstat /home/ec2-user/SageMaker/docker/Dockerfile: no such file or directory
```

Remember that `docker` looks for a file specifically called `Dockerfile` without any extension within the current directory. If you named it something else, you can pass in the file name manually with the `-f` flag. For example, if you named your Dockerfile as `Dockerfile-text.txt`, run the following command:

```
! docker build -t tf-custom-container-test -f Dockerfile-text.txt .
```

---

**Step 4: Test the container**

1. To test the container locally in the notebook instance, open a Jupyter notebook. Choose **New Launcher** and choose **Notebook** in `conda_tensorflow_p36` framework.

2. Paste the following example script into the notebook code cell to configure a SageMaker Estimator.

**SageMaker Python SDK v1**

```python
from sagemaker.estimator import Estimator

estimator = Estimator(image_name='tf-custom-container-test',
                      role='arn:aws:iam::111122223333:role/role-name',
                      instance_count=1,
                      instance_type='local')

estimator.fit()
```

**SageMaker Python SDK v2**

```python
from sagemaker.estimator import Estimator

estimator = Estimator(image_uri='tf-custom-container-test',
                      role='arn:aws:iam::111122223333:role/role-name',
                      instance_count=1,
                      instance_type='local')

estimator.fit()
```

3. Replace the 'Put_Your_ARN_Here' value with **the IAM role ARN number** you copied to a notepad file when you configured the notebook instance. The ARN should look like the following: 'arn:aws:iam::111122223333:role/service-role/AmazonSageMaker-ExecutionRole-20190429T110788'.
4. Run the code cell. This test outputs the training environment configuration, the values used for the environmental variables, the source of the data, and the loss and accuracy obtained during training.

**Step 5: Push the container to Amazon Elastic Container Registry (Amazon ECR)**

1. After you successfully run the local mode test, you can push the Docker container to Amazon ECR and use it to run training jobs.

Run the following command lines in a notebook cell.

```sh
# Specify an algorithm name
algorithm_name=tf-custom-container-test

account=$(aws sts get-caller-identity --query Account --output text)

# Get the region defined in the current configuration (default to us-west-2 if none defined)
region=$(aws configure get region)
region=${region:-us-west-2}

fullname="${account}.dkr.ecr.${region}.amazonaws.com/${algorithm_name}:latest"

# If the repository doesn’t exist in ECR, create it.
aws ecr describe-repositories --repository-names "${algorithm_name}" > /dev/null 2>&1
if [ $? -ne 0 ]
then
    aws ecr create-repository --repository-name "${algorithm_name}" > /dev/null
fi

# Get the login command from ECR and execute it directly
aws ecr get-login-password --region ${region}|docker login --username AWS --password-stdin ${fullname}

# Build the docker image locally with the image name and then push it to ECR with the full name.
docker build -t ${algorithm_name} .
docker tag ${algorithm_name} ${fullname}
docker push ${fullname}
```

**Note**

This bash shell script may raise a permission issue similar to the following error message:

```
"denied: User: [ARN] is not authorized to perform: ecr:InitiateLayerUpload on resource:
arn:aws:ecr:us-east-1:[id]:repository/tf-custom-container-test"
```

If this error occurs, you need to attach the AmazonEC2ContainerRegistryFullAccess policy to your IAM role. Go to the IAM console, choose Roles from the left navigation pane, look up the IAM role you used for the Notebook instance. Under the Permission tab, choose the Attach policies button, and search the AmazonEC2ContainerRegistryFullAccess policy. Mark the check box of the policy, and choose Attach policy to finish.
2. After you push the container, you can call the Amazon ECR image from anywhere in the SageMaker environment. Run the following code example in the next notebook cell.

If you want to use this training container with SageMaker Studio to use its visualization features, you can also run the following code in a Studio notebook cell to call the Amazon ECR image of your training container.

```python
import boto3
account_id = boto3.client('sts').get_caller_identity().get('Account')
ecr_repository = 'tf-custom-container-test'
tag = ':latest'
region = boto3.session.Session().region_name
uri_suffix = 'amazonaws.com'
if region in ['cn-north-1', 'cn-northwest-1']:
    uri_suffix = 'amazonaws.com.cn'
byoc_image_uri = '{}.dkr.ecr.{}.{}/{}'.format(account_id, region, uri_suffix, ecr_repository + tag)
byoc_image_uri
# This should return something like
# 111122223333.dkr.ecr.us-east-2.amazonaws.com/sagemaker-byoc-test:latest
```

3. Use the `ecr_image` retrieved from the previous step to configure a SageMaker estimator object. The following code sample configures a SageMaker estimator with the `byoc_image_uri` and initiates a training job on an Amazon EC2 instance.

**SageMaker Python SDK v1**

```python
import sagemaker
from sagemaker import get_execution_role
from sagemaker.estimator import Estimator
estimator = Estimator(image_uri=byoc_image_uri,
                      role=get_execution_role(),
                      base_job_name='tf-custom-container-test-job',
                      instance_count=1,
                      instance_type='ml.p2.xlarge')

# start training
estimator.fit()

# deploy the trained model
predictor = estimator.deploy(1, instance_type)
```

**SageMaker Python SDK v2**

```python
import sagemaker
from sagemaker import get_execution_role
from sagemaker.estimator import Estimator
estimator = Estimator(image_uri=byoc_image_uri,
                      role=get_execution_role(),
                      base_job_name='tf-custom-container-test-job',
                      instance_count=1,
                      instance_type='ml.p2.xlarge')

# start training
estimator.fit()
```
# deploy the trained model
predictor = estimator.deploy(1, instance_type)

For a full example that shows how to test a custom container locally and push it to an Amazon ECR image, see the Building Your Own TensorFlow Container example notebook.

**Tip**
To profile and debug training jobs to monitor system utilization issues (such as CPU bottlenecks and GPU underutilization) and identify training issues (such as overfitting, overtraining, exploding tensors, and vanishing gradients), use Amazon SageMaker Debugger. For more information, see

Amazon SageMaker Debugger is available for any deep learning models that you bring to Amazon SageMaker. The AWS CLI, SageMaker Estimator API, and the Debugger APIs enable you to use any Docker base images to build and customize containers to train your models. To use Debugger with customized containers, you need to make a minimal change to your training script to implement the Debugger hook callback and retrieve tensors from training jobs.

You need the following resources to build a customized container with Debugger.

- Amazon SageMaker Python SDK
- The SMDebug open source client library
- A Docker base image of your choice
- Your training script with a Debugger hook registered – For more information about registering a Debugger hook to your training script, see Register Debugger Hook to Your Training Script (p. 2285). For an end-to-end example of using Debugger with a custom training container, see the following example notebook.

- Build a Custom Training Container and Debug Training Jobs with Debugger

**Tip**
This custom container with Debugger guide is an extension of the Adapting Your Own Training Container (p. 3016) guide which walks you thorough how to build and push your custom training container to Amazon ECR.

**Prepare to Build a Custom Training Container**

To build a docker container, the basic structure of files should look like the following:

```bash
### debugger_custom_container_test_notebook.ipynb  # a notebook to run python snippet codes
### debugger_custom_container_test_folder  # this is a docker folder
### your-training-script.py  # your training script with Debugger hook
### Dockerfile  # a
```
Register Debugger Hook to Your Training Script

To debug your model training, you need to add a Debugger hook to your training script.

**Note**
This step is required to collect model parameters (output tensors) for debugging your model training. If you only want to monitor and profile, you can skip this hook registration step and exclude the `debugger_hook_config` parameter when constructing an estimator.

The following example code shows the structure of a training script using the Keras ResNet50 model and how to pass the Debugger hook as a Keras callback for debugging. To find a complete training script, see TensorFlow training script with SageMaker Debugger hook.

```python
# An example of training script (your-training-script.py)
import tensorflow.compat.v2 as tf
from tensorflow.keras.applications.resnet50 import ResNet50
import smdebug.tensorflow as smd

def train(batch_size, epoch, model, hook):
    ...

    model.fit(X_train, Y_train,
              batch_size=batch_size,
              epochs=epoch,
              validation_data=(X_valid, Y_valid),
              shuffle=True,

              # smdebug modification: Pass the Debugger hook in the main() as a Keras callback
              callbacks=[hook])

def main():
    parser=argparse.ArgumentParser(description="Train resnet50 cifar10")
    parser.add_argument(...)
    args = parser.parse_args()

    model=ResNet50(weights=None, input_shape=(32,32,3), classes=10)
    # Add the following line to register the Debugger hook for Keras.
    hook=smd.KerasHook.create_from_json_file()

    # Start the training.
    train(args.batch_size, args.epoch, model, hook)

if __name__ == '__main__':
    main()
```

For more information about registering the Debugger hook for the supported frameworks and algorithms, see the following links in the SMDebug client library:

- SMDebug TensorFlow hook
- SMDebug PyTorch hook
• SMDebug PyTorch hook

• SMDebug MXNet hook
• SMDebug XGBoost hook
In the following example notebooks' training scripts, you can find more examples about how to add the Debugger hooks to training scripts and collect output tensors in detail:

• Debugger in script mode with the TensorFlow 2.1 framework

To see the difference between using Debugger in a Deep Learning Container and in script mode, open this notebook and put it and the previous Debugger in a Deep Learning Container TensorFlow v2.1 notebook example side by side.
In script mode, the hook configuration part is removed from the script in which you set the estimator. Instead, the Debugger hook feature is merged into the training script, TensorFlow Keras ResNet training script in script mode. The training script imports the smdebug library in the required TensorFlow Keras environment to communicate with the TensorFlow ResNet50 algorithm. It also manually implements the smdebug hook functionality by adding the callbacks=[hook] argument inside the train function (in line 49), and by adding the manual hook configuration (in line 89) provided through SageMaker Python SDK.
This script mode example runs the training job in the TF 2.1 framework for direct comparison with the zero script change in the TF 2.1 example.
The benefit of setting up Debugger in script mode is the flexibility to choose framework versions not covered by AWS Deep Learning Containers.

• Using Amazon SageMaker Debugger in a PyTorch Container in Script Mode
This notebook enables Debugger in script mode in PyTorch v1.3.1 framework. PyTorch v1.3.1 is supported by SageMaker containers, and this example shows details of how to modify a training script.
The SageMaker PyTorch estimator is already in script mode by default. In the notebook, the line to activate script_mode is not included in the estimator configuration.
This notebook shows detailed steps to change an original PyTorch training script to a modified version with Debugger enabled. Additionally, this example shows how you can use Debugger built-in rules to detect training issues such as the vanishing gradients problem, and the Debugger trial features to call and analyze the saved tensors.

Create and Configure a Dockerfile

Open your SageMaker JupyterLab and create a new folder, debugger_custom_container_test_folder in this example, to save your training script and Dockerfile. The following code example is a Dockerfile that includes essential docker build commend. Paste the following code into the Dockerfile text file and save it. Upload your training script to the same folder.
Adapting Your Own Training Container

# Specify a docker base image
FROM tensorflow/tensorflow:2.2.0rc2-gpu-py3
RUN /usr/bin/python3 -m pip install --upgrade pip
RUN pip install --upgrade protobuf

# Install required packages to enable the SageMaker Python SDK and the smdebug library
RUN pip install sagemaker-training
RUN pip install smdebug

CMD ["bin/bash"]

If you want to use a pre-built AWS Deep Learning Container image, see Available AWS Deep Learning Containers Images.

## Build and Push the Custom Training Container to Amazon ECR

Create a test notebook, debugger_custom_container_test_notebook.ipynb, and run the following code in the notebook cell. This will access the debugger_byoc_test_docker directory, build the docker with the specified algorithm_name, and push the docker container to your Amazon ECR.

```python
import boto3

account_id = boto3.client('sts').get_caller_identity().get('Account')
ecr_repository = 'sagemaker-debugger-mnist-byoc-tf2'
tag = ':latest'
region = boto3.session.Session().region_name
uri_suffix = 'amazonaws.com'
if region in ['cn-north-1', 'cn-northwest-1']:
    uri_suffix = 'amazonaws.com.cn'

byoc_image_uri = '{}.dkr.ecr.{}.{}'.format(account_id, region, uri_suffix, ecr_repository + tag)

!docker build -t $ecr_repository docker
!$(aws ecr get-login --region $region --registry-ids $account_id --no-include-email)
!aws ecr create-repository --repository-name $ecr_repository
!docker tag {ecr_repository + tag} $byoc_image_uri
!docker push $byoc_image_uri
```

Tip
---
If you use one of the AWS Deep Learning Container base images, run the following code to log in to Amazon ECR and access to the Deep Learning Container image repository.

```bash
aws ecr get-login-password --region {region}
docker login --username AWS --password-stdin
763104351884.dkr.ecr.us-east-1.amazonaws.com
```
Amazon SageMaker Developer Guide
Adapting Your Own Training Container

Run and Debug Training Jobs Using the Custom
Training Container
After you build and push your docker container to Amazon ECR, conﬁgure
a SageMaker estimator with your training script and the Debugger-speciﬁc
parameters. After you execute the estimator.fit(), Debugger will
collect output tensors, monitor them, and detect training issues. Using
the saved tensors, you can further analyze the training job by using the
smdebug core features and tools. Conﬁguring a workﬂow of Debugger rule
monitoring process with Amazon CloudWatch Events and AWS Lambda, you
can automate a stopping training job process whenever the Debugger rules
spots training issues.
import sagemaker

from sagemaker.estimator import Estimator
from sagemaker.debugger import Rule, DebuggerHookConfig,
CollectionConfig, rule_configs

profiler_config=ProfilerConfig(...)
debugger_hook_config=DebuggerHookConfig(...)
rules=[
Rule.sagemaker(rule_configs.built_in_rule()),
ProfilerRule.sagemaker(rule_configs.BuiltInRule())
]

estimator=Estimator(
image_uri=byoc_image_uri,
entry_point="./debugger_custom_container_test_folder/yourtraining-script.py"
role=sagemaker.get_execution_role(),
base_job_name='debugger-custom-container-test',
instance_count=1,
instance_type='ml.p3.2xlarge',

# Debugger-specific parameters

debugger_hook_config=debugger_hook_config,


Adapting Your Own Inference Container

If none of the Amazon SageMaker prebuilt inference containers suffice for your situation, and you want to use your own Docker container, use the SageMaker Inference Toolkit to adapt your container to work with SageMaker hosting. To adapt your container to work with SageMaker hosting, create the inference code in one or more Python script files and a Dockerfile that imports the inference toolkit.

The inference code includes an inference handler, a handler service, and an entrypoint. In this example, they are stored as three separate Python files. All three of these Python files must be in the same directory as your Dockerfile.

For an example Jupyter notebook that shows a complete example of extending a container by using the SageMaker inference toolkit, see Amazon SageMaker Multi-Model Endpoints using your own algorithm container.

Step 1: Create an Inference Handler

The SageMaker inference toolkit is built on the multi-model server (MMS). MMS expects a Python script that implements functions to load the model, pre-process input data, get predictions from the model, and process the output data in a model handler.

The model_fn Function

There are default implementations for the model_fn function, named default_model_fn, on the SageMaker PyTorch and MXNet Inference toolkits. The default implementation loads models saved using torchscript, of the form .pt or .pth. If your model requires custom methods to load, or you want to perform extra steps when loading your model, you must implement the model_fn function. The following simple example shows an implementation of a model_fn function that loads a PyTorch model:

```python
def model_fn(self, model_dir):
    import torch
    logger.info('model_fn')
    device = "cuda" if torch.cuda.is_available() else "cpu"
    with open(os.path.join(model_dir, 'model.pth'), 'rb') as f:
        model = torch.jit.load(f)
    return model.to(device)
```

The input_fn Function

The input_fn function is responsible for deserializing your input data so that it can be passed to your model. It takes input data and content type as parameters, and returns deserialized data. The SageMaker inference toolkit provides a default implementation that deserializes the following content types:

- JSON
- CSV
- Numpy array
- NPZ

If your model requires a different content type, or you want to preprocess your input data before sending it to the model, you must implement the input_fn function. The following example shows a simple implementation of the input_fn function.
from sagemaker_inference import content_types, decoder
def input_fn(self, input_data, content_type):
    """A default input_fn that can handle JSON, CSV and NPZ formats.
    """
    Args:
    input_data: the request payload serialized in the content_type format
    content_type: the request content_type
    Returns: input_data deserialized into torch.FloatTensor or torch.cuda.FloatTensor
    depending if cuda is available.
    """
    return decoder.decode(input_data, content_type)

The predict_fn Function

The predict_fn function is responsible for getting predictions from the model. It takes the model and the data returned from input_fn as parameters, and returns the prediction. There is no default implementation for the predict_fn. You must implement it yourself. The following is a simple implementation of the predict_fn function for a PyTorch model.

def predict_fn(self, data, model):
    """A default predict_fn for PyTorch. Calls a model on data deserialized in input_fn.
    Runs prediction on GPU if cuda is available.
    """
    Args:
    data: input data (torch.Tensor) for prediction deserialized by input_fn
    model: PyTorch model loaded in memory by model_fn
    Returns: a prediction
    """
    return model(data)

The output_fn Function

The output_fn function is responsible for serializing the data that the predict_fn function returns as a prediction. The SageMaker inference toolkit implements a default output_fn function that serializes Numpy arrays, JSON, and CSV. If your model outputs any other content type, or you want to perform other post-processing of your data before sending it to the user, you must implement your own output_fn function. The following shows a simple output_fn function for a PyTorch model.

from sagemaker_inference import encoder
def output_fn(self, prediction, accept):
    """A default output_fn for PyTorch. Serializes predictions from predict_fn to JSON, CSV or NPY format.
    """
    Args:
    prediction: a prediction result from predict_fn
    accept: type which the output data needs to be serialized
    Returns: output data serialized
    """
    return encoder.encode(prediction, accept)

Step 2: Implement a Handler Service

The handler service is executed by the model server. The handler service implements initialize and handle methods. The initialize method is invoked when the model server starts, and the handle method is invoked for all incoming inference requests to the model server. For more information, see
Custom Service in the Multi-model server documentation. The following is an example of a handler service for a PyTorch model server.

```python
from sagemaker_inference.default_handler_service import DefaultHandlerService
from sagemaker_inference.transformer import Transformer
from sagemaker_pytorch_serving_container.default_inference_handler import DefaultPytorchInferenceHandler

class HandlerService(DefaultHandlerService):
    """Handler service that is executed by the model server.
    Determines specific default inference handlers to use based on model being used.
    This class extends ``DefaultHandlerService``, which define the following:
    - The ````handle```` method is invoked for all incoming inference requests to the model
      server.
    - The ````initialize```` method is invoked at model server start up.
    Based on: https://github.com/awslabs/mxnet-model-server/blob/master/docs/custom_service.md
    ""
    def __init__(self):
        transformer = Transformer(default_inference_handler=DefaultPytorchInferenceHandler())
        super(HandlerService, self).__init__(transformer=transformer)
```

Step 3: Implement an Entrypoint

The entrypoint starts the model server by invoking the handler service. You specify the location of the entrypoint in your Dockerfile. The following is an example of an entrypoint.

```python
from sagemaker_inference import model_server
model_server.start_model_server(handler_service=HANDLER_SERVICE)
```

Step 4: Write a Dockerfile

In your Dockerfile, copy the model handler from step 2 and specify the Python file from the previous step as the entrypoint in your Dockerfile. The following is an example of the lines you can add to your Dockerfile to copy the model handler and specify the entrypoint. For a full example of a Dockerfile for an inference container, see Dockerfile.

```bash
# Copy the default custom service file to handle incoming data and inference requests
COPY model_handler.py /home/model-server/model_handler.py

# Define an entrypoint script for the docker image
ENTRYPOINT ["python", "/usr/local/bin/entrypoint.py"]
```

Step 5: Build and Register Your Container

Now you can build your container and register it in Amazon Elastic Container Registry (Amazon ECR). The following shell script from the sample notebook builds the container and uploads it to an Amazon ECR repository in your AWS account.

**Note**
SageMaker hosting supports using inference containers that are stored in repositories other than Amazon ECR. For information, see Use a Private Docker Registry for Real-Time Inference Containers (p. 3040).

The following shell script shows how to build and register a container.
If none of the existing SageMaker containers meet your needs and you don’t have an existing container of your own, you may need to create a new Docker container. The following sections show how to create Docker containers with your training and inference algorithms for use with SageMaker.

Topics
- Use Your Own Training Algorithms (p. 3030)
- Use Your Own Inference Code (p. 3037)

Use Your Own Training Algorithms

This section explains how Amazon SageMaker interacts with a Docker container that runs your custom training algorithm. Use this information to write training code and create a Docker image for your training algorithms.
How Amazon SageMaker Runs Your Training Image

To configure a Docker container to run as an executable, use an `ENTRYPOINT` instruction in a Dockerfile.

- For model training, Amazon SageMaker runs the container as follows:
  ```bash
  docker run image train
  ```

  SageMaker overrides any default `CMD` statement in a container by specifying the `train` argument after the image name. The `train` argument also overrides arguments that you provide using `CMD` in the Dockerfile.

- In your Dockerfile, use the `exec` form of the `ENTRYPOINT` instruction:
  ```bash
  ENTRYPOINT ["executable", "param1", "param2", ...]
  ```

  For example:
  ```bash
  ENTRYPOINT ["python", "k-means-algorithm.py"]
  ```

  The `exec` form of the `ENTRYPOINT` instruction starts the executable directly, not as a child of `/bin/sh`. This enables it to receive signals like `SIGTERM` and `SIGKILL` from SageMaker APIs. Note the following:

  - The `CreateTrainingJob` API has a stopping condition that directs SageMaker to stop model training after a specific time.
  - The `StopTrainingJob` API issues the equivalent of the `docker stop`, with a 2-minute timeout command to gracefully stop the specified container:
    ```bash
    docker stop -t120
    ```

    The command attempts to stop the running container by sending a `SIGTERM` signal. After the 2-minute timeout, the API sends `SIGKILL` and forcibly stops the containers. If the container handles the `SIGTERM` gracefully and exits within 120 seconds from receiving it, no `SIGKILL` is sent.

    **Note**
    If you want access to the intermediate model artifacts after SageMaker stops the training, add code to handle saving artifacts in your `SIGTERM` handler.

  - If you plan to use GPU devices for model training, make sure that your containers are `nvidia-docker` compatible. Include only the CUDA toolkit on containers; don't bundle NVIDIA drivers with the image. For more information about `nvidia-docker`, see [NVIDIA/nvidia-docker](https://github.com/NVIDIA/nvidia-docker).
• You can't use the tini initializer as your entry point in SageMaker containers because it gets confused by the train and serve arguments.
• /opt/ml and all sub-directories are reserved by SageMaker training. When building your algorithm's Docker image, please ensure you don't place any data required by your algorithm under them as the data may no longer be visible during training.

How Amazon SageMaker Provides Training Information

This section explains how SageMaker makes training information, such as training data, hyperparameters, and other configuration information, available to your Docker container.

When you send a CreateTrainingJob request to SageMaker to start model training, you specify the Amazon Elastic Container Registry (Amazon ECR) path of the Docker image that contains the training algorithm. You also specify the Amazon Simple Storage Service (Amazon S3) location where training data is stored and algorithm-specific parameters. SageMaker makes this information available to the Docker container so that your training algorithm can use it. This section explains how we make this information available to your Docker container. For information about creating a training job, see CreateTrainingJob. For more information on the way that SageMaker containers organize information, see Using the SageMaker Training and Inference Toolkits (p. 3015).

Topics
• Hyperparameters (p. 3032)
• Environment Variables (p. 3032)
• Input Data Configuration (p. 3032)
• Training Data (p. 3033)
• Distributed Training Configuration (p. 3034)

Hyperparameters

SageMaker makes the hyperparameters in a CreateTrainingJob request available in the Docker container in the /opt/ml/input/config/hyperparameters.json file.

Environment Variables

The following environment variables are set in the container:

• TRAINING_JOB_NAME – Specified in the TrainingJobName parameter of the CreateTrainingJob request.
• TRAINING_JOB_ARN – The Amazon Resource Name (ARN) of the training job returned as the TrainingJobArn in the CreateTrainingJob response.
• All environment variables specified in the Environment parameter in the CreateTrainingJob request.

Input Data Configuration

You specify data channel information in the InputDataConfig parameter in a CreateTrainingJob request. SageMaker makes this information available in the /opt/ml/input/config/inputdataconfig.json file in the Docker container.

For example, suppose that you specify three data channels (train, evaluation, and validation) in your request. SageMaker provides the following JSON:
Use Your Own Training Algorithms

```json
{
  "train": {
    "ContentType": "trainingContentType",
    "TrainingInputMode": "File",
    "S3DistributionType": "FullyReplicated",
    "RecordWrapperType": "None"},
  "evaluation": {
    "ContentType": "evalContentType",
    "TrainingInputMode": "File",
    "S3DistributionType": "FullyReplicated",
    "RecordWrapperType": "None"},
  "validation": {
    "TrainingInputMode": "File",
    "S3DistributionType": "FullyReplicated",
    "RecordWrapperType": "None"}
}
```

**Note**

SageMaker provides only relevant information about each data channel (for example, the channel name and the content type) to the container, as shown. `S3DistributionType` will be set as `FullyReplicated` if specify EFS or FSxLustre as input data sources.

**Training Data**

The `TrainingInputMode` parameter in the `AlgorithmSpecification` of the `CreateTrainingJob` request specifies how the training dataset is made available. The following input modes are available:

- **File mode**
  - TrainingInputMode parameter written to `inputdataconfig.json`: "File"
  - Data channel directory in the Docker container: `/opt/ml/input/data/channel_name`
  - Supported data sources: Amazon Simple Storage Service (Amazon S3), Amazon Elastic File System (Amazon EFS), and Amazon FSx for Lustre

A directory is created for each channel. For example, if you have three channels named training, validation, and testing, SageMaker makes three directories in the Docker container:

- `/opt/ml/input/data/training`
- `/opt/ml/input/data/validation`
- `/opt/ml/input/data/testing`

**Note**

Channels that use file system data sources such as Amazon EFS and Amazon FSx must use File mode. If a file system is specified, the directory path provided in the channel is mounted at `/opt/ml/input/data/channel_name`.

- **FastFile mode**
  - TrainingInputMode parameter written to `inputdataconfig.json`: "FastFile"
  - Data channel directory in the Docker container: `/opt/ml/input/data/channel_name`
  - Supported data sources: Amazon S3

The channel directory is mounted as read-only.

Algorithms that support File mode can seamlessly work with FastFile mode with no code changes.

**Note**

Channels that use FastFile mode must use a `S3DataType` of "S3Prefix". FastFile mode presents a folder view that uses the forward slash (/) as the delimiter for grouping Amazon S3 objects into folders. S3Uri prefixes must not correspond to a partial folder name. For example, if an Amazon S3 dataset contains `s3://my-bucket/train-01/data.csv`, then neither `s3://my-bucket/train` nor `s3://my-bucket/train-01` are allowed as S3Uri prefixes.
A trailing forward slash is recommended to define a channel corresponding to a folder. For example, the s3://my-bucket/train-01/ channel for the train-01 folder. Without the trailing forward slash, the channel would be ambiguous if there existed another folder s3://my-bucket/train-011/ or file s3://my-bucket/train-01.txt/.

- **Pipe mode**
  - TrainingInputMode parameter written to inputdataconfig.json: "Pipe"
  - Data channel directory in the Docker container: /opt/ml/input/data/channel_name_epoch_number
  - Supported data sources: Amazon S3

You need to read from a separate pipe for each channel. For example, if you have three channels named training, validation, and testing, you need to read from the following pipes:

- /opt/ml/input/data/training_0, /opt/ml/input/data/training_1, ...
- /opt/ml/input/data/validation_0, /opt/ml/input/data/validation_1, ...
- /opt/ml/input/data/testing_0, /opt/ml/input/data/testing_1, ...

Read the pipes sequentially. For example, if you have a channel called training, read the pipes in this sequence:

1. Open /opt/ml/input/data/training_0 in read mode and read it to end-of-file (EOF) or, if you are done with the first epoch, close the pipe file early.
2. After closing the first pipe file, look for /opt/ml/input/data/training_1 and read it until you have completed the second epoch, and so on.

If the file for a given epoch doesn't exist yet, your code may need to retry until the pipe is created. There is no sequencing restriction across channel types. For example, you can read multiple epochs for the training channel and only start reading the validation channel when you are ready. Or, you can read them simultaneously if your algorithm requires that.

For an example of a Jupyter notebook that shows how to use Pipe mode when bringing your own container, see Bring your own pipe-mode algorithm to Amazon SageMaker.

**Distributed Training Configuration**

If you're performing distributed training with multiple containers, SageMaker makes information about all containers available in the /opt/ml/input/config/resourceconfig.json file.

To enable inter-container communication, this JSON file contains information for all containers. SageMaker makes this file available for both File and Pipe mode algorithms. The file provides the following information:

- **current_host**—The name of the current container on the container network. For example, algo-1. Host values can change at any time. Don't write code with specific values for this variable.
- **hosts**—The list of names of all containers on the container network, sorted lexicographically. For example, ["algo-1", "algo-2", "algo-3"] for a three-node cluster. Containers can use these names to address other containers on the container network. Host values can change at any time. Don't write code with specific values for these variables.
- **network_interface_name**—The name of the network interface that is exposed to your container. For example, containers running the Message Passing Interface (MPI) can use this information to set the network interface name.
  - Do not use the information in /etc/hostname or /etc/hosts because it might be inaccurate.
  - Hostname information may not be immediately available to the algorithm container. We recommend adding a retry policy on hostname resolution operations as nodes become available in the cluster.

The following is an example file on node 1 in a three-node cluster:
Run Training with EFA

SageMaker provides integration with EFA devices to accelerate High Performance Computing (HPC) and machine learning applications. This integration allows you to leverage an EFA device when running your distributed training jobs. You can add EFA integration to an existing Docker container that you bring to SageMaker. The following information outlines how to configure your own container to use an EFA device for your distributed training jobs.

Prerequisites

Your container must satisfy the SageMaker Training container specification.

Install EFA and required packages

Your container must download and install the EFA software. This allows your container to recognize the EFA device, and provides compatible versions of Libfabric and Open MPI.

Any tools like MPI and NCCL must be installed and managed inside the container to be used as part of your EFA-enabled training job. The following example shows how to modify the Dockerfile of your EFA-enabled container to install EFA, MPI, OFI, NCCL, and NCCL-TEST.

```
ARG OPEN_MPI_PATH=/opt/amazon/openmpi/
ENV NCCL_VERSION=2.7.8
ENV EFA_VERSION=1.11.2
ENV BRANCH_OFI=1.1.1
#################################################
## EFA and MPI SETUP
RUN cd $HOME \\
    && curl -O https://s3-us-west-2.amazonaws.com/aws-efa-installer/aws-efa-installer-
    #$EFA_VERSION.tar.gz \\
    && tar -xf aws-efa-installer-#$EFA_VERSION.tar.gz \\
    && cd aws-efa-installer \\
    && ./efa_installer.sh -y --skip-kmod -g \\
    ENV PATH="$OPEN_MPI_PATH/bin:$PATH"
    ENV LD_LIBRARY_PATH="$OPEN_MPI_PATH/lib/:$LD_LIBRARY_PATH"
#################################################
## NCCL, OFI, NCCL-TEST SETUP
RUN cd $HOME \\
    && git clone https://github.com/NVIDIA/nccl.git -b v$NCCL_VERSION-1 \\
    && cd nccl \\
    && make -j64 src.build BUILDDIR=/usr/local
    RUN apt-get update && apt-get install -y autoconf
```
Considerations when creating your container

The EFA device is mounted to the container as /dev/infiniband/uverbs0 under the list of devices accessible to the container. On P4d instances, the container has access to 4 EFA devices. The EFA devices can be found in the list of devices accessible to the container as:

- /dev/infiniband/uverbs0
- /dev/infiniband/uverbs1
- /dev/infiniband/uverbs2
- /dev/infiniband/uverbs3

To get information about hostname, peer hostnames, and network interface (for MPI) from the resourceconfig.json file provided to each container instances, see Distributed Training Configuration. Your container handles regular TCP traffic among peers through the default Elastic Network Interfaces (ENI), while handling OFI (kernel bypass) traffic through the EFA device.

Verify that your EFA device is recognized

To verify that the EFA device is recognized, run the following command from within your container.

```
/opt/amazon/efa/bin/fi_info -p efa
```

Your output should look similar to the following.

```
provider: efa
  fabric: EFA-fe80::e5:56ff:fe34:56a8
  domain: efa_0-rdm
  version: 2.0
  type: FI_EP_RDM
  protocol: FI_PROTO_EFA
provider: efa
  fabric: EFA-fe80::e5:56ff:fe34:56a8
  domain: efa_0-dgrm
  version: 2.0
  type: FI_EP_DGRAM
  protocol: FI_PROTO_EFA
provider: ofi_rxd
  fabric: EFA-fe80::e5:56ff:fe34:56a8
  domain: efa_0-dgrm
  version: 1.0
  type: FI_EP_RDM
  protocol: FI_PROTO_RXD
```
Running a training job with EFA

Once you've created an EFA-enabled container, you can run a training job with EFA using a SageMaker Estimator the same way as you would with any other Docker image. For more information on registering your container and using it for training, see Adapting Your Own Training Container.

How Amazon SageMaker Signals Algorithm Success and Failure

A training algorithm indicates whether it succeeded or failed using the exit code of its process.

A successful training execution should exit with an exit code of 0 and an unsuccessful training execution should exit with a non-zero exit code. These will be converted to Completed and Failed in the TrainingJobStatus returned by DescribeTrainingJob. This exit code convention is standard and is easily implemented in all languages. For example, in Python, you can use `sys.exit(1)` to signal a failure exit, and simply running to the end of the main routine will cause Python to exit with code 0.

In the case of failure, the algorithm can write a description of the failure to the failure file. See next section for details.

How Amazon SageMaker Processes Training Output

As your algorithm runs in a container, it generates output including the status of the training job and model and output artifacts. Your algorithm should write this information to the following files, which are located in the container's /output directory. Amazon SageMaker processes the information contained in this directory as follows:

- `/opt/ml/model` – Your algorithm should write all final model artifacts to this directory. SageMaker copies this data as a single object in compressed tar format to the S3 location that you specified in the CreateTrainingJob request. If multiple containers in a single training job write to this directory they should ensure no file/directory names clash. SageMaker aggregates the result in a tar file and uploads to S3. SageMaker aggregates the result in a TAR file and uploads to S3 at the end of the training job.

- `/opt/ml/output` – Your algorithm should write artifacts you want to store other than the final model to this directory. SageMaker copies this data as a single object in compressed tar format to the S3 location that you specified in the CreateTrainingJob request. If multiple containers in a single training job write to this directory they should ensure no file/directory names clash. SageMaker aggregates the result in a TAR file and uploads to S3 at the end of the training job.

- `/opt/ml/output/failure` – If training fails, after all algorithm output (for example, logging) completes, your algorithm should write the failure description to this file. In a DescribeTrainingJob response, SageMaker returns the first 1024 characters from this file as FailureReason.

Use Your Own Inference Code

You can use Amazon SageMaker to interact with Docker containers and run your own inference code in one of two ways:

- To use your own inference code with a persistent endpoint to get one prediction at a time, use SageMaker hosting services.
- To use your own inference code to get predictions for an entire dataset, use SageMaker batch transform.

Topics

- Use Your Own Inference Code with Hosting Services (p. 3038)
- Use Your Own Inference Code with Batch Transform (p. 3043)
Use Your Own Inference Code with Hosting Services

This section explains how Amazon SageMaker interacts with a Docker container that runs your own inference code for hosting services. Use this information to write inference code and create a Docker image.

**Topics**

- How SageMaker Runs Your Inference Image (p. 3038)
- How SageMaker Loads Your Model Artifacts (p. 3039)
- How Containers Serve Requests (p. 3039)
- How Your Container Should Respond to Inference Requests (p. 3039)
- How Your Container Should Respond to Health Check (Ping) Requests (p. 3040)
- Use a Private Docker Registry for Real-Time Inference Containers (p. 3040)

**How SageMaker Runs Your Inference Image**

To configure a container to run as an executable, use an `ENTRYPOINT` instruction in a Dockerfile. Note the following:

- For model inference, SageMaker runs the container as:

  ```
  docker run image serve
  ```

  SageMaker overrides default `CMD` statements in a container by specifying the `serve` argument after the image name. The `serve` argument overrides arguments that you provide with the `CMD` command in the Dockerfile.

- We recommend that you use the `exec` form of the `ENTRYPOINT` instruction:

  ```
  ENTRYPOINT ["executable", "param1", "param2"]
  ```

  For example:

  ```
  ENTRYPOINT ["python", "k_means_inference.py"]
  ```

  The `exec` form of the `ENTRYPOINT` instruction starts the executable directly, not as a child of `/bin/sh`. This enables it to receive signals like `SIGTERM` and `SIGKILL` from the SageMaker API operations, which is a requirement.

  For example, when you use the `CreateEndpoint` API to create an endpoint, SageMaker provisions the number of ML compute instances required by the endpoint configuration, which you specify in the request. SageMaker runs the Docker container on those instances.

  If you reduce the number of instances backing the endpoint (by calling the `UpdateEndpointWeightsAndCapacities` API), SageMaker runs a command to stop the Docker container on the instances that are being terminated. The command sends the `SIGTERM` signal, then it sends the `SIGKILL` signal thirty seconds later.
If you update the endpoint (by calling the `UpdateEndpoint` API), SageMaker launches another set of ML compute instances and runs the Docker containers that contain your inference code on them. Then it runs a command to stop the previous Docker containers. To stop a Docker container, command sends the `SIGTERM` signal, then it sends the `SIGKILL` signal 30 seconds later.

- SageMaker uses the container definition that you provided in your `CreateModel` request to set environment variables and the DNS hostname for the container as follows:
  - It sets environment variables using the `ContainerDefinition.Environment` string-to-string map.
  - It sets the DNS hostname using the `ContainerDefinition.ContainerHostname`.

- If you plan to use GPU devices for model inferences (by specifying GPU-based ML compute instances in your `CreateEndpointConfig` request), make sure that your containers are `nvidia-docker` compatible. Don't bundle NVIDIA drivers with the image. For more information about `nvidia-docker`, see NVIDIA/nvidia-docker.

- You can't use the `tini` initializer as your entry point in SageMaker containers because it gets confused by the `train` and `serve` arguments.

**How SageMaker Loads Your Model Artifacts**

In your `CreateModel` request, the container definition includes the `ModelDataUrl` parameter, which identifies the S3 location where model artifacts are stored. SageMaker uses this information to determine from where to copy the model artifacts. It copies the artifacts to the `/opt/ml/model` directory for use by your inference code.

The `ModelDataUrl` must point to a tar.gz file. Otherwise, SageMaker won't download the file.

If you trained your model in SageMaker, the model artifacts are saved as a single compressed tar file in Amazon S3. If you trained your model outside SageMaker, you need to create this single compressed tar file and save it in a S3 location. SageMaker decompresses this tar file into `/opt/ml/model` directory before your container starts.

**How Containers Serve Requests**

Containers need to implement a web server that responds to `/invocations` and `/ping` on port 8080.

**How Your Container Should Respond to Inference Requests**

To obtain inferences, the client application sends a POST request to the SageMaker endpoint. For more information, see the `InvokeEndpoint` API. SageMaker passes the request to the container, and returns the inference result from the container to the client. Note the following:

- SageMaker strips all `POST` headers except those supported by `InvokeEndpoint`. SageMaker might add additional headers. Inference containers must be able to safely ignore these additional headers.
- To receive inference requests, the container must have a web server listening on port 8080 and must accept `POST` requests to the `/invocations` endpoint.
- A customer's model containers must accept socket connection requests within 250 ms.
- A customer's model containers must respond to requests within 60 seconds. The model itself can have a maximum processing time of 60 seconds before responding to the `/invocations`. If your model...
is going to take 50-60 seconds of processing time, the SDK socket timeout should be set to be 70 seconds.

How Your Container Should Respond to Health Check (Ping) Requests

The CreateEndpoint and UpdateEndpoint API calls result in SageMaker starting new inference containers. Soon after container startup, SageMaker starts sending periodic GET requests to the /ping endpoint.

The simplest requirement on the container is to respond with an HTTP 200 status code and an empty body. This indicates to SageMaker that the container is ready to accept inference requests at the /invocations endpoint.

If the container does not begin to pass health checks, by consistently responding with 200s, during the 4 minutes after startup, CreateEndPoint will fail, leaving the endpoint in a failed state, and the update requested by UpdateEndpoint will not be completed.

While the minimum bar is for the container to return a static 200, a container developer can use this functionality to perform deeper checks. The request timeout on /ping attempts is 2 seconds.

Use a Private Docker Registry for Real-Time Inference Containers

Amazon SageMaker hosting enables you to use images stored in Amazon ECR to build your containers for real-time inference by default. Optionally, you can build containers for real-time inference from images in a private Docker registry. The private registry must be accessible from an Amazon VPC in your account. Models that you create based on the images stored in your private Docker registry must be configured to connect to the same VPC where the private Docker registry is accessible. For information about connecting your model to a VPC, see Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC (p. 3486).

Your Docker registry must be secured with a TLS certificate from a known public certificate authority (CA).

Note

Your private Docker registry must allow inbound traffic from the security groups you specify in the VPC configuration for your model, so that SageMaker hosting is able to pull model images from your registry.

SageMaker can pull model images from DockerHub if there's a path to the open internet inside your VPC.

Topics

• Store Images in a Private Docker Registry other than Amazon Elastic Container Registry (p. 3040)
• Use an Image from a Private Docker Registry for Real-time Inference (p. 3041)
• Allow SageMaker to authenticate to a private Docker registry (p. 3042)
• Create the Lambda function (p. 3042)
• Give your execution role permission to Lambda (p. 3043)
• Create an interface VPC endpoint for Lambda (p. 3043)

Store Images in a Private Docker Registry other than Amazon Elastic Container Registry

To use a private Docker registry to store your images for SageMaker real-time inference, create a private registry that is accessible from your Amazon VPC. For information about creating a Docker registry, see Deploy a registry server in the Docker documentation. The Docker registry must comply with the following:

• The registry must be a Docker Registry HTTP API V2 registry.
Use Your Own Inference Code

The Docker registry must be accessible from the same VPC that you specify in the VpcConfig parameter that you specify when you create your model.

Use an Image from a Private Docker Registry for Real-time Inference

When you create a model and deploy it to SageMaker hosting, you can specify that it use an image from your private Docker registry to build the inference container. Specify this in the ImageConfig object in the PrimaryContainer parameter that you pass to a call to the create_model function.

To use an image stored in your private Docker registry for your inference container

1. Create the image configuration object and specify a value of Vpc for the RepositoryAccessMode field.

   ```python
   image_config = {
       'RepositoryAccessMode': 'Vpc'
   }
   ```

2. If your private Docker registry requires authentication, add a RepositoryAuthConfig object to the image configuration object. For the RepositoryCredentialsProviderArn field of the RepositoryAuthConfig object, specify the Amazon Resource Name (ARN) of an AWS Lambda function that provides credentials that allows SageMaker to authenticate to your private Docker Registry. For information about how to create the Lambda function to provide authentication, see Allow SageMaker to authenticate to a private Docker registry (p. 3042).

   ```python
   image_config = {
       'RepositoryAccessMode': 'Vpc',
       'RepositoryAuthConfig': {
           'RepositoryCredentialsProviderArn':
           'arn:aws:lambda:Region:Acct:function:FunctionName'
       }
   }
   ```

3. Create the primary container object that you want to pass to create_model, using the image configuration object that you created in the previous step.

   Provide your image in digest form. If you provide your image using the :latest tag, there is a risk that SageMaker pulls a newer version of the image than intended. Using the digest form ensures that SageMaker pulls the intended image version.

   ```python
   primary_container = {
       'ContainerHostname': 'ModelContainer',
       'Image': 'myteam.myorg.com/docker-local/my-inference-image:<IMAGE-TAG>',
       'ImageConfig': image_config
   }
   ```

4. Specify the model name and the execution role that you want to pass to create_model.

   ```python
   model_name = 'vpc-model'
   execution_role_arn = 'arn:aws:iam::123456789012:role/SageMakerExecutionRole'
   ```

5. Specify one or more security groups and subnets for the VPC configuration for your model. Your private Docker registry must allow inbound traffic from the security groups that you specify. The subnets that you specify must be in the same VPC as your private Docker registry.

   ```python
   vpc_config = {
       'SecurityGroupIds': ['sg-0123456789abcdef0'],
       'Subnets': ['subnet-0123456789abcdef0','subnet-0123456789abcdef1']
   }
   ```

```python
import boto3
sm = boto3.client('sagemaker')
```

7. Create the model by calling `create_model`, using the values you specified in the previous steps for the `PrimaryContainer` and `VpcConfig` parameters.

```python
try:
    resp = sm.create_model(
        ModelName=model_name,
        PrimaryContainer=primary_container,
        ExecutionRoleArn=execution_role_arn,
        VpcConfig=vpc_config,
    )
except Exception as e:
    print(f'error calling CreateModel operation: {e}')
else:
    print(resp)
```

8. Finally, call `create_endpoint_config` and `create_endpoint` to create the hosting endpoint, using the model that you created in the previous step.

```python
endpoint_config_name = 'my-endpoint-config'
sm.create_endpoint_config(
    EndpointConfigName=endpoint_config_name,
    ProductionVariants=[
        {
            'VariantName': 'MyVariant',
            'ModelName': model_name,
            'InitialInstanceCount': 1,
            'InstanceType': 'ml.t2.medium'
        },
    ],
)
endpoint_name = 'my-endpoint'
sm.create_endpoint(
    EndpointName=endpoint_name,
    EndpointConfigName=endpoint_config_name,
)
sm.describe_endpoint(EndpointName=endpoint_name)
```

**Allow SageMaker to authenticate to a private Docker registry**

To pull an inference image from a private Docker registry that requires authentication, create an AWS Lambda function that provides credentials, and provide the Amazon Resource Name (ARN) of the Lambda function when you call `create_model`. When SageMaker runs `create_model`, it calls the Lambda function that you specified to get credentials to authenticate to your Docker registry.

**Create the Lambda function**

Create an AWS Lambda function that returns a response with the following form:

```python
def handler(event, context):
    response = {
        "Credentials": {"Username": "username", "Password": "password"}
    }
```
Depending on how you set up authentication for your private Docker registry, the credentials that your Lambda function returns can mean either of the following:

- If you set up your private Docker registry to use basic authentication, this is the username and password to authenticate to the registry.
- If you set up your private Docker registry to use bearer token authentication, the username and password are sent to your authorization server, which returns a Bearer token that can then be used to authenticate to the private Docker registry.

**Give your execution role permission to Lambda**

The execution role that you use to call `create_model` must have permissions to call AWS Lambda functions. Add the following to the permissions policy of your execution role.

```json
{
   "Effect": "Allow",
   "Action": [
      "lambda:InvokeFunction"
   ],
   "Resource": [
      "arn:aws:lambda:*:*:function:myLambdaFunction"
   ]
}
```

Where `myLambdaFunction` is the name of your Lambda function. For information about editing a role permissions policy, see Modifying a role permissions policy (console) in the AWS Identity and Access Management User Guide.

**Note**

An execution role with the `AmazonSageMakerFullAccess` managed policy attached to it has permission to call any Lambda function with `SageMaker` in its name.

**Create an interface VPC endpoint for Lambda**

Create an interface endpoint so that your Amazon VPC can communicate with your AWS Lambda function without sending traffic over the internet. For information about how to do this, see Configuring interface VPC endpoints for Lambda in the AWS Lambda Developer Guide.

SageMaker hosting sends a request through your VPC to `lambda.region.amazonaws.com`, to call your Lambda function. If you choose Private DNS Name when you create your interface endpoint, Amazon Route 53 routes the call to the Lambda interface endpoint. If you use a different DNS provider, make sure to map `lambda.region.amazonaws.com` to your Lambda interface endpoint.

**Use Your Own Inference Code with Batch Transform**

This section explains how Amazon SageMaker interacts with a Docker container that runs your own inference code for batch transform. Use this information to write inference code and create a Docker image.

**Topics**

- How SageMaker Runs Your Inference Image (p. 3044)
- How SageMaker Loads Your Model Artifacts (p. 3044)
- How Containers Serve Requests (p. 3045)
- How Your Container Should Respond to Inference Requests (p. 3045)
- How Your Container Should Respond to Health Check (Ping) Requests (p. 3046)
How SageMaker Runs Your Inference Image

To configure a container to run as an executable, use an ENTRYPOINT instruction in a Dockerfile. Note the following:

- For batch transforms, SageMaker runs the container as:

```
docker run image serve
```

SageMaker overrides default CMD statements in a container by specifying the serve argument after the image name. The serve argument overrides arguments that you provide with the CMD command in the Dockerfile.

- We recommend that you use the exec form of the ENTRYPOINT instruction:

```
ENTRYPOINT ["executable", "param1", "param2"]
```

For example:

```
ENTRYPOINT ["python", "k_means_inference.py"]
```

- SageMaker sets environment variables specified in CreateModel and CreateTransformJob on your container. Additionally, the following environment variables are populated:
  - `SAGEMAKER_BATCH` is always set to true when the container runs in Batch Transform.
  - `SAGEMAKER_MAX_PAYLOAD_IN_MB` is set to the largest size payload that is sent to the container via HTTP.
  - `SAGEMAKER_BATCH_STRATEGY` is set to SINGLE_RECORD when the container is sent a single record per call to invocations and MULTI_RECORD when the container gets as many records as will fit in the payload.
  - `SAGEMAKER_MAX_CONCURRENT_TRANSFORMS` is set to the maximum number of invocations requests that can be opened simultaneously.

  **Note**
  The last three environment variables come from the API call made by the user. If the user doesn’t set values for them, they aren’t passed. In that case, either the default values or the values requested by the algorithm (in response to the /execution-parameters are used.

- If you plan to use GPU devices for model inferences (by specifying GPU-based ML compute instances in your CreateTransformJob request), make sure that your containers are nvidia-docker compatible. Don't bundle NVIDIA drivers with the image. For more information about nvidia-docker, see NVIDIA/nvidia-docker.

- You can't use the init initializer as your entry point in SageMaker containers because it gets confused by the train and serve arguments.

How SageMaker Loads Your Model Artifacts

In a CreateModel request, container definitions include the ModelDataUrl parameter, which identifies the location in Amazon S3 where model artifacts are stored. When you use SageMaker to run inferences, it uses this information to determine from where to copy the model artifacts. It copies the artifacts to the /opt/ml/model directory in the Docker container for use by your inference code.
The ModelDataUrl parameter must point to a tar.gz file. Otherwise, SageMaker can't download the file. If you train a model in SageMaker, it saves the artifacts as a single compressed tar file in Amazon S3. If you train a model in another framework, you need to store the model artifacts in Amazon S3 as a compressed tar file. SageMaker decompresses this tar file and saves it in the /opt/ml/model directory in the container before the batch transform job starts.

**How Containers Serve Requests**

Containers must implement a web server that responds to invocations and ping requests on port 8080. For batch transforms, you have the option to set algorithms to implement execution-parameters requests to provide a dynamic runtime configuration to SageMaker. SageMaker uses the following endpoints:

- **ping**—Used to periodically check the health of the container. SageMaker waits for an HTTP 200 status code and an empty body for a successful ping request before sending an invocations request. You might use a ping request to load a model into memory to generate inference when invocations requests are sent.
- **(Optional) execution-parameters**—Allows the algorithm to provide the optimal tuning parameters for a job during runtime. Based on the memory and CPUs available for a container, the algorithm chooses the appropriate MaxConcurrentTransforms, BatchStrategy, and MaxPayloadInMB values for the job.

Before calling the invocations request, SageMaker attempts to invoke the execution-parameters request. When you create a batch transform job, you can provide values for the MaxConcurrentTransforms, BatchStrategy, and MaxPayloadInMB parameters. SageMaker determines the values for these parameters using this order of precedence:

1. The parameter values that you provide when you create the CreateTransformJob request.
2. The values that the model container returns when SageMaker invokes the execution-parameters endpoint.
3. The default parameter values, listed in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>MaxConcurrentTransforms</td>
<td>1</td>
</tr>
<tr>
<td>BatchStrategy</td>
<td>MULTI_RECORD</td>
</tr>
<tr>
<td>MaxPayloadInMB</td>
<td>6</td>
</tr>
</tbody>
</table>

The response for a GET execution-parameters request is a JSON object with keys for MaxConcurrentTransforms, BatchStrategy, and MaxPayloadInMB parameters. This is an example of a valid response:

```json
{
    "MaxConcurrentTransforms": 8,
    "BatchStrategy": "MULTI_RECORD",
    "MaxPayloadInMB": 6
}
```

**How Your Container Should Respond to Inference Requests**

To obtain inferences, Amazon SageMaker sends a POST request to the inference container. The POST request body contains data from Amazon S3. Amazon SageMaker passes the request to the container, and returns the inference result from the container, saving the data from the response to Amazon S3.
To receive inference requests, the container must have a web server listening on port 8080 and must accept POST requests to the /invocations endpoint. The inference request timeout and max retries can be configured through ModelClientConfig.

**How Your Container Should Respond to Health Check (Ping) Requests**

The simplest requirement on the container is to respond with an HTTP 200 status code and an empty body. This indicates to SageMaker that the container is ready to accept inference requests at the /invocations endpoint.

While the minimum bar is for the container to return a static 200, a container developer can use this functionality to perform deeper checks. The request timeout on /ping attempts is 2 seconds.

**Example Notebooks: Use Your Own Algorithm or Model**

The following Jupyter notebooks show how to use your own algorithms or pretrained models from an Amazon SageMaker notebook instance. For links to the GitHub repositories with the prebuilt Dockerfiles for the TensorFlow, MXNet, Chainer, and PyTorch frameworks and instructions on using the AWS SDK for Python (Boto3) estimators to run your own training algorithms on SageMaker Learner and your own models on SageMaker hosting, see Prebuilt SageMaker Docker Images for Deep Learning (p. 3001)

**Setup**

1. Create a SageMaker notebook instance. For instructions on how to create and access Jupyter notebook instances, see Use Amazon SageMaker Notebook Instances (p. 283).
2. Open the notebook instance you created.
3. Choose the SageMaker Examples tab for a list of all SageMaker example notebooks.
4. Open the sample notebooks from the Advanced Functionality section in your notebook instance or from GitHub using the provided links. To open a notebook, choose its Use tab, then choose Create copy.

**Host Models Trained in Scikit-learn**

To learn how to host models trained in Scikit-learn for making predictions in SageMaker by injecting them into first-party k-means and XGBoost containers, see the following sample notebooks.

- kmeans_brin_your_own_model
- xgboost_brin_your_own_model

**Package TensorFlow and Scikit-learn Models for Use in SageMaker**

To learn how to package algorithms that you have developed in TensorFlow and scikit-learn frameworks for training and deployment in the SageMaker environment, see the following notebooks. They show you how to build, register, and deploy your own Docker containers using Dockerfiles.

- tensorflow_brin_your_own
Train and Deploy a Neural Network on SageMaker

To learn how to train a neural network locally using MXNet or TensorFlow, and then create an endpoint from the trained model and deploy it on SageMaker, see the following notebooks. The MXNet model is trained to recognize handwritten numbers from the MNIST dataset. The TensorFlow model is trained to classify irises.

- `mxnet_mnist_byom`
- `tensorflow_iris_byom`

Training Using Pipe Mode

To learn how to use a Dockerfile to build a container that calls the `train.py` script and uses pipe mode to custom train an algorithm, see the following notebook. In pipe mode, the input data is transferred to the algorithm while it is training. This can decrease training time compared to using file mode.

- `pipe_bring_your_own`

Bring Your Own R Model

To learn how to use an R container to train and host a model with the R kernel installed in a notebook, see the following notebook. To take advantage of the AWS SDK for Python (Boto3), we use Python within the notebook. You can achieve the same results in R by invoking command line arguments.

- `r_bring_your_own`

Extend a Prebuilt PyTorch Container Image

To learn how to extend a prebuilt SageMaker PyTorch container image when you have additional functional requirements for your algorithm or model that the prebuilt Docker image doesn't support, see the following notebook.

- `pytorch_extending_our_containers`

Train and Debug Training Jobs on a Custom Container

To learn how to train and debug training jobs using SageMaker Debugger, see the following notebook. A training script provided through this example uses the TensorFlow Keras ResNet 50 model and the CIFAR10 dataset. A Docker custom container is built with the training script and pushed to Amazon ECR. While the training job is running, Debugger collects tensor outputs and identifies debugging problems. With `smdebug` client library tools, you can set a `smdebug` trial object that calls the training job and debugging information, check the training and Debugger rule status, and retrieve tensors saved in an Amazon S3 bucket to analyze training issues.

- `build_your_own_container_with_debugger`
Troubleshooting your Docker containers

The following are common errors that you might run into when using Docker containers with SageMaker. Each error is followed by a solution to the error.

• **Error: SageMaker has lost the Docker daemon.**

  To fix this error, restart Docker using the following command.

  ```
sudo service docker restart
  ```

• **Error: The /tmp directory of your Docker container has run out of space.**

  Docker containers use the / and /tmp partitions to store code. These partitions can fill up easily when using large code modules in local mode. The SageMaker Python SDK supports specifying a custom temp directory for your local mode root directory to avoid this issue.

  To specify the custom temp directory in the EBS volume storage, create a file at the following path ~/.sagemaker/config.yaml and add the following configuration. The directory that you specify as container_root must already exist. The SageMaker Python SDK will not try to create it.

  ```
  local:
    container_root: /home/ec2-user/SageMaker/temp
  ```

  With this configuration, local mode uses the /temp directory and not the default /tmp directory.
SageMaker Workflows

You can manage your Amazon SageMaker training and inference workflows using Amazon SageMaker Studio and the Amazon SageMaker Python SDK. With the available tools, you can simplify your SageMaker process and integrate it into your existing project.

The following workflow technologies are supported.

- **Amazon SageMaker Model Building Pipelines (p. 3049):** SageMaker's tool for building and managing end-to-end ML pipelines.
- **Airflow Workflows:** SageMaker APIs to export configurations for creating and managing Airflow workflows.
- **Kubernetes Orchestration (p. 3169):** SageMaker custom operators for your Kubernetes cluster, as well as custom components for Kubeflow Pipelines.
- **AWS Step Functions:** Create multi-step machine learning workflows in Python that orchestrate SageMaker infrastructure without having to provision your resources separately.

For more information on managing SageMaker training and inference, see Amazon SageMaker Python SDK Workflows.

Topics

- Amazon SageMaker Model Building Pipelines (p. 3049)
- Automate MLOps with SageMaker Projects (p. 3123)

Amazon SageMaker Model Building Pipelines

Amazon SageMaker Model Building Pipelines is a tool for building machine learning pipelines that take advantage of direct SageMaker integration. Because of this integration, you can create a pipeline and set up SageMaker Projects for orchestration using a tool that handles much of the step creation and management for you. SageMaker Pipelines provides the following advantages over other AWS workflow offerings:

**SageMaker Integration**

SageMaker Pipelines is integrated directly with SageMaker, so you don't need to interact with any other AWS services. You also don't need to manage any resources because SageMaker Pipelines is a fully managed service, which means that it creates and manages resources for you.

**SageMaker Python SDK Integration**

Because SageMaker Pipelines is integrated with the SageMaker Python SDK, you can create your pipelines programmatically using a high-level Python interface that you might already be familiar
with. To view the SageMaker Python SDK API reference, see Pipelines. For SageMaker Python SDK code examples, see Amazon SageMaker Model Building Pipelines.

SageMaker Studio Integration

SageMaker Studio offers an environment to manage the end-to-end SageMaker Pipelines experience. Using Studio, you can bypass the AWS console for your entire workflow management. For more information on managing SageMaker Pipelines from SageMaker Studio, see View, Track, and Execute SageMaker Pipelines in SageMaker Studio (p. 3108).

Data Lineage Tracking

With SageMaker Pipelines you can track the history of your data within the pipeline execution. Amazon SageMaker ML Lineage Tracking lets you analyze where the data came from, where it was used as an input, and the outputs that were generated from it. For example, you can view the models created from an individual dataset, and you can view the datasets that went into creating an individual model. For more information, see Amazon SageMaker ML Lineage Tracking (p. 3151).

Step Reuse

With SageMaker Pipelines, you can designate steps for caching. When a step is cached, it is indexed for reuse later if the same step is executed again. As a result, you can reuse the output from previous step executions of the same step in the same pipeline without having to run the step again. For more information on step caching, see Caching Pipeline Steps (p. 3076).

Topics

SageMaker Pipelines Overview

An Amazon SageMaker Model Building Pipelines pipeline is a series of interconnected steps that are defined using the Pipelines SDK. This pipeline definition encodes a pipeline using a directed acyclic graph (DAG) that can be exported as a JSON definition. This DAG gives information on the requirements for and relationships between each step of your pipeline. The structure of a pipeline's DAG is determined by the data dependencies between steps. These data dependencies are created when the properties of a step's output are passed as the input to another step. The following image is an example of a pipeline DAG:
The following topics describe fundamental SageMaker Pipelines concepts. For a tutorial describing the implementation of these concepts, see Create and Manage SageMaker Pipelines (p. 3092).

**Topics**

- Amazon SageMaker Experiments Integration (p. 3087)
- Local Mode (p. 3090)
- Troubleshooting Amazon SageMaker Model Building Pipelines (p. 3091)

**Pipeline Structure and Execution**

**Topics**
Pipeline Structure

An Amazon SageMaker Model Building Pipelines instance is composed of a name, parameters, and steps. Pipeline names must be unique within an (account, region) pair. All parameters used in step definitions must be defined in the pipeline. Pipeline steps listed automatically determine their order of execution by their data dependencies on one another. The SageMaker Pipelines service resolves the relationships between steps in the data dependency DAG to create a series of steps that the execution completes. The following is an example of a pipeline structure.

```python
from sagemaker.workflow.pipeline import Pipeline

pipeline_name = f"AbalonePipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[
        processing_instance_type,
        processing_instance_count,
        training_instance_type,
        model_approval_status,
        input_data,
        batch_data,
    ],
    steps=[step_process, step_train, step_eval, step_cond],
)
```

Pipeline Execution using Parallelism Configuration

By default, a pipeline performs all steps that are available to run in parallel. You can control this behavior by using the `ParallelismConfiguration` property when creating or updating a pipeline, as well as when starting or retrying a pipeline execution.

Parallelism configurations are applied per execution. For example, if two executions are started they can each run a maximum of 50 steps concurrently, for a total of 100 concurrently running steps. Also, `ParallelismConfiguration(s)` specified when starting, retrying or updating an execution take precedence over parallelism configurations defined in the pipeline.

Example Creating a pipeline execution with `ParallelismConfiguration`

```python
pipeline = Pipeline(
    name="myPipeline",
    steps=[step_process, step_train]
)

pipeline.create(role, parallelism_config={"MaxParallelExecutionSteps": 50})
```

IAM Access Management

The following sections describe the AWS Identity and Access Management (IAM) requirements for Amazon SageMaker Model Building Pipelines. For an example of how you can implement these permissions, see Prerequisites (p. 3093).

Topics

- Pipeline Role Permissions (p. 3053)
- Pipeline Step Permissions (p. 3053)
Pipeline Overview

- **Service Control Policies with Pipelines** (p. 3053)

**Pipeline Role Permissions**

Your pipeline requires an IAM pipeline execution role that is passed to SageMaker Pipelines when you create a pipeline. The role for the SageMaker instance that is creating the pipeline must have the `iam:PassRole` permission for the pipeline execution role in order to pass it. For more information on IAM roles, see **IAM Roles**.

Your pipeline execution role requires the following permissions:

- To pass any role to a SageMaker job within a pipeline, the `iam:PassRole` permission for the role that is being passed.
- Create and Describe permissions for each of the job types in the pipeline.
- Amazon S3 permissions to use the `JsonGet` function. You control access to your Amazon S3 resources using resource-based policies and identity-based policies. A resource-based policy is applied to your Amazon S3 bucket and grants SageMaker Pipelines access to the bucket. An identity-based policy gives your pipeline the ability to make Amazon S3 calls from your account. For more information on resource-based policies and identity-based policies, see **Identity-based policies and resource-based policies**.

```json
{
   "Action": [
      "s3:GetObject"
   ],
   "Resource": "arn:aws:s3:::<your-bucket-name>/*",
   "Effect": "Allow"
}
```

**Pipeline Step Permissions**

SageMaker Pipelines include steps that run SageMaker jobs. In order for the pipeline steps to run these jobs, they require an IAM role in your account that provides access for the needed resource. This role is passed to the SageMaker service principal by your pipeline. For more information on IAM roles, see **IAM Roles**.

By default, each step takes on the pipeline execution role. You can optionally pass a different role to any of the steps in your pipeline. This ensures that the code in each step does not have the ability to impact resources used in other steps unless there is a direct relationship between the two steps specified in the pipeline definition. You pass these roles when defining the processor or estimator for your step. For examples of how to include these roles in these definitions, see the **SageMaker Python SDK documentation**.

**Service Control Policies with Pipelines**

Service control policies (SCPs) are a type of organization policy that you can use to manage permissions in your organization. SCPs offer central control over the maximum available permissions for all accounts in your organization. By using SageMaker Pipelines within your organization, you can ensure that data scientists manage your pipeline executions without having to interact with the AWS console.

If you're using a VPC with your SCP that restricts access to Amazon S3, you need to take steps to allow your pipeline to access other Amazon S3 resources.

To allow SageMaker Pipelines to access Amazon S3 outside of your VPC with the `JsonGet` function, update your organization's SCP to ensure that the role using SageMaker Pipelines can access Amazon S3. To do this, create an exception for roles that are being used by the SageMaker Pipelines executor via the pipeline execution role using a principal tag and condition key.
To allow SageMaker Pipelines to access Amazon S3 outside of your VPC

1. Create a unique tag for your pipeline execution role following the steps in Tagging IAM users and roles.
2. Grant an exception in your SCP using theAws:PrincipalTag IAM condition key for the tag you created. For more information, see Creating, updating, and deleting service control policies.

Cross-Account Support for SageMaker Pipelines

You can use cross-account support for Amazon SageMaker Model Building Pipelines to share pipeline entities across AWS accounts and access shared pipelines through direct API calls.

Set up cross-account pipeline sharing

SageMaker uses AWS Resource Access Manager (AWS RAM) to help you securely share your pipeline entities across accounts.

Create a resource share

1. Select **Create a resource share** through the AWS RAM console.
2. When specifying resource share details, choose the SageMaker Pipelines resource type and select one or more pipelines that you want to share. When you share a pipeline with any other account, all of its executions are also shared implicitly.
3. Associate permissions with your resource share. Choose either the default read-only permission policy or the extended pipeline execution permission policy. For more detailed information, see Permission policies for SageMaker Pipelines resources (p. 3054).
   
   **Note**
   
   If you select the extended pipeline execution policy, note that any start, stop, and retry commands called by shared accounts use resources in the AWS account that shared the pipeline.
4. Use AWS account IDs to specify the accounts to which you want to grant access to your shared resources.
5. Review your resource share configuration and select **Create resource share**. It may take a few minutes for the resource share and principal associations to complete.

For more information, see Sharing your AWS resources in the AWS Resource Access Manager User Guide.

Get responses to your resource share invitation

Once the resource share and principal associations are set, the specified AWS accounts receive an invitation to join the resource share. The AWS accounts must accept the invite to gain access to any shared resources.

For more information on accepting a resource share invite through AWS RAM, see Using shared AWS resources in the AWS Resource Access Manager User Guide.

Permission policies for SageMaker Pipelines resources

When creating your resource share, choose one of two supported permission policies to associate with the SageMaker pipeline resource type. Both policies grant access to any selected pipeline and all of its executions.

**Default read-only permissions**

The AWSRAMDefaultPermissionSageMakerPipeline policy allows the following read-only actions:
Extended pipeline execution permissions

The AWSRAMPermissionSageMakerPipelineAllowExecution policy includes all of the read-only permissions from the default policy and also allows shared accounts to start, stop, and retry pipeline executions.

Note
Be mindful of AWS resource usage when using the extended pipeline execution permission policy. With this policy, shared accounts are allowed to start, stop, and retry pipeline executions. Any resources used for shared pipeline executions are consumed by the owner account.

The extended pipeline execution permission policy allows the following actions:

- DescribePipeline
- DescribePipelineDefinitionForExecution
- DescribePipelineExecution
- ListPipelineExecutions
- ListPipelineExecutionSteps
- ListPipelineParametersForExecution
- StartPipelineExecution
- StopPipelineExecution
- RetryPipelineExecution
- Search

Access shared pipeline entities through direct API calls

Once cross-account pipeline sharing is set up, you can call the following SageMaker API actions using a pipeline ARN:

Note
You can only call API commands if they are included in the permissions associated with your resource share. If you select the AWSRAMPermissionSageMakerPipelineAllowExecution policy, then the start, stop, and retry commands use resources in the AWS account that shared the pipeline.

- DescribePipeline
- DescribePipelineDefinitionForExecution
- DescribePipelineExecution
- ListPipelineExecutions
- ListPipelineExecutionSteps
- ListPipelineParametersForExecution
- StartPipelineExecution
- StopPipelineExecution
- RetryPipelineExecution

Pipeline Parameters

You can introduce variables into your pipeline definition using parameters. You can reference parameters that you define throughout your pipeline definition. Parameters have a default value, which you can
override by specifying parameter values when starting a pipeline execution. The default value must be an instance matching the parameter type. All parameters used in step definitions must be defined in your pipeline definition. Amazon SageMaker Model Building Pipelines supports the following parameter types:

- **ParameterString** – Representing a string parameter.
- **ParameterInteger** – Representing an integer parameter.
- **ParameterFloat** – Representing a float parameter.
- **ParameterBoolean** – Representing a Boolean Python type.

Parameters take the following format:

```python
<parameter> = <parameter_type>(
    name="<parameter_name>",
    default_value=<default_value>
)
```

The following example shows a sample parameter implementation.

```python
from sagemaker.workflow.parameters import (ParameterInteger, ParameterString, ParameterFloat, ParameterBoolean)

processing_instance_count = ParameterInteger(
    name="ProcessingInstanceCount",
    default_value=1
)
```

You pass the parameter when creating your pipeline as shown in the following example.

```python
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[
        processing_instance_count
    ],
    steps=[step_process]
)
```

You can also pass a parameter value that differs from the default value to a pipeline execution, as shown in the following example.

```python
execution = pipeline.start(
    parameters=dict(
        ProcessingInstanceType="ml.c5.xlarge",
        ModelApprovalStatus="Approved"
    )
)
```

You can manipulate parameters with SageMaker Python SDK functions like `sagemaker.workflow.functions.Join`. For more information on parameters, see **SageMaker Pipelines Parameters**.

For known limitations of SageMaker Pipelines Parameters, see **Limitations - Parameterization** in the **Amazon SageMaker Python SDK**.
Pipeline Steps

SageMaker Pipelines are composed of steps. These steps define the actions that the pipeline takes and the relationships between steps using properties.

Topics
- Step Types (p. 3057)
- Step Properties (p. 3073)
- Step Parallelism (p. 3073)
- Data Dependency Between Steps (p. 3073)
- Custom Dependency Between Steps (p. 3074)
- Use a Custom Image in a Step (p. 3075)

Step Types

The following describes the requirements of each step type and provides an example implementation of the step. These are not functional implementations because they don't provide the resource and inputs needed. For a tutorial that implements these steps, see Create and Manage SageMaker Pipelines (p. 3092).

Amazon SageMaker Model Building Pipelines support the following step types:
- Processing (p. 3057)
- Training (p. 3058)
- Tuning (p. 3059)
- Model (p. 3060)
- CreateModel (p. 3062)
- RegisterModel (p. 3062)
- Transform (p. 3063)
- Condition (p. 3064)
- Callback (p. 3064)
- Lambda (p. 3066)
- ClarifyCheck (p. 3068)
- QualityCheck (p. 3069)
- EMR (p. 3071)
- Fail (p. 3072)

Processing Step

Use a processing step to create a processing job for data processing. For more information on processing jobs, see Process Data and Evaluate Models.

A processing step requires a processor, a Python script that defines the processing code, outputs for processing, and job arguments. The following example shows how to create a ProcessingStep definition.

```python
from sagemaker.sklearn.processing import SKLearnProcessor

sklearn_processor = SKLearnProcessor(framework_version='1.0-1',
    role=<role>,
    instance_type='ml.m5.xlarge',
    instance_count=1)
```
from sagemaker.processing import ProcessingInput, ProcessingOutput
from sagemaker.workflow.steps import ProcessingStep

step_process = ProcessingStep(
    name="AbaloneProcess",
    processor=sklearn_processor,
    inputs=[
        ProcessingInput(source=<input_data>, destination="/opt/ml/processing/input"),
    ],
    outputs=[
        ProcessingOutput(output_name="train", source="/opt/ml/processing/train"),
        ProcessingOutput(output_name="validation", source="/opt/ml/processing/validation"),
        ProcessingOutput(output_name="test", source="/opt/ml/processing/test")
    ],
    code="abalone/preprocessing.py")

**Pass runtime parameters**

The following example shows how to pass runtime parameters from a PySpark processor to a `ProcessingStep`.

from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.spark.processing import PySparkProcessor
from sagemaker.processing import ProcessingInput, ProcessingOutput
from sagemaker.workflow.steps import ProcessingStep

pipeline_session = PipelineSession()
pyspark_processor = PySparkProcessor(
    framework_version='2.4',
    role=<role>,
    instance_type='ml.m5.xlarge',
    instance_count=1,
    sagemaker_session=pipeline_session,
)

step_args = pyspark_processor.run(
    inputs=[ProcessingInput(source=<input_data>, destination="/opt/ml/processing/input"),],
    outputs=[
        ProcessingOutput(output_name="train", source="/opt/ml/processing/train"),
        ProcessingOutput(output_name="validation", source="/opt/ml/processing/validation"),
        ProcessingOutput(output_name="test", source="/opt/ml/processing/test")
    ],
    code="preprocess.py",
    arguments=None,
)

step_process = ProcessingStep(
    name="AbaloneProcess",
    step_args=step_args,
)

For more information on processing step requirements, see the `sagemaker.workflow.steps.ProcessingStep` documentation. For an in-depth example, see *Define a Processing Step for Feature Engineering* in the *Orchestrate Jobs to Train and Evaluate Models with Amazon SageMaker Pipelines* example notebook.

**Training Step**

You use a training step to create a training job to train a model. For more information on training jobs, see *Train a Model with Amazon SageMaker*. 
A training step requires an estimator, as well as training and validation data inputs. The following example shows how to create a `TrainingStep` definition. For more information on training step requirements, see the `sagemaker.workflow.steps.TrainingStep` documentation.

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.inputs import TrainingInput
from sagemaker.workflow.steps import TrainingStep
from sagemaker.xgboost.estimator import XGBoost

pipeline_session = PipelineSession()
xgb_estimator = XGBoost(..., sagemaker_session=pipeline_session)
step_args = xgb_estimator.fit(
    inputs={
        "train": TrainingInput(
            s3_data=step_process.properties.ProcessingOutputConfig.Outputs["train"].S3Output.S3Uri,
            content_type="text/csv"
        ),
        "validation": TrainingInput(
            s3_data=step_process.properties.ProcessingOutputConfig.Outputs["validation"].S3Output.S3Uri,
            content_type="text/csv"
        )
    }
)
step_train = TrainingStep(
    name="TrainAbaloneModel",
    step_args=step_args,
)
```

### Tuning Step

You use a tuning step to create a hyperparameter tuning job, also known as hyperparameter optimization (HPO). A hyperparameter tuning job runs multiple training jobs, each one producing a model version. For more information on hyperparameter tuning, see Perform Automatic Model Tuning with SageMaker (p. 2360).

The tuning job is associated with the SageMaker experiment for the pipeline, with the training jobs created as trials. For more information, see Experiments Integration (p. 3087).

A tuning step requires a `HyperparameterTuner` and training inputs. You can retrain previous tuning jobs by specifying the `warm_start_config` parameter of the `HyperparameterTuner`. For more information on hyperparameter tuning and warm start, see Run a Warm Start Hyperparameter Tuning Job (p. 2381).

You use the `get_top_model_s3_uri` method of the `sagemaker.workflow.steps.TuningStep` class to get the model artifact from one of the top-performing model versions. For a notebook that shows how to use a tuning step in a SageMaker pipeline, see `sagemaker-pipelines-tuning-step.ipynb`.

**Important**

Tuning steps were introduced in Amazon SageMaker Python SDK v2.48.0 and Amazon SageMaker Studio v3.8.0. You must update Studio before you use a tuning step or the pipeline DAG doesn't display. To update Studio, see Shut down and Update SageMaker Studio (p. 181).

The following example shows how to create a `TuningStep` definition.
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.tuner import HyperparameterTuner
from sagemaker.inputs import TrainingInput
from sagemaker.workflow.steps import TuningStep
tuner = HyperparameterTuner(..., sagemaker_session=PipelineSession())
step_tuning = TuningStep(
    name = "HPTuning",
    step_args = tuner.fit(inputs=TrainingInput(s3_data="s3://my-bucket/my-data"))
)

Get the best model version

The following example shows how to get the best model version from the tuning job using the `get_top_model_s3_uri` method. At most, the top 50 performing versions are available ranked according to `HyperParameterTuningJobObjective`. The `top_k` argument is an index into the versions, where `top_k=0` is the best-performing version and `top_k=49` is the worst-performing version.

```python
best_model = Model(
    image_uri=image_uri,
    model_data=step_tuning.get_top_model_s3_uri(
        top_k=0,
    ),
    s3_bucket=sagemaker_session.default_bucket()
)
```

For more information on tuning step requirements, see the `sagemaker.workflow.steps.TuningStep` documentation.

Model Step

Use a `ModelStep` to create or register a SageMaker model. For more information on `ModelStep` requirements, see the `sagemaker.workflow.model_step.ModelStep` documentation.

Create a model

You can use a `ModelStep` to create a SageMaker model. A `ModelStep` requires model artifacts and information about the SageMaker instance type that you need to use to create the model. For more information on SageMaker models, see Train a Model with Amazon SageMaker.

The following example shows how to create a `ModelStep` definition.

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.model import Model
from sagemaker.workflow.model_step import ModelStep
step_train = TrainingStep(...)  
model = Model(
    image_uri=pytorch_estimator.training_image_uri(),
    model_data=step_train.properties.ModelArtifacts.S3ModelArtifacts,
    sagemaker_session=PipelineSession(),
    role=role,
)
```

```python
step_model_create = ModelStep(
    name="MyModelCreationStep",
    step_args=model.create(instance_type="ml.m5.xlarge"),
)```
Register a model

You can use a ModelStep to register a sagemaker.model.Model or a sagemaker.pipeline.PipelineModel with the Amazon SageMaker model registry. A PipelineModel represents an inference pipeline, which is a model composed of a linear sequence of containers that process inference requests. For more information about how to register a model, see Register and Deploy Models with Model Registry (p. 2834).

The following example shows how to create a ModelStep that registers a PipelineModel.

```python
import time
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.sklearn import SKLearnModel
from sagemaker.xgboost import XGBoostModel

pipeline_session = PipelineSession()

sklearn_model = SKLearnModel(
    model_data=processing_step.properties.ProcessingOutputConfig.Outputs['model'].S3Output.S3Uri,
    entry_point='inference.py',
    source_dir='sklearn_source_dir/',
    code_location=code_location,
    framework_version='1.0-1',
    role=role,
    sagemaker_session=pipeline_session,
    py_version='py3'
)

xgboost_model = XGBoostModel(
    model_data=training_step.properties.ModelArtifacts.S3ModelArtifacts,
    entry_point='inference.py',
    source_dir='xgboost_source_dir/',
    code_location=code_location,
    framework_version='0.90-2',
    py_version='py3',
    sagemaker_session=pipeline_session,
    role=role
)

pipeline_model = PipelineModel(
    models=[sklearn_model, xgboost_model],
    role=role,
    sagemaker_session=pipeline_session,
)

register_model_step_args = pipeline_model.register(
    content_types=['application/json'],
    response_types=['application/json'],
    inference_instances=['ml.t2.medium', 'ml.m5.xlarge'],
    transform_instances=['ml.m5.xlarge'],
    model_package_group_name='sipgroup',
)

step_model_registration = ModelStep(
    name="AbaloneRegisterModel",
    step_args=register_model_step_args,
)"
CreateModel Step

Important

We recommend using Model Step (p. 3060) to create models as of v2.90.0 of the SageMaker Python SDK. CreateModelStep will continue to work in previous versions of the SageMaker Python SDK, but is no longer actively supported.

You use a CreateModel step to create a SageMaker model. For more information on SageMaker models, see Train a Model with Amazon SageMaker.

A create model step requires model artifacts and information about the SageMaker instance type that you need to use to create the model. The following example shows how to create a CreateModel step definition. For more information on CreateModel step requirements, see the sagemaker.workflow.steps.CreateModelStep documentation.

```python
from sagemaker.workflow.steps import CreateModelStep

step_create_model = CreateModelStep(
    name="AbaloneCreateModel",
    model=best_model,
    inputs=inputs
)
```

RegisterModel Step

Important

We recommend using Model Step (p. 3060) to register models as of v2.90.0 of the SageMaker Python SDK. RegisterModel will continue to work in previous versions of the SageMaker Python SDK, but is no longer actively supported.

You use a RegisterModel step to register a sagemaker.model.Model or a sagemaker.pipeline.PipelineModel with the Amazon SageMaker model registry. A PipelineModel represents an inference pipeline, which is a model composed of a linear sequence of containers that process inference requests.

For more information about how to register a model, see Register and Deploy Models with Model Registry (p. 2834). For more information on RegisterModel step requirements, see the sagemaker.workflow.step_collections.RegisterModel documentation.

The following example shows how to create a RegisterModel step that registers a PipelineModel.

```python
import time
from sagemaker.sklearn import SKLearnModel
from sagemaker.xgboost import XGBoostModel
code_location = 's3://{0}/{1}/code'.format(bucket_name, prefix)

sklearn_model = SKLearnModel(model_data=processing_step.properties.ProcessingOutputConfig.Outputs["model"].S3Output.S3Uri,
    entry_point='inference.py',
    source_dir='sklearn_source_dir/',
    code_location=code_location,
    framework_version='1.0-1',
    role=role,
    sagemaker_session=sagemaker_session,
    py_version='py3')

xgboost_model =
XGBoostModel(model_data=training_step.properties.ModelArtifacts.S3ModelArtifacts, 3062
entry_point='inference.py',
source_dir='xgboost_source_dir/',
code_location=code_location,
framework_version='0.90-2',
py_version='py3',
sagemaker_session=sagemaker_session,
role=role)

from sagemaker.workflow.step_collections import RegisterModel
from sagemaker import PipelineModel
pipeline_model = PipelineModel(models=[sklearn_model,xgboost_model],role=role,sagemaker_session=sagemaker_session)

step_register = RegisterModel(
    name="AbaloneRegisterModel",
    model=pipeline_model,
    content_types=['application/json'],
    response_types=['application/json'],
    inference_instances=['ml.t2.medium', 'ml.m5.xlarge'],
    transform_instances=['ml.m5.xlarge'],
    model_package_group_name='sipgroup',
)

If model isn't provided, the register model step requires an estimator as shown in the following example.

from sagemaker.workflow.step_collections import RegisterModel

step_register = RegisterModel(
    name="AbaloneRegisterModel",
    estimator=xgb_train,
    model_data=step_train.properties.ModelArtifacts.S3ModelArtifacts,
    content_types=['text/csv'],
    response_types=['text/csv'],
    inference_instances=['ml.t2.medium', 'ml.m5.xlarge'],
    transform_instances=['ml.m5.xlarge'],
    model_package_group_name=model_package_group_name,
    approval_status=model_approval_status,
    model_metrics=model_metrics
)

Transform Step

You use a transform step for batch transformation to run inference on an entire dataset. For more information about batch transformation, see Run Batch Transforms with Inference Pipelines (p. 2680).

A transform step requires a transformer and the data on which to run batch transformation. The following example shows how to create a Transform step definition. For more information on Transform step requirements, see the sagemaker.workflow.steps.TransformStep documentation.

from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.transformer import Transformer
from sagemaker.inputs import TransformInput
from sagemaker.workflow.steps import TransformStep

transformer = Transformer(..., sagemaker_session=PipelineSession())

step_transform = TransformStep(
    name="AbaloneTransform",
    step_args=transformer.transform(data="s3://my-bucket/my-data"),
)
**Condition Step**

You use a condition step to evaluate the condition of step properties to assess which action should be taken next in the pipeline.

A condition step requires a list of conditions, a list of steps to run if the condition evaluates to `true`, and a list of steps to run if the condition evaluates to `false`. The following example shows how to create a `ConditionStep` definition.

**Limitations**

- SageMaker Pipelines doesn't support the use of nested condition steps. You can't pass a condition step as the input for another condition step.
- A condition step can't use identical steps in both branches. If you need the same step functionality in both branches, duplicate the step and give it a different name.

```python
from sagemaker.workflow.conditions import ConditionLessThanOrEqualTo
from sagemaker.workflow.condition_step import (ConditionStep,
                                                JsonGet
)

cond_lte = ConditionLessThanOrEqualTo(
    left=JsonGet(
        step_name=step_eval.name,
        property_file=evaluation_report,
        json_path="regression_metrics.mse.value"
    ),
    right=6.0
)

step_cond = ConditionStep(
    name="AbaloneMSECond",
    conditions=[cond_lte],
    if_steps=[step_register, step_create_model, step_transform],
    else_steps=[]
)
```

For more information on `ConditionStep` requirements, see the `sagemaker.workflow.condition_step.ConditionStep` API reference. For more information on supported conditions, see `Amazon SageMaker Model Building Pipelines - Conditions` in the SageMaker Python SDK documentation.

**Callback Step**

You use a Callback step to incorporate additional processes and AWS services into your workflow that aren't directly provided by Amazon SageMaker Model Building Pipelines. When a Callback step runs, the following procedure occurs:

- SageMaker Pipelines sends a message to a customer-specified Amazon Simple Queue Service (Amazon SQS) queue. The message contains a SageMaker Pipelines–generated token and a customer-supplied list of input parameters. After sending the message, SageMaker Pipelines waits for a response from the customer.
- The customer retrieves the message from the Amazon SQS queue and starts their custom process.
- When the process finishes, the customer calls one of the following APIs and submits the SageMaker Pipelines–generated token:
  - `SendPipelineExecutionStepSuccess`, along with a list of output parameters
  - `SendPipelineExecutionStepFailure`, along with a failure reason
• The API call causes SageMaker Pipelines to either continue the pipeline process or fail the process.

For more information on Callback step requirements, see the `sagemaker.workflow.callback_step.CallbackStep` documentation. For a complete solution, see Extend SageMaker Pipelines to include custom steps using callback steps.

**Important**

Callback steps were introduced in Amazon SageMaker Python SDK v2.45.0 and Amazon SageMaker Studio v3.6.2. You must update Studio before you use a Callback step or the pipeline DAG doesn't display. To update Studio, see Shut down and Update SageMaker Studio (p. 181).

The following sample demonstrates an implementation of the preceding procedure.

```python
from sagemaker.workflow.callback_step import CallbackStep

step_callback = CallbackStep(
    name="MyCallbackStep",
    sqs_queue_url="https://sqs.us-east-2.amazonaws.com/012345678901/MyCallbackQueue",
    inputs={...},
    outputs=[...]
)

callback_handler_code = '    import boto3
    import json

    def handler(event, context):
        sagemaker_client=boto3.client("sagemaker")

        for record in event['Records']:
            payload=json.loads(record['body'])
            token=payload['token']

# Custom processing

# Call SageMaker to complete the step
sagemaker_client.send_pipeline_execution_step_success(
    CallbackToken=token,
    OutputParameters={...}
)

''
```

**Note**

Output parameters for `CallbackStep` should not be nested. For example, if you use a nested dictionary as your output parameter, then the dictionary is treated as a single string (ex. `{"output1": "{"nested_output1":"my-output"}"}`). If you provide a nested value, then when you try to refer to a particular output parameter, a non-retryable client error is thrown.

**Stopping behavior**

A pipeline process doesn't stop while a Callback step is running.

When you call `StopPipelineExecution` on a pipeline process with a running Callback step, SageMaker Pipelines sends an additional Amazon SQS message to the specified SQS queue. The body of the SQS message contains a `Status` field, which is set to `Stopping`. The following shows an example SQS message body.

```json
{
    "token": "26vcYbeWsZ",
}
```
"pipelineExecutionArn": "arn:aws:sagemaker:us-east-2:012345678901:pipeline/callback-pipeline/execution/7pinimwddh3a",
"arguments": {
  "number": 5,
  "stringArg": "some-arg",
  "inputData": "s3://sagemaker-us-west-2-012345678901/abalone/abalone-dataset.csv"
},
"status": "Stopping"
}

You should add logic to your Amazon SQS message consumer to take any needed action (for example, resource cleanup) upon receipt of the message, followed by a call to SendPipelineExecutionStepSuccess or SendPipelineExecutionStepFailure. Only when SageMaker Pipelines receives one of these calls does it stop the pipeline process.

**Lambda Step**

You use a Lambda step to run an AWS Lambda function. You can run an existing Lambda function, or SageMaker can create and run a new Lambda function. For a notebook that shows how to use a Lambda step in a SageMaker pipeline, see sagemaker-pipelines-lambda-step.ipynb.

**Important**

Lambda steps were introduced in Amazon SageMaker Python SDK v2.51.0 and Amazon SageMaker Studio v3.9.1. You must update Studio before you use a Lambda step or the pipeline DAG doesn't display. To update Studio, see Shut down and Update SageMaker Studio (p. 181).

SageMaker provides the sagemaker.lambda_helper.Lambda class to create, update, invoke, and delete Lambda functions. Lambda has the following signature.

```python
Lambda(  
    function_arn,  # Only required argument to invoke an existing Lambda function
    # The following arguments are required to create a Lambda function:
    function_name,  
    execution_role_arn,  
    zipped_code_dir,  # Specify either zipped_code_dir and s3_bucket, OR script
    s3_bucket,  # S3 bucket where zipped_code_dir is uploaded
    script,  # Path of Lambda function script  
    handler,  # Lambda handler specified as "lambda_script.lambda_handler"
    timeout,  # Maximum time the Lambda function can run before the lambda step fails
    ...  
)
```

The sagemaker.workflow.lambda_step.LambdaStep class has a lambda_func argument of type Lambda. To invoke an existing Lambda function, the only requirement is to supply the Amazon Resource Name (ARN) of the function to function_arn. If you don't supply a value for function_arn, you must specify handler and one of the following:

- **zipped_code_dir** – The path of the zipped Lambda function
- **s3_bucket** – Amazon S3 bucket where zipped_code_dir is to be uploaded
- **script** – The path of the Lambda function script file

The following example shows how to create a Lambda step definition that invokes an existing Lambda function.

```python
from sagemaker.workflow.lambda_step import LambdaStep  
from sagemaker.lambda_helper import Lambda  
```
The following example shows how to create a Lambda step definition that creates and invokes a Lambda function using a Lambda function script.

```python
from sagemaker.workflow.lambda_step import LambdaStep
from sagemaker.lambda_helper import Lambda

step_lambda = LambdaStep(
    name="ProcessingLambda",
    lambda_func=Lambda(
        function_name="split-dataset-lambda",
        execution_role_arn=execution_role_arn,
        script="lambda_script.py",
        handler="lambda_script.lambda_handler",
    ),
    inputs={
        s3_bucket = s3_bucket,
        data_file = data_file
    },
    outputs=[
        "train_file", "test_file"
    ]
)
```

**Inputs and outputs**

If your Lambda function has inputs or outputs, these must also be defined in your Lambda step.

**Note**

Input and output parameters should not be nested. For example, if you use a nested dictionary as your output parameter, then the dictionary is treated as a single string (ex. `{"output1": "{"nested_output1": "my-output"}}`). If you provide a nested value and try to refer to it later, a non-retryable client error is thrown.

When defining the Lambda step, `inputs` must be a dictionary of key-value pairs. Each value of the `inputs` dictionary must be a primitive type (string, integer, or float). Nested objects are not supported. If left undefined, the `inputs` value defaults to `None`.

The `outputs` value must be a list of keys. These keys refer to a dictionary defined in the output of the Lambda function. Like `inputs`, these keys must be primitive types, and nested objects are not supported.

**Timeout and stopping behavior**

The Lambda class has a `timeout` argument that specifies the maximum time that the Lambda function can run. The default value is 120 seconds with a maximum value of 10 minutes. If the Lambda function is running when the timeout is met, the Lambda step fails; however, the Lambda function continues to run.
A pipeline process can't be stopped while a Lambda step is running because the Lambda function invoked by the Lambda step can't be stopped. If you attempt to stop the process while the Lambda function is running, the pipeline waits for the Lambda function to finish or until the timeout is hit, whichever occurs first, and then stops. If the Lambda function finishes, the pipeline process status is Stopped. If the timeout is hit the pipeline process status is Failed.

**ClarifyCheck Step**

You can use the ClarifyCheck step to conduct baseline drift checks against previous baselines for bias analysis and model explainability. You can then generate and register your baselines with the `model.register()` method and pass the output of that method to Model Step (p. 3060) using `step_args`. These baselines for drift check can be used by Amazon SageMaker Model Monitor for your model endpoints so that you don't need to do a baseline suggestion separately. The ClarifyCheck step can also pull baselines for drift check from the model registry. The ClarifyCheck step leverages the Amazon SageMaker Clarify prebuilt container that provides a range of model monitoring capabilities, including constraint suggestion and constraint validation against a given baseline. For more information, see Getting Started with a SageMaker Clarify Container.

**Configuring the ClarifyCheck step**

You can configure the ClarifyCheck step to conduct only one of the following check types each time it's used in a pipeline.

- Data bias check
- Model bias check
- Model explainability check

You do this by setting the `clarify_check_config` parameter with one of the following check type values:

- `DataBiasCheckConfig`
- `ModelBiasCheckConfig`
- `ModelExplainabilityCheckConfig`

The ClarifyCheck step launches a processing job that runs the SageMaker Clarify prebuilt container and requires dedicated configurations for the check and the processing job. `clarify_check_config` and `CheckJobConfig` are helper functions for these configurations that are aligned with how the SageMaker Clarify processing job computes for checking model bias, data bias, or model explainability. For more information, see Run SageMaker Clarify Processing Jobs for Bias Analysis and Explainability (p. 2544).

**Controlling step behaviors for drift check**

The ClarifyCheck step requires the following two boolean flags to control its behavior:

- `skip_check`: This parameter indicates if the drift check against the previous baseline is skipped or not. If it is set to `False`, the previous baseline of the configured check type must be available.
- `register_new_baseline`: This parameter indicates if a newly calculated baseline can be accessed through step property `BaselineUsedForDriftCheckConstraints`. If it is set to `False`, the previous baseline of the configured check type also must be available. This can be accessed through the `BaselineUsedForDriftCheckConstraints` property.

For more information, see Baseline calculation, drift detection and lifecycle with ClarifyCheck and QualityCheck steps in Amazon SageMaker Model Building Pipelines (p. 3080).
Working with baselines

You can optionally specify the `model_package_group_name` to locate the existing baseline and the ClarifyCheck step pulls the `DriftCheckBaselines` on the latest approved model package in the model package group. Or, you can provide a previous baseline through the `supplied_baseline_constraints` parameter. If you specify both the `model_package_group_name` and the `supplied_baseline_constraints`, the ClarifyCheck step uses the baseline specified by the `supplied_baseline_constraints` parameter.

For more information on using the ClarifyCheck step requirements, see the `sagemaker.workflow.steps.ClarifyCheckStep` in the [Amazon SageMaker SageMaker SDK for Python](https://sagemaker.amazonaws.com). For an Amazon SageMaker Studio notebook that shows how to use ClarifyCheck step in SageMaker Pipelines, see `sagemaker-pipeline-model-monitor-clarify-steps.ipynb`.

Example Create a ClarifyCheck step for data bias check

```python
from sagemaker.workflow.check_job_config import CheckJobConfig
from sagemaker.workflow.clarify_check_step import DataBiasCheckConfig, ClarifyCheckStep
from sagemaker.workflow.execution_variables import ExecutionVariables

check_job_config = CheckJobConfig(
    role=role,
    instance_count=1,
    instance_type="ml.c5.xlarge",
    volume_size_in_gb=120,
    sagemaker_session=sagemaker_session,
)

data_bias_data_config = DataConfig(
    s3_data_input_path=step_process.properties.ProcessingOutputConfig.Outputs["train"].S3Output.S3Uri,
    s3_output_path=Join(on='/', values=['s3://', your_bucket, base_job_prefix, ExecutionVariables.PIPELINE_EXECUTION_ID, 'databiascheckstep']),
    label=0,
    dataset_type="text/csv",
    s3_analysis_config_output_path=data_bias_analysis_cfg_output_path,
)

data_bias_config = BiasConfig(
    label_values_or_threshold=[15.0], facet_name=[8], facet_values_or_threshold=[[0.5]]
)

data_bias_check_config = DataBiasCheckConfig(
    data_config=data_bias_data_config,
    data_bias_config=data_bias_config,
)

data_bias_check_step = ClarifyCheckStep(
    name="DataBiasCheckStep",
    clarify_check_config=data_bias_check_config,
    check_job_config=check_job_config,
    skip_check=False,
    register_new_baseline=False,
    supplied_baseline_constraints="s3://sagemaker-us-west-2-111122223333/baseline/analysis.json",
    model_package_group_name="MyModelPackageGroup"
)
```

QualityCheck Step

You can use the QualityCheck step to conduct baseline suggestions and drift checks against a previous baseline for data quality or model quality in a pipeline. You can then generate and register your baselines with the `model.register()` method and pass the output of that method to Model
Step (p. 3060) using `step_args`. Model Monitor can use these baselines for drift check for your model endpoints so that you don’t need to do a baseline suggestion separately. The QualityCheck step can also pull baselines for drift check from the model registry. The QualityCheck step leverages the Amazon SageMaker Model Monitor prebuilt container, which has a range of model monitoring capabilities including constraint suggestion, statistics generation, and constraint validation against a baseline. For more information, see Amazon SageMaker Model Monitor prebuilt container (p. 2752).

**Configuring the QualityCheck step**

You can configure the QualityCheck step to conduct only one of the following check types each time it’s used in a pipeline.

- Data quality check
- Model quality check

You do this by setting the `quality_check_config` parameter with one of the following check type values:

- `DataQualityCheckConfig`
- `ModelQualityCheckConfig`

The QualityCheck step launches a processing job that runs the Model Monitor prebuilt container and requires dedicated configurations for the check and the processing job. The `QualityCheckConfig` and `CheckJobConfig` are helper functions for these configurations that are aligned with how Model Monitor creates a baseline for the model quality or data quality monitoring. For more information on the Model Monitor baseline suggestions, see Create a Baseline (p. 2718) and Create a Model Quality Baseline (p. 2723).

**Controlling step behaviors for drift check**

The QualityCheck step requires the following two Boolean flags to control its behavior:

- `skip_check`: This parameter indicates if the drift check against the previous baseline is skipped or not. If it is set to `False`, the previous baseline of the configured check type must be available.
- `register_new_baseline`: This parameter indicates if a newly calculated baseline can be accessed through step properties `BaselineUsedForDriftCheckConstraints` and `BaselineUsedForDriftCheckStatistics`. If it is set to `False`, the previous baseline of the configured check type must also be available. These can be accessed through the `BaselineUsedForDriftCheckConstraints` and `BaselineUsedForDriftCheckStatistics` properties.

For more information, see Baseline calculation, drift detection and lifecycle with ClarifyCheck and QualityCheck steps in Amazon SageMaker Model Building Pipelines (p. 3080).

**Working with baselines**

You can specify a previous baseline directly through the `supplied_baseline_statistics` and `supplied_baseline_constraints` parameters, or you can simply specify the `model_package_group_name` and the QualityCheck step pulls the `DriftCheckBaselines` on the latest approved model package in the model package group. When you specify the `model_package_group_name`, `supplied_baseline_constraints`, and `supplied_baseline_statistics`, the QualityCheck step uses the baseline specified by `supplied_baseline_constraints` and `supplied_baseline_statistics` on the check type of the QualityCheck step you are running.

For more information on using the QualityCheck step requirements, see the `sagemaker.workflow.steps.QualityCheckStep` in the Amazon SageMaker SageMaker SDK for Python. For

3070
an Amazon SageMaker Studio notebook that shows how to use QualityCheck step in SageMaker Pipelines, see sagemaker-pipeline-model-monitor-clarify-steps.ipynb.

**Example Create a QualityCheck step for data quality check**

```python
from sagemaker.workflow.check_job_config import CheckJobConfig
from sagemaker.workflow.quality_check_step import DataQualityCheckConfig, QualityCheckStep
from sagemaker.workflow.execution_variables import ExecutionVariables

check_job_config = CheckJobConfig(
    role=role,
    instance_count=1,
    instance_type="ml.c5.xlarge",
    volume_size_in_gb=120,
    sagemaker_session=sagemaker_session,
)

data_quality_check_config = DataQualityCheckConfig(
    baseline_dataset=step_process.properties.ProcessingOutputConfig.Outputs["train"].S3Output.S3Uri,
    dataset_format=DatasetFormat.csv(header=False, output_columns_position="START"),
    output_s3_uri=Join(on='/', values=['s3:', your_bucket, base_job_prefix, ExecutionVariables.PIPELINE_EXECUTION_ID, 'dataqualitycheckstep'])
)

data_quality_check_step = QualityCheckStep(
    name="DataQualityCheckStep",
    skip_check=False,
    register_new_baseline=False,
    quality_check_config=data_quality_check_config,
    check_job_config=check_job_config,
    supplied_baseline_statistics="s3://sagemaker-us-west-2-555555555555/baseline/statistics.json",
    supplied_baseline_constraints="s3://sagemaker-us-west-2-555555555555/baseline/constraints.json",
    model_package_group_name="MyModelPackageGroup"
)
```

**Amazon EMR Step**

You can use the Amazon SageMaker Model Building Pipelines Amazon EMR step to process EMR steps to a running Amazon EMR cluster. For more information, see Getting started with Amazon EMR.

The Amazon EMR step requires an EMRStepConfig having the Amazon S3 location of the JAR to be used by the Amazon EMR cluster and any arguments to be passed, as well as the Amazon EMR cluster ID.

**Note**

- Amazon EMR steps require that the role passed to your pipeline has additional permissions. You should attach the AWS managed policy: AmazonSageMakerPipelinesIntegrations to your pipeline role, or ensure that the role includes the permissions in that policy.
- Amazon EMR on EKS is not supported.
- You can only run a EMR step on a cluster that is in one of the following states: STARTING, BOOTSTRAPPING, RUNNING, or WAITING.
- You can have at most 256 EMR steps in PENDING on an EMR cluster; EMR steps submitted beyond that limit result in the pipeline execution failing. You may consider using Retry Policy for Pipeline Steps (p. 3077).

**Example Create an Amazon EMR step definition that launches a new job on a EMR cluster.**

```python
from sagemaker.workflow.emr_step import EMRStep, EMRStepConfig
```
emr_config = EMRStepConfig(
    jar="s3://path/to/jar/MyJar.jar", # required, S3 path to jar
    args=["--verbose", "--force"], # optional list of arguments to pass to the jar
    main_class="com.my.Main1", # optional main class, this can be omitted if jar above has
    properties=[ # optional list of Java properties that are set when the step runs
        "key": "mapred.tasktracker.map.tasks.maximum",
        "value": "2"
    ],
    
    "key": "mapreduce.map.sort.spill.percent",
    "value": "0.90"
    
    "key": "mapreduce.tasktracker.reduce.tasks.maximum",
    "value": "5"
]
)

step_emr = EMRStep (
    name="EMRSampleStep", # required
    cluster_id="j-1YONHTCP3YZKC", # required
    step_config=emr_config, # required
    display_name="My EMR Step",
    description="Pipeline step to execute EMR job"
)

Fail Step

You use a FailStep to stop an Amazon SageMaker Model Building Pipelines execution when a desired condition or state is not achieved and to mark that pipeline's execution as failed. The FailStep also allows you to enter a custom error message, indicating the cause of the pipeline's execution failure.

**Note**

When a FailStep and other pipeline steps execute concurrently, the pipeline does not terminate until all concurrent steps are completed.

**Limitations for using FailStep**

- You cannot add a FailStep to the DependsOn list of other steps. For more information, see Custom Dependency Between Steps (p. 3074).
- Other steps cannot reference the FailStep. It is always the last step in a pipeline's execution.
- You cannot retry a pipeline execution ending with a FailStep.

You can create the FailStep ErrorMessage in the form of a static text string. Alternatively, you can also use Pipeline Parameters a Join operation, or other step properties to create a more informative error message.

**Example**

The following example code snippet uses a FailStep with an ErrorMessage configured with Pipeline Parameters and a Join operation.

```python
from sagemaker.workflow.fail_step import FailStep
from sagemaker.workflow.functions import Join
from sagemaker.workflow.parameters import ParameterInteger

mse_threshold_param = ParameterInteger(name="MseThreshold", default_value=5)
```
Step Properties

The `properties` attribute is used to add data dependencies between steps in the pipeline. These data dependencies are then used by SageMaker Pipelines to construct the DAG from the pipeline definition. These properties can be referenced as placeholder values and are resolved at runtime.

The `properties` attribute of a SageMaker Pipelines step matches the object returned by a `Describe` call for the corresponding SageMaker job type. For each job type, the `Describe` call returns the following response object:

- `ProcessingStep` – `DescribeProcessingJob`
- `TrainingStep` – `DescribeTrainingJob`
- `TransformStep` – `DescribeTransformJob`

To check which properties are referrable for each step type during data dependency creation, see `Data Dependency - Property Reference` in the Amazon SageMaker Python SDK.

Step Parallelism

When a step does not depend on any other step, it is run immediately upon pipeline execution. However, executing too many pipeline steps in parallel can quickly exhaust available resources. Control the number of concurrent steps for a pipeline execution with `ParallelismConfiguration`.

The following example uses `ParallelismConfiguration` to set the concurrent step limit to five.

```python
pipeline.create(
    parallelism_config=ParallelismConfiguration(5),
)
```

Data Dependency Between Steps

You define the structure of your DAG by specifying the data relationships between steps. To create data dependencies between steps, pass the properties of one step as the input to another step in the pipeline. The step receiving the input isn't started until after the step providing the input finishes running.

A data dependency uses JsonPath notation in the following format. This format traverses the JSON property file, which means you can append as many `<property>` instances as needed to reach the desired nested property in the file. For more information on JsonPath notation, see the JsonPath repo.

```
<step_name>.properties.<property>.<property>
```

The following shows how to specify an Amazon S3 bucket using the `ProcessingOutputConfig` property of a processing step.

```python
step_process.properties.ProcessingOutputConfig.Outputs["train_data"].S3Output.S3Uri
```

To create the data dependency, pass the bucket to a training step as follows.

```python
from sagemaker.workflow.pipeline_context import PipelineSession
```
sklearn_train = SKLearn(..., sagemaker_session=PipelineSession())

step_train = TrainingStep(
    name="CensusTrain",
    step_args=sklearn_train.fit(inputs=TrainingInput(
        s3_data=step_process.properties.ProcessingOutputConfig.Outputs["train_data"].S3Output.S3Uri
    ))
)

To check which properties are referrable for each step type during data dependency creation, see Data Dependency - Property Reference in the Amazon SageMaker Python SDK.

Custom Dependency Between Steps

When you specify a data dependency, SageMaker Pipelines provides the data connection between the steps. Alternatively, one step can access the data from a previous step without directly using SageMaker Pipelines. In this case, you can create a custom dependency that tells SageMaker Pipelines not to start a step until after another step has finished running. You create a custom dependency by specifying a step's DependsOn attribute.

As an example, the following defines a step C that starts only after both step A and step B finish running.

```json
{  'Steps': [  {'Name':'A', ...},  {'Name':'B', ...},  {'Name':'C', 'DependsOn': ['A', 'B']} ]}
```

SageMaker Pipelines throws a validation exception if the dependency would create a cyclic dependency.

The following example creates a training step that starts after a processing step finishes running.

```python
processing_step = ProcessingStep(...)  
training_step = TrainingStep(...)  
training_step.add_depends_on([processing_step])
```

The following example creates a training step that doesn't start until two different processing steps finish running.

```python
processing_step_1 = ProcessingStep(...)  
processing_step_2 = ProcessingStep(...)  
training_step = TrainingStep(...)  
training_step.add_depends_on([processing_step_1, processing_step_2])
```

The following provides an alternate way to create the custom dependency.

```python
training_step.add_depends_on([processing_step_1])
training_step.add_depends_on([processing_step_2])
```

The following example creates a training step that receives input from one processing step and waits for a different processing step to finish running.
processing_step_1 = ProcessingStep(...)  
processing_step_2 = ProcessingStep(...)  

training_step = TrainingStep(  
    ...,  
    inputs=TrainingInput(  
        s3_data=processing_step_1.properties.ProcessingOutputConfig.Outputs["train_data"].S3Output.S3Uri  
    )  
)  

training_step.add_depends_on([processing_step_2])

The following example shows how to retrieve a string list of the custom dependencies of a step.

custom_dependencies = training_step.depends_on

Use a Custom Image in a Step

You can use any of the available SageMaker Deep Learning Container images when you create a step in your pipeline.

You can also create a step using SageMaker Amazon S3 applications. A SageMaker Amazon S3 application is a tar.gz bundle with one or more Python scripts that can run within that bundle. For more information on application package bundling, see Deploying directly from model artifacts.

You can also use your own container with pipeline steps. Because you can’t create an image from within Amazon SageMaker Studio, you must create your image using another method before using it with Amazon SageMaker Model Building Pipelines.

To use your own container when creating the steps for your pipeline, include the image URI in the estimator definition. For more information on using your own container with SageMaker, see Using Docker Containers with SageMaker.

Property Files and JsonGet

Use property files to store information from the output of a processing step. This is particularly useful when analyzing the results of a processing step to decide how a conditional step should be executed. The JsonGet function processes a property file and enables you to use JsonPath notation to query the property JSON file. For more information on JsonPath notation, see the JsonPath repo.

To store a property file for later use, you must first create a PropertyFile instance with the following format. The path parameter is the name of the JSON file to which the property file is saved. Any output_name must match the output_name of the ProcessingOutput that you define in your processing step. This enables the property file to capture the ProcessingOutput in the step.

```python
from sagemaker.workflow.properties import PropertyFile
<property_file_instance> = PropertyFile(  
    name="<property_file_name>",  
    output_name="<processingoutput_output_name>",  
    path="<path_to_json_file>"
)
```

When you create your ProcessingStep instance, add the property_files parameter to list all of the parameter files that the Amazon SageMaker Model Building Pipelines service must index. This saves the property file for later use.
property_files=[<property_file_instance>]

To use your property file in a condition step, add the `property_file` to the condition that you pass to your condition step as shown in the following example to query the JSON file for your desired property using the `json_path` parameter.

```python
cond_lte = ConditionLessThanOrEqualTo(
    left=JsonGet(
        step_name=step_eval.name,
        property_file=<property_file_instance>,
        json_path="mse"
    ),
    right=6.0
)
```

For more in-depth examples, see `Property File` in the Amazon SageMaker Python SDK.

**Caching Pipeline Steps**

When you use step signature caching, before SageMaker Pipelines executes a step, it attempts to find a previous execution of a step that was called with the same arguments. SageMaker Pipelines checks that the call signatures are identical. Pipelines doesn't check whether the data or code to which the arguments point has changed. If Pipelines finds a previous execution, it creates a cache hit. Pipelines then propagates the values from the cache hit during execution, rather than recomputing the step.

Step caching only considers successful executions, so it never reuses failed executions. When multiple successful executions exist within the timeout period, Pipelines uses the result for the most recent successful execution. If no successful executions match in the timeout period, Pipelines doesn't reuse any steps. If the executor finds a cache hit for a previous step execution that is still in progress, both steps continue executing and update the cache, if they're successful.

You must opt in to step caching, otherwise it is off by default. When you enable step caching, you must also define a timeout. This timeout defines how old a previous execution can be to be considered for reuse.

Step caching is only scoped for individual pipelines, so you can't reuse a step from another pipeline. Even if there is a step signature match in the other pipeline, the step is not reused.

Step caching is available for the following step types:

- Processing (p. 3057)
- Training (p. 3058)
- Tuning (p. 3059)
- Transform (p. 3063)
- ClarifyCheck (p. 3068)
- QualityCheck (p. 3069)
- EMR (p. 3071)

**Enabling Step Caching**

To enable step caching, you must add a `CacheConfig` property to the step definition.

`CacheConfig` properties use the following format in the pipeline definition file.
The `Enabled` field may be true or false. `ExpireAfter` is a string that defines the timeout period. Any ISO 8601 duration string is a valid `ExpireAfter` value. The `ExpireAfter` duration can contain a year, month, week, day, hour, and minute value. Each value is consists of a number followed by a letter indicating the duration unit it is for. For example:

- "30d" = Thirty days
- "5y" = Five years
- "T16m" = 16 minutes
- "30dT5h" = 30 days and five hours.

The following example shows how to enable caching for a training step using the Amazon SageMaker Python SDK.

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.workflow.steps import CacheConfig

cache_config = CacheConfig(enable_caching=True, expire_after="PT1H")
estimator = Estimator(..., sagemaker_session=PipelineSession())

step_train = TrainingStep(
    name="TrainAbaloneModel",
    step_args=estimator.fit(inputs=inputs),
    cache_config=cache_config
)
```

## Retry Policy for Pipeline Steps

Retry policies help you automatically retry your SageMaker Pipelines steps after an error occurs. Any pipeline step can encounter exceptions, and exceptions happen for various reasons. In some cases, a retry can resolve these issues. With a retry policy for pipeline steps, you can choose whether to retry a particular pipeline step or not.

The retry policy only supports the following pipeline steps:

- Processing Step (p. 3057)
- Training Step (p. 3058)
- Tuning Step (p. 3059)

**Note**

The SageMaker hyperparameter tuning job already conducts retries internally so it does not retry the `SageMaker.JOB_INTERNAL_ERROR` exception type, even if a retry policy is configured. If you really want to retry, you can program your own Retry Strategy using the SageMaker API.

- CreateModel Step (p. 3062)
- RegisterModel Step (p. 3062)
- Transform Step (p. 3063)
Supported exception types for the retry policy

The retry policy for pipeline steps supports the following exception types:

- **Step.SERVICE_FAULT**: These exceptions occur when an internal server error or transient error happens when calling downstream services. SageMaker Pipelines retries on this type of error automatically. With a retry policy, you can override the default retry operation for this exception type.

- **Step.THROTTLING**: Throttling exceptions can occur while calling the downstream services. SageMaker Pipelines retries on this type of error automatically. With a retry policy, you can override the default retry operation for this exception type.

- **SageMaker.JOB_INTERNAL_ERROR**: These exceptions occur when the SageMaker job returns InternalServerError. In this case, starting a new job may fix a transient issue.

- **SageMaker.CAPACITY_ERROR**: The SageMaker job may encounter Amazon EC2 InsufficientCapacityErrors, which leads to the SageMaker job's failure. You can retry by starting a new SageMaker job to avoid the issue.

- **SageMaker.RESOURCE_LIMIT**: You can exceed the resource limit quota when running a SageMaker job. You can wait and retry running the SageMaker job after a short period and see if resources are released.

The JSON schema for the retry policy

The retry policy for Pipelines has the following JSON schema:

```
"RetryPolicy": {
   "ExceptionType": [String]
   "IntervalSeconds": Integer
   "BackoffRate": Double
   "MaxAttempts": Integer
   "ExpireAfterMin": Integer
}
```

- **ExceptionType**: This field requires the following exception types in a string array format.
  - Step.SERVICE_FAULT
  - Step.THROTTLING
  - SageMaker.JOB_INTERNAL_ERROR
  - SageMaker.CAPACITY_ERROR
  - SageMaker.RESOURCE_LIMIT

- **IntervalSeconds** (optional): The number of seconds before the first retry attempt (1 by default). IntervalSeconds has a maximum value of 43200 seconds (12 hours).

- **BackoffRate** (optional): The multiplier by which the retry interval increases during each attempt (2.0 by default).

- **MaxAttempts** (optional): A positive integer that represents the maximum number of retry attempts (5 by default). If the error recurs more times than MaxAttempts specifies, retries cease and normal error handling resumes. A value of 0 specifies that errors are never retried. MaxAttempts has a maximum value of 20.

- **ExpireAfterMin** (optional): A positive integer that represents the maximum timespan of retry. If the error recurs after ExpireAfterMin minutes counting from the step gets executed, retries cease and normal error handling resumes. A value of 0 specifies that errors are never retried. ExpireAfterMin has a maximum value of 14,400 minutes (10 days).

**Note**

Only one of MaxAttempts or ExpireAfterMin can be given, but not both; if both are not specified, MaxAttempts becomes the default. If both properties are identified within one policy, then the retry policy generates a validation error.
Configuring a retry policy

The following is an example of a training step with a retry policy.

```
{
    "Steps": [
        {
            "Name": "MyTrainingStep",
            "Type": "Training",
            "RetryPolicies": [
                {
                    "ExceptionType": [
                        "SageMaker.JOB_INTERNAL_ERROR",
                        "SageMaker.CAPACITY_ERROR"
                    ],
                    "IntervalSeconds": 1,
                    "BackoffRate": 2,
                    "MaxAttempts": 5
                }
            ]
        }
    ]
}
```

The following is an example of how to build a `TrainingStep` in SDK for Python (Boto3) with a retry policy.

```
from sagemaker.workflow.retry import (  
    StepRetryPolicy,
    StepExceptionTypeEnum,
    SageMakerJobExceptionTypeEnum,
    SageMakerJobStepRetryPolicy
)

step_train = TrainingStep(  
    name="MyTrainingStep",
    xxx,
    retry_policies=[  
        // override the default
        StepRetryPolicy(  
            exception_types=[  
                StepExceptionTypeEnum.SERVICE_FAULT,  
                StepExceptionTypeEnum.THROTTLING
            ],
            expire_after_min=5,
            interval_seconds=10,
            backoff_rate=2.0
        ),  
        // retry when resource limit quota gets exceeded
        SageMakerJobStepRetryPolicy(  
            exception_types=[SageMakerJobExceptionTypeEnum.RESOURCE_LIMIT]  
            expire_after_min=120,
            interval_seconds=60,
            backoff_rate=2.0
        ),  
        // retry when job failed due to transient error or EC2 ICE.
        SageMakerJobStepRetryPolicy(  
            failure_reason_types=[  
                SageMakerJobExceptionTypeEnum.INTERNAL_ERROR,
                SageMakerJobExceptionTypeEnum.CAPACITY_ERROR,
            ]
        )  
    ]
)
```

3079
Baseline calculation, drift detection and lifecycle with ClarifyCheck and QualityCheck steps in Amazon SageMaker Model Building Pipelines

The following topic discusses how baselines and model versions evolve in the Amazon SageMaker Model Building Pipelines when using the ClarifyCheck (p. 3068) and QualityCheck (p. 3069) steps.

For the ClarifyCheck step, a baseline is a single file that resides in the step properties with the suffix constraints. For the QualityCheck step, a baseline is a combination of two files that resides in the step properties: one with the suffix statistics and the other with the suffix constraints. In the following topics we discuss these properties with a prefix that describes how they are used, impacting baseline behavior and lifecycle in these two pipeline steps. For example, the ClarifyCheck step always calculates and assigns the new baselines in the CalculatedBaselineConstraints property and the QualityCheck step does the same in the CalculatedBaselineConstraints and CalculatedBaselineStatistics properties.

Baseline calculation and registration for ClarifyCheck and QualityCheck steps

Both the ClarifyCheck and QualityCheck steps always calculate new baselines based on step inputs through the underlying processing job run. These newly calculated baselines are accessed through the properties with the prefix CalculatedBaseline. You can record these properties as the ModelMetrics of your model package in the Model Step (p. 3060). This model package can be registered with 5 different baselines. You can register it with one for each check type: data bias, model bias, and model explainability from running the ClarifyCheck step and model quality, and data quality from running the QualityCheck step. The register_new_baseline parameter dictates the value set in the properties with the prefix BaselineUsedForDriftCheck after a step runs.

The following table of potential use cases shows different behaviors resulting from the step parameters you can set for the ClarifyCheck and QualityCheck steps:

<table>
<thead>
<tr>
<th>Possible use case that you may consider for selecting this configuration</th>
<th>skip_check / register_new_baseline</th>
<th>Does step do a drift check?</th>
<th>Value of step property CalculatedBaseline</th>
<th>Value of step property BaselineUsedForDriftCheck</th>
</tr>
</thead>
<tbody>
<tr>
<td>You are doing regular retraining with checks enabled to get a new model version, but you want to carry over the previous baselines as the DriftCheckBaselines in the model registry for</td>
<td>False/ False</td>
<td>Drift check runs against existing baselines</td>
<td>New baselines calculated by running the step</td>
<td>Baseline from the latest approved model in Model Registry or the baseline supplied as step parameter</td>
</tr>
<tr>
<td>Possible use case that you may consider for selecting this configuration</td>
<td>skip_check / register_new_baseline</td>
<td>Does step do a drift check?</td>
<td>Value of step property <code>CalculatedBaseline</code></td>
<td>Value of step property <code>BaselineUsedForDriftCheck</code></td>
</tr>
<tr>
<td>---</td>
<td>---</td>
<td>---</td>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>your new model version.</td>
<td></td>
<td>False/ True</td>
<td>Drift check runs against existing baselines</td>
<td>New baselines calculated by running the step (value of property <code>CalculatedBaseline</code>)</td>
</tr>
<tr>
<td>You are doing regular retraining with checks enabled to get a new model version, but you want to refresh the <code>DriftCheckBaselines in the model registry with the newly calculated baselines</code> for your new model version.</td>
<td></td>
<td></td>
<td>New baselines calculated by running the step</td>
<td>Newly calculated baseline by running the step (value of property <code>CalculatedBaseline</code>)</td>
</tr>
<tr>
<td>You are initiating the pipeline to retrain a new model version because there is a violation detected by Amazon SageMaker Model Monitor on an endpoint for a particular type of check, and you want to <code>skip this type of check against the previous baseline, but carry over the previous baseline as DriftCheckBaselines in the model registry</code> for your new model version.</td>
<td>True/ False</td>
<td>No drift check</td>
<td>New baselines calculated by running</td>
<td>Baseline from the latest approved model in the model registry or the baseline supplied as step parameter</td>
</tr>
</tbody>
</table>
**Possible use case that you may consider for selecting this configuration** | **skip_check / register_new_bas** | **Does step do a drift check?** | **Value of step property** | **Value of step property**
--- | --- | --- | --- | ---
This happens in the following cases: | True/True | No drift check | CalculatedBaseline | BaselineUsedForDriftCheck
- You are starting the initial run of the pipeline, building your first model version, and generating the initial baselines.
- You are initiating the pipeline to retrain a new model version because there is a violation detected by Model Monitor on the endpoint for a particular type of check. If you want to skip the check against the previous baseline and refresh the DriftCheckBaselines with the newly calculated baseline in the model registry directly.

When you register a model with [Model Step](p. 3060), you can register the `BaselineUsedForDriftCheck` property as `DriftCheckBaselines`. These baseline files can then be used by Model Monitor for model and data quality checks. In addition, these baselines can also be used in the [ClarifyCheckStep](p. 3082) and [QualityCheck](p. 3082) step to compare newly trained models against the existing models that are registered in the model registry for future pipeline runs.

**Drift Detection against Previous Baselines in SageMaker Pipelines**

In the case of the [QualityCheck](p. 3082) step, when you initiate the pipeline for regular retraining to get a new model version, you may not want to run the training step if the data quality and the data bias has ?? (p. 2721) on the baselines of your previous approved model version. You also may not want to register the newly trained model version if the model quality, model bias, or model explainability violates the registered baseline of your previous approved model version when running the [ClarifyCheck](p. 3082) step. In these cases, you can enable the checks you want by setting the
skip_check property of the corresponding check step set to False, resulting in the ClarifyCheck and QualityCheck step failing if violation is detected against previous baselines. The pipeline process then does not proceed so that the model drifted from the baseline isn't registered. ClarifyCheck and QualityCheck steps are able to get DriftCheckBaselines of the latest approved model version of a given model package group against which to compare. Previous baselines can also be supplied directly through supplied_baseline_constraints (in addition to supplied_baseline_statistics if it is a QualityCheck step) and are always prioritized over any baselines pulled from the model package group.

Baseline and model version lifecycle and evolution with SageMaker Pipelines

By setting register_new_baseline of your ClarifyCheck and QualityCheck step to False, your previous baseline is accessible through the step property prefix BaselineUsedForDriftCheck. You can then register these baselines as the DriftCheckBaselines in the new model version when you register a model with Model Step (p. 3060). Once you approve this new model version in the model registry, the DriftCheckBaseline in this model version becomes available for the ClarifyCheck and QualityCheck steps in the next pipeline process. If you want to refresh the baseline of a certain check type for future model versions, you can set register_new_baseline to True so that the properties with prefix BaselineUsedForDriftCheck become the newly calculated baseline. In these ways, you can preserve your preferred baselines for a model trained in the future, or refresh the baselines for drift checks when needed, managing your baseline evolution and lifecycle throughout your model training iterations.

The following diagram illustrates a model-version-centric view of the baseline evolution and lifecycle.
Pipeline Run 1: initial run

Pipeline Run 2: Scheduled retraining new model version (Check Succeeded)

Pipeline Run 3: Scheduled retraining new model version (Check Succeeded)

Pipeline Run 4: Drift detected on endpoint, suggest and register new baselines

Pipeline Run 5: Scheduled retraining new model version (Check Succeeded)
Amazon EventBridge Integration

You can schedule your Amazon SageMaker Model Building Pipelines executions using Amazon EventBridge. Amazon SageMaker Model Building Pipelines is supported as a target in Amazon EventBridge. This allows you to initiate the execution of your model building pipeline based on any event in your event bus. With EventBridge, you can automate your pipeline executions and respond automatically to events such as training job or endpoint status changes. Events include a new file being uploaded to your Amazon S3 bucket, a change in status of your Amazon SageMaker endpoint due to drift, and Amazon Simple Notification Service (SNS) topics.

The following SageMaker Pipelines actions can be automatically initiated:

- StartPipelineExecution

For more information on scheduling SageMaker jobs, see Automating SageMaker with Amazon EventBridge.

Schedule a Pipeline with Amazon EventBridge

To start a pipeline execution with Amazon CloudWatch Events, you must create an EventBridge rule. When you create a rule for events, you specify a target action to take when EventBridge receives an event that matches the rule. When an event matches the rule, EventBridge sends the event to the specified target and initiates the action defined in the rule.

The following tutorials show how to schedule a pipeline execution with EventBridge using the EventBridge console or the AWS CLI.

Prerequisites

- A role that EventBridge can assume with the SageMaker::StartPipelineExecution permission. This role can be created automatically if you create a rule from the EventBridge console; otherwise, you need to create this role yourself. For information on creating a SageMaker role, see SageMaker Roles.
- An Amazon SageMaker Pipeline to schedule. To create an Amazon SageMaker Pipeline, see Define a Pipeline.

Create an EventBridge rule using the EventBridge console

The following procedure shows how to create an EventBridge rule using the EventBridge console.

1. Navigate to the EventBridge console.
2. Select Rules on the left hand side.
3. Select Create Rule.
4. Enter a name and description for your rule.
5. Select how you want to initiate this rule. You have the following choices for your rule:

   - **Event pattern**: Your rule is initiated when an event matching the pattern occurs. You can choose a predefined pattern that matches a certain type of event, or you can create a custom pattern. If you select a predefined pattern, you can edit the pattern to customize it. For more information on Event patterns, see Event Patterns in CloudWatch Events.

   - **Schedule**: Your rule is initiated regularly on a specified schedule. You can use a fixed-rate schedule that initiates regularly for a specified number of minutes, hour, or weeks. You can also use a cron expression to create a more fine-grained schedule, such as “the first Monday of each month at 8am.” Schedule is not supported on a custom or partner event bus.

6. Select your desired Event bus.
7. Select the target(s) to invoke when an event matches your event pattern or when the schedule is initiated. You can add up to 5 targets per rule. Select SageMaker Pipeline in the target dropdown list.

8. Select the pipeline you want to initiate from the pipeline dropdown list.

9. Add parameters to pass to your pipeline execution using a name and value pair. Parameter values can be static or dynamic. For more information on Amazon SageMaker Pipeline parameters, see AWS::Events::Rule SagemakerPipelineParameters.

- Static values are passed to the pipeline execution every time the pipeline is initiated. For example, if \{'Name": "Instance_type", "Value": "ml.4xlarge"\} is specified in the parameter list, then it is passed as a parameter in StartPipelineExecutionRequest every time EventBridge initiates the pipeline.

- Dynamic values are specified using a JSON path. EventBridge parses the value from an event payload, then passes it to the pipeline execution. For example: \$.detail.param.value

10. Select the role to use for this rule. You can either use an existing role or create a new one.

11. (Optional) Add tags.

12. Select Create to finalize your rule.

Your rule is now in effect and ready to initiate your pipeline executions.

Create an EventBridge rule using the AWS CLI

The following procedure shows how to create an EventBridge rule using the AWS CLI.

1. Create a rule to be initiated. When creating an EventBridge rule using the AWS CLI, you have two options for how your rule is initiated, event pattern and schedule.

- Event pattern: Your rule is initiated when an event matching the pattern occurs. You can choose a predefined pattern that matches a certain type of event, or you can create a custom pattern. If you select a predefined pattern, you can edit the pattern to customize it. You can create a rule with event pattern using the following command:

  aws events put-rule --name <RULE_NAME> --event-pattern <YOUR_EVENT_PATTERN> --description <RULE_DESCRIPTION> --role-arn <ROLE_TO_EXECUTE_PIPELINE> --tags <TAGS>

- Schedule: Your rule is initiated regularly on a specified schedule. You can use a fixed-rate schedule that initiates regularly for a specified number of minutes, hour, or weeks. You can also use a cron expression to create a more fine-grained schedule, such as "the first Monday of each month at 8am." Schedule is not supported on a custom or partner event bus. You can create a rule with schedule using the following command:

  aws events put-rule --name <RULE_NAME> --schedule-expression <YOUR_CRON_EXPRESSION> --description <RULE_DESCRIPTION> --role-arn <ROLE_TO_EXECUTE_PIPELINE> --tags <TAGS>

2. Add target(s) to invoke when an event matches your event pattern or when the schedule is initiated. You can add up to 5 targets per rule. For each target, you must specify:

- ARN: The resource ARN of your pipeline.
- Role ARN: The ARN of the role EventBridge should assume to execute the pipeline.
- Parameters: Amazon SageMaker pipeline parameters to pass.

3. Run the following command to pass a Amazon SageMaker pipeline as a target to your rule using put-targets:

  aws events put-targets --rule <RULE_NAME> --event-bus-name <EVENT_BUS_NAME> --targets "\{"Id\": <ID>, "Arn\": <RESOURCE_ARN>, "RoleArn\": <ROLE_ARN>\},"
Amazon SageMaker Experiments Integration

Amazon SageMaker Model Building Pipelines is closely integrated with Amazon SageMaker Experiments. By default, when SageMaker Pipelines creates and executes a pipeline, the following SageMaker Experiments entities are created if they don't exist:

- An experiment for the pipeline
- A trial for every execution of the pipeline
- A trial component that's added to the trial for each SageMaker job created in a pipeline execution step

You can compare metrics such as model training accuracy across multiple pipeline executions just as you can compare such metrics across multiple trials of a SageMaker model training experiment.

The following sample shows the relevant parameters of the `Pipeline` class in the Amazon SageMaker Python SDK.

```python
Pipeline(
    name="MyPipeline",
    parameters=[...],
    pipeline_experiment_config=PipelineExperimentConfig(
        ExecutionVariables.PIPELINE_NAME,
        ExecutionVariables.PIPELINE_EXECUTION_ID
    ),
    steps=[...]
)
```

If you don't want an experiment and trial created for the pipeline, set `pipeline_experiment_config` to `None`.

**Note**
Experiments integration was introduced in the Amazon SageMaker Python SDK v2.41.0.

The following naming rules apply based on what you specify for the `ExperimentName` and `TrialName` parameters of `pipeline_experiment_config`:

- If you don't specify `ExperimentName`, the pipeline name is used for the experiment name.
  
  If you do specify `ExperimentName`, it's used for the experiment name. If an experiment with that name exists, the pipeline-created trials are added to the existing experiment. If an experiment with that name doesn't exist, a new experiment is created.

- If you don't specify `TrialName`, the pipeline execution ID is used for the trial name.

  If you do specify `TrialName`, it's used for the trial name. If a trial with that name exists, the pipeline-created trial components are added to the existing trial. If a trial with that name doesn't exist, a new trial is created.

**Note**
The experiment entities aren't deleted when the pipeline that created the entities is deleted. You can use the SageMaker Experiments API to delete the entities. For more information, see Clean Up Amazon SageMaker Experiment Resources (p. 2184).

For information about how to view the SageMaker Experiment entities associated with a pipeline, see View Experiment Entities Created by SageMaker Pipelines (p. 3115). For more information on SageMaker Experiments, see Manage Machine Learning with Amazon SageMaker Experiments (p. 2164).
The following sections show examples of the previous rules and how they are represented in the 
pipeline definition file. For more information on pipeline definition files, see SageMaker Pipelines 
Overview (p. 3050).

Topics

- Default Behavior (p. 3088)
- Disable Experiments Integration (p. 3088)
- Specify a Custom Experiment Name (p. 3089)
- Specify a Custom Trial Name (p. 3089)

Default Behavior

Create a pipeline

The pipeline_experiment_config is omitted. ExperimentName defaults to the pipeline name. 
TrialName defaults to the execution ID.

```python
pipeline_name = f"MyPipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[...],
    steps=[step_train]
)
```

Pipeline definition file

```json
{
    "Version": "2020-12-01",
    "Parameters": [ 
        { "Name": "InputDataSource" },
        { "Name": "InstanceCount",
          "Type": "Integer",
          "DefaultValue": 1
        }
    ],
    "PipelineExperimentConfig": { 
        "ExperimentName": {"Get": "Execution.PipelineName"},
        "TrialName": {"Get": "Execution.PipelineExecutionId"}
    },
    "Steps": [...]
}
```

Disable Experiments Integration

Create a pipeline

The pipeline_experiment_config is set to None.

```python
pipeline_name = f"MyPipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[...],
    pipeline_experiment_config=None,
    steps=[step_train]
)```
Pipeline definition file

This is the same as the preceding default example, without the `PipelineExperimentConfig`.

Specify a Custom Experiment Name

A custom experiment name is used. The trial name is set to the execution ID, as with the default behavior.

Create a pipeline

```python
pipeline_name = f"MyPipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[...],
    pipeline_experiment_config=PipelineExperimentConfig(  
        "CustomExperimentName",
        ExecutionVariables.PIPELINE_EXECUTION_ID
    ),
    steps=[step_train]
)
```

Pipeline definition file

```json
{
    ...
    "PipelineExperimentConfig": {
        "ExperimentName": "CustomExperimentName",
        "TrialName": {"Get": "Execution.PipelineExecutionId"}
    },
    "Steps": [...]  
}
```

Specify a Custom Trial Name

A custom trial name is used and appended with the execution ID. The experiment name is set to the pipeline name, as with the default behavior.

Create a pipeline

```python
pipeline_name = f"MyPipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[...],
    pipeline_experiment_config=PipelineExperimentConfig(  
        ExecutionVariables.PIPELINE_NAME,
        Join(on="-", values=["CustomTrialName", ExecutionVariables.PIPELINE_EXECUTION_ID])
    ),
    steps=[step_train]
)
```

Pipeline definition file

```json
{
    ...
    "PipelineExperimentConfig": {
        "ExperimentName": {"Get": "Execution.PipelineName"},
        "TrialName": {
            "On": "-",
```
"Values": [
  "CustomTrialName",
  {
    "Get": "Execution.PipelineExecutionId"
  }
],
"Steps": [...]}

Local Mode

SageMaker Pipelines local mode is an easy way to test your training, processing and inference scripts, as well as the runtime compatibility of pipeline parameters before you execute your pipeline on the managed SageMaker service. By using local mode, you can test your SageMaker pipeline locally using a smaller dataset. This allows quick and easy debugging of errors in user scripts and the pipeline definition itself without incurring the costs of using the managed service.

Pipelines local mode leverages SageMaker jobs local mode under the hood. This is a feature in the SageMaker Python SDK that allows you to run SageMaker built-in or custom images locally using Docker containers. Pipelines local mode is built on top of SageMaker jobs local mode. Therefore, you can expect to see the same results as if you were running those jobs separately. For example, local mode still uses Amazon S3 to upload model artifacts and processing outputs. If you want data generated by local jobs to reside on local disk, you can use the setup mentioned in Local Mode.

Pipeline local mode currently supports the following step types:

- Training Step (p. 3058)
- Processing Step (p. 3057)
- Transform Step (p. 3063)
- Model Step (with Create Model arguments only)
- Condition Step (p. 3064)
- Fail Step (p. 3072)

As opposed to the managed Pipelines service which allows multiple steps to execute in parallel using Parallelism Configuration, the local pipeline executor runs the steps sequentially. Therefore, overall execution performance of a local pipeline may be poorer than one that runs on the cloud - this mostly depends on the size of the dataset, algorithm, as well as the power of your local computer. Also note that Pipelines runs in local mode are not recorded in SageMaker Experiments.

Note

Pipelines local mode is not compatible with SageMaker algorithms such as XGBoost. If you want to use these algorithms, you must use them in script mode.

In order to execute a pipeline locally, the sagemaker_session fields associated with the pipeline steps and the pipeline itself need to be of type LocalPipelineSession. The following example shows how you can define a SageMaker pipeline to execute locally.

```python
from sagemaker.workflow.pipeline_context import LocalPipelineSession
local_pipeline_session = LocalPipelineSession()
pytorch_estimator = PyTorch(
    sagemaker_session=local_pipeline_session,
    role=sagemaker.get_execution_role(),
    instance_type="ml.c5.xlarge",
    instance_count=1,
```
```python
framework_version="1.8.0",
py_version="py36",
entry_point="/entry_point.py",
)
step = TrainingStep(
    name="MyTrainingStep",
    step_args=pytorch_estimator.fit(
        inputs=TrainingInput(s3_data="s3://my-bucket/my-data/train"),
    )
)

pipeline = Pipeline(
    name="MyPipeline",
    steps=[step],
    sagemaker_session=local_pipeline_session
)

pipeline.create(
    role_arn=sagemaker.get_execution_role(),
    description="local pipeline example"
)

// pipeline will execute locally
pipeline.start()

steps = pipeline.list_steps()

training_job_name = steps['PipelineExecutionSteps'][0]['Metadata']['TrainingJob']['Arn']

step_outputs = pipeline_session.sagemaker_client.describe_training_job(TrainingJobName = training_job_name)
```

Once you are ready to execute the pipeline on the managed SageMaker Pipelines service, you can do so by replacing `LocalPipelineSession` in the previous code snippet with `PipelineSession` (as shown in the following code sample) and rerunning the code.

```python
from sagemaker.workflow.pipeline_context import PipelineSession
pipeline_session = PipelineSession()
```

## Troubleshooting Amazon SageMaker Model Building Pipelines

When using Amazon SageMaker Model Building Pipelines, you might run into issues for various reasons. This topic provides information about common errors and how to resolve them.

### Pipeline Definition Issues

Your pipeline definition might not be formatted correctly. This can result in your execution failing or your job being inaccurate. These errors can be caught when the pipeline is created or when an execution occurs. If your definition doesn’t validate, SageMaker Pipelines returns an error message identifying the character where the JSON file is malformed. To fix this problem, review the steps created using the SageMaker Python SDK for accuracy.

You can only include steps in a pipeline definition once. Because of this, steps cannot exist as part of a condition step and a pipeline in the same pipeline.

### Examining Pipeline Logs

You can view the status of your steps using the following command:
Each step includes the following information:

- The ARN of the entity launched by the pipeline, such as SageMaker job ARN, model ARN, or model package ARN.
- The failure reason includes a brief explanation of the step failure.
- If the step is a condition step, it includes whether the condition is evaluated to true or false.
- If the execution reuses a previous job execution, the CacheHit lists the source execution.

You can also view the error messages and logs in the Amazon SageMaker Studio interface. For information about how to see the logs in Studio, see View a Pipeline Execution (p. 3112).

**Missing Permissions**

Correct permissions are required for the role that creates the pipeline execution, and the steps that create each of the jobs in your pipeline execution. Without these permissions, you may not be able to submit your pipeline execution or run your SageMaker jobs as expected. To ensure that your permissions are properly set up, see IAM Access Management (p. 3052).

**Job Execution Errors**

You may run into issues when executing your steps because of issues in the scripts that define the functionality of your SageMaker jobs. Each job has a set of CloudWatch logs. To view these logs from Studio, see View a Pipeline Execution (p. 3112). For information about using CloudWatch logs with SageMaker, see Log Amazon SageMaker Events with Amazon CloudWatch (p. 3510).

**Property File Errors**

You may have issues when incorrectly implementing property files with your pipeline. To ensure that your implementation of property files works as expected, see Property Files and JsonGet (p. 3075).

**Create and Manage SageMaker Pipelines**

You can use Amazon SageMaker Model Building Pipelines to create end-to-end workflows that manage and deploy SageMaker jobs. SageMaker Pipelines comes with SageMaker Python SDK integration, so you can build each step of your pipeline using a Python-based interface.

After your pipeline is deployed, you can view the directed acyclic graph (DAG) for your pipeline and manage your executions using Amazon SageMaker Studio. Using SageMaker Studio, you can get information about your current and historical pipelines, compare executions, see the DAG for your executions, get metadata information, and more. To learn how to view pipelines from SageMaker Studio, see View, Track, and Execute SageMaker Pipelines in SageMaker Studio (p. 3108).

**Topics**

- Define a Pipeline (p. 3092)
- Run a pipeline (p. 3105)
- View, Track, and Execute SageMaker Pipelines in SageMaker Studio (p. 3108)

**Define a Pipeline**

To orchestrate your workflows with Amazon SageMaker Model Building Pipelines, you need to generate a directed acyclic graph (DAG) in the form of a JSON pipeline definition. The following image is a representation of the pipeline DAG that you create in this tutorial:
You can generate your JSON pipeline definition using the SageMaker Python SDK. The following tutorial shows how to generate a pipeline definition for a pipeline that solves a regression problem to determine the age of an abalone based on its physical measurements. For a Jupyter notebook that includes the content in this tutorial that you can run, see Orchestrating Jobs with Amazon SageMaker Model Building Pipelines.

**Topics**

- Prerequisites (p. 3093)
- Create a Pipeline (p. 3094)

**Prerequisites**

To run the following tutorial you must do the following:

- Set up your notebook instance as outlined in Create a notebook instance. This gives your role permissions to read and write to Amazon S3, and create training, batch transform, and processing jobs in SageMaker.
- Grant your notebook permissions to get and pass its own role as shown in Modifying a role permissions policy. Add the following JSON snippet to attach this policy to your role. Replace `<your-role-arn>` with the ARN used to create your notebook instance.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
```
---

**Create and Manage Pipelines**

```
"Action": [
    "iam:GetRole",
    "iam:PassRole"
],
"Resource": "<your-role-arn>",
}
```

- Trust the SageMaker service principal by following the steps in [Modifying a role trust policy](#). Add the following statement fragment to the trust relationship of your role:

  ```json
  {
    "Sid": "",
    "Effect": "Allow",
    "Principal": {
      "Service": "sagemaker.amazonaws.com"
    },
    "Action": "sts:AssumeRole"
  }
  ```

---

**Set Up Your Environment**

Create a new SageMaker session using the following code block. This returns the role ARN for the session. This role ARN should be the execution role ARN that you set up as a prerequisite.

```python
import boto3
import sagemaker
import sagemaker.session

region = boto3.Session().region_name
sagemaker_session = sagemaker.session.Session()
role = sagemaker_session.get_execution_role()
default_bucket = sagemaker_session.default_bucket()
model_package_group_name = f"AbaloneModelPackageGroupName"
```

**Create a Pipeline**

Run the following steps from your SageMaker notebook instance to create a pipeline including steps for preprocessing, training, evaluation, conditional evaluation, and model registration.

**Step 1: Download the Dataset**

This notebook uses the UCI Machine Learning Abalone Dataset. The dataset contains the following features:

- **length** – The longest shell measurement of the abalone.
- **diameter** – The diameter of the abalone perpendicular to its length.
- **height** – The height of the abalone with meat in the shell.
- **whole_weight** – The weight of the whole abalone.
- **shucked_weight** – The weight of the meat removed from the abalone.
- **viscera_weight** – The weight of the abalone viscera after bleeding.
- **shell_weight** – The weight of the abalone shell after meat removal and drying.
- **sex** – The sex of the abalone. One of 'M', 'F', or 'I', where 'I' is an infant abalone.
- **rings** – The number of rings in the abalone shell.
The number of rings in the abalone shell is a good approximation for its age using the formula \( \text{age} = \text{rings} + 1.5 \). However, obtaining this number is a time-consuming task. You must cut the shell through the cone, stain the section, and count the number of rings through a microscope. However, the other physical measurements are easier to determine. This notebook uses the dataset to build a predictive model of the variable rings using the other physical measurements.

**To download the dataset**

1. Download the dataset into your account's default Amazon S3 bucket.

   ```
   !mkdir -p data
   local_path = "data/abalone-dataset.csv"
   s3 = boto3.resource("s3")
   s3.Bucket(f"sagemaker-servicecatalog-seedcode-{region}").download_file(
       "dataset/abalone-dataset.csv",
       local_path
   )
   base_uri = f"s3://{default_bucket}/abalone"
   input_data_uri = sagemaker.s3.S3Uploader.upload(
       local_path=local_path,
       desired_s3_uri=base_uri,
   )
   print(input_data_uri)
   
   2. Download a second dataset for batch transformation after your model is created.

   ```
   local_path = "data/abalone-dataset-batch"
   s3 = boto3.resource("s3")
   s3.Bucket(f"sagemaker-servicecatalog-seedcode-{region}").download_file(
       "dataset/abalone-dataset-batch",
       local_path
   )
   base_uri = f"s3://{default_bucket}/abalone"
   batch_data_uri = sagemaker.s3.S3Uploader.upload(
       local_path=local_path,
       desired_s3_uri=base_uri,
   )
   print(batch_data_uri)
   ```

**Step 2: Define Pipeline Parameters**

This code block defines the following parameters for your pipeline:

- `processing_instance_count` – The instance count of the processing job.
- `input_data` – The Amazon S3 location of the input data.
- `batch_data` – The Amazon S3 location of the input data for batch transformation.
- `model_approval_status` – The approval status to register the trained model with for CI/CD. For more information, see [Automate MLOps with SageMaker Projects](p. 3123).

```python
from sagemaker.workflow.parameters import (ParameterInteger,
                                            ParameterString,
)
```
Step 3: Define a Processing Step for Feature Engineering

This section shows how to create a processing step to prepare the data from the dataset for training.

To create a processing step

1. Create a directory for the processing script.

```bash
!mkdir -p abalone
```

2. Create a file in the /abalone directory named preprocessing.py with the following content. This preprocessing script is passed in to the processing step for execution on the input data. The training step then uses the preprocessed training features and labels to train a model, and the evaluation step uses the trained model and preprocessed test features and labels to evaluate the model. The script uses scikit-learn to do the following:

- Fill in missing sex categorical data and encode it so it's suitable for training.
- Scale and normalize all numerical fields except for rings and sex.
- Split the data into training, test, and validation datasets.

```python
%%writefile abalone/preprocessing.py
import argparse
import os
import requests
import tempfile
import numpy as np
import pandas as pd

from sklearn.compose import ColumnTransformer
from sklearn.impute import SimpleImputer
from sklearn.pipeline import Pipeline
from sklearn.preprocessing import StandardScaler, OneHotEncoder

# Because this is a headerless CSV file, specify the column names here.
feature_columns_names = [
    "sex",
    "length",
    "diameter",
    "height",
    "whole_weight",
    "shucked_weight",
    "viscera_weight",
```
"shell_weight",
]
label_column = "rings"

feature_columns_dtype = {
    "sex": str,
    "length": np.float64,
    "diameter": np.float64,
    "height": np.float64,
    "whole_weight": np.float64,
    "shucked_weight": np.float64,
    "viscera_weight": np.float64,
    "shell_weight": np.float64
}

label_column_dtype = {"rings": np.float64}

def merge_two_dicts(x, y):
    z = x.copy()
    z.update(y)
    return z

if __name__ == "__main__":
    base_dir = "/opt/ml/processing"

df = pd.read_csv(
    f"{base_dir}/input/abalone-dataset.csv",
    header=None,
    names=feature_columns_names + [label_column],
    dtype=merge_two_dicts(feature_columns_dtype, label_column_dtype)
)

numeric_features = list(feature_columns_names)
numeric_features.remove("sex")
numeric_transformer = Pipeline(
    steps=[
        ("imputer", SimpleImputer(strategy="median")),
        ("scaler", StandardScaler())
    ]
)

categorical_features = ["sex"]
categorical_transformer = Pipeline(
    steps=[
        ("imputer", SimpleImputer(strategy="constant", fill_value="missing")),
        ("onehot", OneHotEncoder(handle_unknown="ignore"))
    ]
)

preprocess = ColumnTransformer(
    transformers=[
        ("num", numeric_transformer, numeric_features),
        ("cat", categorical_transformer, categorical_features)
    ]
)

y = df.pop("rings")
X_pre = preprocess.fit_transform(df)
y_pre = y.to_numpy().reshape(len(y), 1)

X = np.concatenate((y_pre, X_pre), axis=1)
np.random.shuffle(X)
train, validation, test = np.split(X, [int(.7*len(X)), int(.85*len(X))])
3. Create an instance of an `SKLearnProcessor` to pass in to the processing step.

```python
from sagemaker.sklearn.processing import SKLearnProcessor

framework_version = "0.23-1"

sklearn_processor = SKLearnProcessor(
    framework_version=framework_version,
    instance_type="ml.m5.xlarge",
    instance_count=processing_instance_count,
    base_job_name="sklearn-abalone-process",
    role=role,
)
```

4. Create a processing step. This step takes in the `SKLearnProcessor`, the input and output channels, and the preprocessing.py script that you created. This is very similar to a processor instance's run method in the SageMaker Python SDK. The input_data parameter passed into ProcessingStep is the input data of the step itself. This input data is used by the processor instance when it runs.

Note the "train", "validation", and "test" named channels specified in the output configuration for the processing job. Step Properties such as these can be used in subsequent steps and resolve to their runtime values at execution.

```python
from sagemaker.processing import ProcessingInput, ProcessingOutput
from sagemaker.workflow.steps import ProcessingStep

step_process = ProcessingStep(
    name="AbaloneProcess",
    processor=sklearn_processor,
    inputs=[
        ProcessingInput(source=input_data, destination="/opt/ml/processing/input"),
    ],
    outputs=[
        ProcessingOutput(output_name="train", source="/opt/ml/processing/train"),
        ProcessingOutput(output_name="validation", source="/opt/ml/processing/validation"),
        ProcessingOutput(output_name="test", source="/opt/ml/processing/test"),
    ],
    code="abalone/preprocessing.py",
)
```

**Step 4: Define a Training step**

This section shows how to use the SageMaker XGBoost Algorithm to train a model on the training data output from the processing steps.

**To define a training step**

1. Specify the model path where you want to save the models from training.

```python
model_path = f"s3://{default_bucket}/AbaloneTrain"
```
2. Configure an estimator for the XGBoost algorithm and the input dataset. The training instance type is passed into the estimator. A typical training script loads data from the input channels, configures training with hyperparameters, trains a model, and saves a model to `model_dir` so that it can be hosted later. SageMaker uploads the model to Amazon S3 in the form of a `model.tar.gz` at the end of the training job.

```python
from sagemaker.estimator import Estimator

image_uri = sagemaker.image_uris.retrieve(
    framework="xgboost",
    region=region,
    version="1.0-1",
    py_version="py3",
    instance_type="ml.m5.xlarge"
)

xgb_train = Estimator(
    image_uri=image_uri,
    instance_type="ml.m5.xlarge",
    instance_count=1,
    output_path=model_path,
    role=role,
)

xgb_train.set_hyperparameters(
    objective="reg:linear",
    num_round=50,
    max_depth=5,
    eta=0.2,
    gamma=4,
    min_child_weight=6,
    subsample=0.7,
    silent=0
)
```

3. Create a `TrainingStep` using the estimator instance and properties of the `ProcessingStep`. In particular, pass in the S3 Uri of the "train" and "validation" output channel to the `TrainingStep`.

```python
from sagemaker.inputs import TrainingInput
from sagemaker.workflow.steps import TrainingStep

step_train = TrainingStep(
    name="AbaloneTrain",
    estimator=xgb_train,
    inputs={
        "train": TrainingInput(
            s3_data=step_process.properties.ProcessingOutputConfig.Outputs["train"].S3Output.S3Uri,
            content_type="text/csv"
        ),
        "validation": TrainingInput(
            s3_data=step_process.properties.ProcessingOutputConfig.Outputs["validation"].S3Output.S3Uri,
            content_type="text/csv"
        )
    },
)
```
Step 5: Define a Processing Step for Model Evaluation

This section shows how to create a processing step to evaluate the accuracy of the model. The result of this model evaluation is used in the condition step to determine which execute path to take.

To define a processing step for model evaluation

1. Create a file in the /abalone directory named evaluation.py. This script is used in a processing step to perform model evaluation. It takes a trained model and the test dataset as input, then produces a JSON file containing classification evaluation metrics.

```python
%%writefile abalone/evaluation.py
import json
import pathlib
import pickle
import tarfile
import joblib
import numpy as np
import pandas as pd
import xgboost

from sklearn.metrics import mean_squared_error

if __name__ == "__main__":
    model_path = f"/opt/ml/processing/model/model.tar.gz"
    with tarfile.open(model_path) as tar:
        tar.extractall(path=".")

    model = pickle.load(open("xgboost-model", "rb"))

    test_path = "/opt/ml/processing/test/test.csv"
    df = pd.read_csv(test_path, header=None)
    y_test = df.iloc[:, 0].to_numpy()
    df.drop(df.columns[0], axis=1, inplace=True)
    X_test = xgboost.DMatrix(df.values)

    predictions = model.predict(X_test)
    mse = mean_squared_error(y_test, predictions)
    std = np.std(y_test - predictions)

    report_dict = {
        "regression_metrics": {
            "mse": {
                "value": mse,
                "standard_deviation": std
            }
        }
    }

    output_dir = "/opt/ml/processing/evaluation"
    pathlib.Path(output_dir).mkdir(parents=True, exist_ok=True)

    evaluation_path = f"{output_dir}/evaluation.json"
    with open(evaluation_path, "w") as f:
        f.write(json.dumps(report_dict))
```

2. Create an instance of a ScriptProcessor that is used to create a ProcessingStep.

```python
from sagemaker.processing import ScriptProcessor
```
3. Create a ProcessingStep using the processor instance, the input and output channels, and the evaluation.py script. In particular, pass in the S3ModelArtifacts property from the step_train training step, as well as the S3Uri of the "test" output channel of the step_process processing step. This is very similar to a processor instance's run method in the SageMaker Python SDK.

```python
from sagemaker.workflow.properties import PropertyFile

evaluation_report = PropertyFile(
    name="EvaluationReport",
    output_name="evaluation",
    path="evaluation.json"
)

step_eval = ProcessingStep(
    name="AbaloneEval",
    processor=script_eval,
    inputs=[
        ProcessingInput(
            source=step_train.properties.ModelArtifacts.S3ModelArtifacts,
            destination="/opt/ml/processing/model"
        ),
        ProcessingInput(
            source=step_process.properties.ProcessingOutputConfig.Outputs["test"].S3Output.S3Uri,
            destination="/opt/ml/processing/test"
        )
    ],
    outputs=[
        ProcessingOutput(output_name="evaluation", source="/opt/ml/processing/evaluation"),
    ],
    code="abalone/evaluation.py",
    property_files=[evaluation_report],
)
```

**Step 6: Define a CreateModelStep for Batch Transformation**

**Important**

We recommend using Model Step (p. 3060) to create models as of v2.90.0 of the SageMaker Python SDK. CreateModelStep will continue to work in previous versions of the SageMaker Python SDK, but is no longer actively supported.

This section shows how to create a SageMaker model from the output of the training step. This model is used for batch transformation on a new dataset. This step is passed into the condition step and only executes if the condition step evaluates to true.

**To define a CreateModelStep for batch transformation**

from sagemaker.model import Model

model = Model(
    image_uri=image_uri,
    model_data=step_train.properties.ModelArtifacts.S3ModelArtifacts,
    sagemaker_session=sagemaker_session,
    role=role,
)

2. Define the model input for your SageMaker model.

from sagemaker.inputs import CreateModelInput

inputs = CreateModelInput(
    instance_type="ml.m5.large",
    accelerator_type="ml.eia1.medium",
)

3. Create your `CreateModelStep` using the `CreateModelInput` and SageMaker model instance you defined.

from sagemaker.workflow.steps import CreateModelStep

step_create_model = CreateModelStep(
    name="AbaloneCreateModel",
    model=model,
    inputs=inputs,
)

Step 7: Define a TransformStep to Perform Batch Transformation

This section shows how to create a `TransformStep` to perform batch transformation on a dataset after the model is trained. This step is passed into the condition step and only executes if the condition step evaluates to true.

To define a `TransformStep` to perform batch transformation

1. Create a transformer instance with the appropriate compute instance type, instance count, and desired output Amazon S3 bucket URI. Pass in the `ModelName` property from the `step_create_model` `CreateModel` step.

from sagemaker.transformer import Transformer

transformer = Transformer(
    model_name=step_create_model.properties.ModelName,
    instance_type="ml.m5.xlarge",
    instance_count=1,
    output_path=f"s3://{default_bucket}/AbaloneTransform"
)

2. Create a `TransformStep` using the transformer instance you defined and the `batch_data` pipeline parameter.

from sagemaker.inputs import TransformInput
from sagemaker.workflow.steps import TransformStep

step_transform = TransformStep(
    name="AbaloneTransform",
    transformer=transformer,
    inputs=TransformInput(data=batch_data)
)

Step 8: Define a RegisterModel Step to Create a Model Package

Important
We recommend using Model Step (p. 3060) to register models as of v2.90.0 of the SageMaker Python SDK. RegisterModel will continue to work in previous versions of the SageMaker Python SDK, but is no longer actively supported.

This section shows how to construct an instance of RegisterModel. The result of executing RegisterModel in a pipeline is a model package. A model package is a reusable model artifacts abstraction that packages all ingredients necessary for inference. It consists of an inference specification that defines the inference image to use along with an optional model weights location. A model package group is a collection of model packages. You can use a ModelPackageGroup for SageMaker Pipelines to add a new version and model package to the group for every pipeline execution. For more information about model registry, see Register and Deploy Models with Model Registry (p. 2834).

This step is passed into the condition step and only executes if the condition step evaluates to true.

To define a RegisterModel step to create a model package

- Construct a RegisterModel step using the estimator instance you used for the training step. Pass in the S3ModelArtifacts property from the step_train training step and specify a ModelPackageGroup. SageMaker Pipelines creates this ModelPackageGroup for you.

from sagemaker.model_metrics import MetricsSource, ModelMetrics
from sagemaker.workflow.step_collections import RegisterModel

model_metrics = ModelMetrics(
    model_statistics=MetricsSource(
        s3_uri="{}\evaluation.json".format(
            step_eval.arguments["ProcessingOutputConfig"]['Outputs'][0]['S3Output']
        ['S3Uri']
    ),
    content_type="application/json"
)

step_register = RegisterModel(
    name="AbaloneRegisterModel",
    estimator=xgb_train,
    model_data=step_train.properties.ModelArtifacts.S3ModelArtifacts,
    content_types=['text/csv'],
    response_types=['text/csv'],
    inference_instances=['ml.t2.medium', 'ml.m5.xlarge'],
    transform_instances=['ml.m5.xlarge'],
    model_package_group_name=model_package_group_name,
    approval_status=model_approval_status,
    model_metrics=model_metrics
)
Step 9: Define a Condition Step to Verify Model Accuracy

A ConditionStep allows SageMaker Pipelines to support conditional execution in your pipeline DAG based on the condition of step properties. In this case, you only want to register a model package if the accuracy of that model, as determined by the model evaluation step, exceeds the required value. If the accuracy exceeds the required value, the pipeline also creates a SageMaker Model and runs batch transformation on a dataset. This section shows how to define the Condition step.

To define a condition step to verify model accuracy

1. Define a ConditionLessThanOrEqualTo condition using the accuracy value found in the output of the model evaluation processing step, step_eval. Get this output using the property file you indexed in the processing step and the respective JSONPath of the mean squared error value, "mse".

```python
from sagemaker.workflow.conditions import ConditionLessThanOrEqualTo
from sagemaker.workflow.condition_step import ConditionStep
from sagemaker.workflow.functions import JsonGet

cond_lte = ConditionLessThanOrEqualTo(
    left=JsonGet(
        step_name=step_eval.name,
        property_file=evaluation_report,
        json_path="regression_metrics.mse.value"),
    right=6.0)
```

2. Construct a ConditionStep. Pass the ConditionEquals condition in, then set the model package registration and batch transformation steps as the next steps if the condition passes.

```python
step_cond = ConditionStep(
    name="AbaloneMSECond",
    conditions=[cond_lte],
    if_steps=[step_register, step_create_model, step_transform],
    else_steps=[],
)
```

Step 10: Create a pipeline

Now that you’ve created all of the steps, combine them into a pipeline.

To create a pipeline

1. Define the following for your pipeline: name, parameters, and steps. Names must be unique within an (account, region) pair.

   Note
   A step can only appear once in either the pipeline's step list or the if/else step lists of the condition step. It cannot appear in both.

```python
from sagemaker.workflow.pipeline import Pipeline

pipeline_name = f"AbalonePipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[
        processing_instance_count,
    ]
```
model_approval_status,
  input_data,
  batch_data,
],
  steps=[step_process, step_train, step_eval, step_cond],
}

2. (Optional) Examine the JSON pipeline definition to ensure that it's well-formed.

```python
import json
json.loads(pipeline.definition())
```

This pipeline definition is ready to submit to SageMaker. In the next tutorial, you submit this pipeline to SageMaker and start an execution.

**Next step:** Run a pipeline (p. 3105)

## Run a pipeline

After you’ve created a pipeline definition using the SageMaker Python SDK, you can submit it to SageMaker to start your execution. The following tutorial shows how to submit a pipeline, start an execution, examine the results of that execution, and delete your pipeline.

### Topics
- Prerequisites (p. 3105)
- Step 1: Start the Pipeline (p. 3105)
- Step 2: Examine a Pipeline Execution (p. 3106)
- Step 3: Override Default Parameters for a Pipeline Execution (p. 3107)
- Step 4: Stop and Delete a Pipeline Execution (p. 3108)

### Prerequisites

This tutorial requires the following:

- A SageMaker notebook instance.
- A SageMaker Pipelines pipeline definition. This tutorial assumes you're using the pipeline definition created by completing the Define a Pipeline (p. 3092) tutorial.

### Step 1: Start the Pipeline

First, you need to start the pipeline.

**To start the pipeline**

1. Examine the JSON pipeline definition to ensure that it's well-formed.

```python
import json
json.loads(pipeline.definition())
```

2. Submit the pipeline definition to the SageMaker Pipelines service to create a pipeline if it doesn't exist, or update the pipeline if it does. The role passed in is used by SageMaker Pipelines to create all of the jobs defined in the steps.
pipeline.upsert(role_arn=role)

3. Start a pipeline execution.

```python
execution = pipeline.start()
```

### Step 2: Examine a Pipeline Execution

Next, you need to examine the pipeline execution.

#### To examine a pipeline execution

1. Describe the pipeline execution status to ensure that it has been created and started successfully.

```python
execution.describe()
```

2. Wait for the execution to finish.

```python
execution.wait()
```

3. List the execution steps and their status.

```python
execution.list_steps()
```

Your output should look like the following:

```python
[
    {'StepName': 'AbaloneTransform',
     'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 27, 870000, tzinfo=tzlocal()),
     'EndTime': datetime.datetime(2020, 11, 21, 2, 45, 50, 492000, tzinfo=tzlocal()),
     'StepStatus': 'Succeeded',
     'CacheHitResult': {'SourcePipelineExecutionArn': ''},
    {'StepName': 'AbaloneRegisterModel',
     'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 26, 929000, tzinfo=tzlocal()),
     'EndTime': datetime.datetime(2020, 11, 21, 2, 41, 28, 15000, tzinfo=tzlocal()),
     'StepStatus': 'Succeeded',
     'CacheHitResult': {'SourcePipelineExecutionArn': ''},
     'Metadata': {'RegisterModel': {'Arn': 'arn:aws:sagemaker:us-east-2:111122223333:model-package/abalonemodelpackagegroupname/1'}}},
    {'StepName': 'AbaloneCreateModel',
     'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 26, 895000, tzinfo=tzlocal()),
     'EndTime': datetime.datetime(2020, 11, 21, 2, 41, 27, 708000, tzinfo=tzlocal()),
     'StepStatus': 'Succeeded',
     'CacheHitResult': {'SourcePipelineExecutionArn': ''},
     'Metadata': {'Model': {'Arn': 'arn:aws:sagemaker:us-east-2:111122223333:model/pipelines-cfvy1tjuxdg8-abalonecreateamodel-jl94rai0ra'}}},
    {'StepName': 'AbaloneMSECond',
     'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 25, 558000, tzinfo=tzlocal()),
     'EndTime': datetime.datetime(2020, 11, 21, 2, 41, 26, 329000, tzinfo=tzlocal()),
     'StepStatus': 'Succeeded',
     'CacheHitResult': {'SourcePipelineExecutionArn': ''},
     'Metadata': {'Condition': {'Outcome': 'True'}}},
    {'StepName': 'AbaloneEval',
     'StartTime': datetime.datetime(2020, 11, 21, 2, 37, 34, 767000, tzinfo=tzlocal()),
     'EndTime': datetime.datetime(2020, 11, 21, 2, 41, 18, 80000, tzinfo=tzlocal()),
     'StepStatus': 'Succeeded',
]
4. After your pipeline execution is complete, download the resulting evaluation.json file from Amazon S3 to examine the report.

   ```python
   evaluation_json = sagemaker.s3.S3Downloader.read_file("{}/evaluation.json".format(
       step_eval.arguments["ProcessingOutputConfig"]["Outputs"][0]["S3Output"]["S3Uri"]
   ))
   json.loads(evaluation_json)
   ```

### Step 3: Override Default Parameters for a Pipeline Execution

You can run additional executions of the pipeline by specifying different pipeline parameters to override the defaults.

**To override default parameters**

1. Create the pipeline execution. This starts another pipeline execution with the model approval status override set to "Approved". This means that the model package version generated by the RegisterModel step is automatically ready for deployment through CI/CD pipelines, such as with SageMaker Projects. For more information, see [Automate MLOps with SageMaker Projects](p. 3123).

   ```python
   execution = pipeline.start(
       parameters=dict(
           ModelApprovalStatus="Approved",
       )
   )
   ```

2. Wait for the execution to finish.

   ```python
   execution.wait()
   ```

3. List the execution steps and their status.

   ```python
   execution.list_steps()
   ```

4. After your pipeline execution is complete, download the resulting evaluation.json file from Amazon S3 to examine the report.

   ```python
   evaluation_json = sagemaker.s3.S3Downloader.read_file("{}/evaluation.json".format(
       step_eval.arguments["ProcessingOutputConfig"]["Outputs"][0]["S3Output"]["S3Uri"]
   ))
   ```
Step 4: Stop and Delete a Pipeline Execution

When you're finished with your pipeline, you can stop any ongoing executions and delete the pipeline.

To stop and delete a pipeline execution

1. Stop the pipeline execution.

   ```python
   execution.stop()
   ```

2. Delete the pipeline.

   ```python
   pipeline.delete()
   ```

View, Track, and Execute SageMaker Pipelines in SageMaker Studio

To view, track, and execute Amazon SageMaker Pipelines in Amazon SageMaker Studio, you must sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).

Topics

- View a Pipeline (p. 3108)
- View a Pipeline Execution (p. 3112)
- View Experiment Entities Created by SageMaker Pipelines (p. 3115)
- Execute a Pipeline (p. 3117)
- Track the Lineage of a SageMaker ML Pipeline (p. 3119)

View a Pipeline

This procedure shows you how to directly find a pipeline and view its details page. You can also find pipelines that are part of a project listed in the project's details page. For information on finding a pipeline that is part of a project, see Automate MLOps with SageMaker Projects (p. 3123).

To view a list of pipelines

1. In the left sidebar of Studio, choose the SageMaker resources icon (🔍).
2. Select **Pipelines** from the dropdown list.

3. Drag the right border of the **SageMaker resources** pane to the right to view all the columns. Use search to narrow the list of pipelines.

   Search is a two-step process. First, you enter characters that match the column name you want to search. Second, you enter characters to match the item in that column.

   You can have multiple search filters. An example, the following screenshot limits the displayed pipelines to those with a name that starts with `aba` and created by `Me`. For more information on searching in Studio, see [Search Experiments Using Amazon SageMaker Studio](p. 2179).
4. Open a pipeline to view details about the pipeline. The pipeline details tab opens and displays a list of pipeline executions. You can start an execution or choose one of the other tabs for more information about the pipeline. Use the **Settings** icon (⚙️) to choose which columns to display.

5. From the pipeline details page, choose one of the following tabs to view details about the pipeline:
   - **Executions** – Details about the executions. You can start an execution from this tab or the **Graph** tab.
   - **Graph** – The DAG for the pipeline.
- **Parameters** – Includes the model approval status.

- **Settings** – The metadata associated with the pipeline. You can download the pipeline definition file and edit the pipeline name and description from this tab.
View a Pipeline Execution

This procedure shows you how to view a pipeline execution. For information on how to view a list of pipeline executions, and how to use SageMaker search to narrow the executions in the list, see View a Pipeline (p. 3108).

To view details of a pipeline execution

1. In the execution list, open an execution to view details about the execution. The execution details tab opens and displays a graph of the steps in the pipeline. You can choose one of the other tabs to view information about the pipeline execution, which is similar to that shown when viewing the pipeline details.

2. Use search to find a step in the graph. Type characters that match a step name. You can drag the graph around or use the resizing icons on the lower-left side of the graph. The inset on the lower-right side of the graph displays where you are in the graph.

3. Choose one of the steps in the graph to see details about the step. In the preceding screenshot, a training step is chosen and displays the following tabs:
• **Input** – The training inputs. If an input source is from Amazon Simple Storage Service (Amazon S3), choose the link to view the file in the Amazon S3 console.

• **Output** – The training outputs, such as metrics, charts, files, and evaluation outcome. The graphs were produced using the Tracker APIs.
• **Logs** – The Amazon CloudWatch logs produced by the step.

**View Experiment Entities Created by SageMaker Pipelines**

When you create a pipeline and specify `pipeline_experiment_config`, SageMaker Pipelines creates the following SageMaker Experiments entities by default if they don't exist:

- An experiment for the pipeline
- A trial for every execution of the pipeline
- A trial component for each SageMaker job created in a pipeline step
For information on how experiments are integrated with pipelines, see Amazon SageMaker Experiments Integration (p. 3087). For more information on SageMaker Experiments, see Manage Machine Learning with Amazon SageMaker Experiments (p. 2164).

You can get to the list of trial components associated with a pipeline from either the pipeline executions list or the experiments list.

To view the trial components list from the pipeline executions list

1. To view the pipeline executions list, follow the first four steps in View a Pipeline (p. 3108).
2. On the top right of the screen, choose the Settings icon (⚙️) to open TABLE PROPERTIES.
3. Select Experiment. If experiment integration wasn't disabled when the pipeline was created, the experiment name and trial name are displayed in the executions list.

   Note
   Experiments integration was introduced in v2.41.0 of the Amazon SageMaker Python SDK. Pipelines created with an earlier version of the SDK aren't integrated with experiments by default.

4. Select one or more executions, open (right-click) the selection, then choose View trial components generated by execution.

To view the trial components list from the experiments list

1. In the left sidebar of Studio, choose the SageMaker resources icon (🔍).
2. Select Experiments and trials from the dropdown list.
3. Use search to filter the list to experiments created by a pipeline.

   a. Drag the right border of the SageMaker resources pane to the right until you can see the Experiment type column.
   b. In the search box, enter ex and choose Experiment type.
   c. In Filter by values, choose Pipeline, then choose Apply.

   To further narrow the search, you can add additional filters. For more information, see Search Experiments Using Amazon SageMaker Studio (p. 2179).

4. Open (right-click) an experiment name and choose Open in trial component list.
List of trial components

The following shows the list of trial components created by the pipeline.

<table>
<thead>
<tr>
<th>Status</th>

</table>

Execute a Pipeline

This procedure shows you how to execute a pipeline. For information on how to view a list of pipeline executions, see View a Pipeline (p. 3108).

To start a pipeline execution

1. From the Executions or Graph tab in the execution list, choose Start an execution.
2. Enter or update the following required information:
   - **Name** – Must be unique to your account in the AWS Region.
   - **ProcessingInstanceType** – The instance type for processing.
   - **ProcessingInstanceCount** – The number of instances to use for processing.
   - **TrainingInstanceType** – The instance type for training.
   - **ModelApprovalStatus** – For your convenience.
   - **InputData** – The S3 URI of the input data.

3. Choose **Submit**.
   - To see details of the execution or to stop the execution, choose **View details** on the status banner.
   - To stop the execution, choose **Stop** on the status banner.
   - To resume the execution from where it was stopped, choose **Resume** on the status banner.
Note

If your pipeline fails, the status banner will show **Failed** status. After troubleshooting the failed step, choose **Retry** on the status banner to resume running the pipeline from that step.

For a list of registered models, see Automate MLOps with SageMaker Projects (p. 3123).

Track the Lineage of a SageMaker ML Pipeline

In this tutorial, you use Amazon SageMaker Studio to track the lineage of an Amazon SageMaker ML Pipeline.

The pipeline was created by the Orchestrating Jobs with Amazon SageMaker Model Building Pipelines notebook in the Amazon SageMaker example GitHub repository. For detailed information on how the pipeline was created, see Define a Pipeline (p. 3092).

Lineage tracking in Studio is centered around a directed acyclic graph (DAG). The DAG represents the steps in a pipeline. From the DAG you can track the lineage from any step to any other step. The following diagram displays the steps in the pipeline. These steps appear as a DAG in Studio.

Prerequisites

- Access to Amazon SageMaker Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
- Familiarity with the SageMaker Studio user interface. For more information, see Amazon SageMaker Studio UI Overview (p. 117).
- (Recommended) A completed run of the example notebook.

To track the lineage of a pipeline

1. Sign in to SageMaker Studio.
2. In the left sidebar of Studio, choose the **SageMaker resources** icon 🌐.
3. In the drop-down menu, select **Pipelines**.
4. Use the **Search** box to filter the pipelines list. To view all available columns, drag the right border of the pane to the right. For more information, see [Search Experiments Using Amazon SageMaker Studio](p. 2179).

The following screenshot shows the list filtered by a name that starts with "aba" and that was created on 12/5/20.
5. Double-click the AbalonePipeline pipeline to view the execution list and other details about the pipeline. The following screenshot shows the TABLE PROPERTIES pane open where you can choose which properties to view.

6. Choose the Settings tab and then choose Download pipeline definition file. You can view the file to see how the pipeline graph was defined.

7. On the Execution tab, double-click the first row in the execution list to view its execution graph and other details about the execution. Note that the graph matches the diagram displayed at the beginning of the tutorial.

You can drag the graph around (select an area not on the graph itself) or use the resizing icons on the lower-left side of the graph. The inset on the lower-right side of the graph displays your location in the graph.
8. On the **Graph** tab, choose the **AbaloneProcess** step to view details about the step.

9. Find the Amazon S3 paths to the training, validation, and test datasets in the **Output** tab, under **Files**.

   **Note**
   To get the full paths, right-click the path and then choose **Copy cell contents**.

```plaintext
s3://sagemaker-eu-west-1-acct-id/sklearn-abalone-process-2020-12-05-17-28-28-509/output/train
```
10. Choose the AbaloneTrain step.

11. Find the Amazon S3 path to the model artifact in the Output tab, under Files:

s3://sagemaker-eu-west-1-acct-id/AbaloneTrain/pipelines-6locnsqz4bfu-AbaloneTrain-NtfEpI0Ahu/output/model.tar.gz

12. Choose the AbaloneRegisterModel step.

13. Find the ARN of the model package in the Output tab, under Files:

arn:aws:sagemaker:eu-west-1:acct-id:model-package/abalonemodelpackagegroupname/2

Automate MLOps with SageMaker Projects

Create end-to-end ML solutions with CI/CD by using SageMaker projects.

Use SageMaker projects to create an MLOps solution to orchestrate and manage:

- Building custom images for processing, training, and inference
- Data preparation and feature engineering
- Training models
- Evaluating models
- Deploying models
- Monitoring and updating models
Why Should You Use MLOps?

As you move from running individual artificial intelligence and machine learning (AI/ML) projects to using AI/ML to transform your business at scale, the discipline of ML Operations (MLOps) can help. MLOps accounts for the unique aspects of AI/ML projects in project management, CI/CD, and quality assurance, helping you improve delivery time, reduce defects, and make data science more productive. MLOps refers to a methodology that is built on applying DevOps practices to machine learning workloads. For a discussion of DevOps principles, see the white paper Introduction to DevOps on AWS. To learn more about implementation using AWS services, see Practicing CI/CD on AWS and Infrastructure as Code.

Like DevOps, MLOps relies on a collaborative and streamlined approach to the machine learning development lifecycle where the intersection of people, process, and technology optimizes the end-to-end activities required to develop, build, and operate machine learning workloads.

MLOps focuses on the intersection of data science and data engineering in combination with existing DevOps practices to streamline model delivery across the machine learning development lifecycle. MLOps is the discipline of integrating ML workloads into release management, CI/CD, and operations. MLOps requires the integration of software development, operations, data engineering, and data science.

Challenges with MLOps

Although MLOps can provide valuable tools to help you scale your business, you might face certain issues as you integrate MLOps into your machine learning workloads.

Project management

- ML projects involve data scientists, a relatively new role, and one not often integrated into cross-functional teams. These new team members often speak a very different technical language than product owners and software engineers, compounding the usual problem of translating business requirements into technical requirements.

Communication and collaboration

- Building visibility on ML projects and enabling collaboration across different stakeholders such as data engineers, data scientists, ML engineers, and DevOps is becoming increasingly important to ensure successful outcomes.

Everything is code
Why MLOps?

- Use of production data in development activities, longer experimentation lifecycles, dependencies on data pipelines, retraining deployment pipelines, and unique metrics in evaluating the performance of a model.
- Models often have a lifecycle independent of the applications and systems integrating with those models.
- The entire end-to-end system is reproducible through versioned code and artifacts. DevOps projects use Infrastructure-as-Code (IaC) and Configuration-as-Code (CaC) to build environments, and Pipelines-as-Code (PaC) to ensure consistent CI/CD patterns. The pipelines have to integrate with Big Data and ML training workflows. That often means that the pipeline is a combination of a traditional CI/CD tool and another workflow engine. There are important policy concerns for many ML projects, so the pipeline may also need to enforce those policies. Biased input data produces biased results, an increasing concern for business stakeholders.

CI/CD

- In MLOps, the source data is a first-class input, along with source code. That's why MLOps calls for versioning the source data and initiating pipeline runs when the source or inference data changes.
- Pipelines must also version the ML models, along with inputs and other outputs, in order to provide for traceability.
- Automated testing must include proper validation of the ML model during build phases and when the model is in production.
- Build phases may include model training and retraining, a time-consuming and resource-intensive process. Pipelines must be granular enough to only perform a full training cycle when the source data or ML code changes, not when related components change.
- Because machine learning code is typically a small part of an overall solution, a deployment pipeline may also incorporate the additional steps required to package a model for consumption as an API by other applications and systems.

Monitoring and logging

- The feature engineering and model training phases needed to capture model training metrics as well as model experiments. Tuning an ML model requires manipulating the form of the input data as well as algorithm hyperparameters, and systematically capture those experiments. Experiment tracking helps data scientists work more effectively and gives a reproducible snapshot of their work.
- Deployed ML models require monitoring of the data passed to the model for inference, along with the standard endpoint stability and performance metrics. The monitoring system must also capture the quality of model output, as evaluated by an appropriate ML metric.

Benefits of MLOps

Adopting MLOps practices gives you faster time-to-market for ML projects by delivering the following benefits.

- **Productivity**: Providing self-service environments with access to curated data sets lets data engineers and data scientists move faster and waste less time with missing or invalid data.
- **Repeatability**: Automating all the steps in the MLDC helps you ensure a repeatable process, including how the model is trained, evaluated, versioned, and deployed.
- **Reliability**: Incorporating CI/CD practices allows for the ability to not only deploy quickly but with increased quality and consistency.
- **Auditability**: Versioning all inputs and outputs, from data science experiments to source data to trained model, means that we can demonstrate exactly how the model was built and where it was deployed.
• **Data and model quality**: MLOps lets us enforce policies that guard against model bias and track changes to data statistical properties and model quality over time.

**What is a SageMaker Project?**

SageMaker Projects help organizations set up and standardize developer environments for data scientists and CI/CD systems for MLOps engineers. Projects also help organizations set up dependency management, code repository management, build reproducibility, and artifact sharing.

You can provision SageMaker Projects from the AWS Service Catalog using custom or SageMaker-provided templates. For information about the AWS Service Catalog, see What Is AWS Service Catalog. With SageMaker Projects, MLOps engineers and organization admins can define their own templates or use SageMaker-provided templates. The SageMaker-provided templates bootstrap the ML workflow with source version control, automated ML pipelines, and a set of code to quickly start iterating over ML use cases.

**When Should You Use a SageMaker Project?**

While notebooks are helpful for model building and experimentation, a team of data scientists and ML engineers sharing code needs a more scalable way to maintain code consistency and strict version control.

Every organization has its own set of standards and practices that provide security and governance for its AWS environment. SageMaker provides a set of first-party templates for organizations that want to quickly get started with ML workflows and CI/CD. The templates include projects that use AWS-native services for CI/CD, such as AWS CodeBuild, AWS CodePipeline, and AWS CodeCommit. The templates also offer the option to create projects that use third-party tools, such as Jenkins and GitHub. For a list of the project templates that SageMaker provides, see Use SageMaker-Provided Project Templates (p. 3131).

Organizations often need tight control over the MLOps resources that they provision and manage. Such responsibility assumes certain tasks, including configuring IAM roles and policies, enforcing resource tags, enforcing encryption, and decoupling resources across multiple accounts. SageMaker Projects can support all these tasks through custom template offerings where organizations use AWS CloudFormation templates to define the resources needed for an ML workflow. Data Scientists can choose a template to bootstrap and pre-configure their ML workflow. These custom templates are created as AWS Service Catalog products and you can provision them in the Studio UI under Organization Templates. The AWS Service Catalog is a service that helps organizations create and manage catalogs of products that are approved for use on AWS. For more information about creating custom templates, see Build Custom SageMaker Project Templates – Best Practices.

SageMaker Projects can help you manage your Git repositories so that you can collaborate more efficiently across teams, ensure code consistency, and support CI/CD. SageMaker Projects can help you with the following tasks:

- Organize all entities of the ML lifecycle under one project.
- Establish a single-click approach to set up standard ML infrastructure for model training and deployment that incorporates best practices.
- Create and share templates for ML infrastructure to serve multiple use cases.
- Leverage SageMaker-provided pre-built templates to quickly start focusing on model building, or create custom templates with organization-specific resources and guidelines.
- Integrate with tools of your choice by extending the project templates. For an example, see Create a SageMaker Project to integrate with GitLab and GitLab Pipelines.
- Organize all entities of the ML lifecycle under one project.
What is in a SageMaker Project?

Customers have the flexibility to set up their projects with the resources that best serve their use case. The example below showcases the MLOps setup for an ML workflow, including model training and deployment.

A typical project with a SageMaker-provided template might include the following:

- One or more repositories with sample code to build and deploy ML solutions. These are working examples that you can clone locally and modify for your needs. You own this code and can take advantage of the version-controlled repositories for your tasks.
- A SageMaker pipeline that defines steps for data preparation, training, model evaluation, and model deployment, as shown in the following diagram.
• A CodePipeline or Jenkins pipeline that runs your SageMaker pipeline every time you check in a new version of the code. For information about CodePipeline, see What is AWS CodePipeline. For information about Jenkins, see Jenkins User Documentation.

• A model group that contains model versions. Every time you approve the resulting model version from a SageMaker pipeline run, you can deploy it to a SageMaker endpoint.

Each SageMaker project has a unique name and ID that are applied as tags to all of the SageMaker and AWS resources created in the project. With the name and ID, you can view all of the entities associated with your project. These include:

• Pipelines
• Registered models
• Deployed models (endpoints)
• Datasets
• AWS Service Catalog products
• CodePipeline and Jenkins pipelines
• CodeCommit and third-party Git repositories

Do I Need to Create a Project to Use SageMaker Pipelines?

No. SageMaker pipelines are standalone entities just like training jobs, processing jobs, and other SageMaker jobs. You can create, update, and run pipelines directly within a notebook by using the SageMaker Python SDK without using a SageMaker project.

Projects provide an additional layer to help you organize your code and adopt operational best practices that you need for a production-quality system.

SageMaker Studio Permissions Required to Use Projects

Users can view SageMaker provided project templates and create projects with those templates when you grant Projects permissions for users. You can grant these permissions when you onboard or update Amazon SageMaker Studio. There are two permissions to grant.

1. Grant Projects permissions for the Studio administrator to permit the Studio administrator to view the SageMaker-provided templates in the AWS Service Catalog console. The administrator can see what other Studio users create if you grant them permission to use SageMaker projects. The administrator can also view the AWS CloudFormation template that the SageMaker-provided project templates define in the AWS Service Catalog console. For information about using the AWS Service Catalog console, see What Is AWS Service Catalog in the AWS Service Catalog User Guide.

2. Allow Studio users who are configured to use the same execution role as the domain to create projects. This grants Studio users permission to use the SageMaker-provided project templates to create a project from within Studio.

Important
Do not manually create your roles. Always create roles through Studio Settings using the steps described in the following procedure.

For users who use any role other than the domain's execution role to view and use SageMaker-provided project templates, you need to grant Projects permissions to the individual user profiles.
The following procedures show how to grant Projects permissions after you onboard to Studio. For more information about onboarding to Studio, see Onboard to Amazon SageMaker Domain (p. 35).

To grant Projects permissions for the administrator and domain execution role users

1. Open the SageMaker console.
2. Choose Control Panel.
3. If you choose Quick setup to set up your SageMaker Domain, you have permissions to use project templates by default.
4. If you choose Standard setup to set up your SageMaker Domain, make sure you turn on the following options when you configure Studio settings:
   - Enable Amazon SageMaker project templates and Amazon SageMaker JumpStart for this account
   - Enable Amazon SageMaker project templates and Amazon SageMaker JumpStart for Studio users
   - Create the roles which are needed to use the latest updated AWS Service catalog of products for Projects and JumpStart
5. To confirm that your SageMaker Domain has active project template permissions:
   a. Open the SageMaker console.
   b. Choose Control Panel.
   c. Choose the Settings icon in the upper-right corner of the Domain card.
   d. Choose Studio Settings in the left side panel.
   e. Under Projects and JumpStart, make sure the following options are turned on:
      - Enable Amazon SageMaker project templates and Amazon SageMaker JumpStart for this account
      - Enable Amazon SageMaker project templates and Amazon SageMaker JumpStart for Studio users
      - Create the roles which are needed to use the latest updated AWS Service catalog of products for Projects and JumpStart
6. To view a list of your roles:
   a. Open the SageMaker console.
   b. Choose Control Panel.

A list of your roles appears in the Apps card under Projects.

Important
As of July 25, we require additional roles to use project templates. Here is the complete list of roles you should see under Projects:
AmazonSageMakerServiceCatalogProductsLaunchRole
AmazonSageMakerServiceCatalogProductsUseRole
AmazonSageMakerServiceCatalogProductsApiGatewayRole
AmazonSageMakerServiceCatalogProductsCloudformationRole
AmazonSageMakerServiceCatalogProductsCodeBuildRole
AmazonSageMakerServiceCatalogProductsCodePipelineRole
AmazonSageMakerServiceCatalogProductsEventsRole
AmazonSageMakerServiceCatalogProductsFirehoseRole
AmazonSageMakerServiceCatalogProductsGlueRole
Create an MLOps Project using Amazon SageMaker Studio

This procedure demonstrates how to create an MLOps project using Amazon SageMaker Studio.

Prerequisites

- An IAM account or IAM Identity Center to sign in to Studio. For information, see Onboard to Amazon SageMaker Domain (p. 35).
- Permission to use SageMaker-provided project templates. For information, see SageMaker Studio Permissions Required to Use Projects (p. 3128).
- Basic familiarity with the Studio user interface. For information, see Amazon SageMaker Studio UI Overview (p. 117).

To create a project in Studio

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. In the Studio sidebar, choose the SageMaker resources icon (🔍).
3. Select Projects from the dropdown list.
4. Choose Create project.
   
   The Create project tab opens displaying a list of available templates.
5. For SageMaker project templates, choose SageMaker templates. For more information about project templates, see MLOps Project Templates (p. 3130).
6. Choose MLOps template for model building, training, and deployment.
7. Choose Select project template.
   
   The Create project tab changes to display Project details.
8. Enter the following information:
   
   - For Project details, enter a name and description for your project.
   - Optionally, add tags, which are key-value pairs that you can use to track your projects.
9. Choose Create project and wait for the project to appear in the Projects list.

MLOps Project Templates

An Amazon SageMaker project template automates the setup and implementation of MLOps for your projects. A SageMaker project template is an AWS Service Catalog product that SageMaker makes available to Amazon SageMaker Studio users. These AWS Service Catalog products are visible in your AWS Service Catalog console after you enable permissions when you onboard or update Amazon SageMaker Studio. For information about enabling permissions to use SageMaker project templates, see SageMaker Studio Permissions Required to Use Projects (p. 3128). Use SageMaker project templates to create a project that is an end-to-end MLOps solution.

If you are an administrator, you can create custom project templates from scratch or modify one of the project templates provided by SageMaker. Studio users in your organization can use these custom project templates to create their projects.

3130
Use SageMaker-Provided Project Templates

Amazon SageMaker provides project templates that create the infrastructure you need to create an MLOps solution for continuous integration and continuous deployment (CI/CD) of ML models. Use these templates to process data, extract features, train and test models, register the models in the SageMaker model registry, and deploy the models for inference. You can customize the seed code and the configuration files to suit your requirements.

**Important**
As of July 25, 2022, we require additional roles to use project templates. For a complete list of required roles and instructions on how to create them, see SageMaker Studio Permissions Required to Use Projects (p. 3128). If you do not have the new roles, you will get the error message *CodePipeline is not authorized to perform AssumeRole on role arn:aws:iam::xxx:role/service-role/AmazonSageMakerServiceCatalogProductsCodePipelineRole* when you try to create a new project and cannot proceed.

SageMaker project templates offer you the following choice of code repositories, workflow automation tools, and pipeline stages:

- **Code repository**: AWS CodeCommit or third-party Git repositories such as GitHub and Bitbucket
- **CI/CD workflow automation**: AWS CodePipeline or Jenkins
- **Pipeline stages**: Model building and training, model deployment, or both

The following discussion provides an overview of each template you can choose when you create your SageMaker project. You can also view the available templates in Studio by following Step 1: Create the Project of the Project walkthrough.

For step-by-step instructions on how to create a real project, you can follow one of the project walkthroughs:

- If you want to use the template MLOps template for model building, training, and deployment (p. 3132), see SageMaker MLOps Project Walkthrough (p. 3142).
- If you want to use the template MLOps template for model building, training, and deployment with third-party Git repositories using CodePipeline (p. 3135), see SageMaker MLOps Project Walkthrough Using Third-party Git Repos (p. 3147).
- If you want to use the template MLOps template for model building, training, and deployment with third-party Git repositories using Jenkins (p. 3136), see Create Amazon SageMaker projects using third-party source control and Jenkins.

Topics

- MLOps template for model building, training, and deployment (p. 3132)
- MLOps template for model building, training, deployment, and Amazon SageMaker Model Monitor (p. 3134)
- MLOps template for image building, model building, and model deployment (p. 3135)
- MLOps template for model building, training, and deployment with third-party Git repositories using CodePipeline (p. 3135)
- MLOps template for model building, training, and deployment with third-party Git repositories using Jenkins (p. 3136)
MLOps template for model building, training, and deployment

This template is a combination of the following two templates, each of which can be used independently, and contains all of the resources provided in those templates.

- **Code repository**: AWS CodeCommit
- **CI/CD workflow automation**: AWS CodePipeline

MLOps template for model building and training

Use this template when you want an MLOps solution to process data, extract features, train and test models, and register the models in the SageMaker model registry.

This template provides the following resources:

- An AWS CodeCommit repository that contains sample code that creates an Amazon SageMaker Model Building Pipelines pipeline in Python code and shows how to create and update the SageMaker pipeline. This repository also has a Python Jupyter Notebook that you can open and run in Studio.
- An AWS CodePipeline pipeline that has source and build steps. The source step points to the CodeCommit repository. The build step gets the code from that repository, creates and updates the SageMaker pipeline, starts a pipeline execution, and waits for the pipeline execution to complete.
- An Amazon S3 bucket to store artifacts, including CodePipeline and CodeBuild artifacts, and any artifacts generated from the SageMaker pipeline runs.

The following diagram illustrates the workflow and AWS resources used by this template to help you build and train your models.
MLOps template for model deployment

Use this template to automate the deployment of models in the SageMaker model registry to SageMaker endpoints for real-time inference. This template recognizes changes in the model registry. When a new model version is registered and approved, it automatically initiates a deployment.

The template provisions a CodeCommit repository with configuration files to specify the model deployment steps, AWS CloudFormation templates to define endpoints as infrastructure, and seed code for testing the endpoint.

This template provides the following resources:
- An AWS CodeCommit repository that contains sample code that deploys models to endpoints in staging and production environments.
- An AWS CodePipeline pipeline that has source, build, deploy-to-staging, and deploy-to-production steps. The source step points to the CodeCommit repository, and the build step gets the code from that repository and generates CloudFormation stacks to deploy. The deploy-to-staging and deploy-to-production steps deploy the CloudFormation stacks to their respective environments.
  There is a manual approval step between the staging and production build steps, so that a MLOps engineer must approve the model before it is deployed to production.

  There is also a programmatic approval step with placeholder tests in the example code in the CodeCommit repository. You can add additional tests to replace the placeholders tests.
- An Amazon S3 bucket to store artifacts, including CodePipeline and CodeBuild artifacts, and any artifacts generated from the SageMaker pipeline runs.
- A CloudWatch event to initiate the pipeline when a model package version is approved or rejected.

The following diagram illustrates the workflow and AWS resources used by this template to help you deploy your models.
As previously mentioned, see Project Walkthrough for a demonstration that uses this template to create a real project.

**MLOps template for model building, training, deployment, and Amazon SageMaker Model Monitor**

This template is an extension of the MLOps template for model building, training, and deployment. It includes both the model building, training, and deployment components of the template, and an additional Amazon SageMaker Model Monitor template that provides the following types of monitoring:

- **Data Quality** – Monitor drift in data quality.
- **Model Quality** – Monitor drift in model quality metrics, such as accuracy.
- **Bias Drift for Models in Production** – Monitor bias in a model's predictions.

- **Code repository**: AWS CodeCommit
- **CI/CD workflow automation**: AWS CodePipeline

**MLOps template for Amazon SageMaker Model Monitor**

You can use this template for an MLOps solution to deploy one or more of the Amazon SageMaker data quality, model quality, model bias, and model explainability monitors to monitor a deployed model on a SageMaker inference endpoint.

This template provides the following resources:
• An AWS CodeCommit repository that contains sample Python code that gets the baselines used by the monitors from the SageMaker Model Registry, and updates the template's parameters for the staging and production environments. It also contains a AWS CloudFormation template to create the Amazon SageMaker Model Monitors.

• An AWS CodePipeline pipeline that has source, build, and deploy steps. The source step points to the CodePipeline repository. The build step gets the code from that repository, gets the baseline from the Model Registry, and updates template parameters for the staging and production environments. The deploy steps deploy the configured monitors into the staging and production environments. The manual approval step, within the DeployStaging stage, requires you to verify that the production SageMaker endpoint is InService before approving and moving to the DeployProd stage.

• The template uses the same S3 bucket created by the MLOps template for model building, training, and deployment to store the monitors' outputs.

• Two Amazon EventBridge events rules initiate the Amazon SageMaker Model Monitor AWS CodePipeline every time the staging SageMaker endpoint is updated, or a code change is committed to the CodePipeline repository.

MLOps template for image building, model building, and model deployment

This template is an extension of the MLOps template for model building, training, and deployment (p. 3132). It includes both the model building, training, and deployment components of that template and the following options:

• Include processing image-building pipeline
• Include training image-building pipeline
• Include inference image-building pipeline

For each of the components selected during project creation, the following are created by using the template:

• An Amazon ECR repository
• A SageMaker Image
• A CodeCommit repository containing a Dockerfile that you can customize
• A CodePipeline that is initiated by changes to the CodePipeline repository
• A CodeBuild project that builds a Docker image and registers it in the Amazon ECR repository
• An EventBridge rule that initiates the CodePipeline on a schedule

When the CodePipeline is initiated, it builds a new Docker container and registers it with an Amazon ECR repository. When a new container is registered with the Amazon ECR repository, a new ImageVersion is added to the SageMaker image. This initiates the model building pipeline, which in turn initiates the deployment pipeline.

The newly created image is used in the model building, training, and deployment portions of the workflow where applicable.

MLOps template for model building, training, and deployment with third-party Git repositories using CodePipeline

• Code repository: Third-party Git. Establish the AWS CodeStar connection from your AWS account to your GitHub user or organization. Add a tag with the key sagemaker and value true to this AWS CodeStar connection.

• CI/CD workflow automation: AWS CodePipeline
This template provides the following resources:

- Associations with one or more customer-specified Git repositories.
- An AWS CodePipeline pipeline that has source, build, deploy-to-staging, and deploy-to-production steps. The source step points to the third-party Git repository and the build step gets the code from that repository and generates CloudFormation stacks to deploy. The deploy-to-staging and deploy-to-production steps deploy the CloudFormation stacks to their respective environments. There is a manual approval step between the staging and production build steps, so that a MLOps engineer must approve the model before it is deployed to production.
- An AWS CodeBuild project to populate the Git repositories with the seed code information. This requires an AWS CodeStar connection from your AWS account to your account on the Git repository host.
- An Amazon S3 bucket to store artifacts, including CodePipeline and CodeBuild artifacts, and any artifacts generated from the SageMaker pipeline runs.

As previously mentioned, see Project Walkthrough Using Third-party Git Repos for a demonstration that uses this template to create a real project.

**MLOps template for model building, training, and deployment with third-party Git repositories using Jenkins**

- **Code repository**: Third-party Git. Establish the AWS CodeStar connection from your AWS account to your GitHub user or organization. Add a tag with the key `sagemaker` and value `true` to this AWS CodeStar connection.
- **CI/CD workflow automation**: Jenkins

This template provides the following resources:

- Associations with one or more customer-specified Git repositories.
- Seed code to generate Jenkins pipelines that have source, build, deploy-to-staging, and deploy-to-production steps. The source step points to the customer-specified Git repository. The build step gets the code from that repository and generates two CloudFormation stacks. The deploy steps deploy the CloudFormation stacks to their respective environments. There is an approval step between the staging step and the production step.
- An AWS CodeBuild project to populate the Git repositories with the seed code information. This requires an AWS CodeStar connection from your AWS account to your account on the Git repository host.
- An Amazon S3 bucket to store artifacts of the SageMaker project and SageMaker pipeline.

The template creates the association between your project and the source control repositories, but you need to perform additional manual steps to establish communication between your AWS account and Jenkins. For the detailed steps, see Create Amazon SageMaker projects using third-party source control and Jenkins.

The instructions help you build the architecture shown in the following diagram, with GitHub as the source control repository in this example. As shown, you are attaching your Git repository to the project to check in and manage code versions. Jenkins initiates the model build pipeline when it detects changes to the model build code in the Git repository. You are also connecting the project to Jenkins to orchestrate your model deployment steps, which start when you approve the model registered in the model registry, or when Jenkins detects changes to the model deployment code.
In summary, the steps guide you through the following tasks:

1. Establish the connection between your AWS and GitHub accounts.
2. Create the Jenkins account and import needed plugins.
3. Create the Jenkins IAM user and permissions policy.
4. Set the AWS credentials for the Jenkins IAM user on your Jenkins server.
5. Create an API token for communication with your Jenkins server.
6. Use a CloudFormation template to set up an EventBridge rule to monitor the model registry for newly-approved models.
7. Create the SageMaker project, which seeds your GitHub repositories with model build and deploy code.
8. Create your Jenkins model build pipeline with the model build seed code.
9. Create your Jenkins model deploy pipeline with the model deploy seed code.

Update SageMaker Projects to Use Third-Party Git Repositories

The managed policy attached to the AmazonSageMakerServiceCatalogProductsUseRole role was updated on July 27, 2021 for use with the third-party Git templates. Users who onboard to Amazon SageMaker Studio after this date and enable project templates use the new policy. Users who onboarded prior to this date must update the policy to use these templates. Use one of the following options to update the policy:

- Delete role and toggle Studio settings
  1. In the IAM console, delete AmazonSageMakerServiceCatalogProductsUseRole.
  2. In the Studio control panel, choose Edit Settings.
  3. Toggle both settings and then choose Submit.
- In the IAM console, add the following permissions to AmazonSageMakerServiceCatalogProductsUseRole:

```json
{
    "Effect": "Allow",
    "Action": ["codestar-connections:UseConnection"],
    "Resource": "arn:aws:codestar-connections:*::*:connection/**",
    "Condition": {
        "StringEqualsIgnoreCase": { ...
```
Create Custom Project Templates

If the SageMaker-provided templates do not meet your needs (for example, you want to have more complex orchestration in the CodePipeline with multiple stages or custom approval steps), create your own templates.

We recommend starting by using SageMaker-provided templates to understand how to organize your code and resources and build on top of it. To do this, after you enable administrator access to the SageMaker templates, log in to the https://console.aws.amazon.com/servicecatalog/, choose Portfolios, then choose Imported. For information about AWS Service Catalog, see Overview of AWS Service Catalog in the AWS Service Catalog User Guide.

Create your own project templates to customize your MLOps project. SageMaker project templates are AWS Service Catalog–provisioned products to provision the resources for your MLOps project.

To create a custom project template, complete the following steps.

1. Create a portfolio. For information, see Step 3: Create an AWS Service Catalog Portfolio.
2. Create a product. A product is a CloudFormation template. You can create multiple versions of the product. For information, see Step 4: Create an AWS Service Catalog Product.

For the product to work with SageMaker projects, add the following parameters to your product template.

```
SageMakerProjectName: 
  Type: String
  Description: Name of the project

SageMakerProjectId: 
  Type: String
  Description: Service generated Id of the project.
```

**Important**

We recommend that you wrap the CodeCommit repository into the SageMaker code repository for the project's repositories to be visible in VPC mode. The sample template and required addition are shown in the following code samples.

Original (sample) template:

```
ModelBuildCodeCommitRepository: 
  Type: AWS::CodeCommit::Repository
  Properties: 
    # Max allowed length: 100 chars
    RepositoryName: !Sub sagemaker-${SageMakerProjectName}-${SageMakerProjectId}-modelbuild # max: 10+33+15+10=68
```
RepositoryDescription: !Sub SageMaker Model building workflow infrastructure as code for the Project ${SageMakerProjectName}
Code:
S3:
  Bucket: SEEDCODE_BUCKETNAME
  Key: toolchain/model-building-workflow-v1.0.zip
  BranchName: main

Additional content to add in VPC mode:

SageMakerRepository:
  Type: AWS::SageMaker::CodeRepository
  Properties:
    GitConfig:
      RepositoryUrl: !GetAtt ModelBuildCodeCommitRepository.CloneUrlHttp
      Branch: main

3. Add a launch constraint. A launch constraint designates an IAM role that AWS Service Catalog assumes when a user launches a product. For information, see Step 6: Add a Launch Constraint to Assign an IAM Role.

4. Provision the product on https://console.aws.amazon.com/servicecatalog/ to test the template. If you are satisfied with your template, continue to the next step to make the template available in Studio.

5. Grant access to the AWS Service Catalog portfolio that you created in step 1 to your Studio execution role. Use either the Studio domain execution role or a user role that has Studio access. For information about adding a role to the portfolio, see Step 7: Grant End Users Access to the Portfolio.

6. To make your project template available in your Organization templates list in Studio, create a tag with the following key and value to the AWS Service Catalog product you created in step 2.

   • key: sagemaker:studio-visibility
   • value: true

After you complete these steps, Studio users in your organization can create a project with the template you created by following the steps in Create an MLOps Project using Amazon SageMaker Studio (p. 3130) and choosing Organization templates when you choose a template.

View Project Resources

After you create a project, view the resources associated with the project in Amazon SageMaker Studio.

To create a project in Studio

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. Choose SageMaker Resources, and then choose Projects.
3. Double-click the name of the project for which you want to view details.

   A tab with the project details appears.

On the project details tab, you can view the following entities associated with the project.

   • Repositories: Code repositories (repos) associated with this project. If you use a SageMaker-provided template when you create your project, it creates a AWS CodeCommit repo or a third-party Git repo. For more information about CodeCommit, see What is AWS CodeCommit.
   
   • Pipelines: SageMaker ML pipelines that define steps to prepare data, train, and deploy models. For information about SageMaker ML pipelines, see Create and Manage SageMaker Pipelines (p. 3092).
Update an MLOps Project in Amazon SageMaker Studio

This procedure demonstrates how to update an MLOps project in Amazon SageMaker Studio. You can update the **Description**, template version, and template parameters.

**Prerequisites**

- An IAM account or IAM Identity Center to sign in to Studio. For information, see Onboard to Amazon SageMaker Domain (p. 35).
- Basic familiarity with the Studio user interface. For information, see Amazon SageMaker Studio UI Overview (p. 117).
- Add the following custom inline policies to the specified roles:

  **User-created role having AmazonSageMakerFullAccess**

  ```json
  {
    "Version": "2012-10-17",
    "Statement": [
      {
        "Effect": "Allow",
        "Action": [
          "servicecatalog:CreateProvisionedProductPlan",
          "servicecatalog:DescribeProvisionedProductPlan",
          "servicecatalog:DeleteProvisionedProductPlan"
        ],
        "Resource": "*"
      }
    ]
  }
  ``

  **AmazonSageMakerServiceCatalogProductsLaunchRole**

  ```json
  {
    "Version": "2012-10-17",
    "Statement": [
      {
        "Effect": "Allow",
        "Action": [
          "cloudformation:CreateChangeSet",
          "cloudformation:DeleteChangeSet",
          "cloudformation:DescribeChangeSet"
        ],
        "Resource": "arn:aws:cloudformation::*::*:stack/SC-*"
      },
      {
      }
  }
  ```
Delete an MLOps Project using Amazon SageMaker Studio

This procedure demonstrates how to delete an MLOps project using Amazon SageMaker Studio.

**Prerequisites**

**Note**
You can only delete projects in Studio that you have created. This condition is part of the service catalog permission servicecatalog:Terminate ProvisionedProduct in the AmazonSageMakerFullAccess policy. If needed, you can update this policy to remove this condition.

- An IAM account or IAM Identity Center to sign in to Studio. For information, see Onboard to Amazon SageMaker Domain (p. 35).
- Basic familiarity with the Studio user interface. For information, see Amazon SageMaker Studio UI Overview (p. 117).
To delete a project in Amazon SageMaker Studio

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. In the Studio sidebar, choose the SageMaker resources icon (🔍).
3. Select Projects from the dropdown list.
4. Select the target project from the dropdown list. If you don’t see your project, type the project name and apply the filter to find your project.
5. **You can delete a Studio project in one of the following ways:**
   a. **You can delete the project from the projects list.**
      - Right-click the target project and choose Delete from the dropdown list.

      **Note**
      - This functionality is supported in Studio version v3.17.1 or higher. For more information, see Shut down and Update SageMaker Studio (p. 181).

   b. **You can delete a project from the Project details section.**
      i. Once you've found your project, double-click it to view its details.
      ii. Choose Delete from the Actions menu.
6. Confirm your choice by choosing Delete from the Delete Project window.

SageMaker MLOps Project Walkthrough

This walkthrough uses the template MLOps template for model building, training, and deployment (p. 3132) to demonstrate using MLOps projects to create a CI/CD system to build, train, and deploy models.

Prerequisites

To complete this walkthrough, you need:

- An IAM account or IAM Identity Center to sign in to Studio. For information, see Onboard to Amazon SageMaker Domain (p. 35).
- Permission to use SageMaker-provided project templates. For information, see SageMaker Studio Permissions Required to Use Projects (p. 3128).
- Basic familiarity with the Studio user interface. For information, see Amazon SageMaker Studio UI Overview (p. 117).

Topics

- Step 1: Create the Project (p. 3142)
- Step 2: Clone the Code Repository (p. 3143)
- Step 3: Make a Change in the Code (p. 3144)
- Step 4: Approve the Model (p. 3146)
- (Optional) Step 5: Deploy the Model Version to Production (p. 3146)
- Step 6: Clean Up Resources (p. 3146)

Step 1: Create the Project

In this step, you create a SageMaker MLOps project by using a SageMaker-provided project template to build, train, and deploy models.
To create the SageMaker MLOps project

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. Choose SageMaker resources, and then select Projects from the dropdown list.
3. Choose Create project.
   
   The Create project tab appears.

4. For SageMaker project templates, choose Organization templates, then choose MLOps template for model building, training, and deployment.
5. For Project details, enter a name and description for your project.

When the project appears in the Projects list with a Status of Created, move on to the next step.

Important
As of July 25, 2022, we require additional roles to use project templates.
If you see the error message CodePipeline is not authorized to perform AssumeRole on role arn:aws:iam::xxx:role/service-role/AmazonSageMakerServiceCatalogProductsCodePipelineRole, see Steps 5-6 of SageMaker Studio Permissions Required to Use Projects (p. 3128) for a complete list of required roles and instructions on how to create them.

Step 2: Clone the Code Repository

After you create the project, two CodeCommit repositories are created in the project. One of the repositories contains code to build and train a model, and one contains code to deploy the model. In this step, you clone the repository to your local SageMaker project that contains the code to build and train the model to the local Studio environment so that you can work with the code.

To clone the code repository

1. Choose SageMaker resources, and then select Projects from the dropdown list.
2. Find the name of the project you created in the previous step and double-click on it to open the project tab for your project.
3. In the project tab, choose Repositories, and in the Local path column for the repository that ends with modelbuild, choose clone repo....
4. In the dialog box that appears, accept the defaults and choose Clone repository.
When clone of the repository is complete, the local path appears in the **Local path** column. Choose the path to open the local folder that contains the repository code in Studio.

### Step 3: Make a Change in the Code

Now make a change to the pipeline code that builds the model and check in the change to initiate a new pipeline run. The pipeline run registers a new model version.

**To make a code change**

1. In Studio, choose the file browser icon (**file**) and navigate to the `pipelines/abalone` folder. Double-click `pipeline.py` to open the code file.
2. In the `pipeline.py` file, find the line that sets the training instance type.

   ```python
   training_instance_type = ParameterString(
       name="TrainingInstanceType", default_value="ml.m5.xlarge"
   )
   ```

   Change `ml.m5.xlarge` to `ml.m5.large`, then type `Ctrl+S` to save the change.

3. Choose the **Git** icon (**git**) . Stage, commit, and push the change in `pipeline.py`. For information about using Git in Studio, see [Clone a Git Repository in SageMaker Studio (p. 177)](#).
After pushing your code change, the MLOps system initiates a run of the pipeline that creates a new model version. In the next step, you approve the new model version to deploy it to production.

**Step 4: Approve the Model**

Now you approve the new model version that was created in the previous step to initiate a deployment of the model version to a SageMaker endpoint.

**To approve the model version**

1. Choose **SageMaker resources**, and then select **Projects** from the dropdown list.
2. Find the name of the project you created in the first step and double-click on it to open the project tab for your project.
3. In the project tab, choose **Model groups**, then double-click the name of the model group that appears.
   
   The model group tab appears.
4. In the model group tab, double-click **Version 2**. The **Version 2** tab opens. Choose **Update status**
5. In the model **Update model version status** dialog box, in the **Status** dropdown list, select **Approve**, then choose **Update status**.

   Approving the model version causes the MLOps system to deploy the model to staging. To view the endpoint, choose the **Endpoints** tab on the project tab.

**(Optional) Step 5: Deploy the Model Version to Production**

Now you can deploy the model version to the production environment.

**Note**

To complete this step, you need to be an administrator in your Studio domain. If you are not an administrator, skip this step.

**To deploy the model version to the production environment**

1. Log in to the CodePipeline console at [https://console.aws.amazon.com/codepipeline/](https://console.aws.amazon.com/codepipeline/)
2. Choose **Pipelines**, then choose the pipeline with the name `sagemaker-projectname-projectid-modeldeploy`, where `projectname` is the name of your project, and `projectid` is the ID of your project.
3. In the **DeployStaging** stage, choose **Review**.
4. In the **Review** dialog box, choose **Approve**.

   Approving the **DeployStaging** stage causes the MLOps system to deploy the model to production. To view the endpoint, choose the **Endpoints** tab on the project tab in Studio.

**Step 6: Clean Up Resources**

To stop incurring charges, clean up the resources that were created in this walkthrough. To do this, complete the following steps.

**Note**

To delete the AWS CloudFormation stack and the Amazon S3 bucket, you need to be an administrator in Studio. If you are not an administrator, ask your administrator to complete those steps.

1. In the Studio sidebar, choose the **SageMaker resources** icon (衙).
2. Choose **Projects** from the dropdown list.

3. Select the target project from the dropdown list. If you don’t see your project, type the project name and apply the filter to find your project.

4. **You can delete a Studio project in one of the following ways:**
   a. **You can delete the project from the projects list.**
      
      Right-click the target project and choose **Delete** from the dropdown list.
      
      **Note**
      
      This functionality is supported in Studio version v3.17.1 or higher. For more information, see **Shut down and Update SageMaker Studio** (p. 181).
   b. **You can delete a project from the Project details section.**
      
      i. When you’ve found your project, double-click it to view its details in the main panel.
      
      ii. Choose **Delete** from the **Actions** menu.

5. Confirm your choice by choosing **Delete** from the **Delete Project** window.

   This deletes the AWS Service Catalog provisioned product that the project created. This includes the CodeCommit, CodePipeline, and CodeBuild resources created for the project.

6. Delete the AWS CloudFormation stacks that the project created. There are two stacks, one for staging and one for production. The names of the stacks are `sagemaker-projectname-project-id-deploy-staging` and `sagemaker-projectname-project-id-deploy-prod`, where `projectname` is the name of your project, and `project-id` is the ID of your project.

   For information about how to delete a AWS CloudFormation stack, see Deleting a stack on the AWS CloudFormation console in the **AWS CloudFormation User Guide**.

7. Delete the Amazon S3 bucket that the project created. The name of the bucket is `sagemaker-project-project-id`, where `project-id` is the ID of your project.

---

**SageMaker MLOps Project Walkthrough Using Third-party Git Repos**

This walkthrough uses the template **MLOps template for model building, training, and deployment with third-party Git repositories using CodePipeline** (p. 3135) to demonstrate how to use MLOps projects to create a CI/CD system to build, train, and deploy models.

**Prerequisites**

To complete this walkthrough, you need:

- An IAM or IAM Identity Center account to sign in to Studio. For information, see **Onboard to Amazon SageMaker Domain** (p. 35).
- Permission to use SageMaker-provided project templates. For information, see **SageMaker Studio Permissions Required to Use Projects** (p. 3128).
- Basic familiarity with the Studio user interface. For information, see **Amazon SageMaker Studio UI Overview** (p. 117).
- Two GitHub repositories initialized with a README. You input these repositories into the project template, which will seed these repos with model build and deploy code.

**Topics**

- **Step 1: Set up the GitHub connection** (p. 3148)
- **Step 2: Create the Project** (p. 3148)
Step 1: Set up the GitHub connection

In this step, you connect to your GitHub repositories using an AWS CodeStar connection. The SageMaker project uses this connection to access your source code repositories.

To set up the GitHub connection:
1. Log in to the CodePipeline console at https://console.aws.amazon.com/codepipeline/
2. Under Settings in the navigation pane, choose Connections.
3. Choose Create connection.
4. For Select a provider, select GitHub.
5. For Connection name, enter a name.
6. Choose Connect to GitHub.
7. If the AWS Connector GitHub app isn't previously installed, choose Install new app.

   This displays a list of all the GitHub personal accounts and organizations to which you have access.
8. Choose the account where you want to establish connectivity for use with SageMaker projects and GitHub repositories.
9. Choose Configure.
10. You can optionally select your specific repositories or choose All repositories.
11. Choose Save. When the app is installed, you're redirected to the Connect to GitHub page and the installation ID is automatically populated.
12. Choose Connect.
13. Add a tag with the key sagemaker and value true to this AWS CodeStar connection.
14. Copy the connection ARN to save for later. You use the ARN as a parameter in the project creation step.

Step 2: Create the Project

In this step, you create a SageMaker MLOps project by using a SageMaker-provided project template to build, train, and deploy models.

To create the SageMaker MLOps project
1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 35).
2. Choose SageMaker resources, and then select Projects from the dropdown list.
3. Choose Create project.

   The Create project tab appears.
4. For SageMaker project templates, choose MLOps template for model building, training, and deployment with third-party Git repositories.
5. Choose Select project template.
6. Under ModelBuild CodeRepository Info, provide the following parameters:
• For **URL**, enter the URL of your Git repository for the model build code in https://\textit{git-url}.git format.
• For **Branch**, enter the branch to use from your Git repository for pipeline activities.
• For **Full Repository Name**, enter the Git repository name in the format of \textit{username/repo\textunderscore name} or \textit{organization/repo\textunderscore name}.
• For **CodeStar Connection ARN**, enter the ARN of the AWS CodeStar connection you created in Step 1.
• The **Sample Code** toggle switch lets you choose whether to populate the repository with model build seed code. We can leave it on for this demo.

7. Under **ModelDeploy CodeRepository Info**, provide the following parameters:
• For **URL**, enter the URL of your Git repository for the model deploy code in https://\textit{git-url}.git format.
• For **Branch**, enter the branch to use from your Git repository for pipeline activities.
• For **Full Repository Name**, enter the Git repository name in the format of \textit{username/repo\textunderscore name} or \textit{organization/repo\textunderscore name}.
• For **CodeStar Connection ARN**, enter the ARN of the AWS CodeStar connection you created in Step 1.
• The **Sample Code** toggle switch lets you choose whether to populate the repository with model deployment seed code. We can leave it on for this demo.

8. Choose **Create Project**.

The project appears in the **Projects** list with a **Status** of **Created**.

**Step 3: Make a Change in the Code**

Now make a change to the pipeline code that builds the model and commit the change to initiate a new pipeline run. The pipeline run registers a new model version.

**To make a code change**

1. In your model build GitHub repo, navigate to the \textit{pipelines/abalone} folder. Double-click \textit{pipeline.py} to open the code file.
2. In the \textit{pipeline.py} file, find the line that sets the training instance type.

   ```python
   training_instance_type = ParameterString(
       name="TrainingInstanceType", default_value="ml.m5.xlarge"
   )
   ```

   Open the file for editing, change **ml.m5.xlarge** to **ml.m5.large**, then commit.

After you commit your code change, the MLOps system initiates a run of the pipeline that creates a new model version. In the next step, you approve the new model version to deploy it to production.

**Step 4: Approve the Model**

Now you approve the new model version that was created in the previous step to initiate a deployment of the model version to a SageMaker endpoint.

**To approve the model version**

1. Choose **SageMaker resources**, and then select **Projects** from the dropdown list.
2. Find the name of the project you created in the first step and double-click on it to open the project tab for your project.

3. In the project tab, choose **Model groups**, then double-click the name of the model group that appears.

The model group tab appears.

4. In the model group tab, double-click **Version 2**. The **Version 2** tab opens. Choose **Update status**.

5. In the model **Update model version status** dialog box, in the **Status** dropdown list, select **Approve** and then choose **Update status**.

Approving the model version causes the MLOps system to deploy the model to staging. To view the endpoint, choose the **Endpoints** tab on the project tab.

*(Optional) Step 5: Deploy the Model Version to Production*

Now you can deploy the model version to the production environment.

**Note**
To complete this step, you need to be an administrator in your Studio domain. If you are not an administrator, skip this step.

To deploy the model version to the production environment

1. Log in to the CodePipeline console at [https://console.aws.amazon.com/codepipeline/](https://console.aws.amazon.com/codepipeline/)
2. Choose **Pipelines**, then choose the pipeline with the name `sagemaker-projectname-projectid-modeldeploy`, where `projectname` is the name of your project, and `projectid` is the ID of your project.
3. In the **DeployStaging** stage, choose **Review**.
4. In the **Review** dialog box, choose **Approve**.

Approving the **DeployStaging** stage causes the MLOps system to deploy the model to production. To view the endpoint, choose the **Endpoints** tab on the project tab in Studio.

**Step 6: Clean Up Resources**

To stop incurring charges, clean up the resources that were created in this walkthrough.

**Note**
To delete the AWS CloudFormation stack and the Amazon S3 bucket, you need to be an administrator in Studio. If you are not an administrator, ask your administrator to complete those steps.

1. In the Studio sidebar, choose the **SageMaker resources** icon (bolt).
2. Choose **Projects** from the dropdown list.
3. Select the target project from the dropdown list. If you don’t see your project, type the project name and apply the filter to find your project.
4. **You can delete a Studio project in one of the following ways:**
   a. **You can delete the project from the projects list.**

   Right-click the target project and choose **Delete** from the dropdown list.

   **Note**
   This functionality is supported in Studio version v3.17.1 or higher. For more information, see [Shut down and Update SageMaker Studio](p. 181).
b. **You can delete a project from the Project details section.**
   
   i. When you've found your project, double-click it to view its details in the main panel.
   
   ii. Choose **Delete** from the **Actions** menu.

5. Confirm your choice by choosing **Delete** from the **Delete Project** window.

   This deletes the AWS Service Catalog provisioned product that the project created. This includes the CodeCommit, CodePipeline, and CodeBuild resources created for the project.

6. Delete the AWS CloudFormation stacks that the project created. There are two stacks, one for staging and one for production. The names of the stacks are `sagemaker-projectname-project-id-deploy-staging` and `sagemaker-projectname-project-id-deploy-prod`, where `projectname` is the name of your project, and `project-id` is the ID of your project.

   For information about how to delete a AWS CloudFormation stack, see Deleting a stack on the AWS CloudFormation console in the AWS CloudFormation User Guide.

7. Delete the Amazon S3 bucket that the project created. The name of the bucket is `sagemaker-project-project-id`, where `project-id` is the ID of your project.

---

**Amazon SageMaker ML Lineage Tracking**

Amazon SageMaker ML Lineage Tracking creates and stores information about the steps of a machine learning (ML) workflow from data preparation to model deployment. With the tracking information, you can reproduce the workflow steps, track model and dataset lineage, and establish model governance and audit standards.

With SageMaker Lineage Tracking data scientists and model builders can do the following:

- Keep a running history of model discovery experiments.
- Establish model governance by tracking model lineage artifacts for auditing and compliance verification.

**Topics**

- Lineage Tracking Entities (p. 3152)
- Amazon SageMaker–Created Tracking Entities (p. 3154)
- Manually Create Tracking Entities (p. 3156)
- Querying Lineage Entities (p. 3159)
- Cross-Account Lineage Tracking (p. 3165)

The following diagram shows an example lineage graph that Amazon SageMaker automatically creates in an end-to-end model training and deployment ML workflow.
Lineage Tracking Entities

Tracking entities maintain a representation of all the elements of your end-to-end machine learning workflow. You can use this representation to establish model governance, reproduce your workflow, and maintain a record of your work history.

Amazon SageMaker automatically creates tracking entities for trial components and their associated trials and experiments when you create SageMaker jobs such as processing jobs, training jobs, and batch transform jobs. In additional to auto tracking, you can also Manually Create Tracking Entities (p. 3156) to model custom steps in your workflow. For more information, see Manage Machine Learning with Amazon SageMaker Experiments (p. 2164).

SageMaker also automatically creates tracking entities for the other steps in a workflow so you can track the workflow from end to end. For more information, see Amazon SageMaker–Created Tracking Entities (p. 3154).

You can create additional entities to supplement those created by SageMaker. For more information, see Manually Create Tracking Entities (p. 3156).

SageMaker reuses any existing entities rather than creating new ones. For example, there can be only one artifact with a unique SourceUri.
Key concepts for querying lineage

- **Lineage** – Metadata that tracks the relationships between various entities in your ML workflows.
- **QueryLineage** – The action to inspect your lineage and discover relationships between entities.
- **Lineage entities** – The metadata elements of which your lineage is composed.
- **Cross-account lineage** – Your ML workflow may span more than one account. With cross-account lineage, you can configure multiple accounts to automatically create lineage associations between shared entity resources. QueryLineage then can return entities even from these shared accounts.

The following tracking entities are defined:

**Experiment entities**

- **Trial component** – A stage of a machine learning trial. Includes processing jobs, training jobs, and batch transform jobs.
- **Trial** – A combination of trial components that generally produces a model.
- **Experiment** – A grouping of trials generally focused on solving a specific use case.

**Lineage entities**

- **Trial Component** – Represents processing, training, and transform jobs in the lineage. Also part of experiment management.
- **Context** – Provides a logical grouping of other tracking or experiment entities. Conceptually, experiments and trials are contexts. Some examples are an endpoint and a model package.
- **Action** – Represents an action or activity. Generally, an action involves at least one input artifact or output artifact. Some examples are a workflow step and a model deployment.
- **Artifact** – Represents a URI addressable object or data. An artifact is generally either an input or an output to a trial component or action. Some examples include a dataset (S3 bucket URI), or an image (Amazon ECR registry path).
- **Association** – Links other tracking or experiment entities, such as an association between the location of training data and a training job.

An association has an optional `AssociationType` property. The following values are available along with the suggested use for each type. SageMaker places no restrictions on their use:

- **ContributedTo** – The source contributed to the destination or had a part in enabling the destination. For example, the training data contributed to the training job.
- **AssociatedWith** – The source is connected to the destination. For example, an approval workflow is associated with a model deployment.
- **DerivedFrom** – The destination is a modification of the source. For example, a digest output of a channel input for a processing job is derived from the original inputs.
- **Produced** – The source generated the destination. For example, a training job produced a model artifact.
- **SameAs** – When the same lineage entity used in different accounts.

**Common properties**

- **Type property**

  The action, artifact, and context entities have a `type` property, `ActionType`, `ArtifactType`, and `ContextType`, respectively. This property is a custom string which can associate meaningful information with the entity and be used as a filter in the List APIs.

- **Source property**
The action, artifact, and context entities have a `Source` property. This property provides the underlying URI that the entity represents. Some examples are:

- An `UpdateEndpoint` action where the source is the `EndpointArn`.
- An image artifact for a processing job where the source is the `ImageUri`.
- An `Endpoint` context where the source is the `EndpointArn`.

**Metadata property**

The action and artifact entities have an optional `Metadata` property which can provide the following information:

- `ProjectId` – For example, the ID of the SageMaker MLOps project to which a model belongs.
- `GeneratedBy` – For example, the SageMaker pipeline execution that registered a model package version.
- `Repository` – For example, the repository that contains an algorithm.
- `CommitId` – For example, the commit ID of an algorithm version.

## Amazon SageMaker–Created Tracking Entities

Amazon SageMaker automatically creates tracking entities for SageMaker jobs, models, model packages, and endpoints if the data is available. There is no limit to the number of lineage entities created by SageMaker.

For information on how you can manually create tracking entities, see Manually Create Tracking Entities (p. 3156).

**Topics**

- Tracking Entities for SageMaker Jobs (p. 3154)
- Tracking Entities for Model Packages (p. 3155)
- Tracking Entities for Endpoints (p. 3155)

## Tracking Entities for SageMaker Jobs

SageMaker creates a trial component for and associated with each SageMaker job. SageMaker creates artifacts to track the job metadata and associations between each artifact and the job.

Artifacts are created for the following job properties and associated with the Amazon Resource Name (ARN) of the SageMaker job. The artifact `SourceUri` is listed in parentheses.

### Training Job

- The image that contains the training algorithm (`TrainingImage`).
- The data source of each input channel (`S3Uri`).
- The location for the model (`S3OutputPath`).
- The location for the managed spot checkpoint data (`S3Uri`).

### Processing Job

- The container to be run by the processing job (`ImageUri`).
- The data location for each processing input and processing output (`S3Uri`).
Transform Job

- The input data source to be transformed (S3Uri).
- The results of the transform (S3OutputPath).

**Note**

Amazon Simple Storage Service (Amazon S3) artifacts are tracked based on the Amazon S3 URI values provided to the Create API, for example CreateTrainingJob, and not on the Amazon S3 key and hash or etag values from each file.

Tracking Entities for Model Packages

The following entities are created:

**Model Packages**

- A context for each model package group.
- An artifact for each model package.
- An association between each model package artifact and the context for each model package group to which the package belongs to.
- An action for the creation of a model package version.
- An association between the model package artifact and the creation action.
- An association between the model package artifact and each model package group context to which the package belongs to.
- Inference containers
  - An artifact for the image used in each container defined in the model package.
  - An artifact for the model used in each container.
  - An association between each artifact and the model package artifact.
- Algorithms
  - An artifact for each algorithm defined in the model package.
  - An artifact for the model created by each algorithm.
  - An association between each artifact and the model package artifact.

Tracking Entities for Endpoints

The following entities are created by Amazon SageMaker:

**Endpoints**

- A context for each endpoint
- An action for the model deployment that created each endpoint
- An artifact for each model deployed to the endpoint
- An artifact for the image used in the model
- An artifact for the model package for the model
- An artifact for each image deployed to the endpoint
- An association between each artifact and the model deployment action
Manually Create Tracking Entities

You can manually create tracking entities for any property. For information on the tracking entities that Amazon SageMaker automatically creates, see Amazon SageMaker–Created Tracking Entities (p. 3154).

You can add tags to all entities except associations. Tags are arbitrary key-value pairs that provide custom information. You can filter or sort a list or search query by tags. For more information, see Tagging AWS resources in the AWS General Reference.

For a sample notebook that demonstrates how to create lineage entities, see the Amazon SageMaker Lineage notebook in the Amazon SageMaker example GitHub repository.

Topics
- Manually Create Entities (p. 3156)
- Manually Track a Workflow (p. 3157)
- Limits (p. 3158)

Manually Create Entities

The following procedure shows you how to create and associate artifacts between a SageMaker training job and endpoint. You perform the following steps:

Import tracking entities and associations

1. Import the lineage tracking entities.

   ```python
   import sys
   !(sys.executable) -m pip install -q sagemaker
   from sagemaker import get_execution_role
   from sagemaker.session import Session
   from sagemaker.lineage import context, artifact, association, action
   import boto3
   boto_session = boto3.Session(region_name=region)
   sagemaker_client = boto_session.client("sagemaker")
   ```

2. Create the input and output artifacts.

   ```python
   code_location_arn = artifact.Artifact.create(
       artifact_name='source-code-location',
       source_uri='s3://...',
       artifact_type='code-location').artifact_arn
   # Similar constructs for train_data_location_arn and test_data_location_arn
   model_location_arn = artifact.Artifact.create(
       artifact_name='model-location',
       source_uri='s3://...',
       artifact_type='model-location').artifact_arn
   ```

3. Train the model and get the trial_component_arn that represents the training job.
4. Associate the input artifacts and output artifacts with the training job (trial component).

   ```python
   input_artifacts = [code_location_arn, train_data_location_arn, test_data_location_arn]
   for artifact_arn in input_artifacts:
   ```
try:
    association.Association.create(
        source_arn=artifact_arn,
        destination_arn=trial_component_arn,
        association_type='ContributedTo'
    )
except:
    logging.info('association between {} and {} already exists', artifact_arn,
                 trial_component_arn)
output_artifacts = [model_location_arn]
for artifact_arn in output_artifacts:
    try:
        association.Association.create(
            source_arn=trial_component_arn,
            destination_arn=artifact_arn,
            association_type='Produced'
        )
    except:
        logging.info('association between {} and {} already exists', artifact_arn,
                     trial_component_arn)

5. Create the inference endpoint.

    predictor = mnist_estimator.deploy(initial_instance_count=1,
                                       instance_type='ml.m4.xlarge')

6. Create the endpoint context.

    from sagemaker.lineage import context
    endpoint = sagemaker_client.describe_endpoint(EndpointName=predictor.endpoint_name)
    endpoint_arn = endpoint['EndpointArn']
    endpoint_context_arn = context.Context.create(
        context_name=predictor.endpoint_name,
        context_type='Endpoint',
        source_uri=endpoint_arn
    ).context_arn

7. Associate the training job (trial component) and endpoint context.

    association.Association.create(
        source_arn=trial_component_arn,
        destination_arn=endpoint_context_arn
    )

Manually Track a Workflow

You can manually track the workflow created in the previous section.

Given the endpoint Amazon Resource Name (ARN) from the previous example, the following procedure shows you how to track the workflow back to the datasets used to train the model that was deployed to the endpoint. You perform the following steps:

To track a workflow from endpoint to training data source

1. Import the tracking entities.

    import sys
\{(sys.executable) -m pip install -q sagemaker\}

```python
from sagemaker import get_execution_role
from sagemaker.session import Session
from sagemaker.lineage import context, artifact, association, action

import boto3
boto_session = boto3.Session(region_name=region)
sagemaker_client = boto_session.client("sagemaker")
```

2. Get the endpoint context from the endpoint ARN.

```python
endpoint_context_arn = sagemaker_client.list_contexts(
    SourceUri=endpoint_arn)["ContextSummaries"]
[0]["ContextArn"]
```

3. Get the trial component from the association between the trial component and the endpoint context.

```python
trial_component_arn = sagemaker_client.list_associations(
    DestinationArn=endpoint_context_arn)["AssociationSummaries"]
[0]["SourceArn"]
```

4. Get the training data location artifact from the association between the trial component and the endpoint context.

```python
train_data_location_artifact_arn = sagemaker_client.list_associations(
    DestinationArn=trial_component_arn, SourceType='Model')["AssociationSummaries"]
[0]["SourceArn"]
```

5. Get the training data location from the training data location artifact.

```python
train_data_location = sagemaker_client.describe_artifact(
    ArtifactArn=train_data_location_artifact_arn)["Source"]
print(train_data_location)
```

Response:

```
s3://sagemaker-sample-data-us-east-2/mxnet/mnist/train
```

**Limits**

You can create an an association between any entities, experiment and lineage, except the following:

- You cannot create an association between two experiment entities. Experiment entities consist of experiments, trials, and trial components.
- You can create an association with another association.

An error occurs if you try to create an entity that already exists.

**Maximum number of manually created lineage entities**

- Actions: 3000
- Artifacts: 6000
- Associations: 6000
- Contexts: 500
Querying Lineage Entities

Amazon SageMaker automatically generates graphs of lineage entities as you use them. You can query this data to answer a variety of questions. You can query your lineage entities to:

- Retrieve all data sets that went into the creation of a model.
- Retrieve all jobs that went into the creation of an endpoint.
- Retrieve all models that use a data set.
- Retrieve all endpoints that use a model.
- Retrieve which endpoints are derived from a certain data set.
- Retrieve the pipeline execution that created a training job.
- Retrieve the relationships between entities for investigation, governance, and reproducibility.
- Retrieve all downstream trials that use the artifact.
- Retrieve all upstream trials that use the artifact.
- Retrieve a list of artifacts that use the provided S3 uri.
- Retrieve upstream artifacts that use the dataset artifact.
- Retrieve downstream artifacts that use the dataset artifact.
- Retrieve datasets that use the image artifact.
- Retrieve actions that use the context.
- Retrieve processing jobs that use the endpoint.
- Retrieve transform jobs that use the endpoint.
- Retrieve trial components that use the endpoint.
- Retrieve the ARN for the pipeline execution associated with the model package group.
- Retrieve all artifacts that use the action.
- Retrieve all upstream datasets that use the model package approval action.
- Retrieve model package from model package approval action.
- Retrieve downstream endpoint contexts that use the endpoint.
- Retrieve the ARN for the pipeline execution associated with the trial component.
- Retrieve datasets that use the trial component.
- Retrieve models that use the trial component.
- Explore your lineage for visualization.

Topics

- Getting Started with Querying Lineage Entities (p. 3160)

Limitations

- Lineage querying is not available in the following Regions:
  - Asia Pacific (Osaka) – ap-northeast-3
  - Europe (Milan) – eu-south-1
  - Africa (Cape Town) – af-south
- The maximum depth of relationships to discover is currently limited to 10.
• Filtering is limited to the following properties: last modified date, created date, type, and lineage entity type.

Getting Started with Querying Lineage Entities

The easiest way to get started is either via the:

• Amazon SageMaker SDK for Python which has defined many common use cases.
• For a notebook that demonstrates how to use SageMaker Lineage APIs to query relationships across the lineage graph, see sagemaker-lineage-multihop-queries.ipynb.

The following examples show how to use the LineageQuery and LineageFilter APIs to construct queries to answer questions about the Lineage Graph and extract entity relationships for a few use cases.

Example Using the LineageQuery API to find entity associations

```python
from sagemaker.lineage.context import Context, EndpointContext
from sagemaker.lineage.action import Action
from sagemaker.lineage.association import Association
from sagemaker.lineage.artifact import Artifact, ModelArtifact, DatasetArtifact
from sagemaker.lineage.query import (LineageQuery, LineageFilter, LineageSourceEnum, LineageEntityEnum, LineageQueryDirectionEnum,
)
# Find the endpoint context and model artifact that should be used for the lineage queries.
contexts = Context.list(source_uri=endpoint_arn)
context_name = list(contexts)[0].context_name
endpoint_context = EndpointContext.load(context_name=context_name)

Example Find all the datasets associated with an endpoint

```python
# Define the LineageFilter to look for entities of type `ARTIFACT` and the source of type `DATASET`.
query_filter = LineageFilter(
    entities=[LineageEntityEnum.ARTIFACT],
    sources=[LineageSourceEnum.DATASET]
)

# Providing this `LineageFilter` to the `LineageQuery` constructs a query that traverses through the given context `endpoint_context` and find all datasets.
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[endpoint_context.context_arn],
    query_filter=query_filter,
    direction=LineageQueryDirectionEnum.ASCENDANTS,
    include_edges=False,
)

# Parse through the query results to get the lineage objects corresponding to the datasets
dataset_artifacts = []
for vertex in query_result.vertices:
    dataset_artifacts.append(vertex.to_lineage_object().source.source_uri)
```
Example Find the models associated with an endpoint

```python
# Define the LineageFilter to look for entities of type `ARTIFACT` and the source of type `MODEL`.
query_filter = LineageFilter(
    entities=[LineageEntityEnum.ARTIFACT], sources=[LineageSourceEnum.MODEL]
)

# Providing this `LineageFilter` to the `LineageQuery` constructs a query that traverses through the given context `endpoint_context` and find all datasets.
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[endpoint_context.context_arn],
    query_filter=query_filter,
    direction=LineageQueryDirectionEnum.ASCENDANTS,
    include_edges=False,
)

# Parse through the query results to get the lineage objects corresponding to the model
model_artifacts = []
for vertex in query_result.vertices:
    model_artifacts.append(vertex.to_lineage_object().source.source_uri)

# The results of the `LineageQuery` API call return the ARN of the model deployed to the endpoint along with the S3 URI to the model.tar.gz file associated with the model
pp.pprint(model_artifacts)
```

Example Find the trial components associated with the endpoint

```python
# Define the LineageFilter to look for entities of type `TRIAL_COMPONENT` and the source of type `TRAINING_JOB`.
query_filter = LineageFilter(
    entities=[LineageEntityEnum.TRIAL_COMPONENT],
    sources=[LineageSourceEnum.TRAINING_JOB],
)

# Providing this `LineageFilter` to the `LineageQuery` constructs a query that traverses through the given context `endpoint_context` and find all datasets.
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[endpoint_context.context_arn],
    query_filter=query_filter,
    direction=LineageQueryDirectionEnum.ASCENDANTS,
    include_edges=False,
)

# Parse through the query results to get the ARNs of the training jobs associated with this Endpoint
trial_components = []
for vertex in query_result.vertices:
    trial_components.append(vertex.arn)

pp.pprint(trial_components)
```
Example Changing the focal point of lineage

The LineageQuery can be modified to have different start_arns which changes the focal point of lineage. In addition, the LineageFilter can take multiple sources and entities to expand the scope of the query.

In the following we use the model as the lineage focal point and find the endpoints and datasets associated with it.

```python
# Get the ModelArtifact
model_artifact_summary = list(Artifact.list(source_uri=model_package_arn))[0]
model_artifact = ModelArtifact.load(artifact_arn=model_artifact_summary.artifact_arn)
query_filter = LineageFilter(
    entities=[LineageEntityEnum.ARTIFACT],
    sources=[LineageSourceEnum.ENDPOINT, LineageSourceEnum.DATASET],
)
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[model_artifact.artifact_arn],  # Model is the starting artifact
    query_filter=query_filter,
    # Find all the entities that descend from the model, i.e. the endpoint
    direction=LineageQueryDirectionEnum.DESCENDANTS,
    include_edges=False,
)
associations = []
for vertex in query_result.vertices:
    associations.append(vertex.to_lineage_object().source.source_uri)
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[model_artifact.artifact_arn],  # Model is the starting artifact
    query_filter=query_filter,
    # This specifies that the query should look for associations both ascending and descending for the start
    direction=LineageQueryDirectionEnum.BOTH,
    include_edges=False,
)
for vertex in query_result.vertices:
    associations.append(vertex.to_lineage_object().source.source_uri)
p.p.pprint(associations)
```

Example Using LineageQueryDirectionEnum.BOTH to find ascendent and descendent relationships

When the direction is set to BOTH, the query traverses the graph to find ascendent and descendent relationships. This traversal takes place not only from the starting node, but from each node that is visited. For example; if a training job is run twice and both models generated by the training job are deployed to endpoints, the result of the query with direction set to BOTH shows both endpoints. This is because the same image is used for training and deploying the model. Since the image is common to the model, the start_arn and both the endpoints, appear in the query result.

```python
query_filter = LineageFilter(
    entities=[LineageEntityEnum.ARTIFACT],
    sources=[LineageSourceEnum.ENDPOINT, LineageSourceEnum.DATASET],
)
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[model_artifact.artifact_arn],  # Model is the starting artifact
    query_filter=query_filter,
    # This specifies that the query should look for associations both ascending and descending for the start
    direction=LineageQueryDirectionEnum.BOTH,
    include_edges=False,
)
for vertex in query_result.vertices:
    associations.append(vertex.to_lineage_object().source.source_uri)
p.p.pprint(associations)
```
direction=LineageQueryDirectionEnum.BOTH,
       include_edges=False,
   )
associations = []
for vertex in query_result.vertices:
    associations.append(vertex.to_lineage_object().source.source_uri)
pp.pprint(associations)

Example Directions in LineageQuery - ASCENDANTS vs. DESCENDANTS

To understand the direction in the Lineage Graph, take the following entity relationship graph - Dataset → Training Job → Model → Endpoint

The endpoint is a descendant of the model, and the model is a descendant of the dataset. Similarly, the model is an ascendant of the endpoint. The direction parameter can be used to specify whether the query should return entities that are descendants or ascendants of the entity in start_arns. If the start_arns contains a model and the direction is DESCENDANTS, the query returns the endpoint. If the direction is ASCENDANTS, the query returns the dataset.

# In this example, we'll look at the impact of specifying the direction as ASCENDANT or DESCENDANT in a `LineageQuery`.

query_filter = LineageFilter(
    entities=[LineageEntityEnum.ARTIFACT],
    sources=[
        LineageSourceEnum.ENDPOINT,
        LineageSourceEnum.MODEL,
        LineageSourceEnum.DATASET,
        LineageSourceEnum.TRAINING_JOB,
    ],
)
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[model_artifact.artifact_arn],
    query_filter=query_filter,
    direction=LineageQueryDirectionEnum.ASCENDANTS,
    include_edges=False,
)
ascendant_artifacts = []

# The lineage entity returned for the Training Job is a TrialComponent which can't be converted to a lineage object using the method `to_lineage_object()` so we extract the TrialComponent ARN.
for vertex in query_result.vertices:
    try:
        ascendant_artifacts.append(vertex.to_lineage_object().source.source_uri)
    except:
        ascendant_artifacts.append(vertex.arn)
print("Ascendant artifacts :")
pp.pprint(ascendant_artifacts)

query_result = LineageQuery(sagemaker_session).query(
    start_arns=[model_artifact.artifact_arn],
    query_filter=query_filter,
    direction=LineageQueryDirectionEnum.DESCENDANTS,
    include_edges=False,
)
descendant_artifacts = []
for vertex in query_result.vertices:
    try:
        descendant_artifacts.append(vertex.to_lineage_object().source.source_uri)
    except:
        # Handling TrialComponents.
        descendant_artifacts.append(vertex.arn)

print("Descendant artifacts : ")
pp.pprint(descendant_artifacts)

Example SDK helper functions to make lineage queries easier

The classes EndpointContext, ModelArtifact, and DatasetArtifact have helper functions that are wrappers over the LineageQuery API to make certain lineage queries easier to leverage. The following example shows how to use these helper function.

# Find all the datasets associated with this endpoint
datasets = []
dataset_artifacts = endpoint_context.dataset_artifacts()
for dataset in dataset_artifacts:
    datasets.append(dataset.source.source_uri)
print("Datasets : ", datasets)

# Find the training jobs associated with the endpoint
training_job_artifacts = endpoint_context.training_job_arns()
training_jobs = []
for training_job in training_job_artifacts:
    training_jobs.append(training_job)
print("Training Jobs : ", training_jobs)

# Get the ARN for the pipeline execution associated with this endpoint (if any)
pipeline_executions = endpoint_context.pipeline_execution_arn()
if pipeline_executions:
    for pipeline in pipelines_executions:
        print(pipeline)

# Here we use the `ModelArtifact` class to find all the datasets and endpoints associated with the model
dataset_artifacts = model_artifact.dataset_artifacts()
endpoint_contexts = model_artifact.endpoint_contexts()
datasets = [dataset.source.source_uri for dataset in dataset_artifacts]
endpoints = [endpoint.source.source_uri for endpoint in endpoint_contexts]
print("Datasets associated with this model : ")
pp.pprint(datasets)
print("Endpoints associated with this model : ")
pp.pprint(endpoints)

# Here we use the `DatasetArtifact` class to find all the endpoints hosting models that were trained with a particular dataset
# Find the artifact associated with the dataset
dataset_artifact_arn = list(Artifact.list(source_uri=training_data))[0].artifact_arn
dataset_artifact = DatasetArtifact.load(artifact_arn=dataset_artifact_arn)

# Find the endpoints that used this training dataset
endpoint_contexts = dataset_artifact.endpoint_contexts()
endpoints = [endpoint.source.source_uri for endpoint in endpoint_contexts]
print("Endpoints associated with the training dataset {}".format(training_data))
Example Getting a Lineage graph visualization

A helper class `Visualizer` is provided in the sample notebook `visualizer.py` to help plot the lineage graph. When the query response is rendered, a graph with the lineage relationships from the `StartArns` is displayed. From the `StartArns` the visualization shows the relationships with the other lineage entities returned in the `query_lineage` API action.

```python
# Graph APIs
# Here we use the boto3 `query_lineage` API to generate the query response to plot.
from visualizer import Visualizer
query_response = sm_client.query_lineage(
    StartArns=[endpoint_context.context_arn], Direction="Ascendants", IncludeEdges=True
)
viz = Visualizer()
viz.render(query_response, "Endpoint")
query_response = sm_client.query_lineage(
    StartArns=[model_artifact.artifact_arn], Direction="Ascendants", IncludeEdges=True
)
viz.render(query_response, "Model")
```

Cross-Account Lineage Tracking

Amazon SageMaker supports tracking lineage entities from a different AWS account. Other AWS accounts can share their lineage entities with you and you can access these lineage entities through direct API calls or SageMaker lineage queries.

SageMaker uses AWS Resource Access Manager to help you securely share your lineage resources. You can share your resources through the AWS RAM console.

Set Up Cross-Account Lineage Tracking

You can group and share your

Tracking entities maintain a representation of all the elements of your end-to-end machine learning workflow. You can use this representation to establish model governance, reproduce your workflow, and maintain a record of your work history.

Amazon SageMaker automatically creates tracking entities for trial components and their associated trials and experiments when you create SageMaker jobs such as processing jobs, training jobs, and batch transform jobs. In addition to auto tracking, you can also Manually Create Tracking Entities (p. 3156) to model custom steps in your workflow. For more information, see Manage Machine Learning with Amazon SageMaker Experiments (p. 2164).

SageMaker also automatically creates tracking entities for the other steps in a workflow so you can track the workflow from end to end. For more information, see Amazon SageMaker–Created Tracking Entities (p. 3154).

You can create additional entities to supplement those created by SageMaker. For more information, see Manually Create Tracking Entities (p. 3156).

SageMaker reuses any existing entities rather than creating new ones. For example, there can be only one artifact with a unique `SourceUri`. 3165
Key concepts for querying lineage

- **Lineage** – Metadata that tracks the relationships between various entities in your ML workflows.

- **QueryLineage** – The action to inspect your lineage and discover relationships between entities.

- **Lineage entities** – The metadata elements of which your lineage is composed.

- **Cross-account lineage** – Your ML workflow may span more than one account. With cross-account lineage, you can configure multiple accounts to automatically create lineage associations between shared entity resources. QueryLineage then can return entities even from these shared accounts.

The following tracking entities are defined:

**Experiment entities**

- Trial component – A stage of a machine learning trial. Includes processing jobs, training jobs, and batch transform jobs.

- Trial – A combination of trial components that generally produces a model.

- Experiment – A grouping of trials generally focused on solving a specific use case.

**Lineage entities**

- Trial Component – Represents processing, training, and transform jobs in the lineage. Also part of experiment management.

- Context – Provides a logical grouping of other tracking or experiment entities. Conceptually, experiments and trials are contexts. Some examples are an endpoint and a model package.

- Action – Represents an action or activity. Generally, an action involves at least one input artifact or output artifact. Some examples are a workflow step and a model deployment.

- Artifact – Represents a URI addressable object or data. An artifact is generally either an input or an output to a trial component or action. Some examples include a dataset (S3 bucket URI), or an image (Amazon ECR registry path).

- Association – Links other tracking or experiment entities, such as an association between the location of training data and a training job. An association has an optional AssociationType property. The following values are available along with the suggested use for each type. SageMaker places no restrictions on their use:
  - ContributedTo – The source contributed to the destination or had a part in enabling the destination. For example, the training data contributed to the training job.
  - AssociatedWith – The source is connected to the destination. For example, an approval workflow is associated with a model deployment.
  - DerivedFrom – The destination is a modification of the source. For example, a digest output of a channel input for a processing job is derived from the original inputs.
  - Produced – The source generated the destination. For example, a training job produced a model artifact.
  - SameAs – When the same lineage entity used in different accounts.

**Common properties**

- **Type property**
The action, artifact, and context entities have a type property, ActionType, ArtifactType, and ContextType, respectively. This property is a custom string which can associate meaningful information with the entity and be used as a filter in the List APIs.

- **Source property**
The action, artifact, and context entities have a Source property. This property provides the underlying URI that the entity represents. Some examples are:
  - An UpdateEndpoint action where the source is the EndpointArn.
  - An image artifact for a processing job where the source is the ImageUri.
  - An Endpoint context where the source is the EndpointArn.

- **Metadata property**
The action and artifact entities have an optional Metadata property which can provide the following information:
  - ProjectId – For example, the ID of the SageMaker MLOps project to which a model belongs.
  - GeneratedBy – For example, the SageMaker pipeline execution that registered a model package version.
  - Repository – For example, the repository that contains an algorithm.
  - CommitId – For example, the commit ID of an algorithm version.

(p. 3152) through a lineage group in Amazon SageMaker. SageMaker supports only one default lineage group per account. SageMaker creates the default lineage group whenever a lineage entity is created in your account. Every lineage entity owned by your account is assigned to this default lineage group. To share lineage entities with another account, you share this default lineage group with that account.

**Note**
You can share all lineage tracking entities in a lineage group or none.

Create a resource share for your lineage entities using AWS Resource Access Manager console. For more information, see Sharing your AWS resources in the AWS Resource Access Manager User Guide.

**Note**
After the resource share is created, it can take a few minutes for the resource and principal associations to complete. Once the association is set, the shared account receives an invitation to join the resource share. The shared account must accept the invite to gain access to shared resources. For more information on accepting a resource share invite in AWS RAM, see Using shared AWS resources in the AWS Resource Access Manager User Guide.

### Your cross-account lineage tracking resource policy

Amazon SageMaker supports only one type of resource policy. The SageMaker resource policy must allow all of the following operations:

```
"sagemaker:DescribeAction"
"sagemaker:DescribeArtifact"
"sagemaker:DescribeContext"
"sagemaker:DescribeTrialComponent"
"sagemaker:AddAssociation"
"sagemaker:DeleteAssociation"
"sagemaker:QueryLineage"
```
Example The following is a SageMaker resource policy created using AWS Resource Access Manager for creating a resource share for an accounts lineage group.

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "FullLineageAccess",
         "Effect": "Allow",
         "Principal": {
            "AWS": "123456789012" #account-id
         },
         "Action": ["sagemaker:DescribeAction",
                    "sagemaker:DescribeArtifact",
                    "sagemaker:DescribeContext",
                    "sagemaker:DescribeTrialComponent",
                    "sagemaker:AddAssociation",
                    "sagemaker:DeleteAssociation",
                    "sagemaker:QueryLineage"
         ],
      }
   ]
}
```

Tracking Cross-Account Lineage Entities

With cross-account lineage tracking you can associate lineage entities in different accounts using the same AddAssociation API action. When you associate two lineage entities, SageMaker validates if you have permissions to perform the AddAssociation API action on both lineage entities. SageMaker then establishes the association. If you don't have the permissions, SageMaker does not create the association. Once the cross-account association is established, you can access either lineage entity from the other through the QueryLineage API action. For more information, see Querying Lineage Entities (p. 3159).

In addition to SageMaker automatically creating lineage entities, if you have cross-account access, SageMaker connects artifacts that reference the same object or data. If the data from one account is used in lineage tracking by different accounts, SageMaker creates an artifact in each account to track that data. With cross-account lineage, whenever SageMaker creates new artifacts, SageMaker checks if there are other artifacts created for the same data that are also shared with you. SageMaker then establishes associations between the newly created artifact and each of the artifacts shared with you with the AssociationType set to SameAs. You can then use the QueryLineage API action to traverse the lineage entities in your own account to lineage entities shared with you but owned by a different AWS account. For more information, see Querying Lineage Entities (p. 3159).

Topics

- Accessing lineage resources from a different accounts (p. 3168)
- Authorization for querying cross-account lineage entities (p. 3169)

Accessing lineage resources from a different accounts

Once the cross-account access for sharing lineage has been set up, you can call the following SageMaker API actions directly with the ARN to describe the shared lineage entities from another account:

- DescribeAction
- DescribeArtifact
You can also manage Associations for lineage entities owned by different accounts that are shared with you, using the following SageMaker API actions:

- DescribeContext
- DescribeTrialComponent

For a notebook that demonstrates how to use SageMaker Lineage APIs to query lineage across accounts, see sagemaker-lineage-cross-account-with-ram.ipynb.

Authorization for querying cross-account lineage entities

Amazon SageMaker must validate that you have permissions to perform the QueryLineage API action on the StartArns. This is enforced through the resource policy attached to the LineageGroup. The result from this action includes all the lineage entities to which you have access, whether they are owned by your account or shared by another account. For more information, see Querying Lineage Entities (p. 3159).

Kubernetes Orchestration

You can orchestrate your SageMaker training and inference jobs with SageMaker Operators for Kubernetes and SageMaker Components for Kubeflow Pipelines. SageMaker Operators for Kubernetes make it easier for developers and data scientists using Kubernetes to train, tune, and deploy machine learning (ML) models in SageMaker. SageMaker Components for Kubeflow Pipelines allow you to move your data processing and training jobs from the Kubernetes cluster to SageMaker’s machine learning-optimized managed service.

Contents

- SageMaker Operators for Kubernetes (p. 3169)
- SageMaker Components for Kubeflow Pipelines (p. 3212)

SageMaker Operators for Kubernetes

SageMaker Operators for Kubernetes make it easier for developers and data scientists using Kubernetes to train, tune, and deploy machine learning (ML) models in SageMaker. You can install these SageMaker Operators on your Kubernetes cluster in Amazon Elastic Kubernetes Service (Amazon EKS) to create SageMaker jobs natively using the Kubernetes API and command-line Kubernetes tools such as kubectl. This guide shows you how to set up the operators. The guide also explains how to use the operators to run model training, hyperparameter tuning, and inference (real-time and batch).

Important
The new version of SageMaker Operators for Kubernetes uses AWS Controllers for Kubernetes (ACK). For more information, see Migrate resources to the new SageMaker Operators for Kubernetes (p. 3209) or go directly to the ACK documentation.

There is no additional charge to use these operators. You do incur charges for any SageMaker resources that you use through these operators. The procedures and guidelines here assume you are familiar with Kubernetes and its basic commands.

Contents
• What is an operator? (p. 3170)
• Migrate resources to the new operator (p. 3172)
• IAM role-based setup and operator deployment (p. 3172)
• Clean up resources (p. 3180)
• Delete operators (p. 3181)
• Troubleshooting (p. 3182)
• Images and SMlogs in each Region (p. 3183)
• Using Amazon SageMaker Jobs (p. 3184)
• Migrate resources to the new SageMaker Operators for Kubernetes (p. 3209)

**What is an operator?**

Kubernetes is built on top of what is called the *controller pattern*. This pattern allows applications and tools to listen to a central state manager (ETCD) and act when something happens. Examples of such applications include `cloud-controller-manager` and `controller-manager`. The controller pattern allows you to create decoupled experiences and not have to worry about how other components are integrated. To add new capabilities to Kubernetes, developers can extend the Kubernetes API by creating a custom resource that contains their application-specific or domain-specific logic and components. Operators in Kubernetes allow users to natively invoke these custom resources and automate associated workflows.

**Permissions overview**

The SageMaker Operators for Kubernetes allow you to manage jobs in SageMaker from your Kubernetes cluster. The operators access SageMaker resources on your behalf. The IAM role that the operator assumes to interact with AWS resources differs from the credentials you use to access the Kubernetes cluster. The role also differs from the role that SageMaker assumes when running your machine learning jobs. The following image explains this design and flow.
Authentication Layers in the SageMaker Operator for Kubernetes

Developer Machine

Developer machine authenticates with cluster via RBAC and AWS credentials (if using AWS)

Kubernetes Cluster

SageMaker Operator for Kubernetes

Operator authenticates with SageMaker via IAM Role+Authentication Provider with SageMakerFullAccess permissions.

Amazon SageMaker

Training Job

SageMaker accesses AWS resources by assuming an IAM role (TrainingJob.RoleArn)

Amazon S3

Amazon EC2

(+ other AWS services)
Migrate resources to the new operator

The new Amazon SageMaker Operators for Kubernetes use AWS Controllers for Kubernetes (ACK) to train, tune, and deploy machine learning models with Amazon SageMaker. The new operators are not backwards compatible, so be sure to migrate any existing SageMaker Operators for Kubernetes resources from the old operator to the new operator. To get started with migrating resources, see Migrate resources to the new SageMaker Operators for Kubernetes (p. 3209).

IAM role-based setup and operator deployment

The following sections describe the steps to set up and deploy the operator.

Warning

The following steps do not install the latest version of SageMaker Operators for Kubernetes. To install the new SageMaker Operators for Kubernetes, see Migrate resources to the new SageMaker Operators for Kubernetes (p. 3209).

Prerequisites

This guide assumes that you've completed the following prerequisites:

- Installed the following tools on the client machine used to access your Kubernetes cluster:
  - kubectl Version 1.13 or later. Use a kubectl version that is within one minor version of your Amazon EKS cluster control plane. For example, a 1.13 kubectl client works with Kubernetes 1.13 and 1.14 clusters. OpenID Connect (OIDC) is not supported in versions earlier than 1.13.
  - eksctl Version 0.7.0 or later
  - AWS CLI Version 1.16.232 or later
  - (optional) Helm Version 3.0 or later
  - aws-iam-authenticator
- Have IAM permissions to create roles and attach policies to roles.
- Created a Kubernetes cluster on which to run the operators. It should either be Kubernetes version 1.13 or 1.14. For automated cluster creation using eksctl, see Getting Started with eksctl. It takes 20 to 30 minutes to provision a cluster.

Cluster-scoped deployment

Before you can deploy your operator using an IAM role, associate an OpenID Connect (OIDC) provider with your role to authenticate with the IAM service.

Create an OpenID Connect Provider for Your Cluster

The following instructions show how to create and associate an OIDC provider with your Amazon EKS cluster.

1. Set the local CLUSTER_NAME and AWS_REGION environment variables as follows:

   # Set the Region and cluster
   export CLUSTER_NAME="<your cluster name>"
   export AWS_REGION="<your region>"

2. Use the following command to associate the OIDC provider with your cluster. For more information, see Enabling IAM Roles for Service Accounts on your Cluster.

   eksctl utils associate-iam-oidc-provider --cluster $(CLUSTER_NAME) \\
   --region $(AWS_REGION) --approve

   Your output should look like the following:
Now that the cluster has an OIDC identity provider, you can create a role and give a Kubernetes ServiceAccount permission to assume the role.

Get the OIDC ID

To set up the ServiceAccount, obtain the OpenID Connect issuer URL using the following command:

```bash
aws eks describe-cluster --name ${CLUSTER_NAME} --region ${AWS_REGION} --query cluster.identity.oidc.issuer --output text
```

The command returns a URL like the following:

```
https://oidc.eks.${AWS_REGION}.amazonaws.com/id/D48675832CA65BD10A532F597OIDCID
```

In this URL, the value D48675832CA65BD10A532F597OIDCID is the OIDC ID. The OIDC ID for your cluster is different. You need this OIDC ID value to create a role.

If your output is None, it means that your client version is old. To work around this, run the following command:

```bash
aws eks describe-cluster --region ${AWS_REGION} --query cluster.identity.oidc.issuer --output text | grep OIDC
```

The OIDC URL is returned as follows:

```
OIDC https://oidc.eks.us-east-1.amazonaws.com/id/D48675832CA65BD10A532F597OIDCID
```

Create an IAM Role

1. Create a file named `trust.json` and insert the following trust relationship code block into it. Be sure to replace all `<OIDC ID>`, `<AWS account number>`, and `<EKS Cluster region>` placeholders with values corresponding to your cluster.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Principal": {
            "Federated": "arn:aws:iam::<AWS account number>:oidc-provider/oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>"
         },
         "Action": "sts:AssumeRoleWithWebIdentity",
         "Condition": {
            "StringEquals": {
               "oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>:aud": "sts.amazonaws.com",
            }
         }
      }
   ]
}
```

3173
2. Run the following command to create a role with the trust relationship defined in trust.json. This role enables the Amazon EKS cluster to get and refresh credentials from IAM.

```bash
aws iam create-role --region ${AWS_REGION} --role-name <role name> --assume-role-policy-document file://trust.json --output=text
```

Your output should look like the following:

```
ABCDEFSFODNN7EXAMPLE   my-role
ASSUMEROLEPOLICYDOCUMENT        2012-10-17
STATEMENT       sts:AssumeRoleWithWebIdentity   Allow
PRINCIPAL       arn:aws:iam::123456789012:oidc-provider/oidc.eks.us-east-1.amazonaws.com/id/
```

Take note of ROLE ARN; you pass this value to your operator.

### Attach the AmazonSageMakerFullAccess Policy to the Role

To give the role access to SageMaker, attach the AmazonSageMakerFullAccess policy. If you want to limit permissions to the operator, you can create your own custom policy and attach it.

To attach AmazonSageMakerFullAccess, run the following command:

```bash
aws iam attach-role-policy --role-name <role name> --policy-arn arn:aws:iam::aws:policy/AmazonSageMakerFullAccess
```

The Kubernetes ServiceAccount sagemaker-k8s-operator-default should have AmazonSageMakerFullAccess permissions. Confirm this when you install the operator.

### Deploy the Operator

When deploying your operator, you can use either a YAML file or Helm charts.

#### Deploy the Operator Using YAML

This is the simplest way to deploy your operators. The process is as follows:

1. Download the installer script using the following command:

```bash
```

2. Edit the installer.yaml file to replace eks.amazonaws.com/role-arn. Replace the ARN here with the Amazon Resource Name (ARN) for the OIDC-based role you've created.

3. Use the following command to deploy the cluster:

```bash
kubectl apply -f installer.yaml
```

#### Deploy the Operator Using Helm Charts

Use the provided Helm Chart to install the operator.
1. Clone the Helm installer directory using the following command:

```
git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
```

2. Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/installer` folder. Edit the `rolebased/values.yaml` file, which includes high-level parameters for the chart. Replace the role ARN here with the Amazon Resource Name (ARN) for the OIDC-based role you’ve created.

3. Install the Helm Chart using the following command:

```
kubectl create namespace sagemaker-k8s-operator-system
helm install --namespace sagemaker-k8s-operator-system sagemaker-operator rolebased/
```

If you decide to install the operator into a namespace other than the one specified, you need to adjust the namespace defined in the IAM role `trust.json` file to match.

4. After a moment, the chart is installed with a randomly generated name. Verify that the installation succeeded by running the following command:

```
helm ls
```

Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>NAMESPACE</th>
<th>REVISION</th>
<th>UPDATED</th>
</tr>
</thead>
<tbody>
<tr>
<td>sagemaker-operator</td>
<td>sagemaker-k8s-operator-system</td>
<td>1</td>
<td>2019-11-20</td>
</tr>
<tr>
<td></td>
<td>23:14:59.624682 +0000 UTC</td>
<td>deployed</td>
<td>sagemaker-k8s-operator-0.1.0</td>
</tr>
</tbody>
</table>

Verify the operator deployment

1. You should be able to see the SageMaker Custom Resource Definitions (CRDs) for each operator deployed to your cluster by running the following command:

```
kubectl get crd | grep sagemaker
```

Your output should look like the following:

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>batchtransformjobs</td>
<td>sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
<td></td>
</tr>
<tr>
<td>endpointconfigurations</td>
<td>sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
<td></td>
</tr>
<tr>
<td>hostingdeployments</td>
<td>sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
<td></td>
</tr>
<tr>
<td>hyperparametertuningjobs</td>
<td>sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
<td></td>
</tr>
<tr>
<td>models</td>
<td>sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
<td></td>
</tr>
<tr>
<td>trainingjobs</td>
<td>sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
<td></td>
</tr>
</tbody>
</table>

2. Ensure that the operator pod is running successfully. Use the following command to list all pods:

```
kubectl -n sagemaker-k8s-operator-system get pods
```

You should see a pod named `sagemaker-k8s-operator-controller-manager-*****` in the namespace `sagemaker-k8s-operator-system` as follows:

<table>
<thead>
<tr>
<th>NAME</th>
<th>READY</th>
<th>STATUS</th>
<th>RESTARTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>sagemaker-k8s-operator-controller-manager-12345678-r8abc</td>
<td>2/2</td>
<td>Running</td>
<td>0</td>
</tr>
<tr>
<td>23s</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Namespace-scoped deployment

You have the option to install your operator within the scope of an individual Kubernetes namespace. In this mode, the controller only monitors and reconciles resources with SageMaker if the resources are created within that namespace. This allows for finer-grained control over which controller is managing which resources. This is useful for deploying to multiple AWS accounts or controlling which users have access to particular jobs.

This guide outlines how to install an operator into a particular, predefined namespace. To deploy a controller into a second namespace, follow the guide from beginning to end and change out the namespace in each step.

Create an OpenID Connect Provider for Your Amazon EKS cluster

The following instructions show how to create and associate an OIDC provider with your Amazon EKS cluster.

1. Set the local CLUSTER_NAME and AWS_REGION environment variables as follows:

   # Set the region and cluster
   export CLUSTER_NAME="<your cluster name>"
   export AWS_REGION="<your region>"

2. Use the following command to associate the OIDC provider with your cluster. For more information, see Enabling IAM Roles for Service Accounts on your Cluster.

   eksctl utils associate-iam-oidc-provider --cluster ${CLUSTER_NAME} \
   --region ${AWS_REGION} --approve

   Your output should look like the following:

   ```
   [✓]  eksctl version 0.10.1
   [✓]  using region us-east-1
   [✓]  IAM OpenID Connect provider is associated with cluster "my-cluster" in "us-east-1"
   ```

Now that the cluster has an OIDC identity provider, create a role and give a Kubernetes ServiceAccount permission to assume the role.

Get your OIDC ID

To set up the ServiceAccount, first obtain the OpenID Connect issuer URL using the following command:

    aws eks describe-cluster --name ${CLUSTER_NAME} --region ${AWS_REGION} \
    --query cluster.identity.oidc.issuer --output text

The command returns a URL like the following:

    https://oidc.eks.${AWS_REGION}.amazonaws.com/id/D48675832CA65BD10A532F597OIDCID

In this URL, the value D48675832CA65BD10A532F597OIDCID is the OIDC ID. The OIDC ID for your cluster will be different. You need this OIDC ID value to create a role.

If your output is None, it means that your client version is old. To work around this, run the following command:

    aws eks describe-cluster --region ${AWS_REGION} --query cluster --name ${CLUSTER_NAME} --output text | grep OIDC

3176
The OIDC URL is returned as follows:

OIDC https://oidc.eks.us-east-1.amazonaws.com/id/D48675832CA65BD10A532F5970IDCID

Create your IAM Role

1. Create a file named `trust.json` and insert the following trust relationship code block into it. Be sure to replace all `<OIDC ID>`, `<AWS account number>`, `<EKS Cluster region>`, and `<Namespace>` placeholders with values corresponding to your cluster. For the purposes of this guide, `my-namespace` is used for the `<Namespace>` value.

   ```json
   {
   "Version": "2012-10-17",
   "Statement": [
   {
   "Effect": "Allow",
   "Principal": {
   "Federated": "arn:aws:iam::<AWS account number>:oidc-provider/oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>",
   "Action": "sts:AssumeRoleWithWebIdentity",
   "Condition": {
   "StringEquals": {
   "oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>:aud": "sts.amazonaws.com",
   "oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>:sub": "system:serviceaccount:<Namespace>:sagemaker-k8s-operator-default"
   }
   }
   }
   }
   ]
   }
   ```

   2. Run the following command to create a role with the trust relationship defined in `trust.json`. This role enables the Amazon EKS cluster to get and refresh credentials from IAM.

   ```bash
   aws iam create-role --region ${AWS_REGION} --role-name <role name> --assume-role-policy-document file://trust.json --output=text
   ```

   Your output should look like the following:

   ```plaintext
   ABCDEFSFODNN7EXAMPLE my-role
   ASSUMEROLEPOLICYDOCUMENT 2012-10-17
   STATEMENT       sts:AssumeRoleWithWebIdentity       Allow
   STRINGEQUALS    sts.amazonaws.com       system:serviceaccount:my-namespace:sagemaker-k8s-operator-default
   PRINCIPAL       arn:aws:iam::123456789012:oidc-provider/oidc.eks.us-east-1.amazonaws.com/id/
   ```

   Take note of ROLE ARN. You pass this value to your operator.

   **Attach the AmazonSageMakerFullAccess Policy to your Role**

   To give the role access to SageMaker, attach the AmazonSageMakerFullAccess policy. If you want to limit permissions to the operator, you can create your own custom policy and attach it.

   To attach AmazonSageMakerFullAccess, run the following command:
aws iam attach-role-policy --role-name <role name> --policy-arn arn:aws:iam::aws:policy/AmazonSageMakerFullAccess

The Kubernetes ServiceAccount sagemaker-k8s-operator-default should have AmazonSageMakerFullAccess permissions. Confirm this when you install the operator.

**Deploy the Operator to Your Namespace**

When deploying your operator, you can use either a YAML file or Helm charts.

**Deploy the Operator to Your Namespace Using YAML**

There are two parts to deploying an operator within the scope of a namespace. The first is the set of CRDs that are installed at a cluster level. These resource definitions only need to be installed once per Kubernetes cluster. The second part is the operator permissions and deployment itself.

If you have not already installed the CRDs into the cluster, apply the CRD installer YAML using the following command:

```bash
kubectl apply -f https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/release/rolebased/namespaced/crd.yaml
```

To install the operator onto the cluster:

1. Download the operator installer YAML using the following command:

```bash
```

2. Update the installer YAML to place the resources into your specified namespace using the following command:

```bash
sed -i -e 's/PLACEHOLDER-NAMESPACE/<YOUR NAMESPACE>/g' operator.yaml
```

3. Edit the `operator.yaml` file to place resources into your `eks.amazonaws.com/role-arn`. Replace the ARN here with the Amazon Resource Name (ARN) for the OIDC-based role you’ve created.

4. Use the following command to deploy the cluster:

```bash
kubectl apply -f operator.yaml
```

**Deploy the Operator to Your Namespace Using Helm Charts**

There are two parts needed to deploy an operator within the scope of a namespace. The first is the set of CRDs that are installed at a cluster level. These resource definitions only need to be installed once per Kubernetes cluster. The second part is the operator permissions and deployment itself. When using helm charts you have to first create the namespace using `kubectl`.

1. Clone the Helm installer directory using the following command:

```bash
git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
```

2. Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/installer/namespaced` folder. Edit the `rolebased/values.yaml` file, which includes high-level parameters for the chart. Replace the role ARN here with the Amazon Resource Name (ARN) for the OIDC-based role you’ve created.

```bash
```
3. Install the Helm Chart using the following command:

```bash
helm install crds crd_chart/
```

4. Create the required namespace and install the operator using the following command:

```bash
kubectl create namespace <namespace>
helm install --namespace <namespace> operator_chart/
```

5. After a moment, the chart is installed with the name `sagemaker-operator`. Verify that the installation succeeded by running the following command:

```bash
helm ls
```

Your output should look like the following:

```
NAME          NAMESPACE            REVISION     UPDATED      STATUS          CHART                           APP VERSION
sagemaker-operator my-namespace        1            2019-11-20T23:14:59.6777082 +0000 UTC deployed sagemaker-k8s-operator-0.1.0
```

Verify the operator deployment to your namespace

1. You should be able to see the SageMaker Custom Resource Definitions (CRDs) for each operator deployed to your cluster by running the following command:

```bash
kubectl get crd | grep sagemaker
```

Your output should look like the following:

```
batchtransformjobs.sagemaker.aws.amazon.com 2019-11-20T17:12:34Z
endpoints.configs.sagemaker.aws.amazon.com   2019-11-20T17:12:34Z
hostingdeployments.sagemaker.aws.amazon.com  2019-11-20T17:12:34Z
hyperparametertuningjobs.sagemaker.aws.amazon.com 2019-11-20T17:12:34Z
models.sagemaker.aws.amazon.com               2019-11-20T17:12:34Z
trainingjobs.sagemaker.aws.amazon.com         2019-11-20T17:12:34Z
```

2. Ensure that the operator pod is running successfully. Use the following command to list all pods:

```bash
kubectl -n my-namespace get pods
```

You should see a pod named `sagemaker-k8s-operator-controller-manager-*****` in the namespace `my-namespace` as follows:

```
NAME                                                         READY   STATUS    RESTARTS
sagemaker-k8s-operator-controller-manager-12345678-r8abc     2/2     Running   0
```

Install the SageMaker logs `kubectl` plugin

As part of the SageMaker Operators for Kubernetes, you can use the `smlogs` plugin for `kubectl`. This enables SageMaker CloudWatch logs to be streamed with `kubectl`. `kubectl` must be installed onto
your PATH. The following commands place the binary in the sagemaker-k8s-bin directory in your home directory, and add that directory to your PATH.

```bash
export os="linux"
wget https://amazon-sagemaker-operator-for-k8s-us-east-1.s3.amazonaws.com/kubectl-smlogs-plugin/v1/${os}.amd64.tar.gz
tar xzvf ${os}.amd64.tar.gz

# Move binaries to a directory in your homedir.
mkdir ~/sagemaker-k8s-bin
cp ./kubectl-smlogs.${os}.amd64/kubectl-smlogs ~/sagemaker-k8s-bin/.

# This line adds the binaries to your PATH in your .bashrc.
echo 'export PATH=$PATH:~/sagemaker-k8s-bin' >> ~/.bashrc

# Source your .bashrc to update environment variables:
source ~/.bashrc
```

Use the following command to verify that the kubectl plugin is installed correctly:

```
kubectl smlogs
```

If the kubectl plugin is installed correctly, your output should look like the following:

**View SageMaker logs via Kubernetes**

**Usage:**
```
smlogs [command]
```

**Aliases:**
```
smlogs, SMLogs, Smlogs
```

**Available Commands:**
```
BatchTransformJob       View BatchTransformJob logs via Kubernetes
TrainingJob             View TrainingJob logs via Kubernetes
help                    Help about any command
```

**Flags:**
```
-h, --help   help for smlogs
```

Use "smlogs [command] --help" for more information about a command.

**Clean up resources**

To uninstall the operator from your cluster, you must first make sure to delete all SageMaker resources from the cluster. Failure to do so causes the operator delete operation to hang. Run the following commands to stop all jobs:

```bash
# Delete all SageMaker jobs from Kubernetes
kubectl delete --all --all-namespaces hyperparametertuningjob.sagemaker.aws.amazon.com
kubectl delete --all --all-namespaces trainingjobs.sagemaker.aws.amazon.com
kubectl delete --all --all-namespaces batchtransformjob.sagemaker.aws.amazon.com
kubectl delete --all --all-namespaces hostingdeployment.sagemaker.aws.amazon.com
```

You should see output similar to the following:

```bash
$ kubectl delete --all --all-namespaces trainingjobs.sagemaker.aws.amazon.com
3180
```
After you delete all SageMaker jobs, see Delete operators (p. 3181) to delete the operator from your cluster.

Delete operators

Delete cluster-based operators

Operators installed using YAML

To uninstall the operator from your cluster, make sure that all SageMaker resources have been deleted from the cluster. Failure to do so causes the operator delete operation to hang.

**Note**
Before deleting your cluster, be sure to delete all SageMaker resources from the cluster. See Clean up resources (p. 3180) for more information.

After you delete all SageMaker jobs, use `kubectl` to delete the operator from the cluster:

```
# Delete the operator and its resources
kubectl delete -f /installer.yaml
```

You should see output similar to the following:

```
$ kubectl delete -f raw-yaml/installer.yaml
namespace "sagemaker-k8s-operator-system" deleted
customresourcedefinition.apiextensions.k8s.io "batchtransformjobs.sagemaker.aws.amazon.com" deleted
customresourcedefinition.apiextensions.k8s.io "endpointconfigs.sagemaker.aws.amazon.com" deleted
customresourcedefinition.apiextensions.k8s.io "hostingdeployments.sagemaker.aws.amazon.com" deleted
customresourcedefinition.apiextensions.k8s.io "hyperparametertuningjobs.sagemaker.aws.amazon.com" deleted
customresourcedefinition.apiextensions.k8s.io "models.sagemaker.aws.amazon.com" deleted
customresourcedefinition.apiextensions.k8s.io "trainingjobs.sagemaker.aws.amazon.com" deleted
role.rbac.authorization.k8s.io "sagemaker-k8s-operator-leader-election-role" deleted
clusterrole.rbac.authorization.k8s.io "sagemaker-k8s-operator-manager-role" deleted
clusterrole.rbac.authorization.k8s.io "sagemaker-k8s-operator-proxy-role" deleted
rolebinding.rbac.authorization.k8s.io "sagemaker-k8s-operator-leader-election-rolebinding" deleted
clusterrolebinding.rbac.authorization.k8s.io "sagemaker-k8s-operator-manager-rolebinding" deleted
clusterrolebinding.rbac.authorization.k8s.io "sagemaker-k8s-operator-proxy-rolebinding" deleted
service "sagemaker-k8s-operator-controller-manager-metrics-service" deleted
deployment.apps "sagemaker-k8s-operator-controller-manager" deleted
secrets "sagemaker-k8s-operator-abcde" deleted
```

3181
Operators installed using Helm Charts

To delete the operator CRDs, first delete all the running jobs. Then delete the Helm Chart that was used to deploy the operators using the following commands:

```
# get the helm charts
helm ls

# delete the charts
helm delete <chart_name>
```

Delete namespace-based operators

Operators installed with YAML

To uninstall the operator from your cluster, first make sure that all SageMaker resources have been deleted from the cluster. Failure to do so causes the operator delete operation to hang.

**Note**

Before deleting your cluster, be sure to delete all SageMaker resources from the cluster. See Clean up resources (p. 3180) for more information.

After you delete all SageMaker jobs, use `kubectl` to first delete the operator from the namespace and then the CRDs from the cluster. Run the following commands to delete the operator from the cluster:

```
# Delete the operator using the same yaml file that was used to install the operator
kubectl delete -f operator.yaml

# Now delete the CRDs using the CRD installer yaml

# Now you can delete the namespace if you want
kubectl delete namespace <namespace>
```

Operators installed with Helm Charts

To delete the operator CRDs, first delete all the running jobs. Then delete the Helm Chart that was used to deploy the operators using the following commands:

```
# Delete the operator
helm delete <chart_name>

# delete the crds
helm delete crds

# optionally delete the namespace
kubectl delete namespace <namespace>
```

Troubleshooting

Debugging a Failed Job

- Check the job status by running the following:

```
kubectl get <CRD Type> <job name>
```
• If the job was created in SageMaker, you can use the following command to see the STATUS and the SageMaker Job Name:

```
kubectl get <crd type> <job name>
```

• You can use `smlogs` to find the cause of the issue using the following command:

```
kubectl smlogs <crd type> <job name>
```

• You can also use the `describe` command to get more details about the job using the following command. The output has an additional field that has more information about the status of the job.

```
kubectl describe <crd type> <job name>
```

• If the job was not created in SageMaker, then use the logs of the operator's pod to find the cause of the issue as follows:

```
$ kubectl get pods -A | grep sagemaker
# Output:
sagemaker-k8s-operator-system   sagemaker-k8s-operator-controller-manager-5cd7df4d74-wh22z   2/2     Running   0          3h33m
$ kubectl logs -p <pod name> -c manager -n sagemaker-k8s-operator-system
```

**Deleting an Operator CRD**

If deleting a job is not working, check if the operator is running. If the operator is not running, then you have to delete the finalizer using the following steps:

1. In a new terminal, open the job in an editor using `kubectl edit` as follows:

```
kubectl edit <crd type> <job name>
```

2. Edit the job to delete the finalizer by removing the following two lines from the file. Save the file and the job is be deleted.

```
finalizers:
- sagemaker-operator-finalizer
```

**Images and SMlogs in each Region**

The following table lists the available operator images and SMLogs in each region.

<table>
<thead>
<tr>
<th>Region</th>
<th>Controller Image</th>
<th>Linux SMLogs</th>
</tr>
</thead>
<tbody>
<tr>
<td>us-east-1</td>
<td>95758389062.dkr.ecr.us-east-1.amazonaws.com/amazon-sagemaker-operator-for-k8s:v1</td>
<td><a href="https://s3.us-east-1.amazonaws.com/amazon-sagemaker-operator-for-k8s-us-east-1/kubectl-smlogs-plugin/v1/linux.amd64.tar.gz">https://s3.us-east-1.amazonaws.com/amazon-sagemaker-operator-for-k8s-us-east-1/kubectl-smlogs-plugin/v1/linux.amd64.tar.gz</a></td>
</tr>
</tbody>
</table>
Using Amazon SageMaker Jobs

To run an Amazon SageMaker job using the Operators for Kubernetes, you can either apply a YAML file or use the supplied Helm Charts.

**Important**
The new version of SageMaker Operators for Kubernetes uses AWS Controllers for Kubernetes (ACK). For more information, see Migrate resources to the new SageMaker Operators for Kubernetes (p. 3209) or go directly to the ACK documentation.

All sample operator jobs in the following tutorials use sample data taken from a public MNIST dataset. In order to run these samples, download the dataset into your Amazon S3 bucket. You can find the dataset in Download the MNIST Dataset.

Contents

- TrainingJob operator (p. 3184)
- HyperParameterTuningJob operator (p. 3188)
- BatchTransformJob operator (p. 3194)
- HostingDeployment operator (p. 3197)
- ProcessingJob operator (p. 3201)
- HostingAutoscalingPolicy (HAP) Operator (p. 3205)

TrainingJob operator

Training job operators reconcile your specified training job spec to SageMaker by launching it for you in SageMaker. You can learn more about SageMaker training jobs in the SageMaker CreateTrainingJob API documentation.

Topics

- Create a TrainingJob Using a YAML File (p. 3184)
- Create a TrainingJob Using a Helm Chart (p. 3185)
- List TrainingJobs (p. 3186)
- Describe a TrainingJob (p. 3186)
- View Logs from TrainingJobs (p. 3188)
- Delete TrainingJobs (p. 3188)

Create a TrainingJob Using a YAML File

1. Download the sample YAML file for training using the following command:

```bash
wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/xgboost-mnist-trainingjob.yaml
```
2. Edit the `xgboost-mnist-trainingjob.yaml` file to replace the `roleArn` parameter with your `<sagemaker-execution-role>`, and the `outputPath` with your Amazon S3 bucket that the SageMaker execution role has write access to. The `roleArn` must have permissions so that SageMaker can access Amazon S3, Amazon CloudWatch, and other services on your behalf. For more information on creating an SageMaker ExecutionRole, see SageMaker Roles. Apply the YAML file using the following command:

```bash
cubectl apply -f xgboost-mnist-trainingjob.yaml
```

Create a TrainingJob Using a Helm Chart

You can use Helm Charts to run TrainingJobs.

1. Clone the GitHub repository to get the source using the following command:

```bash
git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
```

2. Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/training-jobs/` folder and edit the `values.yaml` file to replace values like `roleARN` and `outputPath` with values that correspond to your account. The RoleARN must have permissions so that SageMaker can access Amazon S3, Amazon CloudWatch, and other services on your behalf. For more information on creating an SageMaker ExecutionRole, see SageMaker Roles.

Create the TrainingJob

With the roles and Amazon S3 buckets replaced with appropriate values in `values.yaml`, you can create a training job using the following command:

```bash
helm install . --generate-name
```

Your output should look like the following:

```
NAME: chart-12345678
LAST DEPLOYED: Wed Nov 20 23:35:49 2019
NAMESPACE: default
STATUS: deployed
REVISION: 1
TEST SUITE: None
NOTES:
Thanks for installing the sagemaker-k8s-trainingjob.
```

Verify Your Training Helm Chart

To verify that the Helm Chart was created successfully, run:

```bash
helm ls
```

Your output should look like the following:

```
NAME                    NAMESPACE       REVISION        UPDATED
STATUS          CHART                           APP VERSION
chart-12345678        default         1               2019-11-20 23:35:49.9136092 +0000 UTC
deployed        sagemaker-k8s-trainingjob-0.1.0
rolebased-12345678    default         1               2019-11-20 23:14:59.6777082 +0000 UTC
deployed        sagemaker-k8s-operator-0.1.0
```

3185
**helm install** creates a TrainingJob Kubernetes resource. The operator launches the actual training job in SageMaker and updates the TrainingJob Kubernetes resource to reflect the status of the job in SageMaker. You incur charges for SageMaker resources used during the duration of your job. You do not incur any charges once your job completes or stops.

**Note:** SageMaker does not allow you to update a running training job. You cannot edit any parameter and re-apply the file/config. Either change the metadata name or delete the existing job and create a new one. Similar to existing training job operators like TFJob in Kubeflow, update is not supported.

**List TrainingJobs**

Use the following command to list all jobs created using the Kubernetes operator:

```
kubectl get TrainingJob
```

The output listing all jobs should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>SECONDARY-STATUS</th>
<th>CREATION-TIME</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAGEMAKER-JOB-NAME</td>
<td>InProgress</td>
<td>Starting</td>
<td>2019-11-20T23:42:35Z xgboost-mnist-from-for-s3</td>
</tr>
</tbody>
</table>

A training job continues to be listed after the job has completed or failed. You can remove a TrainingJob job from the list by following the Delete a Training Job steps. Jobs that have completed or stopped do not incur any charges for SageMaker resources.

**TrainingJob Status Values**

The **STATUS** field can be one of the following values:

- Completed
- InProgress
- Failed
- Stopped
- Stopping

These statuses come directly from the SageMaker official API documentation.

In addition to the official SageMaker status, it is possible for **STATUS** to be **SynchronizingK8sJobWithSageMaker**. This means that the operator has not yet processed the job.

**Secondary Status Values**

The secondary statuses come directly from the SageMaker official API documentation. They contain more granular information about the status of the job.

**Describe a TrainingJob**

You can get more details about the training job by using the `describe` **kubectl** command. This is typically used for debugging a problem or checking the parameters of a training job. To get information about your training job, use the following command:

```
kubectl describe trainingjob xgboost-mnist-from-for-s3
```

The output for your training job should look like the following:

| Name: | xgboost-mnist-from-for-s3 |
Namespace:    default
Labels:       <none>
Annotations:  <none>
API Version:  sagemaker.aws.amazon.com/v1
Kind:         TrainingJob

   Stopping Condition:
      Max Runtime In Seconds:  86400
      Training Job Name:       xgboost-mnist-from-for-s3-6d7fa0af0bef11eab94e0example
Status:
Last Check Time: 2019-11-20T23:44:29Z
SageMaker Training Job Name: xgboost-mnist-from-for-s3-6d7fa0af0bef1eab94eexample
Secondary Status: Downloading
Training Job Status: InProgress
Events: <none>

View Logs from TrainingJobs

Use the following command to see the logs from the kmeans-mnist training job:

```
kubectl smlogs trainingjob xgboost-mnist-from-for-s3
```

Your output should look similar to the following. The logs from instances are ordered chronologically.

```
```

Delete TrainingJobs

Use the following command to stop a training job on Amazon SageMaker:

```
kubectl delete trainingjob xgboost-mnist-from-for-s3
```

This command removes the SageMaker training job from Kubernetes. This command returns the following output:

```
trainingjob.sagemaker.aws.amazon.com "xgboost-mnist-from-for-s3" deleted
```

If the job is still in progress on SageMaker, the job stops. You do not incur any charges for SageMaker resources after your job stops or completes.

**Note:** SageMaker does not delete training jobs. Stopped jobs continue to show on the SageMaker console. The `delete` command takes about 2 minutes to clean up the resources from SageMaker.

**HyperParameterTuningJob operator**

Hyperparameter tuning job operators reconcile your specified hyperparameter tuning job spec to SageMaker by launching it in SageMaker. You can learn more about SageMaker hyperparameter tuning jobs in the SageMaker `CreateHyperParameterTuningJob API documentation`.

**Topics**

- Create a HyperparameterTuningJob Using a YAML File (p. 3189)
- Create a HyperparameterTuningJob using a Helm Chart (p. 3189)
Create a HyperparameterTuningJob Using a YAML File

1. Download the sample YAML file for the hyperparameter tuning job using the following command:

   ```bash
curl https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/xgboost-mnist-hpo.yaml
```

2. Edit the `xgboost-mnist-hpo.yaml` file to replace the `roleArn` parameter with your `sagemaker-execution-role`. For the hyperparameter tuning job to succeed, you must also change the `s3InputPath` and `s3OutputPath` to values that correspond to your account. Apply the updates YAML file using the following command:

   ```bash
ekubectl apply -f xgboost-mnist-hpo.yaml
```

Create a HyperparameterTuningJob using a Helm Chart

You can use Helm Charts to run hyperparameter tuning jobs.

1. Clone the GitHub repository to get the source using the following command:

   ```bash
git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
```

2. Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/hyperparameter-tuning-jobs/` folder.

3. Edit the `values.yaml` file to replace the `roleArn` parameter with your `sagemaker-execution-role`. For the hyperparameter tuning job to succeed, you must also change the `s3InputPath` and `s3OutputPath` to values that correspond to your account.

Create the HyperparameterTuningJob

With the roles and Amazon S3 paths replaced with appropriate values in `values.yaml`, you can create a hyperparameter tuning job using the following command:

```bash
helm install . --generate-name
```

Your output should look similar to the following:

```
NAME: chart-1574292948
LAST DEPLOYED: Wed Nov 20 23:35:49 2019
NAMESPACE: default
STATUS: deployed
REVISION: 1
TEST SUITE: None
NOTES:
Thanks for installing the sagemaker-k8s-hyperparametertuningjob.
```

Verify Chart Installation

To verify that the Helm Chart was created successfully, run the following command:
helm ls

Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>NAMESPACE</th>
<th>REVISION</th>
<th>UPDATED</th>
</tr>
</thead>
<tbody>
<tr>
<td>chart-1474292948</td>
<td>default</td>
<td>1</td>
<td>2019-11-20 23:35:49.9136092 +0000</td>
</tr>
<tr>
<td>UTC deployed</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>chart-1574292948</td>
<td>default</td>
<td>1</td>
<td>2019-11-20 23:35:49.9136092 +0000</td>
</tr>
<tr>
<td>UTC deployed</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>rolebased-1574291698</td>

<td>2019-11-20 23:14:59.6777082 +0000</td>
</tr>
<tr>
<td>UTC deployed</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

helm install creates a HyperParameterTuningJob Kubernetes resource. The operator launches the actual hyperparameter optimization job in SageMaker and updates the HyperParameterTuningJob Kubernetes resource to reflect the status of the job in SageMaker. You incur charges for SageMaker resources used during the duration of your job. You do not incur any charges once your job completes or stops.

**Note:** SageMaker does not allow you to update a running hyperparameter tuning job. You cannot edit any parameter and re-apply the file/config. You must either change the metadata name or delete the existing job and create a new one. Similar to existing training job operators like TFJob in Kubeflow, update is not supported.

**List HyperparameterTuningJobs**

Use the following command to list all jobs created using the Kubernetes operator:

```bash
cubectl get hyperparametertuningjob
```

Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>CREATION-TIME</th>
<th>COMPLETED</th>
<th>INPROGRESS</th>
<th>ERRORS</th>
<th>STOPPED</th>
</tr>
</thead>
<tbody>
<tr>
<td>XGBoost-1</td>
<td>Completed</td>
<td>2019-10-17T01:15:52Z</td>
<td>10</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>xgboosha92f5e3cf0f7b11e9bf6c123</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>xgboosha92f5e3cf0f7b11e9bf6c123</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>xgboosha92f5e3cf0f7b11e9bf6c123</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A hyperparameter tuning job continues to be listed after the job has completed or failed. You can remove a hyperparametertuningjob from the list by following the steps in Delete a Hyperparameter Tuning Job. Jobs that have completed or stopped do not incur any charges for SageMaker resources.

**Hyperparameter Tuning Job Status Values**

The `STATUS` field can be one of the following values:

- Completed
- InProgress
- Failed
- Stopped
- Stopping

These statuses come directly from the SageMaker official API documentation.

In addition to the official SageMaker status, it is possible for `STATUS` to be `SynchronizingK8sJobWithSageMaker`. This means that the operator has not yet processed the job.
Status Counters

The output has several counters, like COMPLETED and INPROGRESS. These represent how many training jobs have completed and are in progress, respectively. For more information about how these are determined, see TrainingJobStatusCounters in the SageMaker API documentation.

Best TrainingJob

This column contains the name of the TrainingJob that best optimized the selected metric.

To see a summary of the tuned hyperparameters, run:

```
kubectl describe hyperparametertuningjob xgboost-mnist-hpo
```

To see detailed information about the TrainingJob, run:

```
kubectl describe trainingjobs <job name>
```

Spawned TrainingJobs

You can also track all 10 training jobs in Kubernetes launched by HyperparameterTuningJob by running the following command:

```
kubectl get trainingjobs
```

Describe a HyperparameterTuningJob

You can obtain debugging details using the describe kubectl command.

```
kubectl describe hyperparametertuningjob xgboost-mnist-hpo
```

In addition to information about the tuning job, the SageMaker Operator for Kubernetes also exposes the best training job found by the hyperparameter tuning job in the describe output as follows:

```
Name:         xgboost-mnist-hpo
Namespace:    default
Labels:       <none>
Annotations:  kubectl.kubernetes.io/last-applied-configuration:

View Logs from HyperparameterTuningJobs

Hyperparameter tuning jobs do not have logs, but all training jobs launched by them do have logs. These logs can be accessed as if they were a normal training job. For more information, see View Logs from Training Jobs.

Delete a HyperparameterTuningJob

Use the following command to stop a hyperparameter job in SageMaker.

```
kubectl delete hyperparametertuningjob xgboost-mnist-hpo
```

This command removes the hyperparameter tuning job and associated training jobs from your Kubernetes cluster and stops them in SageMaker. Jobs that have stopped or completed do not incur any
charges for SageMaker resources. SageMaker does not delete hyperparameter tuning jobs. Stopped jobs continue to show on the SageMaker Console.

Your output should look like the following:

```
hyperparametertuningjob.sagemaker.aws.amazon.com "xgboost-mnist-hpo" deleted
```

**Note:** The delete command takes about 2 minutes to clean up the resources from SageMaker.

**BatchTransformJob operator**

Batch transform job operators reconcile your specified batch transform job spec to SageMaker by launching it in SageMaker. You can learn more about SageMaker batch transform job in the SageMaker CreateTransformJob API documentation.

**Topics**

- Create a BatchTransformJob Using a YAML File (p. 3194)
- Create a BatchTransformJob Using a Helm Chart (p. 3194)
- List BatchTransformJobs (p. 3195)
- Describe a BatchTransformJob (p. 3196)
- View Logs from BatchTransformJobs (p. 3197)
- Delete a BatchTransformJob (p. 3197)

**Create a BatchTransformJob Using a YAML File**

1. Download the sample YAML file for the batch transform job using the following command:

   ```
   wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/xgboost-mnist-batchtransform.yaml
   ```

2. Edit the file `xgboost-mnist-batchtransform.yaml` to change necessary parameters to replace the `inputdataconfig` with your input data and `s3OutputPath` with your Amazon S3 buckets that the SageMaker execution role has write access to.

3. Apply the YAML file using the following command:

   ```
   kubectl apply -f xgboost-mnist-batchtransform.yaml
   ```

**Create a BatchTransformJob Using a Helm Chart**

You can use Helm Charts to run batch transform jobs.

**Get the Helm installer directory**

Clone the GitHub repository to get the source using the following command:

```
git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
```

**Configure the Helm Chart**

Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/batch-transform-jobs/` folder.

Edit the `values.yaml` file to replace the `inputdataconfig` with your input data and `outputPath` with your S3 buckets to which the SageMaker execution role has write access.
Create a BatchTransformJob

1. Use the following command to create a batch transform job:

   ```sh
helm install . --generate-name
   ```

   Your output should look like the following:

   ```
NAME: chart-1574292948
LAST DEPLOYED: Wed Nov 20 23:35:49 2019
NAMESPACE: default
STATUS: deployed
REVISION: 1
TEST SUITE: None
NOTES: Thanks for installing the sagemaker-k8s-batch-transform-job.
   ```

2. To verify that the Helm Chart was created successfully, run the following command:

   ```sh
   helm ls
   ```

   This command creates a BatchTransformJob Kubernetes resource. The operator launches the actual transform job in SageMaker and updates the BatchTransformJob Kubernetes resource to reflect the status of the job in SageMaker. You incur charges for SageMaker resources used during the duration of your job. You do not incur any charges once your job completes or stops.

   **Note:** SageMaker does not allow you to update a running batch transform job. You cannot edit any parameter and re-apply the file/config. You must either change the metadata name or delete the existing job and create a new one. Similar to existing training job operators like TFJob in Kubeflow, update is not supported.

**List BatchTransformJobs**

Use the following command to list all jobs created using the Kubernetes operator:

```sh
kubect1 get batchtransformjob
```

Your output should look like the following:

```text
NAME                                STATUS      CREATION-TIME          SAGEMAKER-JOB-NAME
xgboost-mnist-batch-transform       Completed   2019-11-18T03:44:00Z   xgboost-mnist-a88fb19609b511eeac440aa8axgboost
```

A batch transform job will continue to be listed after the job has completed or failed. You can remove a hyperparametertuningjob from the list by following the Delete a Batch Transform Job steps. Jobs that have completed or stopped do not incur any charges for SageMaker resources.
Amazon SageMaker Developer Guide
SageMaker Operators for Kubernetes

Batch Transform Status Values
The STATUS ﬁeld can be one of the following values:
•
•
•
•
•

Completed
InProgress
Failed
Stopped
Stopping

These statuses come directly from the SageMaker oﬃcial API documentation.
In addition to the oﬃcial SageMaker status, it is possible for STATUS to be
SynchronizingK8sJobWithSageMaker. This means that the operator has not yet processed the job.

Describe a BatchTransformJob
You can obtain debugging details using the describe kubectl command.
kubectl describe batchtransformjob xgboost-mnist-batch-transform

Your output should look like the following:
Name:
Namespace:
Labels:
Annotations:

xgboost-mnist-batch-transform
default
<none>
kubectl.kubernetes.io/last-applied-configuration:
{"apiVersion":"sagemaker.aws.amazon.com/

View Logs from BatchTransformJobs

Use the following command to see the logs from the xgboost-mnist batch transform job:

```
kubectl smlogs batchtransformjob xgboost-mnist-batch-transform
```

Delete a BatchTransformJob

Use the following command to stop a batch transform job in SageMaker.

```
kubectl delete batchTransformJob xgboost-mnist-batch-transform
```

Your output should look like the following:

```
batchtransformjob.sagemaker.aws.amazon.com "xgboost-mnist" deleted
```

This command removes the batch transform job from your Kubernetes cluster, as well as stops them in SageMaker. Jobs that have stopped or completed do not incur any charges for SageMaker resources. Delete takes about 2 minutes to clean up the resources from SageMaker.

**Note:** SageMaker does not delete batch transform jobs. Stopped jobs continue to show on the SageMaker console.

HostingDeployment operator

HostingDeployment operators support creating and deleting an endpoint, as well as updating an existing endpoint, for real-time inference. The hosting deployment operator reconciles your specified hosting deployment job spec to SageMaker by creating models, endpoint-configs and endpoints in SageMaker. You can learn more about SageMaker inference in the SageMaker CreateEndpoint API documentation.

Topics

- Configure a HostingDeployment Resource (p. 3197)
- Create a HostingDeployment (p. 3198)
- List HostingDeployments (p. 3198)
- Describe a HostingDeployment (p. 3198)
- Invoking the Endpoint (p. 3200)
- Update HostingDeployment (p. 3200)
- Delete the HostingDeployment (p. 3201)

Configure a HostingDeployment Resource

Download the sample YAML file for the hosting deployment job using the following command:

```
wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/xgboost-mnist-hostingdeployment.yaml
```

The xgboost-mnist-hostingdeployment.yaml file has the following components that can be edited as required:

- **ProductionVariants.** A production variant is a set of instances serving a single model. SageMaker load-balances between all production variants according to set weights.
- **Models.** A model is the containers and execution role ARN necessary to serve a model. It requires at least a single container.
• **Containers.** A container specifies the dataset and serving image. If you are using your own custom algorithm instead of an algorithm provided by SageMaker, the inference code must meet SageMaker requirements. For more information, see Using Your Own Algorithms with SageMaker.

### Create a HostingDeployment

To create a HostingDeployment, use `kubectl` to apply the file `hosting.yaml` with the following command:

```bash
kubectl apply -f hosting.yaml
```

SageMaker creates an endpoint with the specified configuration. You incur charges for SageMaker resources used during the lifetime of your endpoint. You do not incur any charges once your endpoint is deleted.

The creation process takes approximately 10 minutes.

### List HostingDeployments

To verify that the HostingDeployment was created, use the following command:

```bash
kubectl get hostingdeployments
```

Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>SAGEMAKER-ENDPOINT-NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>host-xgboost</td>
<td>Creating</td>
<td>host-xgboost-083e0d5f1eaa450aSMLOGS</td>
</tr>
</tbody>
</table>

### HostingDeployment Status Values

The status field can be one of several values:

- **SynchronizingK8sJobWithSageMaker:** The operator is preparing to create the endpoint.
- **ReconcilingEndpoint:** The operator is creating, updating, or deleting endpoint resources. If the HostingDeployment remains in this state, use `kubectl describe` to see the reason in the `Additional` field.
- **OutOfService:** Endpoint is not available to take incoming requests.
- **Creating:** CreateEndpoint is executing.
- **Updating:** UpdateEndpoint or UpdateEndpointWeightsAndCapacities is executing.
- **SystemUpdating:** Endpoint is undergoing maintenance and cannot be updated or deleted or rescaled until it has completed. This maintenance operation does not change any customer-specified values such as VPC config, KMS encryption, model, instance type, or instance count.
- **RollingBack:** Endpoint fails to scale up or down or change its variant weight and is in the process of rolling back to its previous configuration. Once the rollback completes, endpoint returns to an InService status. This transitional status only applies to an endpoint that has autoscaling enabled and is undergoing variant weight or capacity changes as part of an UpdateEndpointWeightsAndCapacities call or when the UpdateEndpointWeightsAndCapacities operation is called explicitly.
- **InService:** Endpoint is available to process incoming requests.
- **Deleting:** DeleteEndpoint is executing.
- **Failed:** Endpoint could not be created, updated, or re-scaled. Use DescribeEndpoint:FailureReason for information about the failure. DeleteEndpoint is the only operation that can be performed on a failed endpoint.

### Describe a HostingDeployment

You can obtain debugging details using the `describe kubectl` command.
kubectl describe hostingdeployment

Your output should look like the following:

<table>
<thead>
<tr>
<th>Name:</th>
<th>host-xgboost</th>
</tr>
</thead>
<tbody>
<tr>
<td>Namespace:</td>

The status field provides more information using the following fields:

- **Additional**: Additional information about the status of the hosting deployment. This field is optional and only gets populated in case of error.
- **Creation Time**: When the endpoint was created in SageMaker.
- **Endpoint ARN**: The SageMaker endpoint ARN.
- **Endpoint Config Name**: The SageMaker name of the endpoint configuration.
- **Endpoint Name**: The SageMaker name of the endpoint.
- **Endpoint Status**: The status of the endpoint.
- **Endpoint URL**: The HTTPS URL that can be used to access the endpoint. For more information, see [Deploy a Model on SageMaker Hosting Services](#).
- **FailureReason**: If a create, update, or delete command fails, the cause is shown here.
- **Last Check Time**: The last time the operator checked the status of the endpoint.
- **Last Modified Time**: The last time the endpoint was modified.
- **Model Names**: A key-value pair of HostingDeployment model names to SageMaker model names.

### Invoking the Endpoint

Once the endpoint status is **InService**, you can invoke the endpoint in two ways: using the AWS CLI, which does authentication and URL request signing, or using an HTTP client like cURL. If you use your own client, you need to do AWS v4 URL signing and authentication on your own.

To invoke the endpoint using the AWS CLI, run the following command. Make sure to replace the Region and endpoint-name with your endpoint's Region and SageMaker endpoint name. This information can be obtained from the output of `kubectl describe`.

```bash
# Invoke the endpoint with mock input data.
aws sagemaker-runtime invoke-endpoint \
  --region us-east-2 \ 
  --endpoint-name <endpoint name> \ 
  --body $(seq 784 | xargs echo | sed 's/ /,/g') \ 
  >(cat) \ 
  --content-type text/csv > /dev/null
```

For example, if your Region is `us-east-2` and your endpoint config name is `host-xgboost-f56b6b280d7511ea824b129926example`, then the following command would invoke the endpoint:

```bash
aws sagemaker-runtime invoke-endpoint \
  --region us-east-2 \ 
  --endpoint-name host-xgboost-f56b6b280d7511ea824b129926example \ 
  --body $(seq 784 | xargs echo | sed 's/ /,/g') \ 
  >(cat) \ 
  --content-type text/csv > /dev/null
4.95847082138
```

Here, `4.95847082138` is the prediction from the model for the mock data.

### Update HostingDeployment

1. Once a HostingDeployment has a status of **InService**, it can be updated. It might take about 10 minutes for HostingDeployment to be in service. To verify that the status is **InService**, use the following command:

   ```bash
   kubectl get hostingdeployments
   ```

2. The HostingDeployment can be updated before the status is **InService**. The operator waits until the SageMaker endpoint is **InService** before applying the update.

   To apply an update, modify the `hosting.yaml` file. For example, change the `initialInstanceCount` field from 1 to 2 as follows:

   ```yaml
   apiVersion: sagemaker.aws.amazon.com/v1
   kind: HostingDeployment
   metadata:
     name: host-xgboost
   ```
spec:
  region: us-east-2
  productionVariants:
    - variantName: all-traffic
      name: xgboost-model
      initialInstanceCount: 2
      instanceType: ml.c5.large
      models:
        - name: xgboost-model
          executionRoleArn: arn:aws:iam::123456789012:role/service-role/AmazonSageMaker-ExecutionRole
          primaryContainer: xgboost
          containers:
            - containerHostname: xgboost
              modelDataUrl: s3://my-bucket/inference/xgboost-mnist/model.tar.gz
              image: 123456789012.dkr.ecr.us-east-2.amazonaws.com/xgboost:latest

3. Save the file, then use kubectl to apply your update as follows. You should see the status change from InService to ReconcilingEndpoint, then Updating.

```
$ kubectl apply -f hosting.yaml
hostingdeployment.sagemaker.aws.amazon.com/host-xgboost configured
$ kubectl get hostingdeployments
<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>SAGEMAKER-ENDPOINT-NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>host-xgboost</td>
<td>ReconcilingEndpoint</td>
<td>host-xgboost-def0e83e0d5f11eaaa450a350abcdef</td>
</tr>
</tbody>
</table>
$ kubectl get hostingdeployments
<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>SAGEMAKER-ENDPOINT-NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>host-xgboost</td>
<td>Updating</td>
<td>host-xgboost-def0e83e0d5f11eaaa450a3507abcdef</td>
</tr>
</tbody>
</table>
```

SageMaker deploys a new set of instances with your models, switches traffic to use the new instances, and drains the old instances. As soon as this process begins, the status becomes Updating. After the update is complete, your endpoint becomes InService. This process takes approximately 10 minutes.

Delete the HostingDeployment

1. Use kubectl to delete a HostingDeployment with the following command:

```
kubectl delete hostingdeployments host-xgboost
```

Your output should look like the following:

```
hostingdeployment.sagemaker.aws.amazon.com "host-xgboost" deleted
```

2. To verify that the hosting deployment has been deleted, use the following command:

```
kubectl get hostingdeployments
No resources found.
```

Endpoints that have been deleted do not incur any charges for SageMaker resources.

ProcessingJob operator

ProcessingJob operators are used to launch Amazon SageMaker processing jobs. For more information on SageMaker processing jobs, see CreateProcessingJob.
**Create a ProcessingJob Using a YAML File**

Follow these steps to create an Amazon SageMaker processing job by using a YAML file:

1. Download the `kmeans_preprocessing.py` pre-processing script.
   
   ```
   wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/kmeans_preprocessing.py
   ```

2. In one of your Amazon Simple Storage Service (Amazon S3) buckets, create a `mnist_kmeans_example/processing_code` folder and upload the script to the folder.

3. Download the `kmeans-mnist-processingjob.yaml` file.
   
   ```
   wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/kmeans-mnist-processingjob.yaml
   ```

4. Edit the YAML file to specify your `sagemaker-execution-role` and replace all instances of `my-bucket` with your S3 bucket.
   
   ```
   ...
   metadata:
     name: kmeans-mnist-processing
   ...
   roleArn: arn:aws:iam::<acct-id>:role/service-role/<sagemaker-execution-role>
   ...
   processingOutputConfig:
     outputs:
       ...
       s3Output:
         s3Uri: s3://<my-bucket>/mnist_kmeans_example/output/
   ...
   processingInputs:
     ...
     s3Input:
       s3Uri: s3://<my-bucket>/mnist_kmeans_example/processing_code/kmeans_preprocessing.py
   ```

   The `sagemaker-execution-role` must have permissions so that SageMaker can access your S3 bucket, Amazon CloudWatch, and other services on your behalf. For more information on creating an execution role, see [SageMaker Roles](#).

5. Apply the YAML file using one of the following commands.

   For cluster-scoped installation:
   ```
   kubectl apply -f kmeans-mnist-processingjob.yaml
   ```

   For namespace-scoped installation:
   ```
   kubectl apply -f kmeans-mnist-processingjob.yaml -n <NAMESPACE>
   ```
**List ProcessingJobs**

Use one of the following commands to list all the jobs created using the ProcessingJob operator. `SAGEMAKER-JOB-NAME` comes from the metadata section of the YAML file.

For cluster-scoped installation:

```bash
kubectl get ProcessingJob kmeans-mnist-processing
```

For namespace-scoped installation:

```bash
kubectl get ProcessingJob -n <NAMESPACE> kmeans-mnist-processing
```

Your output should look similar to the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>CREATION-TIME</th>
<th>SAGEMAKER-JOB-NAME</th>
</tr>
</thead>
</table>

The output lists all jobs regardless of their status. To remove a job from the list, see Delete a Processing Job.

**ProcessingJob Status**

- **SynchronizingK8sJobWithSageMaker** – The job is first submitted to the cluster. The operator has received the request and is preparing to create the processing job.
- **Reconciling** – The operator is initializing or recovering from transient errors, along with others. If the processing job remains in this state, use the `kubectl describe` command to see the reason in the Additional field.
- **InProgress | Completed | Failed | Stopping | Stopped** – Status of the SageMaker processing job. For more information, see DescribeProcessingJob.
- **Error** – The operator cannot recover by reconciling.

Jobs that have completed, stopped, or failed do not incur further charges for SageMaker resources.

**Describe a ProcessingJob**

Use one of the following commands to get more details about a processing job. These commands are typically used for debugging a problem or checking the parameters of a processing job.

For cluster-scoped installation:

```bash
kubectl describe processingjob kmeans-mnist-processing
```

For namespace-scoped installation:

```bash
kubectl describe processingjob kmeans-mnist-processing -n <NAMESPACE>
```

The output for your processing job should look similar to the following.

```bash
$ kubectl describe ProcessingJob kmeans-mnist-processing
Name: kmeans-mnist-processing
Namespace: default
```
Labels:       <none>

Delete a ProcessingJob

When you delete a processing job, the SageMaker processing job is removed from Kubernetes but the job isn't deleted from SageMaker. If the job status in SageMaker is InProgress the job is stopped. Processing jobs that are stopped do not incur any charges for SageMaker resources. Use one of the following commands to delete a processing job.

For cluster-scoped installation:

```bash
kubectl delete processingjob kmeans-mnist-processing
```

For namespace-scoped installation:

```bash
kubectl delete processingjob kmeans-mnist-processing -n <NAMESPACE>
```

The output for your processing job should look similar to the following.

```bash
processingjob.sagemaker.aws.amazon.com "kmeans-mnist-processing" deleted
```

**Note**
SageMaker does not delete the processing job. Stopped jobs continue to show in the SageMaker console. The delete command takes a few minutes to clean up the resources from SageMaker.

HostingAutoscalingPolicy (HAP) Operator

The HostingAutoscalingPolicy (HAP) operator takes a list of resource IDs as input and applies the same policy to each of them. Each resource ID is a combination of an endpoint name and a variant name. The HAP operator performs two steps: it registers the resource IDs and then applies the scaling policy to each resource ID. Delete undoes both actions. You can apply the HAP to an existing SageMaker endpoint or you can create a new SageMaker endpoint using the HostingDeployment operator. You can read more about SageMaker autoscaling in the Application Autoscaling Policy documentation.

**Note**
In your `kubectl` commands, you can use the short form, hap, in place of hostingautoscalingpolicy.

Topics
- Create a HostingAutoscalingPolicy Using a YAML File (p. 3206)
- List HostingAutoscalingPolicies (p. 3207)
- Describe a HostingAutoscalingPolicy (p. 3208)
- Update a HostingAutoscalingPolicy (p. 3208)
Create a HostingAutoscalingPolicy Using a YAML File

Use a YAML file to create a HostingAutoscalingPolicy (HAP) that applies a predefined or custom metric to one or multiple SageMaker endpoints.

Amazon SageMaker requires specific values in order to apply autoscaling to your variant. If these values are not specified in the YAML spec, the HAP operator applies the following default values.

```yaml
# Do not change
Namespace                    = "sagemaker"
# Do not change
ScalableDimension            = "sagemaker:variant:DesiredInstanceCount"
# Only one supported
PolicyType                   = "TargetTrackingScaling"
# This is the default policy name but can be changed to apply a custom policy
DefaultAutoscalingPolicyName = "SageMakerEndpointInvocationScalingPolicy"
```

Use the following samples to create a HAP that applies a predefined or custom metric to one or multiple endpoints.

Sample 1: Apply a Predefined Metric to a Single Endpoint Variant

1. Download the sample YAML file for a predefined metric using the following command:

   ```bash
   wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/hap-predefined-metric.yaml
   ```

2. Edit the YAML file to specify your `endpointName`, `variantName`, and `region`.

3. Use one of the following commands to apply a predefined metric to a single resource ID (endpoint name and variant name combination).

   For cluster-scoped installation:
   ```bash
   kubectl apply -f hap-predefined-metric.yaml
   ```

   For namespace-scoped installation:
   ```bash
   kubectl apply -f hap-predefined-metric.yaml -n <NAMESPACE>
   ```

Sample 2: Apply a Custom Metric to a Single Endpoint Variant

1. Download the sample YAML file for a custom metric using the following command:

   ```bash
   wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/hap-custom-metric.yaml
   ```

2. Edit the YAML file to specify your `endpointName`, `variantName`, and `region`.

3. Use one of the following commands to apply a custom metric to a single resource ID (endpoint name and variant name combination) in place of the recommended `SageMakerVariantInvocationsPerInstance`.

   **Note**
   Amazon SageMaker does not check the validity of your YAML spec.
For cluster-scoped installation:

```bash
cubectl apply -f hap-custom-metric.yaml
```

For namespace-scoped installation:

```bash
cubectl apply -f hap-custom-metric.yaml -n <NAMESPACE>
```

### Sample 3: Apply a Scaling Policy to Multiple Endpoints and Variants

You can use the HAP operator to apply the same scaling policy to multiple resource IDs. A separate `scaling_policy` request is created for each resource ID (endpoint name and variant name combination).

1. Download the sample YAML file for a predefined metric using the following command:

   ```bash
   wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/hap-predefined-metric.yaml
   ```

2. Edit the YAML file to specify your `region` and multiple `endpointName` and `variantName` values.

3. Use one of the following commands to apply a predefined metric to multiple resource IDs (endpoint name and variant name combinations).

   For cluster-scoped installation:

   ```bash
cubectl apply -f hap-predefined-metric.yaml
   ```

   For namespace-scoped installation:

   ```bash
ckubectl apply -f hap-predefined-metric.yaml -n <NAMESPACE>
   ```

### Considerations for HostingAutoscalingPolicies for Multiple Endpoints and Variants

The following considerations apply when you use multiple resource IDs:

- If you apply a single policy across multiple resource IDs, one PolicyARN is created per resource ID. Five endpoints have five PolicyARNs. When you run the `describe` command on the policy, the responses show up as one job and include a single job status.

- If you apply a custom metric to multiple resource IDs, the same dimension or value is used for all the resource ID (variant) values. For example, if you apply a customer metric for instances 1-5, and the endpoint variant dimension is mapped to variant 1, when variant 1 exceeds the metrics, all endpoints are scaled up or down.

- The HAP operator supports updating the list of resource IDs. If you modify, add, or delete resource IDs to the spec, the autoscaling policy is removed from the previous list of variants and applied to the newly specified resource ID combinations. Use the `describe` command to list the resource IDs to which the policy is currently applied.

### List HostingAutoscalingPolicies

Use one of the following commands to list all HostingAutoscalingPolicies (HAPs) created using the HAP operator.
For cluster-scoped installation:

```bash
kubectl get hap
```

For namespace-scoped installation:

```bash
kubectl get hap -n <NAMESPACE>
```

Your output should look similar to the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>CREATION-TIME</th>
</tr>
</thead>
<tbody>
<tr>
<td>hap-predefined</td>
<td>Created</td>
<td>2021-07-13T21:32:21Z</td>
</tr>
</tbody>
</table>

Use the following command to check the status of your HostingAutoscalingPolicy (HAP).

```bash
kubectl get hap <job-name>
```

One of the following values is returned:

- Reconciling – Certain types of errors show the status as Reconciling instead of Error. Some examples are server-side errors and endpoints in the Creating or Updating state. Check the Additional field in status or operator logs for more details.
- Created
- Error

**To view the autoscaling endpoint to which you applied the policy**

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the left side panel, expand **Inference**.
3. Choose **Endpoints**.
4. Select the name of the endpoint of interest.
5. Scroll to the **Endpoint runtime settings** section.

**Describe a HostingAutoscalingPolicy**

Use the following command to get more details about a HostingAutoscalingPolicy (HAP). These commands are typically used for debugging a problem or checking the resource IDs (endpoint name and variant name combinations) of a HAP.

```bash
kubectl describe hap <job-name>
```

**Update a HostingAutoscalingPolicy**

The HostingAutoscalingPolicy (HAP) operator supports updates. You can edit your YAML spec to change the values and then reapply the policy. The HAP operator deletes the existing policy and applies the new policy.

**Delete a HostingAutoscalingPolicy**

Use one of the following commands to delete a HostingAutoscalingPolicy (HAP) policy.

For cluster-scoped installation:

```bash
kubectl delete hap hap-predefined
```
For namespace-scoped installation:

```
kubectl delete hap hap-predefined -n <NAMESPACE>
```

This command deletes the scaling policy and deregisters the scaling target from Kubernetes. This command returns the following output:

```
hostingautoscalingpolicies.sagemaker.aws.amazon.com "hap-predefined" deleted
```

**Update or Delete an Endpoint with a HostingAutoscalingPolicy**

To update an endpoint that has a HostingAutoscalingPolicy (HAP), use the `kubectl delete` command to remove the HAP, update the endpoint, and then reapply the HAP.

To delete an endpoint that has a HAP, use the `kubectl delete` command to remove the HAP before you delete the endpoint.

**Migrate resources to the new SageMaker Operators for Kubernetes**

The new Amazon SageMaker Operators for Kubernetes uses AWS Controllers for Kubernetes (ACK) to train, tune, and deploy machine learning models with Amazon SageMaker. ACK is a framework for building Kubernetes custom controllers, where each controller communicates with an AWS service API. These controllers allow Kubernetes users to provision AWS resources like databases or message queues using the Kubernetes API. For a list of all ACK service controllers, see Services in the ACK documentation.

**Note**
The new SageMaker Operators for Kubernetes are not backwards compatible. Use the following steps to migrate your resources.

For more information, see the ACK documentation or the ACK SageMaker controller GitHub repository. For a list of supported SageMaker resources, refer to the ACK API Reference. To get started with hands-on examples, see Tutorials (p. 3211).

**Prerequisites**

To successfully migrate resources to the new SageMaker Operators for Kubernetes, you must:

2. If you are using HostingAutoscalingPolicy resources (p. 3211), install the new Application Auto Scaling Operator. See Setup in Scale SageMaker Workloads with Application Auto Scaling for step-by-step instructions. This step is optional if you are not using HostingAutoscalingPolicy resources.

If permissions are configured correctly, then the ACK SageMaker service controller can determine the specification and status of the AWS resource and reconcile the resource as if the ACK controller originally created it.

**Adopt resources**

The new SageMaker Operators for Kubernetes provide the ability to adopt resources that were not originally created by the ACK service controller. For more information, see Adopt Existing AWS Resources in the ACK documentation.

The following steps show how the new SageMaker Operators for Kubernetes can adopt an existing SageMaker endpoint. Save the following sample to a file named `adopt-endpoint-sample.yaml`.
apiVersion: services.k8s.aws/v1alpha1
kind: AdoptedResource
metadata:
  name: adopt-endpoint-sample
spec:
  aws:
    # resource to adopt, not created by ACK
    nameOrID: xgboost-endpoint
  kubernetes:
    group: sagemaker.services.k8s.aws
    kind: Endpoint
    metadata:
      # target K8s CR name
      name: xgboost-endpoint

Submit the custom resource (CR) using `kubectl apply`:

`kubectl apply -f adopt-endpoint-sample.yaml`

Use `kubectl describe` to check the status conditions of your adopted resource.

`kubectl describe adoptedresource adopt-endpoint-sample`

Verify that the ACK.Adopted condition is True. The output should look similar to the following:

```
---
kind: AdoptedResource
metadata:
  annotations:
    kubectl.kubernetes.io/last-applied-configuration: '{"apiVersion":"services.k8s.aws/v1alpha1","kind":"AdoptedResource","metadata":{"annotations":{},"name":"xgboost-endpoint","namespace":"default"},"spec":{"aws":{"nameOrID":"xgboost-endpoint"},"kubernetes":{"group":"sagemaker.services.k8s.aws","kind":"Endpoint","metadata":{"name":"xgboost-endpoint"}}}}'
  creationTimestamp: '2021-04-27T02:49:14Z'
  finalizers:
    - finalizers.services.k8s.aws/AdoptedResource
  generation: 1
  name: adopt-endpoint-sample
  namespace: default
  resourceVersion: '12669876'
  selfLink: '/apis/services.k8s.aws/v1alpha1/namespaces/default/adoptedresources/adopt-endpoint-sample'
  uid: 35f8fa92-29dd-4040-9d0d-0b07bbd7ca0b
spec:
  aws:
    nameOrID: xgboost-endpoint
  kubernetes:
    group: sagemaker.services.k8s.aws
    kind: Endpoint
    metadata:
      name: xgboost-endpoint
  status:
    conditions:
    - status: 'True'
      type: ACK.Adopted

Check that your resource exists in your cluster:

`kubectl describe endpoints.sagemaker xgboost-endpoint`
HostingAutoscalingPolicy resources

The HostingAutoscalingPolicy (HAP) resource consists of multiple Application Auto Scaling resources: ScalableTarget and ScalingPolicy. When adopting a HAP resource with ACK, you need to first install the Application Auto Scaling controller. To adopt HAP resources, you need to adopt both ScalableTarget and ScalingPolicy resources. The resource identifier for these resources can be found in the status of the HostingAutoscalingPolicy resource (status.ResourceIDList).

HostingDeployment resources

The HostingDeployment resource consists of multiple SageMaker resources: Endpoint, EndpointConfig, and each Model. If you adopt a SageMaker endpoint in ACK, you need to adopt the Endpoint, EndpointConfig, and each Model separately. The Endpoint, EndpointConfig, and Model names can be found in status of the HostingDeployment resource (status.endpointName, status.endpointConfigName, and status.modelNames).

For a list of all supported SageMaker resources, refer to the ACK API Reference.

Clean up old resources

After the new SageMaker Operators for Kubernetes adopt your resources, it is time to uninstall old operators and clean up old resources.

Step 1: Uninstall the old operator

To uninstall the old operator, see Delete operators (p. 3181).

Warning
Uninstall the old operator before deleting any old resources.

Step 2: Remove finalizers and delete old resources

Warning
Before deleting old resources, be sure that the old operator is uninstalled.

After uninstalling the old operator, you must explicitly remove the finalizers to delete old operator resources. The sample script below shows how to delete all training jobs managed by the old operator in a given namespace. You can use a similar pattern to delete additional resources once they are adopted by the new operator.

Note
You must use full resource names to get resources. For example, use kubectl get trainingjobs.sagemaker.aws.amazon.com instead of kubectl get trainingjob.

```bash
namespace=sagemaker_namespace
training_jobs=$(kubectl get trainingjobs.sagemaker.aws.amazon.com -n $namespace -ojson | jq -r '.items | .[] | .metadata.name')
for job in $training_jobs
do
  echo "Deleting $job resource in $namespace namespace"
  kubectl patch trainingjobs.sagemaker.aws.amazon.com $job -n $namespace -p '{"metadata":{"finalizers":null}}' --type=merge
  kubectl delete trainingjobs.sagemaker.aws.amazon.com $job -n $namespace
done
```

Tutorials

For more in-depth guides on installing and using the new SageMaker Operator for Kubernetes, see the following tutorials:

- Machine Learning with the ACK SageMaker Controller
SageMaker Components for Kubeflow Pipelines

This document outlines how to use SageMaker Components for Kubeflow Pipelines (KFP). With these pipeline components, you can create and monitor training, tuning, endpoint deployment, and batch transform jobs in SageMaker. By running Kubeflow Pipeline jobs on SageMaker, you move data processing and training jobs from the Kubernetes cluster to SageMaker's machine learning-optimized managed service. This document assumes prior knowledge of Kubernetes and Kubeflow.

Contents
- What is Kubeflow Pipelines? (p. 3212)
- Kubeflow Pipeline components (p. 3212)
- IAM permissions (p. 3213)
- Converting Pipelines to use SageMaker (p. 3214)
- Using SageMaker Components (p. 3214)

What is Kubeflow Pipelines?

Kubeflow Pipelines (KFP) is a platform for building and deploying portable, scalable machine learning (ML) workflows based on Docker containers. The Kubeflow Pipelines platform consists of the following:

- A user interface (UI) for managing and tracking experiments, jobs, and runs.
- An engine (Argo) for scheduling multi-step ML workflows.
- A Python SDK for defining and manipulating pipelines and components.
- Notebooks for interacting with the system using the SDK.

A pipeline is a description of an ML workflow expressed as a directed acyclic graph as shown in the following diagram. Every step in the workflow is expressed as a Kubeflow Pipeline component, which is a Python module.

If your data has been preprocessed, the standard pipeline takes a subset of the data and runs hyperparameter optimization of the model. The pipeline then trains a model with the full dataset using the optimal hyperparameters. This model is used for both batch inference and endpoint creation.

For more information on Kubeflow Pipelines, see the Kubeflow Pipelines documentation.

Kubeflow Pipeline components

A Kubeflow Pipeline component is a set of code used to execute one step in a Kubeflow pipeline. Components are represented by a Python module that is converted into a Docker image. These components make it fast and easy to write pipelines for experimentation and production environments without having to interact with the underlying Kubernetes infrastructure.

What do SageMaker Components for Kubeflow Pipelines provide?

SageMaker Components for Kubeflow Pipelines offer an alternative to launching compute-intensive jobs in SageMaker. These components integrate SageMaker with the portability and orchestration of Kubeflow Pipelines. Using the SageMaker components, each of the jobs in the pipeline workflow runs on SageMaker instead of the local Kubernetes cluster. The job parameters, status, logs, and outputs from SageMaker are still accessible from the Kubeflow Pipelines UI. The following SageMaker components have been created to integrate six key SageMaker features into your ML workflows. You can create a Kubeflow Pipeline built entirely using these components, or integrate individual components into your workflow as needed.
There is no additional charge for using SageMaker Components for Kubeflow Pipelines. You incur charges for any SageMaker resources you use through these components.

Training components

Training

The Training component allows you to submit SageMaker Training jobs directly from a Kubeflow Pipelines workflow. For more information, see SageMaker Training Kubeflow Pipelines component.

Hyperparameter Optimization

The Hyperparameter Optimization component enables you to submit hyperparameter tuning jobs to SageMaker directly from a Kubeflow Pipelines workflow. For more information, see SageMaker hyperparameter optimization Kubeflow Pipeline component.

Processing

The Processing component enables you to submit processing jobs to SageMaker directly from a Kubeflow Pipelines workflow. For more information, see SageMaker Processing Kubeflow Pipeline component.

Inference components

Hosting Deploy

The Deploy component enables you to deploy a model in SageMaker Hosting from a Kubeflow Pipelines workflow. For more information, see SageMaker Hosting Services - Create Endpoint Kubeflow Pipeline component.

Batch Transform component

The Batch Transform component enables you to run inference jobs for an entire dataset in SageMaker from a Kubeflow Pipelines workflow. For more information, see SageMaker Batch Transform Kubeflow Pipeline component.

Ground Truth components

Ground Truth  The Ground Truth component enables you to submit SageMaker Ground Truth labeling jobs directly from a Kubeflow Pipelines workflow. For more information, see SageMaker Ground Truth Kubeflow Pipelines component.

Workteam

The Workteam component enables you to create SageMaker private workteam jobs directly from a Kubeflow Pipelines workflow. For more information, see SageMaker create private workteam Kubeflow Pipelines component.

IAM permissions

Deploying Kubeflow Pipelines with SageMaker components requires the following three levels of IAM permissions:

- An IAM user/role to access your AWS account (your_credentials). Note: You don’t need this at all if you already have access to KFP web UI and have your input data in Amazon S3, or if you already have an Amazon Elastic Kubernetes Service (Amazon EKS) cluster with KFP.

You use this user/role from your gateway node, which can be your local machine or a remote instance, to:

- Create an Amazon EKS cluster and install KFP
- Create IAM roles/users
- Create Amazon S3 buckets for your sample input data

The IAM user/role needs the following permissions:
• CloudWatchLogsFullAccess
• AWSCloudFormationFullAccess
• IAMFullAccess
• AmazonS3FullAccess
• AmazonEC2FullAccess
• AmazonEKSAdminPolicy (Create this policy using the schema from Amazon EKS Identity-Based Policy Examples)

• An IAM role used by KFP pods to access SageMaker (kfp-example-pod-role) The KFP pods use this permission to create SageMaker jobs from KFP components. Note: If you want to limit permissions to the KFP pods, create your own custom policy and attach it.

  The role needs the following permission:
  • AmazonSageMakerFullAccess

• An IAM role used by SageMaker jobs to access resources such as Amazon S3 and Amazon ECR etc. (kfp-example-sagemaker-execution-role).

  Your SageMaker jobs use this role to:
  • Access SageMaker resources
  • Input Data from Amazon S3
  • Store your output model to Amazon S3

  The role needs the following permissions:
  • AmazonSageMakerFullAccess
  • AmazonS3FullAccess

These are all the IAM users/roles you need to run KFP components for SageMaker.

When you have run the components and have created the SageMaker endpoint, you also need a role with the sagemaker:InvokeEndpoint permission to query inference endpoints.

Converting Pipelines to use SageMaker

You can convert an existing pipeline to use SageMaker by porting your generic Python processing containers and training containers. If you are using SageMaker for inference, you also need to attach IAM permissions to your cluster and convert an artifact to a model.

Using SageMaker Components

In this tutorial, you run a pipeline using SageMaker Components for Kubeflow Pipelines to train a classification model using Kmeans with the MNIST dataset. This workflow uses Kubeflow pipelines as the orchestrator and SageMaker as the backend to run the steps in the workflow. For the full code for this and other pipeline examples, see the Sample SageMaker Kubeflow Pipelines. For information on the components used, see the KubeFlow Pipelines GitHub repository.

Contents

• Setup (p. 3214)
• Running the Kubeflow Pipeline (p. 3221)

Setup

To use Kubeflow Pipelines (KFP), you need an Amazon Elastic Kubernetes Service (Amazon EKS) cluster and a gateway node to interact with that cluster. The following sections show the steps needed to set up these resources.

Topics
• Set up a gateway node (p. 3215)
• Set up an Amazon EKS cluster (p. 3215)
• Install Kubeflow Pipelines (p. 3216)
• Access the KFP UI (p. 3217)
• Create IAM Users/Roles for KFP pods and the SageMaker service (p. 3218)
• Add access to additional IAM users or roles (p. 3220)

Set up a gateway node

A gateway node is used to create an Amazon EKS cluster and access the Kubeflow Pipelines UI. Use your local machine or an Amazon EC2 instance as your gateway node. If you want to use a new Amazon EC2 instance, create one with the latest Ubuntu 18.04 DLAMI version from the AWS console using the steps in Launching and Configuring a DLAMI.

Complete the following steps to set up your gateway node. Depending on your environment, you may have certain requirements already configured.

1. If you don’t have an existing Amazon EKS cluster, create a user named your_credentials using the steps in Creating an IAM User in Your AWS Account. If you have an existing Amazon EKS cluster, use the credentials of the IAM role or user that has access to it.
2. Add the following permissions to your user using the steps in Changing Permissions for an IAM User:
   • CloudWatchLogsFullAccess
   • AWSCloudFormationFullAccess
   • IAMFullAccess
   • AmazonS3FullAccess
   • AmazonEC2FullAccess
   • AmazonEKSAdminPolicy (Create this policy using the schema from Amazon EKS Identity-Based Policy Examples)
3. Install the following on your gateway node to access the Amazon EKS cluster and KFP UI.
   • AWS CLI. If you are using an IAM user, configure your Access Key ID, Secret Access Key and preferred AWS Region by running: aws configure
   • aws-iam-authenticator version 0.1.31 and above
   • eksctl version above 0.15.
   • kubectl (The version needs to match your Kubernetes version within one minor version)
4. Install boto3.
   ```
   pip install boto3
   ```

Set up an Amazon EKS cluster

Run the following steps from the command line of your gateway node to set up an Amazon EKS cluster:

1. If you do not have an existing Amazon EKS cluster, complete the following substeps. If you already have an Amazon EKS cluster, skip this step.
   a. Run the following from your command line to create an Amazon EKS cluster with version 1.17 or above. Replace <your-cluster-name> with any name for your cluster.
   ```
   eksctl create cluster --name <your-cluster-name> --region us-east-1 --auto-kubeconfig --timeout=50m --managed --nodes=1
   ```
   b. When cluster creation is complete, verify that you have access to the cluster using the following command.
kubectl get nodes

2. Verify that the current kubectl context is the cluster you want to use with the following command. The current context is marked with an asterisk (*) in the output.

```bash
kubectl config get-contexts
```

<table>
<thead>
<tr>
<th>CURRENT NAME</th>
<th>CLUSTER</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>&lt;username&gt;@&lt;clusternname&gt;.us-east-1.eksctl.io</td>
</tr>
<tr>
<td></td>
<td>&lt;clustername&gt;.us-east-1.eksctl.io</td>
</tr>
</tbody>
</table>

3. If the desired cluster is not configured as your current default, update the default with the following command.

```bash
aws eks update-kubeconfig --name <clusternname> --region us-east-1
```

**Install Kubeflow Pipelines**

Run the following steps from the command line of your gateway node to install Kubeflow Pipelines on your cluster.

1. Install Kubeflow Pipelines on your cluster by following step 1 of Deploying Kubeflow Pipelines documentation. Your KFP version must be 1.7.0 or above.

2. Verify that the Kubeflow Pipelines service and other related resources are running.

```bash
kubectl -n kubeflow get all | grep pipeline
```

Your output should look like the following.

<table>
<thead>
<tr>
<th>pod/ml-pipeline-6b88c67994-kdtjv</th>
<th>1/1 Running 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>pod/ml-pipeline-persistenceagent-64d7f4dbf-66stk</td>
<td>1/1 Running 0</td>
</tr>
<tr>
<td>pod/ml-pipeline-scheduledworkflow-65bdf46db7-5x9qj</td>
<td>1/1 Running 0</td>

</tr>
<tr>
<td>replicaset.apps/ml-pipeline-persistenceagent-64d7f4dbf</td>
<td>1 1 1 2d</td>
</tr>
<tr>
<td>replicaset.apps/ml-pipeline-scheduledworkflow-65bdf46db7</td>
<td>1 1 1 2d</td>
</tr>
</tbody>
</table>
Access the KFP UI

The Kubeflow Pipelines UI is used for managing and tracking experiments, jobs, and runs on your cluster. You can use port forwarding to access the Kubeflow Pipelines UI from your gateway node.

Set up port forwarding to the KFP UI service

Run the following from the command line of your gateway node:

1. Verify that the KFP UI service is running using the following command:

   ```
kubectl -n kubeflow get service ml-pipeline-ui
   ```

<table>
<thead>
<tr>
<th>NAME</th>
<th>TYPE</th>
<th>CLUSTER-IP</th>
<th>EXTERNAL-IP</th>
<th>PORT(S)</th>
<th>AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>ml-pipeline-ui</td>
<td>ClusterIP</td>
<td>10.100.38.71</td>
<td>&lt;none&gt;</td>
<td>80/TCP</td>
<td>2d22h</td>
</tr>
</tbody>
</table>

2. Run the following command to set up port forwarding to the KFP UI service. This forwards the KFP UI to port 8080 on your gateway node and allows you to access the KFP UI from your browser.

   ```
kubectl port-forward -n kubeflow service/ml-pipeline-ui 8080:80
   ```

   The port forward from your remote machine drops if there is no activity. Run this command again if your dashboard is unable to get logs or updates. If the commands return an error, ensure that there is no process already running on the port you are trying to use.

Access the KFP UI service

Your method of accessing the KFP UI depends on your gateway node type.

- Local machine as the gateway node
  
  1. Access the dashboard in your browser as follows:

     ```
     http://localhost:8080
     ```

  2. Choose **Pipelines** to access the pipelines UI.

- Amazon EC2 instance as the gateway node

  1. You need to set up an SSH tunnel on your Amazon EC2 instance to access the Kubeflow dashboard from your local machine's browser.

     From a new terminal session in your local machine, run the following. Replace `<public-DNS-of-gateway-node>` with the IP address of your instance found on the Amazon EC2 console. You can also use the public DNS. Replace `<path_to_key>` with the path to the pem key used to access the gateway node.

     ```
     public_dns_address=<public-DNS-of-gateway-node>
     key=<path_to_key>
     ```

     on Ubuntu:
ssh -i ${key} -L 9000:localhost:8080 ubuntu@${public_DNS_address}

or on Amazon Linux:
ssh -i ${key} -L 9000:localhost:8080 ec2-user@${public_DNS_address}

2. Access the dashboard in your browser.

http://localhost:9000

3. Choose **Pipelines** to access the KFP UI.

Create IAM Users/Roles for KFP pods and the SageMaker service

You now have a Kubernetes cluster with Kubeflow set up. To run SageMaker Components for Kubeflow Pipelines, the Kubeflow Pipeline pods need access to SageMaker. In this section, you create IAM users/roles to be used by Kubeflow Pipeline pods and SageMaker.

Create a KFP execution role

Run the following from the command line of your gateway node:

1. Enable OIDC support on the Amazon EKS cluster with the following command. Replace `<cluster_name>` with the name of your cluster and `<cluster_region>` with the region your cluster is in.

   ```bash
   eksctl utils associate-iam-oidc-provider --cluster <cluster-name> \
   --region <cluster-region> --approve
   ```

2. Run the following to get the OIDC issuer URL. This URL is in the form `https://oidc.eks.<region>.amazonaws.com/id/<OIDC_ID>`.

   ```bash
   aws eks describe-cluster --region <cluster-region> --name <cluster-name> --query "cluster.identity.oidc.issuer" --output text
   ```

3. Run the following to create a file named `trust.json`. Replace `<OIDC_URL>` with your OIDC issuer URL. Don't include `https://` when in your OIDC issuer URL. Replace `<AWS_account_number>` with your AWS account number.

   ```bash
   OIDC_URL="<OIDC_URL>"
   AWS_ACC_NUM="<AWS-account-number>"

   # Run this to create trust.json file
   cat <<EOF > trust.json
   {
   "Version": "2012-10-17",
   "Statement": [
   {
   "Effect": "Allow",
   "Principal": {
   "Federated": "arn:aws:iam::${AWS_ACC_NUM}:oidc-provider/${OIDC_URL}" },
   "Action": "sts:AssumeRoleWithWebIdentity",
   "Condition": {
   "StringEquals": {
   "${OIDC_URL}:aud": "sts.amazonaws.com",
   "${OIDC_URL}:sub": "system:serviceaccount:kubeflow:pipeline-runner"
   }
   }
   }
   ]
   }
   ```
4. Create an IAM role named `kfp-example-pod-role` using `trust.json` using the following command. This role is used by KFP pods to create SageMaker jobs from KFP components. Note the ARN returned in the output.

```bash
aws iam create-role --role-name kfp-example-pod-role --assume-role-policy-document file://trust.json
aws iam attach-role-policy --role-name kfp-example-pod-role --policy-arn arn:aws:iam::aws:policy/AmazonSageMakerFullAccess
aws iam get-role --role-name kfp-example-pod-role --output text --query 'Role.Arn'
```

5. Edit your pipeline-runner service account with the following command.

```bash
kubectl edit -n kubeflow serviceaccount pipeline-runner
```

6. In the file, add the following Amazon EKS role annotation and replace `<role_arn>` with your role ARN.

```
eks.amazonaws.com/role-arn: <role_arn>
```

7. Your file should look like the following when you've added the Amazon EKS role annotation. Save the file.

```yaml
apiVersion: v1
kind: ServiceAccount
metadata:
  annotations:
    eks.amazonaws.com/role-arn: <role_arn>
    kubectl.kubernetes.io/last-applied-configuration: |
      "apiVersion":"v1","kind":"ServiceAccount","metadata":{"annotations":{}
      },"labels":{"app":"pipeline-runner","app.kubernetes.io/component":"pipelines-runner","app.kubernetes.io/instance":"pipelines-runner-0.2.0","app.kubernetes.io/managed-by":"kfctl","app.kubernetes.io/name":"pipelines-runner","app.kubernetes.io/version":"0.2.0"},"name":"pipeline-runner","namespace":"kubeflow"}
creationTimestamp: "2020-04-16T05:48:06Z"
labels:
  app: pipeline-runner
  app.kubernetes.io/component: pipelines-runner
  app.kubernetes.io/instance: pipelines-runner-0.2.0
  app.kubernetes.io/managed-by: kfctl
  app.kubernetes.io/name: pipelines-runner
  app.kubernetes.io/part-of: kubeflow
  app.kubernetes.io/version: 0.2.0
name: pipeline-runner

secrets:
  - name: pipeline-runner-token-dkjrk
```

### Create an SageMaker execution role

The `kfp-example-sagemaker-execution-role` IAM role is used by SageMaker jobs to access AWS resources. For more information, see the IAM Permissions section. You provide this role as an input parameter when running the pipeline.

Run the following to create the role. Note the ARN that is returned in your output.
Add access to additional IAM users or roles

If you use an intuitive IDE like Jupyter or want other people in your organization to use the cluster you set up, you can also give them access. The following steps run through this workflow using SageMaker notebooks. An SageMaker notebook instance is a fully managed Amazon EC2 compute instance that runs the Jupyter Notebook App. You use the notebook instance to create and manage Jupyter notebooks to create ML workflows. You can define, compile, deploy, and run your pipeline using the KFP Python SDK or CLI. If you're not using an SageMaker notebook to run Jupyter, you need to install the AWS CLI and the latest version of kubectl.

1. Follow the steps in Create an SageMaker Notebook Instance to create a SageMaker notebook instance if you do not already have one. Give the IAM role for this instance the S3FullAccess permission.

2. Amazon EKS clusters use IAM users and roles to control access to the cluster. The rules are implemented in a config map named aws-auth. Only the user/role that has access to the cluster will be able to edit this config map. Run the following from the command line of your gateway node to get the IAM role of the notebook instance you created. Replace <instance-name> with the name of your instance.

   ```bash
   aws sagemaker describe-notebook-instance --notebook-instance-name <instance-name> --region <region> --output text --query 'RoleArn'
   ```

   This command outputs the IAM role ARN in the arn:aws:iam::<account-id>:role/<role-name> format. Take note of this ARN.

3. Run the following to attach the policies the IAM role. Replace <role-name> with the <role-name> in your ARN.

   ```bash
   aws iam attach-role-policy --role-name <role-name> --policy-arn arn:aws:iam::aws:policy/AmazonSageMakerFullAccess
   aws iam attach-role-policy --role-name <role-name> --policy-arn arn:aws:iam::aws:policy/AmazonEKSWorkerNodePolicy
   aws iam attach-role-policy --role-name <role-name> --policy-arn arn:aws:iam::aws:policy/AmazonS3FullAccess
   ```

4. eksctl provides commands to read and edit the aws-auth config map. system:masters is one of the default user groups. You add the user to this group. The system:masters group has super user permissions to the cluster. You can also create a group with more restrictive permissions or you can bind permissions directly to users. Replace <IAM-Role-arn> with the ARN of the IAM role. <your_username> can be any unique username.

   ```bash
   eksctl create iamidentitymapping \ 
   --cluster <cluster-name> \ 
   --arn <IAM-Role-arn> \ 
   --group system:masters 
   ```
5. Open the Jupyter notebook on your SageMaker instance and run the following to verify that it has access to the cluster.

```bash
aws eks --region <region> update-kubeconfig --name <cluster-name>
kubectl -n kubeflow get all | grep pipeline
```

## Running the Kubeflow Pipeline

Now that setup of your gateway node and Amazon EKS cluster is complete, you can create your classification pipeline. To create your pipeline, you need to define and compile it. You then deploy it and use it to run workflows. You can define your pipeline in Python and use the KFP dashboard, KFP CLI, or Python SDK to compile, deploy, and run your workflows. The full code for the MNIST classification pipeline example is available in the Kubeflow Github repository. To use it, clone the example Python files to your gateway node.

### Topics

- Prepare datasets (p. 3221)
- Create a Kubeflow Pipeline using SageMaker Components (p. 3221)
- Compile and deploy your pipeline (p. 3222)
- Running predictions (p. 3224)
- View results and logs (p. 3225)
- Cleanup (p. 3225)

### Prepare datasets

To run the pipelines, you need to upload the data extraction pre-processing script to an Amazon S3 bucket. This bucket and all resources for this example must be located in the us-east-1 Amazon Region. If you don't have a bucket, create one using the steps in Creating a bucket.

From the `mnist-kmeans-sagemaker` folder of the Kubeflow repository you cloned on your gateway node, run the following command to upload the `kmeans_preprocessing.py` file to your Amazon S3 bucket. Change `<bucket-name>` to the name of the Amazon S3 bucket you created.

```bash
aws s3 cp mnist-kmeans-sagemaker/kmeans_preprocessing.py s3://<bucket-name>/mnist_kmeans_example/processing_code/kmeans_preprocessing.py
```

### Create a Kubeflow Pipeline using SageMaker Components

The full code for the MNIST classification pipeline is available in the Kubeflow Github repository. To use it, clone the example Python files to your gateway node.

### Input Parameters

The full MNIST classification pipeline has run-specific parameters for which you must provide values when creating a run. You must provide these parameters for each component of your pipeline. These parameters can also be updated when using other pipelines. We have provided default values for all parameters in the sample classification pipeline file.

The following are the only parameters you need to pass to run the sample pipelines. To pass these parameters, update their entries when creating a new run.
• **Role-ARN:** This must be the ARN of an IAM role that has full SageMaker access in your AWS account. Use the ARN of `kfp-example-pod-role`.

- **Bucket:** This is the name of the Amazon S3 bucket that you uploaded the `kmeans_preprocessing.py` file to.

You can adjust any of the input parameters using the KFP UI and trigger your run again.

### Compile and deploy your pipeline

After defining the pipeline in Python, you must compile the pipeline to an intermediate representation before you can submit it to the Kubeflow Pipelines service. The intermediate representation is a workflow specification in the form of a YAML file compressed into a `tar.gz` file. You need the KFP SDK to compile your pipeline.

### Install KFP SDK

Run the following from the command line of your gateway node:

1. Install the KFP SDK following the instructions in the [Kubeflow pipelines documentation](#).
2. Verify that the KFP SDK is installed with the following command:

   ```bash
   pip show kfp
   ```
3. Verify that `dsl-compile` has been installed correctly as follows:

   ```bash
   which dsl-compile
   ```

### Compile your pipeline

You have three options to interact with Kubeflow Pipelines: KFP UI, KFP CLI, or the KFP SDK. The following sections illustrate the workflow using the KFP UI and CLI.

Complete the following from your gateway node to compile your pipeline.

1. Modify your Python file with your Amazon S3 bucket name and IAM role ARN.
2. Use the `dsl-compile` command from the command line to compile your pipeline as follows. Replace `<path-to-python-file>` with the path to your pipeline and `<path-to-output>` with the location where you want your `tar.gz` file to be.

   ```bash
   dsl-compile --py <path-to-python-file> --output <path-to-output>
   ```

### Upload and run the pipeline using the KFP CLI

Complete the following steps from the command line of your gateway node. KFP organizes runs of your pipeline as experiments. You have the option to specify an experiment name. If you do not specify one, the run will be listed under `Default` experiment.

1. Upload your pipeline as follows:

   ```bash
   kfp pipeline upload --pipeline-name <pipeline-name> <path-to-output-tar.gz>
   ```

   Your output should look like the following. Take note of the ID.

   ```bash
   Pipeline 29c3ff21-49f5-4dfe-94f6-618c0e2420fe has been submitted
   ```
2. Create a run using the following command. The KFP CLI run command currently does not support specifying input parameters while creating the run. You need to update your parameters in the Python pipeline file before compiling. Replace `<experiment-name>` and `<job-name>` with any names. Replace `<pipeline-id>` with the ID of your submitted pipeline. Replace `<your-role-arn>` with the ARN of kfp-example-pod-role. Replace `<your-bucket-name>` with the name of the Amazon S3 bucket you created.

```
kfp run submit --experiment-name <experiment-name> --run-name <job-name> --pipeline-id <pipeline-id> role_arn="<your-role-arn>" bucket_name="<your-bucket-name>"
```

You can also directly submit a run using the compiled pipeline package created as the output of the dsl-compile command.

```
kfp run submit --experiment-name <experiment-name> --run-name <job-name> --package-file <path-to-output> role_arn="<your-role-arn>" bucket_name="<your-bucket-name>"
```

Your output should look like the following:

```
Creating experiment aws. Run 95084a2c-f18d-4b77-a9da-eba00bf01e63 is submitted
+--------------------------------------------------------------------------------------------------------------------------+
| run id           | name  | status | created at          |
+--------------------------------------------------------------------------------------------------------------------------+
| 95084a2c-f18d-4b77-a9da-eba00bf01e63 | sm-job |        | 2020-04-30T20:36:41+00:00 |
+--------------------------------------------------------------------------------------------------------------------------+
```

3. Navigate to the UI to check the progress of the job.

Upload and run the pipeline using the KFP UI

1. On the left panel, choose the **Pipelines** tab.
2. In the upper-right corner, choose **UploadPipeline**.
3. Enter the pipeline name and description.
4. Choose **Upload a file** and enter the path to the tar.gz file you created using the CLI or with the Python SDK.
5. On the left panel, choose the **Pipelines** tab.
6. Find the pipeline you created.
7. Choose **CreateRun**.
8. Enter your input parameters.
9. Choose **Run**.
Running predictions

Once your classification pipeline is deployed, you can run classification predictions against the endpoint that was created by the Deploy component. Use the KFP UI to check the output artifacts for sagemaker-deploy-model-endpoint_name. Download the .tgz file to extract the endpoint name or check the SageMaker console in the region you used.

Configure permissions to run predictions

If you want to run predictions from your gateway node, skip this section.

1. To use any other machine to run predictions, assign the sagemaker:InvokeEndpoint permission to the IAM role or IAM user used by the client machine. This permission is used to run predictions.
2. On your gateway node, run the following to create a policy file:

   ```
   cat <<EoF > ./sagemaker-invoke.json
   {
     "Version": "2012-10-17",
     "Statement": [
       {
         "Effect": "Allow",
         "Action": [
           "sagemaker:InvokeEndpoint"
         ],
         "Resource": "*"
       }
     ]
   }
   EoF
   ```

3. Attach the policy to the client node's IAM role or IAM user.
4. If your client machine has an IAM role attached, run the following. Replace `<your-instance-IAM-role>` with the name of the client node's IAM role. Replace `<path-to-sagemaker-invoke-json>` with the path to the policy file you created.

   ```
   aws iam put-role-policy --role-name <your-instance-IAM-role> --policy-name sagemaker-invoke-for-worker --policy-document file://<path-to-sagemaker-invoke-json>
   ```

5. If your client machine has IAM user credentials configured, run the following. Replace `<your_IAM_user_name>` with the name of the client node's IAM user. Replace `<path-to-sagemaker-invoke-json>` with the path to the policy file you created.

   ```
   aws iam put-user-policy --user-name <your-IAM-user-name> --policy-name sagemaker-invoke-for-worker --policy-document file://<path-to-sagemaker-invoke-json>
   ```

Run predictions

1. Create a Python file from your client machine named mnist-predictions.py with the following content. Replace the ENDPOINT_NAME variable. This script loads the MNIST dataset, then creates a CSV from those digits and sends it to the endpoint for prediction. It then outputs the results.

   ```python
   import boto3
   import gzip
   import io
   import json
   import numpy
   import pickle
   ```
ENDPOINT_NAME='<endpoint-name>'
region = boto3.Session().region_name

# S3 bucket where the original mnist data is downloaded and stored
downloaded_data_bucket = f"jumpstart-cache-prod-{region}"
downloaded_data_prefix = "ip-notebooks-data/mnist"

# Download the dataset
s3 = boto3.client("s3")
s3.download_file(downloaded_data_bucket, f"{downloaded_data_prefix}/mnist.pkl.gz", "mnist.pkl.gz")

# Load the dataset
with gzip.open('mnist.pkl.gz', 'rb') as f:
    train_set, valid_set, test_set = pickle.load(f, encoding='latin1')

# Simple function to create a csv from our numpy array
def np2csv(arr):
    csv = io.BytesIO()
    numpy.savetxt(csv, arr, delimiter=',', fmt='%g')
    return csv.getvalue().decode().rstrip()

runtime = boto3.Session(region).client('sagemaker-runtime')
payload = np2csv(train_set[0][30:31])
response = runtime.invoke_endpoint(EndpointName=ENDPOINT_NAME,
    ContentType='text/csv',
    Body=payload)
result = json.loads(response['Body'].read().decode())
print(result)

2. Run the Python file as follows:

```
python mnist-predictions.py
```

**View results and logs**

When the pipeline is running, you can choose any component to check execution details, such as inputs and outputs. This lists the names of created resources.

If the KFP request is successfully processed and an SageMaker job is created, the component logs in the KFP UI provide a link to the job created in SageMaker. The CloudWatch logs are also provided if the job is successfully created.

If you run too many pipeline jobs on the same cluster, you may see an error message that indicates you do not have enough pods available. To fix this, log in to your gateway node and delete the pods created by the pipelines you are not using as follows:

```
kubectl get pods -n kubeflow
kubectl delete pods -n kubeflow <name-of-pipeline-pod>
```

**Cleanup**

When you’re finished with your pipeline, you need to clean up your resources.

1. From the KFP dashboard, terminate your pipeline runs if they do not exit properly by choosing **Terminate**.
2. If the **Terminate** option doesn’t work, log in to your gateway node and manually terminate all the pods created by your pipeline run as follows:
3. Using your AWS account, log in to the SageMaker service. Manually stop all training, batch transform, and HPO jobs. Delete models, data buckets, and endpoints to avoid incurring any additional costs. Terminating the pipeline runs does not stop the jobs in SageMaker.

Amazon SageMaker Workflows FAQ

Use the following FAQ items to find answers to commonly asked questions about MLOps workflows.

Q. Do I need to use the SageMaker Python SDK to create a SageMaker pipeline?

No, the SageMaker Python SDK is not required to create a SageMaker pipeline. You can also use boto3 or AWS CloudFormation. Creating a pipeline requires a pipeline definition, which is a JSON object that defines each step of the pipeline. The SageMaker SDK offers a simple way to construct the pipeline definition, which you can use with any of the APIs previously mentioned to create the pipeline itself. Without using the SDK, users have to write the raw JSON definition to create the pipeline without any of the error checks provided by the SageMaker Python SDK. To see the schema for the pipeline JSON definition, see SageMaker Pipeline Definition JSON Schema. The following code sample shows an example of a SageMaker pipeline definition JSON object:

```json
{
    'Version': '2020-12-01',
    'Metadata': {},
    'Parameters': [
        {'Name': 'ProcessingInstanceType', 'Type': 'String', 'DefaultValue': 'ml.m5.xlarge'},
        {'Name': 'ProcessingInstanceCount', 'Type': 'Integer', 'DefaultValue': 1},
        {'Name': 'TrainingInstanceType', 'Type': 'String', 'DefaultValue': 'ml.m5.xlarge'},
        {'Name': 'ModelApprovalStatus', 'Type': 'String', 'DefaultValue': 'PendingManualApproval'},
        {'Name': 'ProcessedData', 'Type': 'String', 'DefaultValue': 'S3_URL'},
        {'Name': 'InputDataUrl', 'Type': 'String', 'DefaultValue': 'S3_URL'},
        {'PipelineExperimentConfig': {'ExperimentName': {'Get': 'Execution.PipelineName'}, 'TrialName': {'Get': 'Execution.PipelineExecutionId'}},
        'Steps': ["{'Name': 'ReadTrainDataFromFS', 'Type': 'Processing', 'Arguments': {'ProcessingResources': {'ClusterConfig': {'InstanceType': 'ml.m5.4xlarge', 'InstanceCount': 2, 'VolumeSizeInGB': 30}},
        'AppSpecification': {'ImageUri': 'IMAGE_URI',
        'ContainerArguments': [....],
            'RoleArn': 'ROLE',
            'ProcessingInputs': [....],
            'ProcessingOutputConfig': {'Outputs': [.....]},
            'StoppingCondition': {'MaxRuntimeInSeconds': 86400},
            'CacheConfig': {'Enabled': True, 'ExpireAfter': '30d'}},
        ...
```

```
Q. Why do I see a repack step in my SageMaker pipeline?

Model repacking happens when the pipeline needs to include a custom script in the compressed model file (model.tar.gz) to be uploaded to Amazon S3 and used to deploy a model to a SageMaker endpoint. When SageMaker pipeline trains a model and registers it to the model registry, it introduces a repack step if the trained model output from the training job needs to include a custom inference script. The repack step uncompressed the model, adds a new script, and recompresses the model. Running the pipeline adds the repack step as a training job.

Q. Can I use SageMaker Experiments with SageMaker Pipelines?

Yes. SageMaker Pipelines is natively integrated with SageMaker Experiments. You can use `PipelineExperimentConfig` when creating a pipeline and set your own SageMaker Experiment name. Each run of the pipeline creates a trial, and each step in the pipeline corresponds to a `TrialComponent` within the trial. If no trial name is specified in the experiment config, the pipeline execution ID is used as the trial name.

```python
pipeline = Pipeline(    name=pipeline_name,
            parameters=[...],
            steps=[...],
            sagemaker_session=sagemaker_session,
            pipeline_experiment_config=PipelineExperimentConfig(                ExecutionVariables.PIPELINE_NAME,
                ExecutionVariables.PIPELINE_EXECUTION_ID
        )
)
```

Q. SageMaker Project templates have a model deploy repository that uses CloudFormation (CFN) to create an endpoint. Are there ways to deploy the model without using CloudFormation?

You can customize the deploy repository in the project template to deploy the model from the model registry any way you like. The template uses CloudFormation to create a real-time endpoint, as an example. You can update the deployment to use the SageMaker SDK, boto3, or any other API that can create endpoints instead of CFN. If you need to update the CodeBuild steps as part of the deployment pipeline, you can create a custom template.

Q. How do we pass the model file Amazon S3 URL from the train step to the model register step in a SageMaker pipeline at run time?

You can reference the model location as a property of the training step, as shown in the end-to-end example `CustomerChurn pipeline` in Github.
Q. If I am extending a prebuilt container to train an estimator or for a ProcessingStep on SageMaker Pipelines, is it necessary to copy the script to the container in the Dockerfile?

No, you can either copy the script to the container or pass it via the entry_point argument (of your estimator entity) or code argument (of your processor entity), as demonstrated in the following code sample.

```python
step_process = ProcessingStep(
    name="PreprocessAbaloneData",
    processor=sklearn_processor,
    inputs = [
        ProcessingInput(
            input_name='dataset',
            source=...,
            destination="/opt/ml/processing/code",
        ),
    ],
    outputs=[
        ProcessingOutput(output_name="train", source="/opt/ml/processing/train",
            destination = processed_data_path),
        ProcessingOutput(output_name="validation", source="/opt/ml/processing/validation",
            destination = processed_data_path),
        ProcessingOutput(output_name="test", source="/opt/ml/processing/test", destination
            = processed_data_path),
    ],
    code=os.path.join(BASE_DIR, "process.py"), # Code is passed through an argument
    cache_config = cache_config,
    job_arguments = ['--input', 'arg1']
)

sklearn_estimator = SKLearn(
    entry_point=os.path.join(BASE_DIR, "train.py"), # Code is passed through the
    entry_point
    framework_version="0.23-1",
    instance_type=training_instance_type,
    role=role,
    output_path=model_path, # New
    sagemaker_session=sagemaker_session, # New
    instance_count=1, # New
    base_job_name=f"{base_job_prefix}/pilot-train",
    metric_definitions=[
        {'Name': 'train:accuracy', 'Regex': 'accuracy_train=(.*?);'},
        {'Name': 'validation:accuracy', 'Regex': 'accuracy_validation=(.*?);'}
    ],
)
```

Q. What's the recommended way to manage dependencies for different SageMaker Pipelines steps?

You can use a SageMaker Projects template to implement image-building CI/CD. With this template, you can automate the CI/CD of images that are built and pushed to Amazon ECR. Changes in the container files in your project's source control repositories initiate the ML pipeline and deploy the latest version for your container. For more information, see the blog Create Amazon SageMaker projects with image building CI/CD pipelines.
Q. How do I provide SageMaker Project access to specific user profiles in Amazon SageMaker Studio?

Since SageMaker Projects is backed by AWS Service Catalog, you must add each role that requires access to SageMaker Projects to the Amazon SageMaker Solutions and ML Ops products Portfolio in the service catalog. You can do this on the Groups, roles, and users tab, as shown in the following image. If each user profile in Studio has a different role, you should add each of those roles to the service catalog. You can also do this while creating a user profile in Studio.

Q. Where do I see the properties associated with each SageMaker pipeline step so that I can use them in subsequent steps?

Each step in the pipeline uses the underlying SageMaker APIs for the corresponding jobs. For example, TrainingStep invokes the CreateTrainingJob API and the step properties correspond to the response from DescribeTrainingJob. The response output can be found in the API reference link for DescribeTrainingJob. You can follow the same procedure to get the properties for TransformStep, ProcessingStep, TuningStep, and CreateModelStep. For more information about pipeline steps, see Pipeline Steps.

Q. What’s the best way to reproduce my model in SageMaker?

SageMaker's Lineage Tracking service works in the backend to track all the metadata associated with your model training and deployment workflows. This includes your training jobs, datasets used, pipelines, endpoints, and the actual models. You can query the lineage service at any point to find the exact artifacts used to train a model. Using those artifacts, you can recreate the same ML workflow to reproduce the model as long as you have access to the exact dataset that was used. A trial component tracks the training job. This trial component has all the parameters used as part of the training job. If you don't need to rerun the entire workflow, you can reproduce the training job to derive the same model.
Using Amazon Augmented AI for Human Review

When you use AI applications such as Amazon Rekognition, Amazon Textract, or your custom machine learning (ML) models, you can use Amazon Augmented AI to get human review of low-confidence predictions or random prediction samples.

What is Amazon Augmented AI?

Amazon Augmented AI (Amazon A2I) is a service that brings human review of ML predictions to all developers by removing the heavy lifting associated with building human review systems or managing large numbers of human reviewers.

Many ML applications require humans to review low-confidence predictions to ensure the results are correct. For example, extracting information from scanned mortgage application forms can require human review due to low-quality scans or poor handwriting. Building human review systems can be time-consuming and expensive because it involves implementing complex processes or workflows, writing custom software to manage review tasks and results, and managing large groups of reviewers.

Amazon A2I streamlines building and managing human reviews for ML applications. Amazon A2I provides built-in human review workflows for common ML use cases, such as content moderation and text extraction from documents. You can also create your own workflows for ML models built on SageMaker or any other tools. Using Amazon A2I, you can allow human reviewers to step in when a model is unable to make a high-confidence prediction or to audit its predictions on an ongoing basis.

Amazon A2I Use Case Examples

The following examples demonstrate how you can use Amazon A2I to integrate a human review loop into your ML application. For each of these examples, you can find a Jupyter Notebook that demonstrates that workflow in Use Cases and Examples Using Amazon A2I (p. 3251).

- **Use Amazon A2I with Amazon Textract** – Have humans review important key-value pairs in single-page documents or have Amazon Textract randomly sample and send documents from your dataset to humans for review.
- **Use Amazon A2I with Amazon Rekognition** – Have humans review unsafe images for explicit adult or violent content if Amazon Rekognition returns a low-confidence score, or have Amazon Rekognition randomly sample and send images from your dataset to humans for review.
- **Use Amazon A2I to review real-time ML inferences** – Use Amazon A2I to review real-time, low-confidence inferences made by a model deployed to a SageMaker hosted endpoint and incrementally train your model using Amazon A2I output data.
- **Use Amazon A2I with Amazon Comprehend** – Have humans review Amazon Comprehend inferences about text data such as sentiment analysis, text syntax, and entity detection.
- **Use Amazon A2I with Amazon Transcribe** – Have humans review Amazon Transcribe transcriptions of video or audio files. Use the results of transcription human review loops to create a custom vocabulary and improve future transcriptions of similar video or audio content.
- **Use Amazon A2I with Amazon Translate** – Have humans review low-confidence translations returned from Amazon Translate.
• **Use Amazon A2I to review tabular data** – Use Amazon A2I to integrate a human review loop into an ML application that uses tabular data.

**Get Started with Amazon Augmented AI**

To get started using Amazon Augmented AI, review the Core Components of Amazon A2I (p. 3231) and Prerequisites to Using Augmented AI (p. 3235). Then, use the following documentation to learn how to use the Amazon A2I console and API.

- Tutorial: Get Started in the Amazon A2I Console (p. 3235)
- Tutorial: Get Started Using the Amazon A2I API (p. 3241)

You can also get started using the Amazon A2I API by following a Jupyter Notebook tutorial. See Use Cases and Examples Using Amazon A2I (p. 3251) for a list of notebooks and use cases.

**Core Components of Amazon A2I**

Review the following terms to familiarize yourself with the core components of Amazon A2I.

**Task Types**

The AI/ML workflow into which you integrate Amazon A2I defines an Amazon A2I task type.
Amazon A2I supports:

- **Two built-in task types**: Amazon Textract key-value pair extraction and Amazon Rekognition image moderation.
- **A custom task type**: Use a custom task type to integrate a human review loop into any machine learning workflow. You can use a custom task type to integrate Amazon A2I with other AWS services like Amazon Comprehend, Amazon Transcribe, and Amazon Translate, as well as your own custom machine learning workflows. To learn more, see Use Cases and Examples Using Amazon A2I (p. 3251).

Select a tab in the following table to see diagrams that illustrate how Amazon A2I works with each task type. Select the task type page using the links in the preceding list to learn more about that task type.

**Amazon Textract – Key-value pair extraction**

This image depicts the Amazon A2I built-in workflow with Amazon Textract. On the left, the resources that are required to create an Amazon Textract human review workflow are depicted: an Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Textract to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

**Amazon Rekognition – Image moderation**

This image depicts the Amazon A2I built-in workflow with Amazon Rekognition. On the left, the resources that are required to create an Amazon Rekognition human review workflow are depicted: an Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Rekognition to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.
Custom Task Type

The following image depicts the Amazon A2I custom workflow. A custom ML model is used to generate predictions. The client application filters these predictions using user-defined criteria and determines if a human review is required. If so, these predictions are sent to Amazon A2I for human review. Amazon A2I collects the results of human review in Amazon S3, which can access by the client application. If the filter determines that no human review is needed, predictions can be fed directly to the client application.

Human Review Workflow (Flow Definition)

You use a human review workflow to specify your human work team, to set up your worker UI using a worker task template, and to provide information about how workers should complete the review task.

For built-in task types, you also use the human review workflow to identify the conditions under which a human loop is initiated. For example, Amazon Rekognition can perform image content moderation using machine learning. You can use the human review workflow to specify that an image is sent to a human for content moderation review if Amazon Rekognition’s confidence is too low.

You can use a human review workflow to create multiple human loops.
You can create a flow definition in the SageMaker console or with the SageMaker API. To learn more about both of these options, see Create a Human Review Workflow (p. 3259).

Work Team

A work team is a group of human workers to whom you send your human review tasks.

When you create a human review workflow, you specify a single work team.

Your work team can come from the Amazon Mechanical Turk workforce, a vendor-managed workforce, or your own private workforce. When you use the private workforce, you can create multiple work teams. Each work team can be used in multiple human review workflows. To learn how to create a workforce and work teams, see Create and Manage Workforces (p. 671).

Worker Task Template and Human Task UI

You use a worker task template to create a worker UI (a human task UI) for your human review tasks.

The human task UI displays your input data, such as documents or images, and instructions to workers. It also provides interactive tools that the worker uses to complete your tasks.

For built-in task types, you must use the Amazon A2I worker task template provided for that task type.

Human Loops

A human loop is used to create a single human review job. For each human review job, you can choose the number of workers that are sent a task to review a single data object. For example, if you set the number of workers per object to 3 for an image classification labeling job, three workers classify each input image. Increasing the number of workers per object can improve label accuracy.

A human loop is created using a human review workflow as follows:

- For built-in task types, the conditions specified in the human review workflow determine when the human loop is created.
- Human review tasks are sent to the work team specified in the human review workflow.
- The worker task template specified in the human review workflow is used to render the human task UI.

When do human loops get created?

When you use one of the built-in task types, the corresponding AWS service creates and starts a human loop on your behalf when the conditions specified in your human review workflow are met. For example:

- When you use Augmented AI with Amazon Textract, you can integrate Amazon A2I into a document review task using the API operation AnalyzeDocument. A human loop is created every time Amazon Textract returns inferences about key-value pairs that meet the conditions you specify in your human review workflow.
- When you use Augmented AI with Amazon Rekognition, you can integrate Amazon A2I into an image moderation task using the API operation DetectModerationLabels. A human loop is created every time Amazon Rekognition returns inferences about image content that meet the conditions you specify in your human review workflow.

When using a custom task type, you start a human loop using the Amazon Augmented AI Runtime API. When you call StartHumanLoop in your custom application, a task is sent to human reviewers.

To learn how to create and start a human loop, see Create and Start a Human Loop (p. 3278).
To generate these resources and create a human review workflow, Amazon A2I integrates multiple APIs, including the Amazon Augmented AI Runtime Model, the SageMaker APIs, and APIs associated with your task type. To learn more, see Use APIs in Amazon Augmented AI (p. 3314).

**Note**
AWS Region availability may differ when you use Augmented AI with other AWS services, such as Amazon Textract. Create Augmented AI resources in the same AWS Region that you use to interact with those AWS services. For AWS Region availability for all services, see the Region Table.

**Prerequisites to Using Augmented AI**

Amazon A2I uses resources in IAM, SageMaker, and Amazon S3 to create and run your human review workflows. You can create some of these resources in the Amazon A2I console when you create a human review workflow. To learn how, see Tutorial: Get Started in the Amazon A2I Console (p. 3235).

To use Amazon A2I, you need the following resources:

- One or more Amazon S3 buckets in the same AWS Region as the workflow for your input and output data. To create a bucket, follow the instructions in Create a Bucket in the Amazon Simple Storage Service Console User Guide.

- An IAM role with required permissions to create a human review workflow and an IAM user or role with permission to access Augmented AI. For more information, see Permissions and Security in Amazon Augmented AI (p. 3306).

- A public, private, or vendor workforce for your human review workflows. If you plan to use a private workforce, you need to set one up ahead of time in the same AWS Region as your Amazon A2I workflow. To learn more about these workforce types, see Create and Manage Workforces (p. 671).

**Important**
To learn about the compliance programs that cover Amazon Augmented AI at this time, see AWS Services in Scope by Compliance Program. If you use Amazon Augmented AI in conjunction with other AWS services (such as Amazon Rekognition and Amazon Textract), note that Amazon Augmented AI may not be in scope for the same compliance programs as those other services. You are responsible for how you use Amazon Augmented AI, including understanding how the service processes or stores customer data and any impact on the compliance of your data environment. You should discuss your workload objectives and goals with your AWS account team; they can help you evaluate whether the service is a good fit for your proposed use case and architecture.

**Tutorial: Get Started in the Amazon A2I Console**

The following tutorial shows you how to get started using Amazon A2I in the Amazon A2I console.

The tutorial gives you the option to use Augmented AI with Amazon Textract for document review or Amazon Rekognition for image content review.

**Prerequisites**

To get started using Amazon A2I, complete the following prerequisites.

- Create an Amazon S3 bucket in the same AWS Region as the workflow for your input and output data. For example, if you are using Amazon A2I with Amazon Textract in us-east-1, create your bucket in us-east-1. To create a bucket, follow the instructions in Create a Bucket in the Amazon Simple Storage Service Console User Guide.

- Do one of the following:
• If you want to complete the tutorial using Amazon Textract, download this sample document and place it in your Amazon S3 bucket.
• If you want to complete the tutorial using Amazon Rekognition, download this image and place it in your Amazon S3 bucket.

Note
The Amazon A2I console is embedded in the SageMaker console.

Step 1: Create a Work Team

First, create a work team in the Amazon A2I console and add yourself as a worker so that you can preview the worker review task.

Important
This tutorial uses a private work team. The Amazon A2I private workforce is configured in the Ground Truth area of the SageMaker console and is shared between Amazon A2I and Ground Truth.

To create a private workforce using worker emails

2. In the navigation pane, choose Labeling workforces under Ground Truth.
3. Choose Private, then choose Create private team.
4. Choose Invite new workers by email.
5. For this tutorial, enter your email and any others that you want to be able to preview the human task UI. You can paste or type a list of up to 50 email addresses, separated by commas, into the email addresses box.
6. Enter an organization name and contact email.
7. Optionally, choose an Amazon SNS topic to which to subscribe the team so workers are notified by email when new Ground Truth labeling jobs become available. Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to Amazon SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.
8. Choose Create private team.

If you add yourself to a private work team, you receive an email from no-reply@verificationemail.com with login information. Use the link in this email to reset your password and log in to your worker portal. This is where your human review tasks appear when you create a human loop.

Step 2: Create a Human Review Workflow

In this step, you create a human review workflow. Each human review workflow is created for a specific task type. This tutorial allows you to choose between the built-in task types: Amazon Rekognition and Amazon Textract.

To create a human review workflow:

1. Open the Augmented AI console at https://console.aws.amazon.com/a2i to access the Human review workflows page.
2. Select Create human review workflow.
3. In Workflow settings, enter a workflow Name, S3 bucket, and the IAM role that you created for this tutorial, with the AWS managed policy AmazonAugmentedAIIntegratedAPIAccess attached.
4. For Task type, select Textract – Key-value pair extraction or Rekognition – Image moderation.
5. Select the task type that you chose from the following table for instructions for that task type.

Amazon Textract – Key-value pair extraction

1. Select Trigger a human review for specific form keys based on the form key confidence score or when specific form keys are missing.

2. For Key name, enter Mail Address.

3. Set the identification confidence threshold between 0 and 99.

4. Set the qualification confidence threshold between 0 and 99.

5. Select Trigger a human review for all form keys identified by Amazon Textract with confidence scores in a specific range.

6. Set the identification confidence threshold between 0 and 90.

7. Set the qualification confidence threshold between 0 and 90.

This initiates a human review if Amazon Textract returns a confidence score that is less than 99 for Mail Address and its key, or if it returns a confidence score less than 90 for any key value pair detected in the document.

The following image shows the Amazon Textract form extraction - Conditions for invoking human review section of the Amazon A2I console. In the image, the check boxes for the two types of triggers explained in the proceeding paragraph are checked, and Mail Address is used as a Key name for the first trigger. The identification confidence threshold is defined using confidence scores for key-value pairs detect within the form and is set between 0 and 99. The qualification confidence threshold is defined using confidence scores for text contained within keys and values in a form and is set between 0 and 99.
Amazon Rekognition – Image moderation

1. Select Trigger human review for labels identified by Amazon Rekognition based on label confidence score.

2. Set the Threshold between 0 and 98.

This initiates a human review if Amazon Rekognition returns a confidence score that is less than 98 for an image moderation job.

The following image shows how you can select the Trigger human review for labels identified by Amazon Rekognition based on label confidence score option and enter a Threshold between 0 and 98 in the Amazon A2I console.
Step 3: Start a Human Loop

You must use an API operation to start a human loop. There are a variety of language-specific SDKs that you can use to interact with these API operations. To see documentation for each of these SDKs, refer to the See Also section in the API documentation, as shown in the following image.

For this tutorial, you use one of the following APIs:

- If you chose the Amazon Textract task type, you use the `AnalyzeDocument` operation.
- If you chose the Amazon Rekognition task type, you use the `DetectModerationLabels` operation.
You can interact with these APIs using a SageMaker notebook instance (recommended for new users) or the AWS Command Line Interface (AWS CLI). Choose one of the following to learn more about these options:

- To learn more about and set up a notebook instance, see Use Amazon SageMaker Notebook Instances (p. 283).
- To learn more about and get started using the AWS CLI, see What Is the AWS Command Line Interface? in the AWS Command Line Interface User Guide.

Select your task type in the following table to see example requests for Amazon Textract and Amazon Rekognition using the AWS SDK for Python (Boto3).

### Amazon Textract – Key-value pair extraction

The following example uses the AWS SDK for Python (Boto3) to call `analyze_document` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the `analyze_document` documentation in the AWS SDK for Python (Boto) API Reference.

```python
response = client.analyze_document(
    Document={
        "S3Object": {
            "Bucket": "AWSDOC-EXAMPLE-BUCKET",
            "Name": "document-name.pdf"
        }
    },
    HumanLoopConfig={
        "HumanLoopName": "human-loop-name",
        "DataAttributes": {
            "ContentClassifiers": [
                "FreeOfPersonallyIdentifiableInformation",
                "FreeOfAdultContent"
            ]
        }
    },
    FeatureTypes=["TABLES", "FORMS"]
)
```

### Amazon Rekognition – Image moderation

The following example uses the AWS SDK for Python (Boto3) to call `detect_moderation_labels` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the `detect_moderation_labels` documentation in the AWS SDK for Python (Boto) API Reference.

```python
response = client.detect_moderation_labels(
    Image={
        "S3Object": {
            "Bucket": "AWSDOC-EXAMPLE-BUCKET",
            "Name": "image-name.png"
        }
    },
    HumanLoopConfig={
        "HumanLoopName": "human-loop-name",
        "DataAttributes": {
            "ContentClassifiers": [
                "FreeOfPersonallyIdentifiableInformation",
                "FreeOfAdultContent"
            ]
        }
    }
)
```
Step 4: View Human Loop Status in Console

When you start a human loop, you can view its status in the Amazon A2I console.

**To view your human loop status**

1. Open the Augmented AI console at https://console.aws.amazon.com/a2i to access the Human review workflows page.
2. Select the human review workflow that you used to start your human loop.
3. In the Human loops section, you can see your human loop. View its status in the Status column.

Step 5: Download Output Data

Your output data is stored in the Amazon S3 bucket you specified when you created a human review workflow.

**To view your Amazon A2I output data**

1. Open the Amazon S3 console.
2. Select the Amazon S3 bucket you specified when you created your human review workflow in step 2 of this example.
3. Starting with the folder that is named after your human review workflow, navigate to your output data by selecting the folder with the following naming convention:

   ```
   s3://output-bucket-specified-in-human-review-workflow/human-review-workflow-name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json
   ```

4. Select `output.json` and choose **Download**.

Tutorial: Get Started Using the Amazon A2I API

This tutorial explains the API operations you can use to get started using Amazon A2I.

To use a Jupyter Notebook to run these operations, select a Jupyter Notebook from Use Cases and Examples Using Amazon A2I (p. 3251) and use Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook (p. 3253) to learn how to use it in a SageMaker notebook instance.

To learn more about the API operations you can use with Amazon A2I, see Use APIs in Amazon Augmented AI (p. 3314).

Create a Private Work Team

You can create a private work team and add yourself as a worker so that you can preview Amazon A2I.

If you are not familiar with Amazon Cognito, we recommend that you use the SageMaker console to create a private workforce and add yourself as a private worker. For instructions, see Step 1: Create a Work Team (p. 3236).

If you are familiar with Amazon Cognito, you can use the following instructions to create a private work team using the SageMaker API. After you create a work team, note the work team ARN (WorkteamArn).

To learn more about the private workforce and other available configurations, see Use a Private Workforce (p. 676).
Create a private workforce

If you have not created a private workforce, you can do so using an Amazon Cognito user pool. Make sure that you have added yourself to this user pool. You can create a private work team using the AWS SDK for Python (Boto3) create_workforce function. For other language-specific SDKs, refer to the list in CreateWorkforce.

```python
response = client.create_workforce(
    CognitoConfig={
        "UserPool": "Pool_ID",
        "ClientId": "app-client-id"
    },
    WorkforceName="workforce-name"
)
```

Create a private work team

After you have created a private workforce in the AWS Region to configure and start your human loop, you can create a private work team using the AWS SDK for Python (Boto3) create_workteam function. For other language-specific SDKs, refer to the list in CreateWorkteam.

```python
response = client.create_workteam(
    WorkteamName="work-team-name",
    WorkforceName="workforce-name",
    MemberDefinitions=[
        {
            "CognitoMemberDefinition": {
                "UserPool": "<aws-region>_ID",
                "UserGroup": "user-group",
                "ClientId": "app-client-id"
            },
        }
    ]
)
```

Access your work team ARN as follows:

```python
workteamArn = response["WorkteamArn"]
```

List private work teams in your account

If you have already created a private work team, you can list all work teams in a given AWS Region in your account using the AWS SDK for Python (Boto3) list_workteams function. For other language-specific SDKs, refer to the list in ListWorkteams.

```python
response = client.list_workteams()
```

If you have numerous work teams in your account, you may want to use MaxResults, SortBy, and NameContains to filter your results.

Create a Human Review Workflow

You can create a human review workflow using the Amazon A2I CreateFlowDefinition operation. Before you create your human review workflow, you need to create a human task UI. You can do this with the CreateHumanTaskUi operation.
If you are using Amazon A2I with the Amazon Textract or Amazon Rekognition integrations, you can specify activation conditions using a JSON.

Create a Human Task UI

If you are creating a human review workflow to be used with Amazon Textract or Amazon Rekognition integrations, you need to use and modify pre-made worker task template. For all custom integrations, you can use your own custom worker task template. Use the following table to learn how to create a human task UI using a worker task template for the two built-in integrations. Replace the template with your own to customize this request.

Amazon Textract – Key-value pair extraction

To learn more about this template, see Custom Template Example for Amazon Textract (p. 3289).

```template = r'""
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/ {{ task.input.aiServiceRequest.document.s3Object.bucket }}/{{ task.input.aiServiceRequest.document.s3Object.name }}{% endcapture %}
<short-instructions header="Instructions">
<p>Click on a key-value block to highlight the corresponding key-value pair in the document.</p>
<p>If it is a valid key-value pair, review the content for the value. If the content is incorrect, correct it.</p>
<p>The text of the value is incorrect, correct it.</p>
<p>A wrong value is identified, correct it.</p>
<p>If it is not a valid key-value relationship, choose No.</p>
<p>If you can't find the key in the document, choose Key not found.</p>
<p>If the content of a field is empty, choose Value is blank.</p>
<p>Key and value are often displayed next or below to each other.</p>
<p>Key and value displayed in one line.</p>
<p>Key and value displayed in two lines.</p>
</short-instructions>
<crowd-form>
<crowd-textract-analyze-document
src="{{ s3_uri | grant_read_access }}"
initial-value="{{ task.input.selectedAiServiceResponse.blocks }}"
header="Review the key-value pairs listed on the right and correct them if they don't match the following document."
no-key-edit=""
no-geometry-edit=""
keys="{{ task.input.humanLoopContext.importantFormKeys }}"
block-types='["KEY_VALUE_SET"]'>
```
Amazon Rekognition – Image moderation

To learn more about this template, see Custom Template Example for Amazon Rekognition (p. 3291).

```template
<template src="https://assets.crowd.aws/crowd-html-elements.js"></template>
<script src="http://s3.amazonaws.com/{{ task.input.aiServiceRequest.image.s3Object.bucket }}/\{ task.input.aiServiceRequest.image.s3Object.name }"></script>
</template>
<short-instructions header="Instructions">
  <p class="instructions">Review the image and choose all applicable categories. If no categories apply, choose None.</p>
  <b>Nudity</b>
  Visuals depicting nude male or female person or persons
  <b>Partial Nudity</b>
  Visuals depicting covered up nudity, for example using hands or pose
  <b>Revealing Clothes</b>
  Visuals depicting revealing clothes and poses
  <b>Physical Violence</b>
  Visuals depicting violent physical assault, such as kicking or punching
  <b>Weapon Violence</b>
  Visuals depicting violence using weapons like firearms or blades, such as shooting
  <b>Weapons</b>
  Visuals depicting weapons like firearms and blades
</short-instructions>
<full-instructions header="Instructions"></full-instructions>
</crowd-form>
```

3244
Custom Integration

The following is an example template that can be used in a custom integration. This template is used in this notebook, demonstrating a custom integration with Amazon Comprehend.

```python
			template = r""
			<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
			<crowd-form>
				<crowd-classifier
					name="sentiment"
					categories='["Positive", "Negative", "Neutral", "Mixed"]'
					initial-value="{{ task.input.initialValue }}"
					header="What sentiment does this text convey?"
					>
					<classification-target>{{ task.input.taskObject }}</classification-target>
					</crowd-classifier>
				</crowd-form>

Using the template specified above, you can create a template using the AWS SDK for Python (Boto3) `create_humantask_ui` function. For other language-specific SDKs, refer to the list in CreateHumanTaskUi.

```python
response = client.create_humantask_ui(
    HumanTaskUiName="human-task-ui-name",
    UiTemplate={
        "Content": template
    }
)
```

This response element contains the human task UI ARN. Save this as follows:

```python
humanTaskUiArn = response["HumanTaskUiArn"]
```

Create JSON to specify activation conditions

For Amazon Textract and Amazon Rekognition built-in integrations, you can save activation conditions in a JSON object and use this in your CreateFlowDefinition request.
Next, select a tab to see example activation conditions you can use for these built-in integrations. For additional information about activation condition options, see JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI (p. 3265).

**Amazon Textract – Key-value pair extraction**

This example specifies conditions for specific keys (such as *Mail address*) in the document. If Amazon Textract’s confidence falls outside of the thresholds set here, the document is sent to a human for review, with the specific keys that initiated the human loop prompted to the worker.

```python
import json

humanLoopActivationConditions = json.dumps(
    {
        "Conditions": [
            {
                "Or": [
                    {
                        "ConditionType": "ImportantFormKeyConfidenceCheck",
                        "ConditionParameters": {
                            "ImportantFormKey": "Mail address",
                            "ImportantFormKeyAliases": ["Mail Address:","Mail address:","Mailing Add:","Mailing Addresses"],
                            "KeyValueBlockConfidenceLessThan": 100,
                            "WordBlockConfidenceLessThan": 100
                        }
                    },
                    {
                        "ConditionType": "MissingImportantFormKey",
                        "ConditionParameters": {
                            "ImportantFormKey": "Mail address",
                            "ImportantFormKeyAliases": ["Mail Address:","Mail address:","Mailing Add:","Mailing Addresses"]
                        }
                    },
                    {
                        "ConditionType": "ImportantFormKeyConfidenceCheck",
                        "ConditionParameters": {
                            "ImportantFormKey": "Phone Number",
                            "ImportantFormKeyAliases": ["Phone number:","Phone No.:"],
                            "Number:"],
                            "KeyValueBlockConfidenceLessThan": 100,
                            "WordBlockConfidenceLessThan": 100
                        }
                    },
                    {
                        "ConditionType": "ImportantFormKeyConfidenceCheck",
                        "ConditionParameters": {
                            "ImportantFormKey": "*",
                            "KeyValueBlockConfidenceLessThan": 100,
                            "WordBlockConfidenceLessThan": 100
                        }
                    },
                    {
                        "ConditionType": "ImportantFormKeyConfidenceCheck",
                        "ConditionParameters": {
                            "ImportantFormKey": "*",
                            "KeyValueBlockConfidenceGreaterThan": 0,
                            "WordBlockConfidenceGreaterThan": 0
                        }
                    }
                ]
            }
        ]
    }
)
Amazon Rekognition – Image moderation

The human loop activation conditions used here are tailored towards Amazon Rekognition content moderation; they are based on the confidence thresholds for the Suggestive and Female Swimwear Or Underwear moderation labels.

```python
import json

humanLoopActivationConditions = json.dumps(
    {
        "Conditions": [
            {
                "Or": [
                    {
                        "ConditionType": "ModerationLabelConfidenceCheck",
                        "ConditionParameters": {
                            "ModerationLabelName": "Suggestive",
                            "ConfidenceLessThan": 98
                        }
                    },
                    {
                        "ConditionType": "ModerationLabelConfidenceCheck",
                        "ConditionParameters": {
                            "ModerationLabelName": "Female Swimwear Or Underwear",
                            "ConfidenceGreaterThan": 98
                        }
                    }
                ]
            }
        ]
    }
)
```

Create a human review workflow

This section gives an example of the CreateFlowDefinition AWS SDK for Python (Boto3) request using the resources created in the previous sections. For other language-specific SDKs, refer to the list in CreateFlowDefinition. Use the tabs in the following table to see the requests to create a human review workflow for Amazon Textract and Amazon Rekognition built-in integrations.

Amazon Textract – Key-value pair extraction

If you use the built-in integration with Amazon Textract, you must specify "AWS/Textract/AnalyzeDocument/Forms/V1" for "AwsManagedHumanLoopRequestSource" in HumanLoopRequestSource.

```python
response = client.create_flow_definition(
    FlowDefinitionName="human-review-workflow-name",
    HumanLoopRequestSource={
        "AwsManagedHumanLoopRequestSource": "AWS/Textract/AnalyzeDocument/Forms/V1"
    },
    HumanLoopActivationConfig={
        "HumanLoopActivationConditionsConfig": {
            "HumanLoopActivationConditions": humanLoopActivationConditions
        }
    }
)
```
Amazon Rekognition – Image moderation

If you use the built-in integration with Amazon Rekognition, you must specify "AWS/Rekognition/DetectModerationLabels/Image/V3" for "AwsManagedHumanLoopRequestSource" in HumanLoopRequestSource.

```python
response = client.create_flow_definition(
    FlowDefinitionName="human-review-workflow-name",
    HumanLoopRequestSource={
        "AwsManagedHumanLoopRequestSource": "AWS/Rekognition/DetectModerationLabels/Image/V3"
    },
    HumanLoopActivationConfig={
        "HumanLoopActivationConditionsConfig": {
            "HumanLoopActivationConditions": humanLoopActivationConditions
        }
    },
    HumanLoopConfig={
        "WorkteamArn": workteamArn,
        "HumanTaskUiArn": humanTaskUiArn,
        "TaskTitle": "Image content moderation",
        "TaskDescription": "Review the image and instructions. Complete the task",
        "TaskCount": 1,
        "TaskAvailabilityLifetimeInSeconds": 43200,
        "TaskTimeLimitInSeconds": 3600,
        "TaskKeywords": [
            "content moderation",
        ],
    },
    OutputConfig={
        "S3OutputPath": "s3://DOC-EXAMPLE-BUCKET/prefix/",
    },
    RoleArn="arn:aws:iam::<account-number>:role/<role-name>",
    Tags=[
        {
            "Key": "string",
            "Value": "string"
        }
    ]
)
```
Custom Integration

If you use a custom integration, exclude the following parameters: HumanLoopRequestSource, HumanLoopActivationConfig.

```python
response = client.create_flow_definition(
    FlowDefinitionName="human-review-workflow-name",
    HumanLoopConfig={
        "WorkteamArn": workteamArn,
        "HumanTaskUiArn": humanTaskUiArn,
        "TaskTitle": "Image content moderation",
        "TaskDescription": "Review the image and instructions. Complete the task",
        "TaskCount": 1,
        "TaskAvailabilityLifetimeInSeconds": 43200,
        "TaskTimeLimitInSeconds": 3600,
        "TaskKeywords": [
            "content moderation",
        ],
    },
    OutputConfig={
        "S3OutputPath": "s3://DOC-EXAMPLE-BUCKET/prefix/",
    },
    RoleArn="arn:aws:iam::<account-number>:role/<role-name>",
    Tags=[
        {
            "Key": "string",
            "Value": "string"
        },
    ]
)
```

After you create a human review workflow, you can retrieve the flow definition ARN from the response:

```python
humanReviewWorkflowArn = response["FlowDefinitionArn"]
```

Create a Human Loop

The API operation you use to start a human loop depends on the Amazon A2I integration you use.

- If you use the Amazon Textract built-in integration, you use the **AnalyzeDocument** operation.
- If you use the Amazon Rekognition built-in integration, you use the **DetectModerationLabels** operation.
- If you use a custom integration, you use the **StartHumanLoop** operation.

Select your task type in the following table to see example requests for Amazon Textract and Amazon Rekognition using the AWS SDK for Python (Boto3).

**Amazon Textract – Key-value pair extraction**

The following example uses the AWS SDK for Python (Boto3) to call `analyze_document` in `us-west-2`. Replace the italicized red text with your resources. Include the **DataAttributes**
parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the `analyze_document` documentation in the AWS SDK for Python (Boto) API Reference.

```python
response = client.analyze_document(
    Document={"S3Object": {"Bucket": "AWSDOC-EXAMPLE-BUCKET", "Name": "document-name.pdf"}},
    HumanLoopConfig={
        "HumanLoopName": "human-loop-name",
        "DataAttributes": {"ContentClassifiers": ["FreeOfPersonallyIdentifiableInformation", "FreeOfAdultContent"]}
    }
)
```

Human loops are only created if Amazon Textract's confidence for document analysis task meets the activation conditions you specified in your human review workflow. You can check the `response` element to determine if a human loop has been created. To see everything included in this response, see `HumanLoopActivationOutput`.

```python
if "HumanLoopArn" in analyzeDocumentResponse["HumanLoopActivationOutput"]:  # A human loop has been started:
    print(f"A human loop has been started with ARN: {analyzeDocumentResponse["HumanLoopActivationOutput"]['HumanLoopArn']}")
```

Amazon Rekognition – Image moderation

The following example uses the AWS SDK for Python (Boto3) to call `detect_moderation_labels` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the `detect_moderation_labels` documentation in the AWS SDK for Python (Boto) API Reference.

```python
response = client.detect_moderation_labels(
    Image={"S3Object": {"Bucket": "AWSDOC-EXAMPLE-BUCKET", "Name": "image-name.png"}},
    HumanLoopConfig={
        "HumanLoopName": "human-loop-name",
        "DataAttributes": {"ContentClassifiers": ["FreeOfPersonallyIdentifiableInformation", "FreeOfAdultContent"]}
    }
)
```

Human loops are only created if Amazon Rekognition's confidence for an image moderation task meets the activation conditions you specified in your human review workflow. You can check the `response` element to determine if a human loop has been created. To see everything included in this response, see `HumanLoopActivationOutput`.

```python
if "HumanLoopArn" in response["HumanLoopActivationOutput"]:  # A human loop has been started:
    print(f"A human loop has been started with ARN: {response["HumanLoopActivationOutput"]['HumanLoopArn']}")
```
Custom Integration

The following example uses the AWS SDK for Python (Boto3) to call `start_human_loop` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the `start_human_loop` documentation in the `AWS SDK for Python (Boto) API Reference`.

```python
response = client.start_human_loop(
    HumanLoopName= "human-loop-name",
    HumanLoopInput={"InputContent": inputContentJson},
    DataAttributes={"ContentClassifiers": ["FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent"]}
)
```

This example stores input content in the variable `inputContentJson`. Assume that the input content contains two elements: a text blurb and sentiment (such as Positive, Negative, or Neutral), and it is formatted as follows:

```python
inputContent = {
    "initialValue": sentiment,
    "taskObject": blurb
}
```

The keys `initialValue` and `taskObject` must correspond to the keys used in the liquid elements of the worker task template. Refer to the custom template in Create a Human Task UI (p. 3243) to see an example.

To create `inputContentJson`, do the following:

```python
import json
inputContentJson = json.dumps(inputContent)
```

A human loop starts each time you call `start_human_loop`. To check the status of your human loop, use `describe_human_loop`:

```python
human_loop_info = a2i.describe_human_loop(HumanLoopName="human_loop_name")
print(f"HumanLoop Status: {resp["HumanLoopStatus"]}")
print(f"HumanLoop Output Destination: {resp["HumanLoopOutput"]}")
```

---

Use Cases and Examples Using Amazon A2I

You can use Amazon Augmented AI to incorporate a human review into your workflow for built-in task types, Amazon Textract and Amazon Rekognition, or your own custom tasks using a custom task type.

When you create a human review workflow using one of the built-in task types, you can specify conditions, such as confidence thresholds, that initiate a human review. The service (Amazon Rekognition or Amazon Textract) creates a human loop on your behalf when these conditions are met and supplies your input data directly to Amazon A2I to send to human reviewers. To learn more about the built-in task types, use the following:
- Use Amazon Augmented AI with Amazon Textract (p. 3253)
- Use Amazon Augmented AI with Amazon Rekognition (p. 3256)

When you use a custom task type, you create and start a human loop using the Amazon A2I Runtime API. Use the custom task type to incorporate a human review workflow with other AWS services or your own custom ML application.

- For more details, see Use Amazon Augmented AI with Custom Task Types (p. 3257)

The following table outlines a variety of Amazon A2I use cases that you can explore using SageMaker Jupyter Notebooks. To get started with a Jupyter Notebook, use the instructions in Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook (p. 3253). For more examples, see this GitHub repository.

Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook

For an end-to-end example that demonstrates how to integrate an Amazon A2I human review loop into a machine learning workflow, you can use a Jupyter Notebook from this GitHub Repository in a SageMaker notebook instance.

To use an Amazon A2I custom task type sample notebook in an Amazon SageMaker notebook instance:

1. If you do not have an active SageMaker notebook instance, create one by following the instructions in Step 1: Create an Amazon SageMaker Notebook Instance (p. 74).
2. When your notebook instance is active, choose Open JupyterLab to the right of the notebook instance's name. It may take a few moments for JupyterLab to load.
3. Choose the  icon to clone a GitHub repository into your workspace.
4. Enter the amazon-a2i-sample-jupyter-notebooks repository HTTPS URL.
5. Choose CLONE.
6. Open the notebook that you would like to run.
7. Follow the instructions in the notebook to configure your human review workflow and human loop and run the cells.
8. To avoid incurring unnecessary charges, when you are done with the demo, stop and delete your notebook instance in addition to any Amazon S3 buckets, IAM roles, and CloudWatch Events resources created during the walkthrough.

Use Amazon Augmented AI with Amazon Textract

Amazon Textract enables you to add document text detection and analysis to your applications. Amazon Augmented AI (Amazon A2I) directly integrates with Amazon Textract's AnalyzeDocument API operation. You can use AnalyzeDocument to analyze a document for relationships between detected items. When you add an Amazon A2I human review loop to an AnalyzeDocument request, Amazon A2I monitors the Amazon Textract results and sends a document to one or more human workers for...
review when the conditions specified in your flow definition are met. For example, if you want a human to review a specific key like Full name: and their associated input values, you can create an activation condition that starts a human review any time the Full name: key is detected or when the inference confidence for that key falls within a range that you specify.

The following image depicts the Amazon A2I built-in workflow with Amazon Textract. On the left, the resources that are required to create an Amazon Textract human review workflow are depicted: and Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Textract to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

You can specify when Amazon Textract sends a task to a human worker for review when creating a human review workflow or flow definition by specifying *activation conditions*.

You can set the following activation conditions when using the Amazon Textract task type:

- Initiate a human review for specific form keys based on the form key confidence score.
- Initiate a human review when specific form keys are missing.
- Initiate human review for all form keys identified by Amazon Textract with confidence scores in a specified range.
- Randomly send a sample of forms to humans for review.

When your activation condition depends on form key confidence scores, you can use two types of prediction confidence to initiate human loops:

- **Identification confidence** – The confidence score for key-value pairs detected within a form.
- **Qualification confidence** – The confidence score for text contained within key and value in a form.

In the image in the following section, **Full Name: Jane Doe** is the key-value pair, **Full Name** is the key, and **Jane Doe** is the value.

You can set these activation conditions using the Amazon SageMaker console when you create a human review workflow, or by creating a JSON for human loop activation conditions and specifying this as input in the `HumanLoopActivationConditions` parameter of `CreateFlowDefinition` API operation. To
Get Started: Integrate a Human Review into an Amazon Textract Analyze Document Job

To integrate a human review into an Amazon Textract text detection and analysis job, you need to create a flow definition, and then use the Amazon Textract API to integrate that flow definition into your workflow. To learn how to create a flow definition using the SageMaker console or Augmented AI API, see the following topics:

- Create a Human Review Workflow (Console) (p. 3260)
- Create a Human Review Workflow (API) (p. 3262)

After you've created your flow definition, see Using Augmented AI with Amazon Textract to learn how to integrate your flow definition into your Amazon Textract task.

End-to-End Example Using Amazon Textract and Amazon A2I

For an end-to-end example that demonstrates how to use Amazon Textract with Amazon A2I using the console, see Tutorial: Get Started in the Amazon A2I Console (p. 3235).

To learn how to use the Amazon A2I API to create and start a human review, you can use Amazon Augmented AI (Amazon A2I) integration with Amazon Textract’s Analyze Document [Example] in a SageMaker Notebook instance. To get started, see Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook (p. 3253).

A2I Textract Worker Console Preview

When they're assigned a review task in an Amazon Textract workflow, workers might see a user interface similar to the following:

![A2I Textract Worker Console Preview](image-url)

**Note**

When using Augmented AI with Amazon Textract, create Augmented AI resources in the same AWS Region you use to call `AnalyzeDocument`.
You can customize this interface in the SageMaker console when you create your human review definition, or by creating and using a custom template. To learn more, see Create and Manage Worker Task Templates (p. 3286).

**Use Amazon Augmented AI with Amazon Rekognition**

Amazon Rekognition makes it easy to add image analysis to your applications. The Amazon Rekognition DetectModerationLabels API operation is directly integrated with Amazon A2I so that you can easily create a human loop to review unsafe images, such as explicit adult or violent content. You can use DetectModerationLabels to configure a human loop using a flow definition ARN. This enables Amazon A2I to analyze predictions made by Amazon Rekognition and send results to a human for review to ensure they meet the conditions set in your flow definition.

The following image depicts the Amazon A2I built-in workflow with Amazon Rekognition. On the left, the resources that are required to create an Amazon Rekognition human review workflow are depicted: and Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Rekognition to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

You can set the following activation conditions when using the Amazon Rekognition task type:

- Initiate human review for labels identified by Amazon Rekognition based on the label confidence score.
- Randomly send a sample of images to humans for review.

You can set these activation conditions using the Amazon SageMaker console when you create a human review workflow, or by creating a JSON for human loop activation conditions and specifying this as input in the HumanLoopActivationConditions parameter of the CreateFlowDefinition API operation. To learn how specify activation conditions in JSON format, see JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI (p. 3265) and Use Human Loop Activation Conditions JSON Schema with Amazon Rekognition (p. 3273).

**Note**
When using Augmented AI with Amazon Rekognition, create Augmented AI resources in the same AWS Region you use to call DetectModerationLabels.
Get Started: Integrate a Human Review into an Amazon Rekognition Image Moderation Job

To integrate a human review into an Amazon Rekognition, see the following topics:

- Create a Human Review Workflow (Console) (p. 3260)
- Create a Human Review Workflow (API) (p. 3262)

After you've created your flow definition, see Using Augmented AI with Amazon Rekognition to learn how to integrate your flow definition into your Amazon Rekognition task.

End-to-end Demo Using Amazon Rekognition and Amazon A2I

For an end-to-end example that demonstrates how to use Amazon Rekognition with Amazon A2I using the console, see Tutorial: Get Started in the Amazon A2I Console (p. 3235).

To learn how to use the Amazon A2I API to create and start a human review, you can use Amazon Augmented AI (Amazon A2I) integration with Amazon Rekognition [Example] in a SageMaker notebook instance. To get started, see Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook (p. 3253).

A2I Rekognition Worker Console Preview

When they're assigned a review task in an Amazon Rekognition workflow, workers might see a user interface similar to the following:

You can customize this interface in the SageMaker console when you create your human review definition, or by creating and using a custom template. To learn more, see Create and Manage Worker Task Templates (p. 3286).

Use Amazon Augmented AI with Custom Task Types

You can use Amazon Augmented AI (Amazon A2I) to incorporate a human review (human loop) into any machine learning workflow using the custom task type. This option gives you the most flexibility to customize the conditions under which your data objects are sent to humans for review, as well as the look and feel of your worker user interface.
When you use a custom task type, you create a custom human review workflow and specify the conditions under which a data object is sent for human review directly in your application.

The following image depicts the Amazon A2I custom workflow. A custom ML model is used to generate predictions. The client application filters these predictions using user-defined criteria and determines if a human review is required. If so, these predictions are sent to Amazon A2I for human review. Amazon A2I collects the results of human review in Amazon S3, which can access by the client application. If the filter determines that no human review is needed, predictions can be fed directly to the client application.

Use the procedures on this page to learn how to integrate Amazon A2I into any machine learning workflow using the custom task type.

**Create a human loop using a flow definition, integrate it into your application, and monitor the results**

1. Complete the Amazon A2I Prerequisites to Using Augmented AI (p. 3235). Note the following:
   - The path to the Amazon Simple Storage Service (Amazon S3) bucket or buckets where you store your input and output data.
   - The Amazon Resource Name (ARN) of an AWS Identity and Access Management (IAM) role with required permissions attached.
   - (Optional) The ARN of your private workforce, if you plan to use one.
2. Using HTML elements, create a custom worker template which Amazon A2I uses to generate your worker task UI. To learn how to create a custom template, see Create Custom Worker Task Templates (p. 3288).
3. Use the custom worker template from step 2 to generate a worker task template in the Amazon SageMaker console. To learn how, see Create a Worker Task Template (p. 3287).

In the next step, you create a flow definition:

- If you want to create a flow definition using the SageMaker API, note the ARN of this worker task template for the next step.
- If you are creating a flow definition using the console, your template automatically appears in Worker task template section when you choose Create human review workflow.
4. When creating your flow definition, provide the path to your S3 buckets, your IAM role ARN, and your worker template.
   - To learn how to create a flow definition using the SageMaker CreateFlowDefinition API, see Create a Human Review Workflow (API) (p. 3262).
Create a Human Review Workflow

Use an Amazon Augmented AI (Amazon A2I) human review workflow, or flow definition, to specify the following:

- For the Amazon Textract and Amazon Rekognition built-in task types, the conditions under which your human loop is called
- The workforce to which your tasks are sent
- The set of instructions that your workforce receives, which is called a worker task template
- The configuration of your worker tasks, including the number of workers that receive a task and time limits to complete tasks
- Where your output data is stored

You can create a human review workflow in the SageMaker console or using the SageMaker CreateFlowDefinition operation. You can build a worker task template using the console for Amazon Textract and Amazon Rekognition task types while creating your flow definition.

**Important**

Human loop activation conditions, which initiate the human loop—for example, confidence thresholds—are not available for Amazon A2I custom task types. When using the console to create a flow definition for a custom task type, you can't specify activation conditions. When using the Amazon A2I API to create a flow definition for a custom task type, you can't set the `HumanLoopActivationConditions` attribute of the `HumanLoopActivationConditionsConfig` parameter. To control when human reviews are initiated, specify conditions under which `StartHumanLoop` is called in your custom application. In this case, every `StartHumanLoop` invocation results in a human review. For more information, see Use Amazon Augmented AI with Custom Task Types (p. 3257).

**Prerequisites**

To create a human review workflow definition, you must have completed the prerequisites described in Prerequisites to Using Augmented AI (p. 3235).
If you use the API to create a flow definition for any task type, or if you use a custom task type when creating a flow definition in the console, first create a worker task template. For more information, see Create and Manage Worker Task Templates (p. 3286).

If you want to preview your worker task template while creating a flow definition for a built-in task type in the console, ensure that you grant the role that you use to create the flow definition permission to access the Amazon S3 bucket that contains your template artifacts using a policy like the one described in Enable Worker Task Template Previews (p. 3310).

Topics
- Create a Human Review Workflow (Console) (p. 3260)
- Create a Human Review Workflow (API) (p. 3262)
- JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI (p. 3265)

Create a Human Review Workflow (Console)

Use this procedure to create a Amazon Augmented AI (Amazon A2I) human review workflow using the SageMaker console. If you are new to Amazon A2I, we recommend that you create a private work team using people in your organization, and use this work team's ARN when creating your flow definition. To learn how to set up a private workforce and create a work team, see Create a Private Workforce (Amazon SageMaker Console) (p. 677). If you have already set up a private workforce, see Create a Work Team Using the SageMaker Console (p. 680) to learn how to add a work team to that workforce.

If you are using Amazon A2I with one of the built-in task types, you can create worker instructions using a default worker task template provided by Augmented AI while creating a human review workflow in the console. To see samples of the default templates provided by Augmented AI, see the built-in task types in Use Cases and Examples Using Amazon A2I (p. 3251).

To create flow definition (console)

2. In the navigation pane, under the Augmented AI section, choose Human review workflows and then choose Create human review workflow.
3. In Overview, do the following:
   a. For Name, enter a unique workflow name. The name must be lowercase, unique within the AWS Region in your account, and can have up to 63 characters. Valid characters include: a-z, 0-9, and - (hyphen).
   b. For S3 location for output, enter the S3 bucket where you want to store the human review results. The bucket must be located in the same AWS Region as the workflow.
   c. For IAM role, choose the role that has the required permissions. If you choose a built-in task type and want to preview your worker template in the console, provide a role with the type of policy described in Enable Worker Task Template Previews (p. 3310) attached.
4. For Task type, choose the task type that you want the human worker to perform.
5. If you chose the Amazon Rekognition or Amazon Textract task type, specify the conditions that invoke human review.
   - For Amazon Rekognition image moderation tasks, choose an inference confidence score threshold interval that initiates human review.
   - For Amazon Textract tasks, you can initiate a human review when specific form keys are missing or when form key detection confidence is low. You can also initiate a human review if, after evaluating all of the form keys in the text, confidence is lower than your required threshold for...
any form key. Two variables specify your confidence thresholds: Identification confidence and Qualification confidence. To learn more about these variables, see Use Amazon Augmented AI with Amazon Textract (p. 3253).

- For both task types, you can randomly send a percentage of data objects (images or forms) and their labels to humans for review.

6. Configure and specify your worker task template:

   a. If you are using the Amazon Rekognition or Amazon Textract task type:
      
      - In the Create template section:
        
        - To create instructions for your workers using the Amazon A2I default template for Amazon Rekognition and Amazon Textract task types, choose Build from a default template.
        
        - If you choose Build from a default template, create your instructions under Worker task design:
          
          - Provide a Template name that is unique in the AWS Region you are in.
          
          - In the Instructions section, provide detailed instructions on how to complete your task. To help workers achieve greater accuracy, provide good and bad examples.
          
          - (Optional) In Additional instructions, provide your workers with additional information and instructions.
          
          For information on creating effective instructions, see Creating Good Worker Instructions (p. 3295).
          
        - To select a custom template that you've created, choose it from the Template menu and provide a Task description to briefly describe the task for your workers. To learn how to create a custom template, see Create a Worker Task Template (p. 3287).
        
    b. If you are using the custom task type:
        
        - In the Worker task template section, select your template from the list. All of the templates that you have created in the SageMaker console appear in this list. To learn how to create a template for custom task types, see Create and Manage Worker Task Templates (p. 3286).

7. (Optional) Preview your worker template:

   For Amazon Rekognition and Amazon Textract task types, you have the option to choose See a sample worker task to preview your worker task UI.

   If you are creating a flow definition for a custom task type, you can preview your worker task UI using the RenderUiTemplate operation. For more information, see Preview a Worker Task Template (p. 3295).

8. For Workers, choose a workforce type.

9. Choose Create.

Next Steps

After you’ve created a human review workflow, it appears in the console under Human review workflows. To see your flow definition's Amazon Resource Name (ARN) and configuration details, choose the workflow by selecting its name.

If you are using a built-in task type, you can use the flow definition ARN to start a human loop using that AWS service's API (for example, the Amazon Textract API). For custom task types, you can use the ARN to start a human loop using the Amazon Augmented AI Runtime API. To learn more about both options, see Create and Start a Human Loop (p. 3278).
Create a Human Review Workflow (API)

To create a flow definition using the SageMaker API, you use the CreateFlowDefinition operation. After you complete the Prerequisites to Using Augmented AI (p. 3235), use the following procedure to learn how to use this API operation.

For an overview of the CreateFlowDefinition operation, and details about each parameter, see CreateFlowDefinition.

To create a flow definition (API)

1. For FlowDefinitionName, enter a unique name. The name must be unique within the AWS Region in your account, and can have up to 63 characters. Valid characters include: a-z, 0-9, and - (hyphen).
2. For RoleArn, enter the ARN of the role that you configured to grant access to your data sources.
3. For HumanLoopConfig, enter information about the workers and what they should see. For information about each parameter in HumanLoopConfig, see HumanLoopConfig.
4. (Optional) If you are using a built-in task type, provide conditions that initiate a human loop in HumanLoopActivationConfig. To learn how to create the input required for the HumanLoopActivationConfig parameter, see JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI (p. 3265). If you do not specify conditions here, when you provide a flow definition to the AWS service associated with a built-in task type (for example, Amazon Textract or Amazon Rekognition), that service sends every task to a human worker for review.

If you are using a custom task type, HumanLoopActivationConfig is disabled. To learn how to control when tasks are sent to human workers using a custom task type, see Use Amazon Augmented AI with Custom Task Types (p. 3257).

5. (Optional) If you are using a built-in task type, specify the integration source (for example, Amazon Rekognition or Amazon Textract) in the HumanLoopRequestSource parameter.
6. For OutputConfig, indicate where in Amazon Simple Storage Service (Amazon S3) to store the output of the human loop.
7. (Optional) Use Tags to enter key-value pairs to help you categorize and organize a flow definition. Each tag consists of a key and a value, both of which you define.

Amazon Textract – Key-value pair extraction

The following is an example of a request to create an Amazon Textract human review workflow (flow definition) using the AWS SDK for Python (Boto3). You must use ‘AWS/Text extract/AnalyzeDocument/Forms/V1’ to create a Amazon Textract human loop. Only include PublicWorkforceTaskPrice if you are using the Mechanical Turk workforce.

```python
sagemaker_client = boto3.client('sagemaker', aws_region)

response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
    HumanLoopRequestSource={
        'AwsManagedHumanLoopRequestSource': 'AWS/Text extract/AnalyzeDocument/Forms/V1'
    },
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig': {
            'HumanLoopActivationConditions': '{...}'
        }
    },
    HumanLoopConfig={
    },
)```
Amazon Rekognition – Image moderation

The following is an example of a request to create an Amazon Rekognition human review workflow (flow definition) using the AWS SDK for Python (Boto3). You must use 'AWS/Rekognition/DetectModerationLabels/Image/V3' to create an Amazon Rekognition flow definition. Only include 'PublicWorkforceTaskPrice' if you are using the Mechanical Turk workforce.

```python
sagemaker_client = boto3.client('sagemaker', aws_region)
response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
    HumanLoopRequestSource={
        'AwsManagedHumanLoopRequestSource': 'AWS/Rekognition/DetectModerationLabels/Image/V3'
    },
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig':{
            'HumanLoopActivationConditions': '(...)'
        }
    },
    HumanLoopConfig={
        'TaskTitle': 'Example task title',
        'TaskDescription': 'Example task description.',
        'TaskCount': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskKeywords': [  
            'Keyword1', 'Keyword2'
        ],
        'PublicWorkforceTaskPrice': {
            'AmountInUsd': {
                'Dollars': 123,
                'Cents': 123,
                'TenthFractionsOfACent': 123
            }
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/',
        'KmsKeyId': '1234abcd-12ab-34cd-56ef-1234567890ab'
    },
    RoleArn='arn:aws:iam::aws_account_number:role/role_name',
    Tags=[
        {'Key': 'KeyName', 'Value': 'ValueName'}
    ]
)
```

Custom Workflow

The following is an example of a request to create a human review workflow (flow definition) for a custom integration. To create this type of human review workflow, omit HumanLoopRequestSource from the flow definition request. You only need to include PublicWorkforceTaskPrice if you are using the Mechanical Turk workforce.

```python
sagemaker_client = boto3.client('sagemaker', aws_region)
response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig': {
            'HumanLoopActivationConditions': '{...}'
        }
    },
    HumanLoopConfig={
        'TaskTitle': 'Example task title',
        'TaskDescription': 'Example task description.',
        'TaskCount': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskKeywords': ['Keyword1','Keyword2'],
        'PublicWorkforceTaskPrice': {
            'AmountInUsd': {
                'Dollars': 123,
                'Cents': 123,
                'TenthFractionsOfACent': 123
            }
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/',
        'KmsKeyId': '1234abcd-12ab-34cd-56ef-1234567890ab'
    },
    RoleArn='arn:aws:iam::aws_account_number:role/role_name',
    Tags={[
        {'Key': 'KeyName',
        'Value': 'ValueName'
    ]}
)
```

3264
Next Steps

The return value of a successful call of the CreateFlowDefinition API operation is a flow definition Amazon Resource Name (ARN).

If you are using a built-in task type, you can use the flow definition ARN to start a human loop using that AWS service's API (i.e. the Amazon Textract API). For custom task types, you can use the ARN to start a human loop using the Amazon Augmented AI Runtime API. To learn more about both of these options, see Create and Start a Human Loop (p. 3278).

JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI

The HumanLoopActivationConditions is an input parameter of the CreateFlowDefinition API. This parameter is a JSON-formatted string. The JSON models the conditions under which a human loop is created when those conditions are evaluated against the response from an integrating AI service API (such as Rekognition.DetectModerationLabels or Textract.AnalyzeDocument). This response is referred to as an inference. For example, Amazon Rekognition sends an inference of a moderation label with an associated confidence score. In this example, the inference is the model’s best estimate of the appropriate label for an image. For Amazon Textract, inference is made on the association between blocks of text (key-value pairs), such as the association between Name: and Sue in a form as well as content within a block of text, or word block, such as ‘Name’.

The following is the schema for the JSON. At the top level, the HumanLoopActivationConditions has a JSON array, Conditions. Each member of this array is an independent condition that, if evaluated to true, results in Amazon A2I creating a human loop. Each such independent condition can be a simple condition or a complex condition. A simple condition has the following attributes:

- **ConditionType**: This attribute identifies the type of condition. Each AWS AI service API that integrates with Amazon A2I defines its own set of allowed ConditionTypes.
  - Rekognition DetectModerationLabels – This API supports the ModerationLabelConfidenceCheck and Sampling ConditionType values.
  - Textract AnalyzeDocument – This API supports the ImportantFormKeyConfidenceCheck, MissingImportantFormKey, and Sampling ConditionType values.
- **ConditionParameters**: This is a JSON object that parameterizes the condition. The set of allowed attributes of this object is dependent on the value of the ConditionType. Each ConditionType defines its own set of ConditionParameters.

A member of the Conditions array can model a complex condition. This is accomplished by logically connecting simple conditions using the And and Or logical operators and nesting the underlying simple conditions. Up to two levels of nesting are supported.

```json
{
"$schema": "http://json-schema.org/draft-07/schema#",
"definitions": {

  "Condition": {
    "type": "object",
    "properties": {

      "ConditionType": {
        "type": "string"
      }
    }
  }

}
```
Note

Human loop activation conditions aren't available for human review workflows that are integrated with custom task types. The `HumanLoopActivationConditions` parameter is disabled for custom task types.

Topics
Use Human Loop Activation Conditions JSON Schema with Amazon Textract

When used with Amazon A2I, the AnalyzeDocument operation supports the following inputs in the ConditionType parameter:

- **ImportantFormKeyConfidenceCheck** – Use this condition to create a human loop when inference confidence is within a specified range for document form keys and word blocks. A *form key* is any word in a document that is associated with an input. The input is called a *value*. Together, form keys and values are referred to as *key-value pairs*. A *word block* refers to the words that Amazon Textract recognizes inside of a detected block of text. To learn more about Amazon Textract document blocks, see [Documents and Block Objects](https://docs.aws.amazon.com/textract/latest/developerguide/textract-developer-guide.html) in the *Amazon Textract Developer Guide*.

- **MissingImportantFormKey** – Use this condition to create a human loop when Amazon Textract did not identify the key or its associated aliases within the document.

- **Sampling** – Use this condition to specify a percentage of forms to send to humans for review, regardless of inference confidence scores. Use this condition to do the following:
  - Audit your ML model by randomly sampling all forms analyzed by your model and sending a specified percentage to humans for review.
  - Using the **ImportantFormKeyConfidenceCheck** condition, randomly sample a percentage of the inferences that met the conditions specified in **ImportantFormKeyConfidenceCheck** to start a human loop and send only the specified percentage to humans for review.

**Note**

If you send the same request to AnalyzeDocument multiple times, the result of Sampling does not change for the inference of that input. For example, if you make an AnalyzeDocument request once, and Sampling doesn't initiate a human loop, subsequent requests to AnalyzeDocument with the same configuration do not initiate a human loop.

**ImportantFormKeyConfidenceCheck Inputs and Results**

The **ImportantFormKeyConfidenceCheck** ConditionType supports the following **ConditionParameters**:

- **ImportantFormKey** – A string representing a key in a key-value pair detected by Amazon Textract that needs to be reviewed by human workers. If the value of this parameter is the special catch-all value (*), then all keys are considered to be matched to the condition. You can use this to model the case where any key-value pair satisfying certain confidence thresholds needs human review.

- **ImportantFormKeyAliases** – An array that represents alternate spellings or logical equivalents for the important form key.

- **KeyValueBlockConfidenceEquals**

- **KeyValueBlockConfidenceLessThan**

- **KeyValueBlockConfidenceLessThanEquals**

- **KeyValueBlockConfidenceGreaterThan**

- **KeyValueBlockConfidenceGreaterThanEquals**

- **WordBlockConfidenceEquals**

- **WordBlockConfidenceLessThan**

- **WordBlockConfidenceLessThanEquals**
- WordBlockConfidenceGreaterThan
- WordBlockConfidenceGreaterThanEquals

When you use the `ImportantFormKeyConfidenceCheck` ConditionType, Amazon A2I sends the key-value block and word block inferences of the key-value blocks and associated aliases that you specified in `ImportantFormKey` and `ImportantFormKeyAliases` for human review.

When creating a flow definition, if you use the default worker task template that is provided in the Human review workflows section of the Amazon SageMaker console, key-value and block inferences sent for human review by this activation condition are included in the worker UI. If you use a custom worker task template, you need to include the `{{ task.input.selectedAiServiceResponse.blocks }}` element to include initial-value input data (inferences) from Amazon Textract. For an example of a custom template that uses this input element, see Custom Template Example for Amazon Textract (p. 3289).

**MissingImportantFormKey Inputs and Results**

The `MissingImportantFormKey` ConditionType supports the following ConditionParameters:

- `ImportantFormKey` – A string representing a key in a key-value pair detected by Amazon Textract that needs to be reviewed by human workers.
- `ImportantFormKeyAliases` – An array that represents alternate spellings or logical equivalents for the important form key.

When you use the `MissingImportantFormKey` ConditionType, if the key in `ImportantFormKey` or aliases in `ImportantFormKeyAliases` are not included in the Amazon Textract inference, that form is sent to human for review and no predicted key-value pairs are included. For example, if Amazon Textract only identified Address and Phone in a form, but was missing the `ImportantFormKey` Name (in the MissingImportantFormKey condition type) that form would be sent to humans for review without any of the form keys detected (Address and Phone).

If you use the default worker task template that is provided in the SageMaker console, a task is created asking workers to identify the key in `ImportantFormKey` and associated value. If you use a custom worker task template, you need to include the `<task.input.humanLoopContext>` custom HTML element to configure this task.

**Sampling Inputs and Results**

The `Sampling` ConditionType supports the RandomSamplingPercentage ConditionParameters. The input for RandomSamplingPercentage must be a real number between 0.01 and 100. This number represents the percentage of data that qualifies for a human review and is sent to humans for review. If you use the Sampling condition without any other conditions, this number represents the percentage of all resulting inferences made by the AnalyzeDocument operation from a single request that is sent to humans for review.

If you specify the Sampling condition without any other condition type, all key-value and block inferences are sent to workers for review.

When creating a flow definition, if you use the default worker task template that is provided in the Human review workflows section of the SageMaker console, all key-value and block inferences sent for human review by this activation condition are included in the worker UI. If you use a custom worker task template, you need to include the `{{ task.input.selectedAiServiceResponse.blocks }}` element to include initial-value input data (inferences) from Amazon Textract. For an example of a custom template that uses this input element, see Custom Template Example for Amazon Textract (p. 3289).
Examples

While only one condition needs to evaluate to true to initiate a human loop, Amazon A2I evaluates all conditions for each object analyzed by Amazon Textract. The human reviewers are asked to review the important form keys for all the conditions that evaluated to true.

Example 1: Detect important form keys with confidence scores in a specified range that initiate a human loop

The following example shows a HumanLoopActivationConditions JSON that initiates a human loop if any one of the following three conditions is met:

- The Amazon Textract AnalyzeDocument API returns a key-value pair whose key is one of Employee Name, Name, or EmployeeName, with the confidence of the key-value block being less than 60 and the confidences of each of the word blocks making up the key and value being less than 85.
- The Amazon Textract AnalyzeDocument API returns a key-value pair whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with the confidence of the key-value block being less than 65 and the confidences of each of the word blocks making up the key and value being less than 85.
- The Amazon Textract AnalyzeDocument API returns a key-value pair whose key is one of Gross Pay, GrossPay, or GrossAmount, with the confidence of the key-value block being less than 60 and the confidences of each of the word blocks making up the key and value being less than 85.

```json
{
   "Conditions": [
      {
         "ConditionType": "ImportantFormKeyConfidenceCheck",
         "ConditionParameters": {
            "ImportantFormKey": "Employee Name",
            "ImportantFormKeyAliases": [
               "Name",
               "EmployeeName"
            ],
            "KeyValueBlockConfidenceLessThan": 60,
            "WordBlockConfidenceLessThan": 85
         }
      },
      {
         "ConditionType": "ImportantFormKeyConfidenceCheck",
         "ConditionParameters": {
            "ImportantFormKey": "Pay Date",
            "ImportantFormKeyAliases": [
               "PayDate",
               "DateOfPay",
               "pay-date"
            ],
            "KeyValueBlockConfidenceLessThan": 65,
            "WordBlockConfidenceLessThan": 85
         }
      },
      {
         "ConditionType": "ImportantFormKeyConfidenceCheck",
         "ConditionParameters": {
            "ImportantFormKey": "Gross Pay",
            "ImportantFormKeyAliases": [
               "GrossPay",
               "GrossAmount"
            ],
            "KeyValueBlockConfidenceLessThan": 60,
            "WordBlockConfidenceLessThan": 85
         }
      }
   ]
}
```
Example 2: Use `ImportantFormKeyConfidenceCheck`

In the following example, if Amazon Textract detects a key-value pair whose confidence for the key-value block is less than 60 and is less than 90 for any underlying word blocks, it creates a human loop. The human reviewers are asked to review all the form key-value pairs that matched the confidence value comparisons.

```json
{
"Conditions": [
{
"ConditionType": "ImportantFormKeyConfidenceCheck",
"ConditionParameters": {
"ImportantFormKey": "*",
"KeyValueBlockConfidenceLessThan": 60,
"WordBlockConfidenceLessThan": 90
}
}
]
}
```

Example 3: Use `Sampling`

In the following example, 5% of inferences resulting from an Amazon Textract AnalyzeDocument request are sent to human workers for review. All detected key-value pairs returned by Amazon Textract are sent to workers for review.

```json
{
"Conditions": [
{
"ConditionType": "Sampling",
"ConditionParameters": {
"RandomSamplingPercentage": 5
}
}
]
}
```

Example 4: Use `MissingImportantFormKey`

In the following example, if `Mailing Address` or its alias, `Mailing Address:`, is missing from keys detected by Amazon Textract, a human review is initiated. When using the default worker task template, the worker UI asks workers to identify the key `Mailing Address` or `Mailing Address:` and its associated value.

```json
{
"ConditionType": "MissingImportantFormKey",
"ConditionParameters": {
"ImportantFormKey": "Mailing Address",
"ImportantFormKeyAliases": ["Mailing Address:"
}
}
```

Example 5: Use `Sampling` and `ImportantFormKeyConfidenceCheck` with the `And` operator

In this example, 5% of key-value pairs detected by Amazon Textract whose key is one of `Pay Date`, `PayDate`, `DateOfPay`, or `pay-date`, with the confidence of the key-value block less than 65 and the confidences of each of the word blocks making up the key and value less than 85, are sent to workers for review.

```json
{
"ConditionType": "Sampling and ImportantFormKeyConfidenceCheck with the And operator",
"ConditionParameters": {
"RandomSamplingPercentage": 5,
"ConditionType": "ImportantFormKeyConfidenceCheck",
"ConditionParameters": {
"ImportantFormKey": "Pay Date",
"KeyValueBlockConfidenceLessThan": 65,
"WordBlockConfidenceLessThan": 85
}
}
```
Example 6: Use Sampling and ImportantFormKeyConfidenceCheck with the And operator

Use this example to configure your human review workflow to always send low confidence inferences of a specified key-value pair for human review and sample high confidence inference of a key-value pair at a specified rate.

In the following example, a human review is initiated in one of the following ways:

- Key-value pairs detected whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with key-value and word block confidences less than 60, are sent for human review. Only the Pay Date form key (and its aliases) and associated values are sent to workers to review.
- 5% of key-value pairs detected whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with key-value and word block confidences greater than 90, are sent for human review. Only the Pay Date form key (and its aliases) and associated values are sent to workers to review.
Example 7: Use Sampling and ImportantFormKeyConfidenceCheck with the Or operator

In the following example, the Amazon Textract AnalyzeDocument operation returns a key-value pair whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with the confidence of the key-value block less than 65 and the confidences of each of the word blocks making up the key and value less than 85. Additionally, 5% of all other forms initiate a human loop. For each form randomly chosen, all key-value pairs detected for that form are sent to humans for review.

```json
{
    "Conditions": [
        {
            "Or": [
                {
                    "ConditionType": "Sampling",
                    "ConditionParameters": {
                        "RandomSamplingPercentage": 5
                    }
                },
                {
                    "ConditionType": "ImportantFormKeyConfidenceCheck",
                    "ConditionParameters": {
                        "ImportantFormKey": "Pay Date",
                        "ImportantFormKeyAliases": [
                            "PayDate",
                            "DateOfPay",
                            "pay-date"
                        ],
                        "KeyValueBlockConfidenceLessThan": 65,
                        "WordBlockConfidenceLessThan": 85
                    }
                }
            ]
        }
    ]
}
```
Use Human Loop Activation Conditions JSON Schema with Amazon Rekognition

When used with Amazon A2I, the Amazon Rekognition DetectModerationLabels operation supports the following inputs in the ConditionType parameters:

- **ModerationLabelConfidenceCheck** – Use this condition type to create a human loop when inference confidence is low for one or more specified labels.
- **Sampling** – Use this condition to specify a percentage of all inferences to send to humans for review. Use this condition to do the following:
  - Audit your ML model by randomly sampling all of your model’s inferences and sending a specified percentage to humans for review.
  - Using the **ModerationLabelConfidenceCheck** condition, randomly sample a percentage of the inferences that met the conditions specified in **ModerationLabelConfidenceCheck** to start a human loop and send only the specified percentage to humans for review.

**Note**

If you send the same request to **DetectModerationLabels** multiple times, the result of **Sampling** does not change for the inference of that input. For example, if you make a **DetectModerationLabels** request once, and **Sampling** does not initiate a human loop, subsequent requests to **DetectModerationLabels** with the same configuration don't initiate a human loop.

When creating a flow definition, if you use the default worker task template that is provided in the Human review workflows section of the Amazon SageMaker console, inferences sent for human review by these activation conditions are included in the worker UI when a worker opens your task. If you use a custom worker task template, you need to include the `<task.input.selectedAiServiceResponse.blocks>` custom HTML element to access these inferences. For an example of a custom template that uses this HTML element, see Custom Template Example for Amazon Rekognition (p. 3291).

**ModerationLabelConfidenceCheck Inputs**

For the **ModerationLabelConfidenceCheck** ConditionType, the following ConditionParameters are supported:

- **ModerationLabelName** – The exact (case-sensitive) name of a **ModerationLabel** detected by the Amazon Rekognition DetectModerationLabels operation. You can specify the special catch-all value (*) to denote any moderation label.
- **ConfidenceEquals**
- **ConfidenceLessThan**
- **ConfidenceLessThanEquals**
- **ConfidenceGreaterThan**
- **ConfidenceGreaterThanEquals**

When you use the **ModerationLabelConfidenceCheck** ConditionType, Amazon A2I sends label inferences for the labels that you specified in **ModerationLabelName** for human review.

**Sampling Inputs**

The **Sampling** ConditionType supports the RandomSamplingPercentage ConditionParameters. The input for the RandomSamplingPercentage parameter should be a real number between 0.01 and
100. This number represents the percentage of inferences that qualifies for a human review that are sent to humans for review. If you use the Sampling condition without any other conditions, this number represents the percentage of all inferences that result from a single DetectModerationLabel request that are sent to humans for review.

**Examples**

**Example 1: Use ModerationLabelConfidenceCheck with the And operator**

The following example of a HumanLoopActivationConditions condition initiates a human loop when one or more of the following conditions are met:

- Amazon Rekognition detects the Graphic Male Nudity moderation label with a confidence between 90 and 99.
- Amazon Rekognition detects the Graphic Female Nudity moderation label with a confidence between 80 and 99.

Note the use of the Or and And logical operators to model this logic.

Although only one of the two conditions under the Or operator needs to evaluate to true for a human loop to be created, Amazon Augmented AI evaluates all conditions. Human reviewers are asked to review the moderation labels for all the conditions that evaluated to true.

```json
{
  "Conditions": [{
    "Or": [{
      "And": [{
        "ConditionType": "ModerationLabelConfidenceCheck",
        "ConditionParameters": {
          "ModerationLabelName": "Graphic Male Nudity",
          "ConfidenceLessThanEquals": 99
        }
      }, {
        "ConditionType": "ModerationLabelConfidenceCheck",
        "ConditionParameters": {
          "ModerationLabelName": "Graphic Male Nudity",
          "ConfidenceGreaterThanEquals": 90
        }
      }
    }, {
      "And": [{
        "ConditionType": "ModerationLabelConfidenceCheck",
        "ConditionParameters": {
          "ModerationLabelName": "Graphic Female Nudity",
          "ConfidenceLessThanEquals": 99
        }
      }, {
        "ConditionType": "ModerationLabelConfidenceCheck",
        "ConditionParameters": {
          "ModerationLabelName": "Graphic Female Nudity",
          "ConfidenceGreaterThanEquals": 80
        }
      }
    }
  }
}
]}
```
Example 2: Use `ModerationLabelConfidenceCheck` with the catch-all value (*)

In the following example, if any moderation label with a confidence greater than or equal to 75 is detected, a human loop is initiated. Human reviewers are asked to review all moderation labels with confidence scores greater than or equal to 75.

```json
{
  "Conditions": [
    {
      "ConditionType": "ModerationLabelConfidenceCheck",
      "ConditionParameters": {
        "ModerationLabelName": "*",
        "ConfidenceGreaterThanEquals": 75
      }
    }
  ]
}
```

Example 3: Use Sampling

In the following example, 5% of Amazon Rekognition inferences from a `DetectModerationLabels` request are sent to human workers. When using the default worker task template provided in the SageMaker console, all moderation labels returned by Amazon Rekognition are sent to workers for review.

```json
{
  "Conditions": [
    {
      "ConditionType": "Sampling",
      "ConditionParameters": {
        "RandomSamplingPercentage": 5
      }
    }
  ]
}
```

Example 4: Use Sampling and `ModerationLabelConfidenceCheck` with the And operator

In this example, 5% of Amazon Rekognition inferences of the Graphic Male Nudity moderation label with a confidence greater than 50 are sent workers for review. When using the default worker task template provided in the SageMaker console, only the inferences of the Graphic Male Nudity label are sent to workers for review.

```json
{
  "Conditions": [
    {
      "And": [
        {
          "ConditionType": "Sampling",
          "ConditionParameters": {
            "RandomSamplingPercentage": 5
          }
        },
        {
          "ConditionType": "ModerationLabelConfidenceCheck",
          "ConditionParameters": {
            "ModerationLabelName": "Graphic Male Nudity",
            "ConfidenceGreaterThan": 50
          }
        }
      ]
    }
  ]
}
```
Example 5: Use Sampling and ModerationLabelConfidenceCheck with the And operator

Use this example to configure your human review workflow to always send low-confidence inferences of a specified label for human review and sample high-confidence inferences of a label at a specified rate.

In the following example, a human review is initiated in one of the following ways:

- Inferences for the Graphic Male Nudity moderation label with confidence scores less than 60 are always sent for human review. Only the Graphic Male Nudity label is sent to workers to review.
- 5% of all inferences for the Graphic Male Nudity moderation label with confidence scores greater than 90 are sent for human review. Only the Graphic Male Nudity label is sent to workers to review.

```json
{
    "Conditions": [
        {
            "Or": [
                {
                    "ConditionType": "ModerationLabelConfidenceCheck",
                    "ConditionParameters": {
                        "ModerationLabelName": "Graphic Male Nudity",
                        "ConfidenceLessThan": 60
                    }
                },
                {
                    "And": [
                        {
                            "ConditionType": "Sampling",
                            "ConditionParameters": {
                                "RandomSamplingPercentage": 5
                            }
                        },
                        {
                            "ConditionType": "ModerationLabelConfidenceCheck",
                            "ConditionParameters": {
                                "ModerationLabelName": "Graphic Male Nudity",
                                "ConfidenceGreaterThan": 90
                            }
                        }
                    ]
                }
            ]
        }
    ]
}
```

Example 6: Use Sampling and ModerationLabelConfidenceCheck with the Or operator

In the following example, a human loop is created if the Amazon Rekognition inference response contains the 'Graphic Male Nudity' label with inference confidence greater than 50. Additionally, 5% of all other inferences initiate a human loop.

```json
{
    "Conditions": [
        {
            "ConditionType": "ModerationLabelConfidenceCheck",
            "ConditionParameters": {
                "ModerationLabelName": "Graphic Male Nudity",
                "ConfidenceGreaterThan": 50
            }
        }
    ]
}
```
Delete a Human Review Workflow

When you delete a human review workflow or you delete your AWS account while a human loop is in process, your human review workflow status changes to Deleting. Amazon A2I automatically stops and deletes all associated human loops if workers have not started tasks created by those human loops. If human workers are already working on a task, that task continues to be available until it is completed or expires. As long as workers are still working on a task, your human review workflow's status is Deleting. If these tasks are completed, the results are stored in the Amazon S3 bucket specified in your flow definition.

Deleting a flow definition does not remove any worker answers from your S3 bucket. If the tasks are completed, but you deleted your AWS account, the results are stored in the Augmented AI service bucket for 30 days and then permanently deleted.

After all human loops have been deleted, the human review workflow is permanently deleted. When a human review workflow has been deleted, you can reuse its name to create a new human review workflow.

You might want to delete a human review workflow for any of the following reasons:

- You have sent data to a set of human reviewers and you want to delete all non-started human loops because you do not want those workers to work on those tasks any longer.
- The worker task template used to generate your worker UI does not render correctly or is not functioning as expected.

After you delete a human review workflow, the following changes occur:

- The human review workflow no longer appears on the Human review workflows page in the Augmented AI area of the Amazon SageMaker console.
- When you use the human review workflow name as input to the API operations DescribeFlowDefinition or DeleteFlowDefinition, Augmented AI returns a ResourceNotFound error.
- When you use ListFlowDefinitions, deleted human review workflows aren't included in the results.
- When you use the human review workflow ARN as input to the Augmented AI Runtime API operation ListHumanLoops, Augmented AI returns a ResourceNotFoundException.
Delete a Flow Definition Using the Console or the SageMaker API

You can delete a human review workflow on the Human review workflows page in the Augmented AI area of the SageMaker console or by using the SageMaker API.

Flow definitions can only be deleted if their status is Active.

**Delete a human review workflow (console)**

1. Navigate to the Augmented AI console at https://console.aws.amazon.com/a2i/.
2. In the navigation pane, under the Augmented AI section, choose Human review workflows.
3. Select the hyperlinked name of the human review workflow that you want to delete.
4. On the Summary page of your human review workflow, choose Delete.
5. In the dialog box asking you to confirm that you want to delete your human review workflow, choose Delete.

You're automatically redirected to the Human review workflows page. While your human review workflow is being deleted, the status Deleting appears in the status column for that workflow. After it's deleted, it doesn't appear in the list of workflows on this page.

**Delete a human review workflow (API)**

You can delete a human review workflow (flow definition) using the SageMaker DeleteFlowDefinition API operation. This API operation is supported through the AWS CLI and a variety of language specific SDKs.

The following table shows example requests using SDK for Python (Boto3) and the AWS CLI to delete the human review workflow, example-flow-definition.

**AWS SDK for Python (Boto3)**

The following request example uses the SDK for Python (Boto3) to delete the human review workflow. For more information, see delete_flow_definition in the AWS SDK for Python (Boto) API Reference.

```python
import boto3

sagemaker_client = boto3.client('sagemaker')
response = sagemaker_client.delete_flow_definition(FlowDefinitionName='example-flow-definition')
```

**AWS CLI**

The following request example uses the AWS CLI to delete the human review workflow. For more information, see delete-flow-definition in the AWS CLI Command Reference.

```bash
$ aws sagemaker delete-flow-definition --flow-definition-name 'example-flow-definition'
```

If the action is successful, Augmented AI sends back an HTTP 200 response with an empty HTTP body.

Create and Start a Human Loop

A human loop starts your human review workflow and sends data review tasks to human workers. When you use one of the Amazon A2I built-in task types, the corresponding AWS service creates and
starts a human loop on your behalf when the conditions specified in your flow definition are met. If no conditions are specified in your flow definition, a human loop is created for each object. When using Amazon A2I for a custom task, a human loop starts when your application calls StartHumanLoop.

Use the following instructions to configure a human loop with Amazon Rekognition or Amazon Textract built-in task types and custom task types.

Prerequisites

To create and start a human loop, you must attach the AmazonAugmentedAIFullAccess policy to the AWS Identity and Access Management (IAM) user or role that configures or starts the human loop. This is the identity that you use to configure the human loop using HumanLoopConfig for built-in task types. For custom task types, this is the identity that you use to call StartHumanLoop.

Additionally, when using a built-in task type, your IAM user or role must have permission to invoke API operations of the AWS service associated with your task type. For example, if you are using Amazon Rekognition with Augmented AI, you must attach permissions required to call DetectModerationLabels. For examples of identity-based policies you can use to grant these permissions, see Amazon Rekognition Identity-Based Policy Examples and Amazon Textract Identity-Based Policy Examples. You can also use the more general policy AmazonAugmentedAIIIntegratedAPIAccess to grant these permissions. For more information, see Create an IAM User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations (p. 3309).

To create and start a human loop, you need a flow definition ARN. To learn how to create a flow definition (or human review workflow), see Create a Human Review Workflow (p. 3259).

Important
Amazon A2I requires all S3 buckets that contain human loop input image data to have a CORS policy attached. To learn more about this change, see CORS Permission Requirement (p. 3307).

Create and Start a Human Loop for a Built-in Task Type

To start a human loop using a built-in task type, use the corresponding service's API to provide your input data and to configure the human loop. For Amazon Textract, you use the AnalyzeDocument API operation. For Amazon Rekognition, you use the DetectModerationLabels API operation. You can use the AWS CLI or a language-specific SDK to create requests using these API operations.

Important
When you create a human loop using a built-in task type, you can use DataAttributes to specify a set of ContentClassifiers related to the input provided to the StartHumanLoop operation. Use content classifiers to declare that your content is free of personally identifiable information or adult content.

To use Amazon Mechanical Turk, ensure your data is free of personally identifiable information, including protected health information under HIPAA. Include the FreeOfPersonallyIdentifiableInformation content classifier. If you do not use this content classifier, SageMaker does not send your task to Mechanical Turk. If your data is free of adult content, also include the 'FreeOfAdultContent' classifier. If you do not use these content classifiers, SageMaker may restrict the Mechanical Turk workers that can view your task.

After you start your ML job using your built-in task type's AWS service API, Amazon A2I monitors the inference results of that service. For example, when running a job with Amazon Rekognition, Amazon A2I checks the inference confidence score for each image and compares it to the confidence thresholds specified in your flow definition. If the conditions to start a human review task are satisfied, or if you didn't specify conditions in your flow definition, a human review task is sent to workers.
Create an Amazon Textract Human Loop

Amazon A2I integrates with Amazon Textract so that you can configure and start a human loop using the Amazon Textract API. To send a document file to Amazon Textract for document analysis, you use the Amazon Textract \texttt{AnalyzeDocument} API operation. To add a human loop to this document analysis job, you must configure the parameter HumanLoopConfig.

When you configure your human loop, the flow definition you specify in \texttt{FlowDefinitionArn} of HumanLoopConfig must be located in the same AWS Region as the bucket identified in \texttt{Bucket} of the Document parameter.

The following table shows examples of how to use this operation with the AWS CLI and AWS SDK for Python (Boto3).

### AWS SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3). For more information, see \texttt{analyze_document} in the \textit{AWS SDK for Python (Boto) API Reference}.

```python
import boto3
textract = boto3.client('textract', aws_region)
response = textract.analyze_document(
    Document={'S3Object': {'Bucket': bucket_name, 'Name': document_name}},
    FeatureTypes=['TABLES', 'FORMS'],
    HumanLoopConfig={'
        'HumanLoopName': 'human_loop_name',
        'DataAttributes': {'ContentClassifiers': ['FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent']}
    }
)
```

### AWS CLI

The following request example uses the AWS CLI. For more information, see \texttt{analyze-document} in the \textit{AWS CLI Command Reference}.

```bash
```

```bash
$ aws textract analyze-document --document '{"S3Object":{"Bucket":"bucket_name","Name":"document_name"}}' --human-loop-config '{"HumanLoopName":"human_loop_name","FlowDefinitionArn":"arn:aws:sagemaker:aws_region:aws_account_definition/flow_def_name","DataAttributes": "ContentClassifiers": ["FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent"]} --feature-types ['"TABLES", "FORMS"]
```
After you run `AnalyzeDocument` with a human loop configured, Amazon A2I monitors the results from `AnalyzeDocument` and checks it against the flow definition's activation conditions. If the Amazon Textract inference confidence score for one or more key-value pairs meets the conditions for review, Amazon A2I starts a human review loop and includes the `HumanLoopActivationOutput` object in the `AnalyzeDocument` response.

### Create an Amazon Rekognition Human Loop

Amazon A2I integrates with Amazon Rekognition so that you can configure and start a human loop using the Amazon Rekognition API. To send images to Amazon Rekognition for content moderation, you use the Amazon Rekognition `DetectModerationLabels` API operation. To configure a human loop, set the `HumanLoopConfig` parameter when you configure `DetectModerationLabels`.

When you configure your human loop, the flow definition you specify in `FlowDefinitionArn` of `HumanLoopConfig` must be located in the same AWS Region as the S3 bucket identified in `Bucket` of the `Image` parameter.

The following table shows examples of how to use this operation with the AWS CLI and AWS SDK for Python (Boto3).

#### AWS SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3). For more information, see `detect_moderation_labels` in the [AWS SDK for Python (Boto) API Reference](https://aws.amazon.com/documentation/rekognition/api-reference/).

```python
import boto3
rekognition = boto3.client("rekognition", aws_region)
response = rekognition.detect_moderation_labels( 
    Image={"S3Object": {"Bucket": bucket_name, "Name": image_name}}, 
    HumanLoopConfig={ 
        "HumanLoopName": human_loop_name, 
        "FlowDefinitionArn": ,
        "DataAttributes": {'ContentClassifiers': ['FreeOfPersonallyIdentifiableInformation','FreeOfAdultContent']}
    })
```

#### AWS CLI

The following request example uses the AWS CLI. For more information, see `detect-moderation-labels` in the [AWS CLI Command Reference](https://aws.amazon.com/documentation/cli/).

```bash
$ aws rekognition detect-moderation-labels 
   --image "S3Object={Bucket='bucket_name',Name='image_name'}" 
   --human-loop-config 
   HumanLoopName="human_loop_name",FlowDefinitionArn="arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name",DataAttributes="{'ContentClassifiers': ['FreeOfPersonallyIdentifiableInformation','FreeOfAdultContent']}
```

```bash
$ aws rekognition detect-moderation-labels 
   --image "S3Object={Bucket='bucket_name',Name='image_name'}" 
   --human-loop-config 
   DataAttributes="{'ContentClassifiers': ['FreeOfPersonallyIdentifiableInformation','FreeOfAdultContent']}
```
After you run `DetectModerationLabels` with a human loop configured, Amazon A2I monitors the results from `DetectModerationLabels` and checks it against the flow definition's activation conditions. If the Amazon Rekognition inference confidence score for an image meets the conditions for review, Amazon A2I starts a human review loop and includes the response element `HumanLoopActivationOutput` in the `DetectModerationLabels` response.

Create and Start a Human Loop for a Custom Task Type

To configure a human loop for a custom human review task, use the `StartHumanLoop` operation within your application. This section provides an example of a human loop request using the AWS SDK for Python (Boto3) and the AWS Command Line Interface (AWS CLI). For documentation on other language-specific SDKs that support `StartHumanLoop`, use the See Also section of `StartHumanLoop` in the Amazon Augmented AI Runtime API documentation. Refer to Use Cases and Examples Using Amazon A2I (p. 3251) to see examples that demonstrate how to use Amazon A2I with a custom task type.

Prerequisites

To complete this procedure, you need:

- Input data formatted as a string representation of a JSON-formatted file
- The Amazon Resource Name (ARN) of your flow definition

To configure the human loop

1. For `DataAttributes`, specify a set of `ContentClassifiers` related to the input provided to the `StartHumanLoop` operation. Use content classifiers to declare that your content is free of personally identifiable information or adult content.

   To use Amazon Mechanical Turk, ensure your data is free of personally identifiable information, including protected health information under HIPAA, and include the `FreeOfPersonallyIdentifiableInformation` content classifier. If you do not use this content classifier, SageMaker does not send your task to Mechanical Turk. If your data is free of adult content, also include the 'FreeOfAdultContent' classifier. If you do not use these content classifiers, SageMaker may restrict the Mechanical Turk workers that can view your task.

2. For `FlowDefinitionArn`, enter the Amazon Resource Name (ARN) of your flow definition.

3. For `HumanLoopInput`, enter your input data as a string representation of a JSON-formatted file. Structure your input data and custom worker task template so that your input data is properly displayed to human workers when you start your human loop. See Preview a Worker Task Template (p. 3295) to learn how to preview your custom worker task template.

4. For `HumanLoopName`, enter a name for the human loop. The name must be unique within the Region in your account and can have up to 63 characters. Valid characters are a-z, 0-9, and - (hyphen).

To start a human loop

- To start a human loop, submit a request similar to the following examples using your preferred language-specific SDK.

AWS SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3). For more information, see Boto 3 Augmented AI Runtime in the AWS SDK for Python (Boto) API Reference.
import boto3

a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')

response = a2i_runtime_client.start_human_loop(
    HumanLoopName='human_loop_name',
    HumanLoopInput={
        'InputContent': '{"prompt":"What is the answer?"}'
    },
    DataAttributes={
        'ContentClassifiers': ['FreeOfPersonallyIdentifiableInformation','FreeOfAdultContent'],
    }
)

AWS CLI

The following request example uses the AWS CLI. For more information, see start-human-loop in the AWS CLI Command Reference.

```
$ aws sagemaker-a2i-runtime start-human-loop
--flow-definition-arn 'arn:aws:sagemaker:aws-region:xyz:flow-definition/flow_def_name' \ 
--human-loop-name 'human_loop_name' \ 
--human-loop-input '{"InputContent": "{\"prompt\":\"What is the answer?\"}"}' \ 
--data-attributes ContentClassifiers="FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent"
```

When you successfully start a human loop by invoking StartHumanLoop directly, the response includes a HumanLoopARN and a HumanLoopActivationResults object which is set to NULL. You can use this the human loop name to monitor and manage your human loop.

**Next Steps:**

After starting a human loop, you can manage and monitor it with the Amazon Augmented AI Runtime API and Amazon CloudWatch Events. To learn more, see Monitor and Manage Your Human Loop (p. 3296).

**Delete a Human Loop**

When you delete a human loop, the status changes to Deleting. When the human loop is deleted, the associated human review task is no longer available to workers. You might want to delete a human loop in one of the following circumstances:

- The worker task template used to generate your worker user interface does not render correctly or is not functioning as expected.
- A single data object was accidentally sent to workers multiple times.
- You no longer need a data object reviewed by a human.

If the status of a human loop is InProgress, you must stop the human loop before deleting it. When you stop a human loop, the status changes to Stopping while it is being stopped. When the status changes to Stopped, you can delete the human loop.
If human workers are already working on a task when you stop the associated human loop, that task continues to be available until it is completed or expires. As long as workers are still working on a task, your human loop's status is Stopping. If these tasks are completed, the results are stored in the Amazon S3 bucket URI specified in your human review workflow. If the worker leaves the task without submitting work, it is stopped and the worker can't return to the task. If no worker has started working on the task, it is stopped immediately.

If you delete the AWS account used to create the human loop, it is stopped and deleted automatically.

**Human Loop Data Retention and Deletion**

When a human worker completes a human review task, the results are stored in the Amazon S3 output bucket you specified in the human review workflow used to create the human loop. Deleting or stopping a human loop does not remove any worker answers from your S3 bucket.

Additionally, Amazon A2I temporarily stores human loop input and output data internally for the following reasons:

- If you configure your human loops so that a single data object is sent to multiple workers for review, Amazon A2I does not write output data to your S3 bucket until all workers have completed the review task. Amazon A2I stores partial answers—answers from individual workers—internally so that it can write full results to your S3 bucket.
- If you report a low-quality human review result, Amazon A2I can investigate and respond to your issue.
- If you lose access to or delete the output S3 bucket specified in the human review workflow used to create a human loop, and the task has already been sent to one or more workers, Amazon A2I needs a place to temporarily store human review results.

Amazon A2I deletes this data internally 30 days after a human loop's status changes to one of the following: Deleted, Stopped, or Completed. In other words, data is deleted 30 days after the human loop has been completed, stopped, or deleted. Additionally, this data is deleted after 30 days if you close the AWS account used to create associated human loops.

**Stop and Delete a Flow Definition Using the Console or the Amazon A2I API**

You can stop and delete a human loop in the Augmented AI console or by using the SageMaker API. When the human loop has been deleted, the status changes to Deleted.

**Delete a human loop (console)**

1. Navigate to the Augmented AI console at https://console.aws.amazon.com/a2i/.
2. In the navigation pane, under the Augmented AI section, choose Human review workflows.
3. Choose the hyperlinked name of the human review workflow you used to create the human loop you want to delete.
4. In the Human loops section at the bottom of the page, select the human loop you want to stop and delete.
5. If the human loop status is Completed, Stopped, or Failed, select Delete.

   If the human loop Status is InProgress, select Stop. When the status changes to Stopped, select Delete.
Delete a human loop (API)

1. Check the status of your human loop using the Augmented AI Runtime API operation `DescribeHumanLoop`. See examples using this operation in the following table.

   **AWS SDK for Python (Boto3)**

   The following example uses the SDK for Python (Boto3) to describe the human loop named `example-human-loop`. For more information, see `describe_human_loop` in the *AWS SDK for Python (Boto) API Reference*.

   ```python
   import boto3
   a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
   response = a2i_runtime_client.describe_human_loop(HumanLoopName='example-human-loop')
   human_loop_status = response['HumanLoopStatus']
   print(f'example-human-loop status is: {human_loop_status}')
   ```

   **AWS CLI**

   The following example uses the AWS CLI to describe the human loop named `example-human-loop`. For more information, see `describe-human-loop` in the *AWS CLI Command Reference*.

   ```bash
   $ aws sagemaker-a2i-runtime describe-human-loop --human-loop-name 'example-human-loop'
   ```

2. If the flow definition status is *Completed*, *Stopped*, or *Failed*, delete the flow definition using the Augmented AI Runtime API operation `DeleteHumanLoop`.

   **AWS SDK for Python (Boto3)**

   The following example uses the SDK for Python (Boto3) to delete the human loop named `example-human-loop`. For more information, see `delete_human_loop` in the *AWS SDK for Python (Boto) API Reference*.

   ```python
   import boto3
   a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
   response = a2i_runtime_client.delete_human_loop(HumanLoopName='example-human-loop')
   ```

   **AWS CLI**

   The following example uses the AWS CLI to delete the human loop named `example-human-loop`. For more information, see `delete-human-loop` in the *AWS CLI Command Reference*.

   ```bash
   $ aws sagemaker-a2i-runtime delete-human-loop --human-loop-name 'example-human-loop'
   ```

If the human loop status is *InProgress*, stop the human loop using `StopHumanLoop` and then use `DeleteHumanLoop` to delete it.

**AWS SDK for Python (Boto3)**

The following example uses the SDK for Python (Boto3) to describe the human loop named `example-human-loop`. For more information, see `stop_human_loop` in the *AWS SDK for Python (Boto) API Reference*. 

3285
import boto3
a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
response = a2i_runtime_client.stop_human_loop(HumanLoopName='example-human-loop')

AWS CLI

The following example uses the AWS CLI to describe the human loop named example-human-loop. For more information, see stop-human-loop in the AWS CLI Command Reference.

$ aws sagemaker-a2i-runtime stop-human-loop --human-loop-name 'example-human-loop'

Create and Manage Worker Task Templates

You can create a task user interface for your workers by creating a worker task template. A worker task template is an HTML file that is used to display your input data and instructions to help workers complete your task.

For Amazon Rekognition or Amazon Textract task types, you can customize a pre-made worker task template using a graphical user interface (GUI) and avoid interacting with HTML code. For this option, use the instructions in Create a Human Review Workflow (Console) (p. 3260) to create a human review workflow and customize your worker task template in the Amazon SageMaker console. Once you create a template using these instructions, it appears on the worker task templates page of the Augmented AI console.

If you are creating a human review workflow for a custom task type, you must create a custom worker task template using HTML code. For more information, see Create Custom Worker Task Templates (p. 3288).

If you create your template using HTML, you must use this template to generate an Amazon A2I human task UI Amazon Resource Name (ARN) in the Amazon A2I console. This ARN has the following format: arn:aws:sagemaker:<aws-region>:<aws-account-number>:human-task-ui/<template-name>. This ARN is associated with a worker task template resource that you can use in one or more human review workflows (flow definitions).

Generate a human task UI ARN using a worker task template by following the instructions found in Create a Worker Task Template (p. 3287) or by using the CreateHumanTaskUi API operation.

Topics

- Create and Delete Worker Task Templates (p. 3286)
- Create Custom Worker Task Templates (p. 3288)
- Creating Good Worker Instructions (p. 3295)

Create and Delete Worker Task Templates

You can use a worker template to customize the interface and instructions that your workers see when working on your tasks. Use the instructions on this page to create a worker task template in the Augmented AI area of the Amazon SageMaker console. A starter template is provided for Amazon Textract and Amazon Rekognition tasks. To learn how to customize your template using HTML crowd elements, see Create Custom Worker Task Templates (p. 3288).

When you create a worker template in the worker task templates page of the Augmented AI area of the SageMaker console, a worker task template ARN is generated. Use this ARN as the input to
Create a Worker Task Template

You can create a worker task template using the SageMaker console and using the SageMaker API operation CreateHumanTaskUi.

Create a worker task template (console)

1. Open the Amazon A2I console at https://console.aws.amazon.com/a2i/.
2. Under Amazon Augmented AI in the left navigation pane, choose Worker task templates.
3. Choose Create template.
4. In Template name, enter a unique name.
5. (Optional) Enter an IAM role that grants Amazon A2I the permissions necessary to call services on your behalf.
6. In Template type, choose a template type from the dropdown list. If you are creating a template for a Textract-form extraction or Rekognition-image moderation task, choose the appropriate option.
7. Enter your custom template elements as follows:
   - If you selected the Amazon Textract or Amazon Rekognition task template, the Template editor autopopulates with a default template that you can customize.
   - If you are using a custom template, enter your predefined template in the editor.
8. (Optional) To complete this step, you must provide an IAM role ARN with permission to read Amazon S3 objects that get rendered on your user interface in Step 5.

You can only preview your template if you are creating templates for Amazon Textract or Amazon Rekognition.

Choose See preview to preview the interface and instructions that workers see. This is an interactive preview. After you complete the sample task and choose Submit, you see the resulting output from the task that you just performed.

If you are creating a worker task template for a custom task type, you can preview your worker task UI using RenderUiTemplate. For more information, see Preview a Worker Task Template (p. 3295).

9. When you're satisfied with your template, choose Create.

After you've created your template, you can select that template when you create a human review workflow in the console. Your template also appears in the Amazon Augmented AI section of the SageMaker console under Worker task templates. Choose your template to view its ARN. Use this ARN when using the CreateFlowDefinition API operation.

Create a worker task template using a worker task template (API)

To generate a worker task template using the SageMaker API operation CreateHumanTaskUi, specify a name for your UI in HumanTaskUiName and input your HTML template in Content under UiTemplate. Find documentation on language-specific SDKs that support this API operation in the See Also section of the CreateHumanTaskUi.
Delete a Worker Task Template

Once you have created a worker task template, you can delete it using the SageMaker console or the SageMaker API operation `DeleteHumanTaskUi`.

When you delete a worker task template, you are not able to use human review workflows (flow definitions) created using that template to start human loops. Any human loops that have already been created using the worker task template that you delete continue to be processed until completion and are not impacted.

**Delete a worker task template (console)**

1. Open the Amazon A2I console at `https://console.aws.amazon.com/a2i/`.
2. Under Amazon Augmented AI in the left navigation pane, choose **Worker task templates**.
3. Select the template that you want to delete.
4. Select **Delete**.
5. A modal appears to confirm your choice. Select **Delete**.

**Delete a worker task template (API)**

To delete a worker task template using the SageMaker API operation `DeleteHumanTaskUi`, specify a name of your UI in `HumanTaskUiName`.

Create Custom Worker Task Templates

*Crowd HTML Elements* are web components that provide a number of task widgets and design elements that you can tailor to the question you want to ask. You can use these crowd elements to create a custom worker template and integrate it with an Amazon Augmented AI (Amazon A2I) human review workflow to customize the worker console and instructions.

For a list of all HTML crowd elements available to Amazon A2I users, see *Crowd HTML Elements Reference (p. 696)*. For examples of templates, see the AWS GitHub repository, which contains over 60 sample custom task templates.

**Develop Templates Locally**

When in the console to test how your template processes incoming data, you can test the look and feel of your template's HTML and custom elements in your browser by adding the following code to the top of your HTML file.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
```

This loads the necessary code to render the custom HTML elements. Use this code if you want to develop your template's look and feel in your preferred editor instead of in the console.

This code won't parse your variables. You might want to replace them with sample content while developing locally.

**Use External Assets**

Amazon Augmented AI custom templates enable you to embed external scripts and style sheets. For example, the following header embeds a text/css style sheet name `stylesheet` located at `https://www.example.com/my-enhancement-styles.css` into the custom template.
Amazon SageMaker Developer Guide
Create Custom Worker Task Templates

Example
<script src="https://www.example.com/my-enhancment-script.js"></script>
<link rel="stylesheet" type="text/css" href="https://www.example.com/my-enhancementstyles.css">

If you encounter errors, ensure that your originating server is sending the correct MIME type and
encoding headers with the assets.
For example, the MIME and encoding type for remote scripts is application/
javascript;CHARSET=UTF-8.
The MIME and encoding type for remote stylesheets is text/css;CHARSET=UTF-8.

Track Your Variables
When building a custom template, you must add variables to it to represent the pieces of data that
might change from task to task, or worker to worker. If you're starting with one of the sample templates,
you need to make sure you're aware of the variables it already uses.
For example, for a custom template that integrates an Augmented AI human review loop with a
Amazon Textract text review task, {{ task.input.selectedAiServiceResponse.blocks }}
is used for initial-value input data. For Amazon Augmented AI (Amazon A2I) integration with
Amazon Rekognition , {{ task.input.selectedAiServiceResponse.moderationLabels }}
is used. For a custom task type, you need to determine the input parameter for your task type.
Use {{ task.input.customInputValuesForStartHumanLoop}} where you specify
customInputValuesForStartHumanLoop.

Custom Template Example for Amazon Textract
All custom templates begin and end with the <crowd-form> </crowd-form> elements. Like standard
HTML <form> elements, all of your form code should go between these elements.
For an Amazon Textract document analysis task, use the <crowd-textract-analyze-document>
element. It uses the following attributes:
• src – Speciﬁes the URL of the image ﬁle to be annotated.
• initialValue – Sets initial values for attributes found in the worker UI.
• blockTypes (required) – Determines the kind of analysis that the workers can do. Only
KEY_VALUE_SET is currently supported.
• keys (required) – Speciﬁes new keys and the associated text value that the worker can add.
• no-key-edit (required) – Prevents the workers from editing the keys of annotations passed through
initialValue.
• no-geometry-edit – Prevents workers from editing the polygons of annotations passed through
initialValue.
For children of the <crowd-textract-analyze-document> element, you must have two Regions. You
can use arbitrary HTML and CSS elements in these Regions.
• <full-instructions> – Instructions that are available from the View full instructions link in the
tool. You can leave this blank, but we recommend that you provide complete instructions to get better
results.
• <short-instructions> – A brief description of the task that appears in the tool's sidebar. You can
leave this blank, but we recommend that you provide complete instructions to get better results.

3289


An Amazon Textract template would look similar to the following.

Example

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.document.s3Object.bucket }}/
{{ task.input.aiServiceRequest.document.s3Object.name }}{% endcapture %}

<crowd-form>
  <crowd-textract-analyze-document
    src="{{ s3_uri | grant_read_access }}"
    initial-value="{{ task.input.selectedAiServiceResponse.blocks }}"
    header="Review the key-value pairs listed on the right and correct them if they don't match the following document."
    no-key-edit
    no-geometry-edit
    keys="{{ task.input.humanLoopContext.importantFormKeys }}"
    block-types="['KEY_VALUE_SET']"
  >
    <short-instructions header="Instructions">
      <style>
        .instructions {
          white-space: pre-wrap;
        }
        .instructionsImage {
          display: inline-block;
          max-width: 100%;
        }
      </style>
      <p class='instructions'>Choose a key-value block to highlight the corresponding key-value pair in the document.

      If it is a valid key-value pair, review the content for the value. If the content is incorrect, correct it.

      The text of the value is incorrect, correct it.
      <img class='instructionsImage' src="https://example-site/correct-value-text.png" />

      A wrong value is identified, correct it.
      <img class='instructionsImage' src="https://example-site/correct-value.png" />

      If it is not a valid key-value relationship, choose No.
      <img class='instructionsImage' src="https://example-site/not-a-key-value-pair.png" />

      If you can’t find the key in the document, choose Key not found.
      <img class='instructionsImage' src="https://example-site/key-is-not-found.png" />

      If the content of a field is empty, choose Value is blank.
      <img class='instructionsImage' src="https://example-site/value-is-blank.png" />

      <b>Examples</b>

      Key and value are often displayed next to or below to each other.
      <img class='instructionsImage' src="https://example-site/sample-key-value-pair-1.png" />

      Key and value displayed in one line.
      <img class='instructionsImage' src="https://example-site/sample-key-value-pair-2.png" />

      Key and value displayed in two lines.
      <img class='instructionsImage' src="https://example-site/sample-key-value-pair-2.png" />

      If the content of the value has multiple lines, enter all the text without a line break.
      Include all value text even if it extends beyond the highlight box.
      <img class='instructionsImage' src="https://assets.crowd.aws/images/a2i-console/multiple-lines.png" />
    </short-instructions>
</crowd-textract-analyze-document>
</crowd-form>
```
Create Custom Worker Task Templates

Custom Template Example for Amazon Rekognition

All custom templates begin and end with the `<crowd-form>` elements. Like standard HTML `<form>` elements, all of your form code should go between these elements. For an Amazon Rekognition custom task template, use the `<crowd-rekognition-detect-moderation-labels>` element. This element supports the following attributes:

- **categories** – An array of strings or an array of objects where each object has a `name` field.
  - If the categories come in as objects, the following applies:
    - The displayed categories are the value of the `name` field.
    - The returned answer contains the **full** objects of any selected categories.
  - If the categories come in as strings, the following applies:
    - The returned answer is an array of all the strings that were selected.
- **exclusion-category** – By setting this attribute, you create a button underneath the categories in the UI. When a user selects the button, all categories are deselected and disabled. If the worker selects the button again, you re-enable users to choose categories. If the worker submits the task by selecting **Submit** after you select the button, that task returns an empty array.

For children of the `<crowd-rekognition-detect-moderation-labels>` element, you must have two Regions.

- **<full-instructions>** – Instructions that are available from the **View full instructions** link in the tool. You can leave this blank, but we recommend that you provide complete instructions to get better results.
- **<short-instructions>** – Brief description of the task that appears in the tool's sidebar. You can leave this blank, but we recommend that you provide complete instructions to get better results.

A template using these elements would look similar to the following.

```html
<full-instructions header="Instructions"></full-instructions>
</crowd-teextract-analyze-document>
</crowd-form>

Custom Template Example for Amazon Rekognition

All custom templates begin and end with the `<crowd-form>` elements. Like standard HTML `<form>` elements, all of your form code should go between these elements. For an Amazon Rekognition custom task template, use the `<crowd-rekognition-detect-moderation-labels>` element. This element supports the following attributes:

- **categories** – An array of strings or an array of objects where each object has a `name` field.
  - If the categories come in as objects, the following applies:
    - The displayed categories are the value of the `name` field.
    - The returned answer contains the **full** objects of any selected categories.
  - If the categories come in as strings, the following applies:
    - The returned answer is an array of all the strings that were selected.
- **exclusion-category** – By setting this attribute, you create a button underneath the categories in the UI. When a user selects the button, all categories are deselected and disabled. If the worker selects the button again, you re-enable users to choose categories. If the worker submits the task by selecting **Submit** after you select the button, that task returns an empty array.

For children of the `<crowd-rekognition-detect-moderation-labels>` element, you must have two Regions.

- **<full-instructions>** – Instructions that are available from the **View full instructions** link in the tool. You can leave this blank, but we recommend that you provide complete instructions to get better results.
- **<short-instructions>** – Brief description of the task that appears in the tool's sidebar. You can leave this blank, but we recommend that you provide complete instructions to get better results.

A template using these elements would look similar to the following.

```html
<full-instructions header="Instructions"></full-instructions>
</crowd-teextract-analyze-document>
</crowd-form>
```
Create Custom Worker Task Templates

Review the image and choose all applicable categories. If no categories apply, choose None.

**Nudity**
Visuals depicting nude male or female person or persons

**Graphic Male Nudity**
Visuals depicting full frontal male nudity, often close ups

**Graphic Female Nudity**
Visuals depicting full frontal female nudity, often close ups

**Sexual Activity**
Visuals depicting various types of explicit sexual activities and pornography

**Illustrated Nudity or Sexual Activity**
Visuals depicting animated or drawn sexual activity, nudity, or pornography

**Adult Toys**
Visuals depicting adult toys, often in a marketing context

**Female Swimwear or Underwear**
Visuals depicting female person wearing only swimwear or underwear

**Male Swimwear Or Underwear**
Visuals depicting male person wearing only swimwear or underwear

**Partial Nudity**
Visuals depicting covered up nudity, for example using hands or pose

**Revealing Clothes**
Visuals depicting revealing clothes and poses, such as deep cut dresses

**Graphic Violence or Gore**
Visuals depicting prominent blood or bloody injuries

**Physical Violence**
Visuals depicting violent physical assault, such as kicking or punching

**Weapon Violence**
Visuals depicting violence using weapons like firearms or blades, such as shooting

**Weapons**
Visuals depicting weapons like firearms and blades

**Self Injury**
Visuals depicting self-inflicted cutting on the body, typically in distinctive patterns using sharp objects

**Emaciated Bodies**
Visuals depicting extremely malnourished human bodies

**Corpses**
Visuals depicting human dead bodies

**Hanging**
Visuals depicting death by hanging
Add Automation with Liquid

The custom template system uses Liquid for automation. Liquid is an open-source inline markup language. For more information and documentation, see the Liquid homepage.

In Liquid, the text between single curly braces and percent symbols is an instruction or tag that performs an operation like control flow or iteration. Text between double curly braces is a variable or object that outputs its value. The following list includes two types of liquid tags that you may find useful to automate template input data processing. If you select one of the following tag-types, you are redirected to the Liquid documentation.

- **Control flow**: Includes programming logic operators like if/else, unless, and case/when.
- **Iteration**: Enables you to run blocks of code repeatedly using statements like for loops.

For example, the following code example demonstrates how you can use the Liquid for tag to create a for loop. This example loops through the moderationLabels returned from Amazon Rekognition and displays the moderationLabels attributes name and parentName for workers to review:

```liquid
{% for label in task.input.selectedAiServiceResponse.moderationLabels %}
 { name: &quot;{{ label.name }}&quot;,
   parentName: &quot;{{ label.parentName }}&quot;,
 },
{% endfor %}
```

Use Variable Filters

In addition to the standard Liquid filters and actions, Amazon Augmented AI (Amazon A2I) offers additional filters. You apply filters by placing a pipe (|) character after the variable name, and then specifying a filter name. To chain filters, use the following format.

**Example**

```liquid
{{ <content> | <filter> | <filter> }}
```

Autoescape and Explicit Escape

By default, inputs are HTML-escaped to prevent confusion between your variable text and HTML. You can explicitly add the escape filter to make it more obvious to someone reading the source of your template that escaping is being done.

- **escape_once**

  escape_once ensures that if you've already escaped your code, it doesn't get re-escaped again. For example, it ensures that &amp; doesn't become &amp;amp;.

- **skip_autoescape**

  skip_autoescape is useful when your content is meant to be used as HTML. For example, you might have a few paragraphs of text and some images in the full instructions for a bounding box.

  **Note**

  Use skip_autoescape sparingly. As a best practice for templates, avoid passing in functional code or markup with skip_autoescape unless you are absolutely sure that you have strict control over what's being passed. If you're passing user input, you could be opening your workers up to a cross-site scripting attack.
to\_json

`to\_json` encodes data that you provide to JavaScript Object Notation (JSON). If you provide an object, it serializes it.

grant\_read\_access

grant\_read\_access takes an Amazon Simple Storage Service (Amazon S3) URI and encodes it into an HTTPS URL with a short-lived access token for that resource. This makes it possible to display photo, audio, or video objects stored in S3 buckets that are not otherwise publicly accessible to workers.

Example Example of the to\_json and grant\_read\_access filters

Input

```
auto-escape: {{ "Have you read 'James & the Giant Peach'?' }}
explicit escape: {{ "Have you read 'James & the Giant Peach'?' | escape }}
explicit escape_once: {{ "Have you read 'James & the Giant Peach'?' | escape_once }}
skip_autoescape: {{ "Have you read 'James & the Giant Peach'?' | skip_autoescape }}
to_json: {{ jsObject | to_json }}
grant_read_access: {{ "s3://examplebucket/myphoto.png" | grant_read_access }}
```

Output

```
auto-escape: Have you read 'James & the Giant Peach'?
explicit escape: Have you read 'James & the Giant Peach'?
explicit escape_once: Have you read 'James & the Giant Peach'?
skip_autoescape: Have you read 'James & the Giant Peach'?
to_json: { "point_number": 8, "coords": [ 59, 76 ] }
grant_read_access: https://s3.amazonaws.com/examplebucket/myphoto.png?<access token and other params>
```

Example Example of an automated classification template.

To automate this simple text classification sample, include the Liquid tag `{{ task.input.source }}`. This example uses the `crowd-classifier` (p. 710) element.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-classifier
    name="tweetFeeling"
    categories="['positive', 'negative', 'neutral', 'cannot determine']"
    header="Which term best describes this tweet?"
  >
    <classification-target>
      {{ task.input.source }}
    </classification-target>
  </crowd-classifier>

  <full-instructions header="Analyzing a sentiment">
    Try to determine the feeling the author of the tweet is trying to express.
    If none seems to match, choose "other."
  </full-instructions>

  <short-instructions>
    Pick the term that best describes the sentiment of the tweet.
  </short-instructions>
```

3294
Preview a Worker Task Template

To preview a custom worker task template, use the SageMaker RenderUiTemplate operation. You can use the RenderUiTemplate operation with the AWS CLI or your preferred AWS SDK. For documentation on the supported language specific SDKs for this API operation, see the See Also section of the RenderUiTemplate.

Prerequisites

To preview your worker task template, the AWS Identity and Access Management (IAM) role Amazon Resource Name (ARN), or RoleArn, that you use must have permission to access to the S3 objects that are used by the template. To learn how to configure your role or user see Enable Worker Task Template Previews (p. 3310).

To preview your worker task template using the RenderUiTemplate operation:

1. Provide a RoleArn of the role with required policies attached to preview your custom template.
2. In the Input parameter of Task, provide a JSON object that contains values for the variables defined in the template. These are the variables that are substituted for the task.input.source variable. For example, if you define a task.input.text variable in your template, you can supply the variable in the JSON object as text: sample text.
3. In the Content parameter of UiTemplate, insert your template.

Once you’ve configured RenderUiTemplate, use your preferred SDK or the AWS CLI to submit a request to render your template. If your request was successful, the response includes RenderedContent, a Liquid template that renders the HTML for the worker UI.

Important

To preview your template, you need an IAM role with permissions to read Amazon S3 objects that get rendered on your user interface. For a sample policy that you can attach to your IAM role to grant these permissions, see Enable Worker Task Template Previews (p. 3310).

Creating Good Worker Instructions

Creating good instructions for your human review jobs improves your worker's accuracy in completing their task. You can modify the default instructions that are provided in the console when creating a human review workflow, or you can use the console to create a custom worker template and include your instructions in this template. The instructions are shown to the worker on the UI page where they complete their labeling task.

Create Good Worker Instructions

There are three kinds of instructions in the Amazon Augmented AI console:

- **Task Description** – The description should provide a succinct explanation of the task.
- **Instructions** – These instructions are shown on the same webpage where workers complete a task. These instructions should provide an easy reference to show the worker the correct way to complete the task.
- **Additional Instructions** – These instructions are shown in a dialog box that appears when a worker chooses View full instructions. We recommend that you provide detailed instructions for completing the task, and include several examples showing edge cases and other difficult situations for labeling objects.
Add Example Images to Your Instructions

Images provide useful examples for your workers. To add a publicly accessible image to your instructions, do the following:

1. Place the cursor where the image should go in the instructions editor.
2. Choose the image icon in the editor toolbar.
3. Enter the URL of your image.

If your instruction image is in an S3 bucket that isn't publicly accessible, do the following:

- For the image URL, enter: `{{ 'https://s3.amazonaws.com/your-bucket-name/image-file-name' | grant_read_access }}`.

This renders the image URL with a short-lived, one-time access code that’s appended so the worker’s browser can display it. A broken image icon is displayed in the instructions editor, but previewing the tool displays the image in the rendered preview. See grant_read_access (p. 3294) for more information about the grant_read_access element.

Monitor and Manage Your Human Loop

Once you've started a human review loop, you can check the results of tasks sent to the loop and manage it using the Amazon Augmented AI Runtime API. Additionally, Amazon A2I integrates with Amazon EventBridge (also known as Amazon CloudWatch Events) to alert you when a human review loop status changes to Completed, Failed, or Stopped. This event delivery is guaranteed at least once, which means all events created when human loops finish are successfully delivered to EventBridge.

Use the procedures below to learn how to use the Amazon A2I Runtime API to monitor and manage your human loops. See Use Amazon CloudWatch Events in Amazon Augmented AI (p. 3311) to learn how Amazon A2I integrates with Amazon EventBridge.

To check your output data:

1. Check the results of your human loop by calling the DescribeHumanLoop operation. The result of this API operation contains information about the reason for and outcome of the loop activation.
2. Check the output data from your human loop in Amazon Simple Storage Service (Amazon S3). In the path to the data, `YYYY/MM/DD/hh/mm/ss` represents the human loop creation date with year (`YYYY`), month (`MM`), and day (`DD`), and the creation time with hour (`hh`), minute (`mm`), and second (`ss`).

    s3://customer-output-bucket-specified-in-flow-definition/flow-definition-name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json

You can integrate this structure with AWS Glue or Amazon Athena to partition and analyze your output data. For more information, see Managing Partitions for ETL Output in AWS Glue.

To learn more about Amazon A2I output data format, see Amazon A2I Output Data (p. 3297).

To stop and delete your human loop:

1. Once a human loop has been started, you can stop your human loop by calling the StopHumanLoop operation using the HumanLoopName. If a human loop was successfully stopped, the server sends back an HTTP 200 response.
2. To delete a human loop for which the status equals Failed, Completed, or Stopped, use the `DeleteHumanLoop` operation.

**To list human loops:**

1. You can list all active human loops by calling the `ListHumanLoops` operation. You can filter human loops by the creation date of the loop using the `CreationTimeAfter` and `CreateTimeBefore` parameters.
2. If successful, `ListHumanLoops` returns `HumanLoopSummaries` and `NextToken` objects in the response element. `HumanLoopSummaries` contains information about a single human loop. For example, it lists a loop's status and, if applicable, its failure reason.

   Use the string returned in `NextToken` as an input in a subsequent call to `ListHumanLoops` to see the next page of human loops.

### Amazon A2I Output Data

When your machine learning workflow sends Amazon A2I a data object, a human loop is created and human reviewers receive a task to review that data object. The output data from each human review task is stored in the Amazon Simple Storage Service (Amazon S3) output bucket you specify in your human review workflow. In the path to the data, `YYYY/MM/DD/hh/mm/ss` represents the human loop creation date with year (`YYYY`), month (`MM`), and day (`DD`), and the creation time with hour (`hh`), minute (`mm`), and second (`ss`).

```
s3://customer-output-bucket-specified-in-flow-definition/flow-definition-name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json
```

The content of your output data depends on the type of task type (built-in or custom) and the type of workforce you use. Your output data always includes the response from the human worker. Additionally, output data may include metadata about the human loop, the human reviewer (worker), and the data object.

Use the following sections to learn more about Amazon A2I output data format for different task types and workforces.

### Output Data From Built-In Task Types

Amazon A2I built-in task types include Amazon Textract and Amazon Rekognition. In addition to human responses, the output data from one of these tasks includes details about the reason the human loop was created and information about the integrated service used to create the human loop. Use the following table to learn more about the output data schema for all built-in task types. The value for each of these parameters depends on the service you use with Amazon A2I. Refer to the second table in this section for more information about these service-specific values.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value Type</th>
<th>Example Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>awsManagedHumanLoopRequestSource</code></td>
<td>String</td>
<td>AWS/Rekognition/DetectModerationLabels/Image/V3 or AWS/Textract/AnalyzeDocument/Forms/V1</td>
<td>The API operation and associated AWS services that requested that Amazon A2I create the human loop. This is the API operation you use to configure your workflow.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Value Type</td>
<td>Example Values</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>----------------</td>

Select a tab on the following table to learn about the task type–specific parameters and see an example output-data code block for each of the built-in task types.

Amazon Textract Task Type Output Data

When you use the Amazon Textract built-in integration, you see 'AWS/Textract/AnalyzeDocument/Forms/V1' as the value for awsManagedHumanLoopRequestSource in your output data.

The answerContent parameter contains a Block object that includes human responses for all blocks sent to Amazon A2I.

The aiServiceResponse parameter also includes a Block object with Amazon Textract's response to the original request sent using to AnalyzeDocument.

To learn more about the parameters you see in the block object, refer to Block in the Amazon Textract Developer Guide.

The following is an example of the output data from an Amazon A2I human review of Amazon Textract document analysis inferences.

```
{
   "awsManagedHumanLoopRequestSource": "AWS/Textract/AnalyzeDocument/Forms/V1",
   "humanAnswers": [
      {
         "answerContent": {
            "AWS/Textract/AnalyzeDocument/Forms/V1": {
               "blocks": [...]}
      }

                            "Mail Address:",
                            "Mail address:",
                            "Mailing address:"
                        ],
                        "KeyValueBlockConfidenceLessThan": 100,
                        "WordBlockConfidenceLessThan": 100
                    },
                    "ConditionType": "ImportantFormKeyConfidenceCheck",
                    "EvaluationResult": true
                }
            ]
        }
    ]
}
Amazon Rekognition Task Type Output Data

When you use the Amazon Textract built-in integration, you see the string 'AWS/Rekognition/DetectModerationLabels/Image/V3' as the value for awsManagedHumanLoopRequestSource in your output data.

The answerContent parameter contains a moderationLabels object that contains human responses for all moderation labels sent to Amazon A2I.

The aiServiceResponse parameter also includes a moderationLabels object with Amazon Rekognition's response to the original request sent to DetectModerationLabels.

To learn more about the parameters you see in the block object, refer to ModerationLabel in the Amazon Rekognition Developer Guide.

The following is an example of the output data from an Amazon A2I human review of Amazon Rekognition image moderation inferences.

```json
{
   "awsManagedHumanLoopRequestSource": "AWS/Rekognition/DetectModerationLabels/Image/V3",
   "humanAnswers": [
      {
         "answerContent": {
            "AWS/Rekognition/DetectModerationLabels/Image/V3": {
               "moderationLabels": [
               ]
            }
         },
         "submissionTime": "2020-09-28T19:22:35.508Z",
         "workerId": "ef7294f850a3d9d1",
         "workerMetadata": {
            "identityData": {
               "identityProviderType": "Cognito",
               "sub": "c6aa8eb7-9944-42e9-a6b9-111122223333"
            }
         }
      }
   ],
   "humanLoopName": "human-loop-name",
   "inputContent": {
      "aiServiceRequest": {
         "humanLoopConfig": {
            "blocks": [...]
         }
      }
   }
}
```
Output Data From Custom Task Types

When you add Amazon A2I to a custom human review workflow, you see the following parameters in the output data returned from human review tasks.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flowDefinitionArn</td>
<td>String</td>
<td>The Amazon Resource Number (ARN) of the human review workflow.</td>
</tr>
</tbody>
</table>

"humanLoopName": "human-loop-name",

"image": {
  "s3Object": {
    "bucket": "DOC-EXAMPLE-BUCKET1",
    "name": "example-image.jpg"
  }
},

"aiServiceResponse": {
  "moderationLabels": [],
  "moderationModelVersion": "3.0"
},

"humanTaskActivationConditionResults": {
  "Conditions": [
    {
      "EvaluationResult": true,
      "Or": [
        {
          "ConditionParameters": {
            "ConfidenceLessThan": 98,
            "ModerationLabelName": "Suggestive"
          },
          "ConditionType": "ModerationLabelConfidenceCheck",
          "EvaluationResult": true
        },
        {
          "ConditionParameters": {
            "ConfidenceGreaterThan": 98,
            "ModerationLabelName": "Female Swimwear Or Underwear"
          },
          "ConditionType": "ModerationLabelConfidenceCheck",
          "EvaluationResult": false
        }
      ]
    }
  ]
},

"selectedAiServiceResponse": {
  "moderationLabels": [
    {
      "confidence": 96.7122802734375,
      "name": "Suggestive",
      "parentName": ""
    }
  ],
  "moderationModelVersion": "3.0"
}
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow</td>
<td>workflow (flow definition) used to create the human loop.</td>
<td></td>
</tr>
<tr>
<td>humanAnswers</td>
<td>List of JSON objects</td>
<td>A list of JSON objects that contain worker responses in answerContent. The value in this parameter is determined by the output received from your worker task template. If you are using a private workforce, worker metadata is included. To learn more, see Track Worker Activity (p. 3305).</td>
</tr>
<tr>
<td>humanLoopName</td>
<td>String</td>
<td>The name of the human loop.</td>
</tr>
<tr>
<td>inputContent</td>
<td>JSON Object</td>
<td>The input content sent to Amazon A2I in the request to StartHumanLoop.</td>
</tr>
</tbody>
</table>

The following is an example of output data from a custom integration with Amazon A2I and Amazon Transcribe. In this example, the inputContent consists of:

- A path to an .mp4 file in Amazon S3 and the video title
- The transcription returned from Amazon Transcribe (parsed from Amazon Transcribe output data)
- A start and end time used by the worker task template to clip the .mp4 file and show workers a relevant portion of the video

```
{
    "humanAnswers": [
        {
            "answerContent": {
                "transcription": "use lambda to turn your notebook"
            },
            "submissionTime": "2020-06-18T17:08:26.246Z",
            "workerId": "ef7294f850a3d9d1",
            "workerMetadata": {
                "identityData": {
                    "identityProviderType": "Cognito",
                    "sub": "c6aa8eb7-9944-42e9-a6b9-111122223333"
                }
            }
        }
    ],
    "humanLoopName": "human-loop-name",
    "inputContent": {
        "audioPath": "s3://DOC-EXAMPLE-BUCKET1/a2i_transcribe_demo/Fully-Managed Notebook Instances with Amazon SageMaker - a Deep Dive.mp4",
        "end_time": 950.27,
        "original_words": "but definitely use Lambda to turn your ",
        "start_time": 948.51
    }
}
```
Track Worker Activity

Amazon A2I provides information that you can use to track individual workers in task output data. To identify the worker that worked on the human review task, use the following from the output data in Amazon S3:

- The `acceptanceTime` is the time that the worker accepted the task. The format of this date and time stamp is `YYYY-MM-DDTHH:MM:SS.mmmZ` for the year (YYYY), month (MM), day (DD), hour (HH), minute (MM), second (SS), and millisecond (mmm). The date and time are separated by a T.
- The `submissionTime` is the time that the worker submitted their annotations using the Submit button. The format of this date and time stamp is `YYYY-MM-DDTHH:MM:SS.mmmZ` for the year (YYYY), month (MM), day (DD), hour (HH), minute (MM), second (SS), and millisecond (mmm). The date and time are separated by a T.
- The `timeSpentInSeconds` reports the total time, in seconds, that a worker actively worked on that task. This metric does not include time when a worker paused or took a break.
- The `workerId` is unique to each worker.
- If you use a private workforce, in `workerMetadata`, you see the following.
  - The `identityProviderType` is the service used to manage the private workforce.
  - The `issuer` is the Amazon Cognito user pool or OpenID Connect (OIDC) Identity Provider (IdP) issuer associated with the work team assigned to this human review task.
  - A unique `sub` identifier refers to the worker. If you create a workforce using Amazon Cognito, you can retrieve details about this worker (such as the name or user name) associated with this ID using Amazon Cognito. To learn how, see Managing and Searching for User Accounts in Amazon Cognito Developer Guide.

The following is an example of the output you may see if you use Amazon Cognito to create a private workforce. This is identified in the `identityProviderType`.

```json
"submissionTime": "2020-12-28T18:59:58.321Z",
"acceptanceTime": "2020-12-28T18:59:15.191Z",
"timeSpentInSeconds": 40.543,
"workerId": "a12b3defg4h5i67",
"workerMetadata": {
  "identityData": {
    "identityProviderType": "Cognito",
    "sub": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee"
  }
}
```

The following is an example of the output you may see if you use your own OIDC IdP to create a private workforce:

```json
"workerMetadata": {
  "identityData": {
    "identityProviderType": "Oidc",
    "issuer": "https://example-oidc-ipd.com/adfs",
    "sub": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee"
  }
}
```
To learn more about using private workforces, see Use a Private Workforce (p. 676).

Permissions and Security in Amazon Augmented AI

When using Amazon Augmented AI (Amazon A2I) to create a human review workflow for your ML/AI application, you create and configure resources in Amazon SageMaker such as a human workforce and worker task templates. To configure and start a human loop, you either integrate Amazon A2I with other AWS services such as Amazon Textract or Amazon Rekognition, or use the Amazon Augmented AI Runtime API. To create a human review workflow and start a human loop, you must attach certain policies to your AWS Identity and Access Management (IAM) role or user. Specifically:

- When you start a human loop using image input data on or after January 12th, 2020, you must add a CORS header policy to the Amazon S3 bucket that contains your input data. See CORS Permission Requirement (p. 3307) to learn more.
- When you create a flow definition, you need to provide a role that grants Amazon A2I permission to access Amazon S3 both for reading objects that are rendered in a human task UI and for writing the results of the human review.

This role must also have a trust policy attached to give SageMaker permission to assume the role. This allows Amazon A2I to perform actions in accordance with permissions that you attach to the role.

See Add Permissions to the IAM Role Used to Create a Flow Definition (p. 3307) for example policies that you can modify and attach to the role you use to create a flow definition. These are the policies that are attached to the IAM role that is created in the Human review workflows section of the Amazon A2I area of the SageMaker console.

- To create and start human loops, you either use an API operation from a built-in task type (such as DetectModerationLabel or AnalyzeDocument) or the Amazon A2I Runtime API operation StartHumanLoop in a custom ML application. You need to attach the AmazonAugmentedAIFullAccess managed policy to the IAM user that invokes these API operations to grant permission to these services to use Amazon A2I operations. To learn how, see Create an IAM User That Can Invoke Amazon A2I API Operations (p. 3309).

This policy does not grant permission to invoke the API operations of the AWS service associated with built-in task types. For example, AmazonAugmentedAIFullAccess does not grant permission to call the Amazon Rekognition DetectModerationLabel API operation or Amazon Textract AnalyzeDocument API operation. You can use the more general policy, AmazonAugmentedAI IntegratedAPIAccess, to grant these permissions. For more information, see Create an IAM User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations (p. 3309). This is a good option when you want to grant an IAM user broad permissions to use Amazon A2I and integrated AWS services’ API operations.

If you want to configure more granular permissions, see Amazon Rekognition Identity-Based Policy Examples and Amazon Textract Identity-Based Policy Examples for identity-based policies you can use to grant permission to use these individual services.

- To preview your custom worker task UI template, you need an IAM role with permissions to read Amazon S3 objects that get rendered on your user interface. See a policy example in Enable Worker Task Template Previews (p. 3310).

Topics

- CORS Permission Requirement (p. 3307)
- Add Permissions to the IAM Role Used to Create a Flow Definition (p. 3307)
- Create an IAM User That Can Invoke Amazon A2I API Operations (p. 3309)
- Create an IAM User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations (p. 3309)
CORS Permission Requirement

Earlier in 2020, widely used browsers like Chrome and Firefox changed their default behavior for rotating images based on image metadata, referred to as EXIF data. Previously, images would always display in browsers exactly how they are stored on disk, which is typically unrotated. After the change, images now rotate according to a piece of image metadata called orientation value. This has important implications for the entire machine learning (ML) community. For example, if the EXIF orientation is not considered, applications that are used to annotate images may display images in unexpected orientations and result in incorrect labels.

Starting with Chrome 89, AWS can no longer automatically prevent the rotation of images because the web standards group W3C has decided that the ability to control rotation of images violates the web’s Same-Origin Policy. Therefore, to ensure human workers annotate your input images in a predictable orientation when you submit requests to create a human loop, you must add a CORS header policy to the S3 buckets that contain your input images.

Important
If you do not add a CORS configuration to the S3 buckets that contains your input data, human review tasks for those input data objects fail.

You can add a CORS policy to an S3 bucket that contains input data in the Amazon S3 console. To set the required CORS headers on the S3 bucket that contains your input images in the S3 console, follow the directions detailed in How do I add cross-domain resource sharing with CORS?. Use the following CORS configuration code for the buckets that host your images. If you use the Amazon S3 console to add the policy to your bucket, you must use the JSON format.

**JSON**

```
[
    "AllowedHeaders": [],
    "AllowedMethods": ["GET"],
    "AllowedOrigins": ["*"]
]
```

**XML**

```
<CORSConfiguration>
    <CORSRule>
        <AllowedOrigin>*</AllowedOrigin>
        <AllowedMethod>GET</AllowedMethod>
    </CORSRule>
</CORSConfiguration>
```

Add Permissions to the IAM Role Used to Create a Flow Definition

To create a flow definition, attach the policies in this section to the role that you use when creating a human review workflow in the SageMaker console, or when using the CreateFlowDefinition API operation.
Add Permissions to the IAM Role
Used to Create a Flow Definition

- If you are using the console to create a human review workflow, enter the role Amazon Resource Name (ARN) in the IAM role field when creating a human review workflow in the console.
- When creating a flow definition using the API, attach these policies to the role that is passed to the RoleArn parameter of the CreateFlowDefinition operation.

When you create a human review workflow (flow definition), Amazon A2I invokes Amazon S3 to complete your task. To grant Amazon A2I permission to retrieve and store your files in your Amazon S3 bucket, create the following policy and attach it to your role. For example, if the images, documents, and other files that you are sending for human review are stored in an S3 bucket named my_input_bucket, and if you want the human reviews to be stored in a bucket named my_output_bucket, create the following policy.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": ["s3:GetObject"],
      "Resource": [
        "arn:aws:s3:::my_input_bucket/*"
      ]
    },
    {
      "Effect": "Allow",
      "Action": ["s3:PutObject"],
      "Resource": [
        "arn:aws:s3:::my_output_bucket/*"
      ]
    }
  ]
}
```

In addition, the IAM role must have the following trust policy to give SageMaker permission to assume the role. To learn more about IAM trust policies, see Resource-Based Policies section of Policies and Permissions in the AWS Identity and Access Management documentation.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "AllowSageMakerToAssumeRole",
      "Effect": "Allow",
      "Principal": {
        "Service": "sagemaker.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

For more information about creating and managing IAM roles and policies, see the following topics in the AWS Identity and Access Management User Guide:

- To create an IAM role, see Creating a Role to Delegate Permissions to an IAM User.
- To learn how to create IAM policies, see Creating IAM Policies.
Create an IAM User That Can Invoke Amazon A2I API Operations

To use Amazon A2I to create and start human loops for Amazon Rekognition, Amazon Textract, or the Amazon A2I runtime API, you must use an IAM user that has permissions to invoke Amazon A2I operations. To do this, use the IAM console to attach the `AmazonAugmentedAIFullAccess` managed policy to a new or existing IAM user.

This policy grants permission to an IAM user to invoke API operations from the SageMaker API for flow definition creation and management and the Amazon Augmented AI Runtime API for human loop creation and management. To learn more about these API operations, see Use APIs in Amazon Augmented AI.

`AmazonAugmentedAIFullAccess` does not grant permissions to use Amazon Rekognition or Amazon Textract API operations.

**Note**

You can also attach the `AmazonAugmentedAIFullAccess` policy to an IAM role that is used to create and start a human loop.

**To create the required IAM user**

2. Choose **Users** and choose an existing user, or create a new user by choosing **Add user**. To learn how to create a new user, see Creating an IAM User in Your AWS Account in the AWS Identity and Access Management User Guide.

   - If you chose to attach the policy to an existing user, choose **Add permissions**.
   - While creating a new user, follow the next step on the **Set permissions** page.
3. Choose **Attach existing policies directly**.
4. In the **Search** bar, enter `AmazonAugmentedAIFullAccess` and check the box next to that policy.

   To enable this IAM user to create a flow definition with the public work team, also attach the `AmazonSageMakerMechanicalTurkAccess` managed policy.

5. After attaching the policy or policies:
   a. If you are using an existing user, choose **Next: Review**, and then choose **Add permissions**.
   b. If you are creating a new user, choose **Next: Tags** and complete the process of creating your user.

For more information, see Adding and Removing IAM Identity Permissions in the AWS Identity and Access Management User Guide.

Create an IAM User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations

To create an IAM user that has permission to invoke the API operations used by the built-in task types (that is, `DetectModerationLabels` for Amazon Rekognition and `AnalyzeDocument` for Amazon Textract), use the following steps:

2. Choose **Users** and choose an existing user, or create a new user by choosing **Add user**. To learn how to create a new user, see Creating an IAM User in Your AWS Account in the AWS Identity and Access Management User Guide.

   - If you chose to attach the policy to an existing user, choose **Add permissions**.
   - While creating a new user, follow the next step on the **Set permissions** page.
3. Choose **Attach existing policies directly**.
4. In the **Search** bar, enter `AmazonAugmentedAIFullAccess` and check the box next to that policy.

   To enable this IAM user to create a flow definition with the public work team, also attach the `AmazonSageMakerMechanicalTurkAccess` managed policy.

5. After attaching the policy or policies:
   a. If you are using an existing user, choose **Next: Review**, and then choose **Add permissions**.
   b. If you are creating a new user, choose **Next: Tags** and complete the process of creating your user.

For more information, see Adding and Removing IAM Identity Permissions in the AWS Identity and Access Management User Guide.
Enable Worker Task Template Previews

To customize the interface and instructions that your workers see when working on your tasks, you create a worker task template. You can create the template using the `CreateHumanTaskUi` operation or the SageMaker console.

To preview your template, you need an IAM role with the following permissions to read Amazon S3 objects that get rendered on your user interface.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": ["s3:GetObject"],
            "Resource": ["arn:aws:s3:::my_input_bucket/*"]
        }
    ]
}
```
For Amazon Rekognition and Amazon Textract task types, you can preview your template using the Amazon Augmented AI section of the SageMaker console. For custom task types, you preview your template by invoking the `RenderUiTemplate` operation. To preview your template, follow the instructions for your task type:

- Amazon Rekognition and Amazon Textract task types – In the SageMaker console, use the role's Amazon Resource Name (ARN) in the procedure documented in Create a Worker Task Template (p. 3287).
- Custom task types – In the `RenderUiTemplate` operation, use the role's ARN in the `RoleArn` parameter.

### Using Amazon A2I with AWS KMS Encrypted Buckets

If you specify an AWS Key Management Service (AWS KMS) customer managed key to encrypt output data in `OutputConfig` of `CreateFlowDefinition`, you must add an IAM policy similar to the following to that key. This policy gives the IAM execution role that you use to create your human loops permission to use this key to perform all of the actions listed in "Action". To learn more about these actions, see AWS KMS permissions in the AWS Key Management Service Developer Guide.

To use this policy, replace the IAM service-role ARN in "Principal" with the ARN of the execution role you use to create the human review workflow (flow definition). When you create a labeling job using `CreateFlowDefinition`, this is the ARN you specify for `RoleArn`. Note that you cannot provide a `KmsKeyId` when you create a flow definition in the console.

```json
{
    "Sid": "AllowUseOfKmsKey",
    "Effect": "Allow",
    "Principal": {
        "AWS": "arn:aws:iam::111122223333:role/service-role/example-role"
    },
    "Action": [
        "kms:Encrypt",
        "kms:Decrypt",
        "kms:ReEncrypt",
        "kms:GenerateDataKey",
        "kms:DescribeKey"
    ],
    "Resource": "*
}
```

### Additional Permissions and Security Resources

- the section called “Control Access to SageMaker Resources by Using Tags” (p. 3367).
- the section called “SageMaker Identity-Based Policies” (p. 3344)
- the section called “Control Creation of SageMaker Resources with Condition Keys” (p. 3357)
- the section called “Amazon SageMaker API Permissions Reference” (p. 3393)
- Security (p. 3333)

### Use Amazon CloudWatch Events in Amazon Augmented AI

Amazon Augmented AI uses Amazon CloudWatch Events to alert you when a human review loop status changes to Completed, Failed, or Stopped. This event delivery is guaranteed at least once, which
means all events created when human loops finish are successfully delivered to CloudWatch Events (Amazon EventBridge). When a review loop changes to one of these states, Augmented AI sends an event to CloudWatch Events similar to the following.

```
{
  "version": "0",
  "id": "12345678-1111-2222-3333-12345EXAMPLE",
  "detail-type": "SageMaker A2I HumanLoop Status Change",
  "source": "aws.sagemaker",
  "account": "1111111111111",
  "time": "2019-11-14T17:49:25Z",
  "region": "us-east-1",
  "resources": ["arn:aws:sagemaker:us-east-1:111111111111:human-loop/humanloop-nov-14-1"],
  "detail":{
    "creationTime": "2019-11-14T17:37:36.740Z",
    "failureCode": null,
    "failureReason": null,
    "flowDefinitionArn": "arn:aws:sagemaker:us-east-1:111111111111:flow-definition/flowdef-nov-12",
    "humanLoopName": "humanloop-nov-14-1",
    "humanLoopOutput":{
      "outputS3Uri": "s3://customer-output-bucket-specified-in-flow-definition/flowdef-nov-12/2019/11/14/17/37/36/humanloop-nov-14-1/output.json"
    },
    "humanLoopStatus": "Completed"
  }
}
```

The details in the JSON output include the following:

creationTime

The timestamp when Augmented AI created the human loop.

failureCode

A failure code denoting a specific type of failure.

failureReason

The reason why a human loop has failed. The failure reason is only returned when the human review loop status is failed.

flowDefinitionArn

The Amazon Resource Name (ARN) of the flow definition, or human review workflow.

humanLoopArn

The Amazon Resource Name (ARN) of the human loop.

humanLoopName

The name of the human loop.

humanLoopOutput

An object containing information about the output of the human loop.

outputS3Uri

The location of the Amazon S3 object where Augmented AI stores your human loop output.
humanLoopStatus

The status of the human loop.

Send Events from Your Human Loop to CloudWatch Events

To configure a CloudWatch Events rule to get status updates, or events, for your Amazon A2I human loops, use the AWS Command Line Interface (AWS CLI) put-rule command. When using the put-rule command, specify the following to receive human loop statuses:

• "source": ["aws.sagemaker"]
• "detail-type": ["SageMaker A2I HumanLoop Status Change"]

To configure a CloudWatch Events rule to watch for all status changes, use the following command and replace the placeholder text. For example, replace "A2IHumanLoopStatusChanges" with a unique CloudWatch Events rule name and "arn:aws:iam::111122223333:role/MyRoleForThisRule" with the Amazon Resource Number (ARN) of an IAM role with an events.amazonaws.com trust policy attached. Replace region with the AWS Region in which you want to create the rule.

```bash
aws events put-rule --name "A2IHumanLoopStatusChanges"
   --event-pattern "{"source": ["aws.sagemaker"], "detail-type": ["SageMaker A2I HumanLoop Status Change"]}"
   --role-arn "arn:aws:iam::111122223333:role/MyRoleForThisRule"
   --region "region"
```

To learn more about the put-rule request, see Event Patterns in CloudWatch Events in the Amazon CloudWatch Events User Guide.

Set Up a Target to Process Events

To process events, you need to set up a target. For example, if you want to receive an email when a human loop status changes, use a procedure in Setting Up Amazon SNS Notifications in the Amazon CloudWatch User Guide to set up an Amazon SNS topic and subscribe your email to it. Once you have created a topic, you can use it to create a target.

To add a target to your CloudWatch Events rule

1. Open the CloudWatch console: https://console.aws.amazon.com/cloudwatch/home
2. In the navigation pane, choose Rules.
3. Choose the rule to which you want to add a target.
4. Choose Actions, and then choose Edit.
5. Under Targets, choose Add Target and choose the AWS service you want to act when a human loop status change event is detected.
6. Configure your target. For instructions, see the topic for configuring a target in the AWS documentation for that service.
7. Choose Configure details.
8. For Name, enter a name and, optionally, provide details about the purpose of the rule in Description.
9. Make sure that the check box next to State is selected so that your rule is listed as Enabled.
10. Choose Update rule.
Use Human Review Output

After you receive human review results, you can analyze the results and compare them to machine learning predictions. The JSON that is stored in the Amazon S3 bucket contains both the machine learning predictions and the human review results.

More Information

Automating Amazon SageMaker with Amazon EventBridge (p. 3514)

Use APIs in Amazon Augmented AI

You can create a human review workflow or a worker task template programmatically. The APIs you use depend on whether you are creating a Amazon Rekognition, Amazon Textract, or custom task type. This topic provides links to API reference documentation for each task type and programming task.

The following APIs can be used with Augmented AI:

Amazon Augmented AI

Use the Augmented AI API to start, stop, and delete human review loops. You can also list all human review loops and return information about human review loops in your account.

Learn more about human review loop APIs in the Amazon Augmented AI Runtime API Reference.

Amazon Rekognition

Use the HumanLoopConfig parameter of the DetectModerationLabels API to initiate a human review workflow using Amazon Rekognition.

Amazon SageMaker

Use the Amazon SageMaker API to create a FlowDefinition, also known as a human review workflow. You can also create a HumanTaskUi or worker task template.

For more information, see the CreateFlowDefinition or the CreateHumanTaskUi API documentation.

Amazon Textract

Use the HumanLoopConfig parameter of the AnalyzeDocument API to initiate a human review workflow using Amazon Textract.

Programmatic Tutorials

The following tutorials provide example code and step-by-step instructions for creating human review workflows and worker task templates programmatically.

- Tutorial: Get Started Using the Amazon A2I API (p. 3241)
- Create a Human Review Workflow (API) (p. 3262)
- Create and Start a Human Loop (p. 3278)
- Using Amazon Augmented AI with Amazon Rekognition in the Amazon Rekognition Developer Guide
- Using Amazon Augmented AI with Amazon Textract AnalyzeDocument in the Amazon Textract Developer Guide
Buy and Sell Amazon SageMaker Algorithms and Models in AWS Marketplace

Amazon SageMaker integrates with AWS Marketplace, enabling developers to charge other SageMaker users for the use of their algorithms and model packages. AWS Marketplace is a curated digital catalog that makes it easy for customers to find, buy, deploy, and manage third-party software and services that customers need to build solutions and run their businesses. AWS Marketplace includes thousands of software listings in popular categories, such as security, networking, storage, machine learning, business intelligence, database, and DevOps. It simplifies software licensing and procurement with flexible pricing options and multiple deployment methods.

For information, see AWS Marketplace Documentation.

Topics

- SageMaker Algorithms (p. 3315)
- SageMaker Model Packages (p. 3315)
- Sell Amazon SageMaker Algorithms and Model Packages (p. 3329)
- Find and Subscribe to Algorithms and Model Packages on AWS Marketplace (p. 3332)
- Use Algorithm and Model Package Resources (p. 3322)

SageMaker Algorithms

An algorithm enables you to perform end-to-end machine learning. It has two logical components: training and inference. Buyers can use the training component to create training jobs in SageMaker and build a machine learning model. SageMaker saves the model artifacts generated by the algorithm during training to an Amazon S3 bucket. For more information, see Train a Model with Amazon SageMaker (p. 9).

Buyers use the inference component with the model artifacts generated during a training job to create a deployable model in their SageMaker account. They can use the deployable model for real-time inference by using SageMaker hosting services. Or, they can get inferences for an entire dataset by running batch transform jobs. For more information, see Deploy a Model in Amazon SageMaker (p. 11).

SageMaker Model Packages

Buyers use a model package to build a deployable model in SageMaker. They can use the deployable model for real-time inference by using SageMaker hosting services. Or, they can get inferences for an entire dataset by running batch transform jobs. For more information, see Deploy a Model in Amazon SageMaker (p. 11). As a seller, you can build your model artifacts by training in SageMaker, or you can use your own model artifacts from a model that you trained outside of SageMaker. You can charge buyers for inference.
Use your own algorithms and models with the AWS Marketplace

The following sections show how to create algorithm and model package resources that you can use locally and publish to the AWS Marketplace.

Topics
- Create Algorithm and Model Package Resources (p. 3316)
- Use Algorithm and Model Package Resources (p. 3322)

Create Algorithm and Model Package Resources

After your training and/or inference code is packaged in Docker containers, create algorithm and model package resources that you can use in your Amazon SageMaker account and, optionally, publish on AWS Marketplace.

Topics
- Create an Algorithm Resource (p. 3316)
- Create a Model Package Resource (p. 3319)

Create an Algorithm Resource

To create an algorithm resource that you can use to run training jobs in Amazon SageMaker and publish on AWS Marketplace specify the following information:

- The Docker containers that contains the training and, optionally, inference code.
- The configuration of the input data that your algorithm expects for training.
- The hyperparameters that your algorithm supports.
- Metrics that your algorithm sends to Amazon CloudWatch during training jobs.
- The instance types that your algorithm supports for training and inference, and whether it supports distributed training across multiple instances.
- Validation profiles, which are training jobs that SageMaker uses to test your algorithm's training code and batch transform jobs that SageMaker runs to test your algorithm's inference code.

To ensure that buyers and sellers can be confident that products work in SageMaker, we require that you validate your algorithms before listing them on AWS Marketplace. You can list products in the AWS Marketplace only if validation succeeds. To validate your algorithms, SageMaker uses your validation profile and sample data to run the following validations tasks:

1. Create a training job in your account to verify that your training image works with SageMaker.
2. If you included inference code in your algorithm, create a model in your account using the algorithm's inference image and the model artifacts produced by the training job.
3. If you included inference code in your algorithm, create a transform job in your account using the model to verify that your inference image works with SageMaker.

When you list your product on AWS Marketplace, the inputs and outputs of this validation process persist as part of your product and are made available to your buyers. This helps buyers understand and evaluate the product before they buy it. For example, buyers can inspect the input data that you used, the outputs generated, and the logs and metrics emitted by your code. The more comprehensive your validation specification, the easier it is for customers to evaluate your product.
Note
In your validation profile, provide only data that you want to expose publicly.

Validation can take up to a few hours. To see the status of the jobs in your account, in the SageMaker console, see the Training jobs and Transform jobs pages. If validation fails, you can access the scan and validation reports from the SageMaker console. If any issues are found, you will have to create the algorithm again.

Note
To publish your algorithm on AWS Marketplace, at least one validation profile is required.

You can create an algorithm by using either the SageMaker console or the SageMaker API.

Topics
• Create an Algorithm Resource (Console) (p. 3317)
• Create an Algorithm Resource (API) (p. 3319)

Create an Algorithm Resource (Console)

To create an algorithm resource (console)

2. From the left menu, choose Training.
3. From the dropdown menu, choose Algorithms, then choose Create algorithm.
4. On the Training specifications page, provide the following information:
   a. For Algorithm name, type a name for your algorithm. The algorithm name must be unique in your account and in the AWS region. The name must have 1 to 64 characters. Valid characters are a-z, A-Z, 0-9, and - (hyphen).
   b. Type a description for your algorithm. This description appears in the SageMaker console and in the AWS Marketplace.
   c. For Training image, type the path in Amazon ECR where your training container is stored.
   d. For Support distributed training, Choose Yes if your algorithm supports training on multiple instances. Otherwise, choose No.
   e. For Support instance types for training, choose the instance types that your algorithm supports.
   f. For Channel specification, specify up to 8 channels of input data for your algorithm. For example, you might specify 3 input channels named train, validation, and test. For each channel, specify the following information:
      i. For Channel name, type a name for the channel. The name must have 1 to 64 characters. Valid characters are a-z, A-Z, 0-9, and - (hyphen).
      ii. To require the channel for your algorithm, choose Channel required.
      iii. Type a description for the channel.
      iv. For Supported input modes, choose Pipe mode if your algorithm supports streaming the input data, and File mode if your algorithm supports downloading the input data as a file. You can choose both.
      v. For Supported content types, type the MIME type that your algorithm expects for input data.
      vi. For Supported compression type, choose Gzip if your algorithm supports Gzip compression. Otherwise, choose None.
vii. Choose Add channel to add another data input channel, or choose Next if you are done adding channels.

5. On the Tuning specifications page, provide the following information:

   a. For Hyperparameter specification, specify the hyperparameters that your algorithm supports by editing the JSON object. For each hyperparameter that your algorithm supports, construct a JSON block similar to the following:

   
   ```json
   {
   "DefaultValue": "5",
   "Description": "The first hyperparameter",
   "IsRequired": true,
   "IsTunable": false,
   "Name": "intRange",
   "Range": {
   "IntegerParameterRangeSpecification": {
   "MaxValue": "10",
   "MinValue": "1"
   },
   "Type": "Integer"
   }
   }
   ``

   In the JSON, supply the following:

   i. For DefaultValue, specify a default value for the hyperparameter, if there is one.
   ii. For Description, specify a description for the hyperparameter.
   iii. For IsRequired, specify whether the hyperparameter is required.
   iv. For IsTunable, specify true if this hyperparameter can be tuned when a user runs a hyperparameter tuning job that uses this algorithm. For information, see Perform Automatic Model Tuning with SageMaker (p. 2360).
   v. For Name, specify a name for the hyperparameter.
   vi. For Range, specify one of the following:
      - IntegerParameterRangeSpecification - the values of the hyperparameter are integers. Specify minimum and maximum values for the hyperparameter.
      - ContinuousParameterRangeSpecification - the values of the hyperparameter are floating-point values. Specify minimum and maximum values for the hyperparameter.
      - CategoricalParameterRangeSpecification - the values of the hyperparameter are categorical values. Specify a list of all of the possible values.
   vii. For Type, specify Integer, Continuous, or Categorical. The value must correspond to the type of Range that you specified.

   b. For Metric definitions, specify any training metrics that you want your algorithm to emit. SageMaker uses the regular expression that you specify to find the metrics by parsing the logs from your training container during training. Users can view these metrics when they run training jobs with your algorithm, and they can monitor and plot the metrics in Amazon CloudWatch. For information, see Monitor and Analyze Training Jobs Using Amazon CloudWatch Metrics (p. 2612). For each metric, provide the following information:

   i. For Metric name, type a name for the metric.
   ii. For Regex, type the regular expression that SageMaker uses to parse training logs so that it can find the metric value.
   iii. For Objective metric support choose Yes if this metric can be used as the objective metric for a hyperparameter tuning job. For information, see Perform Automatic Model Tuning with SageMaker (p. 2360).
iv. Choose Add metric to add another metric, or choose Next if you are done adding metrics.

6. On the **Inference specifications** page, provide the following information if your algorithm supports inference:
   a. For **Location of inference image**, type the path in Amazon ECR where your inference container is stored.
   b. For **Container DNS host name**, type the name of a DNS host for your image.
   c. For **Supported instance types for real-time inference**, choose the instance types that your algorithm supports for models deployed as hosted endpoints in SageMaker. For information, see *Deploy Models for Inference* (p. 2619).
   d. For **Supported instance types for batch transform jobs**, choose the instance types that your algorithm supports for batch transform jobs. For information, see *Use Batch Transform* (p. 2807).
   e. For **Supported content types**, type the type of input data that your algorithm expects for inference requests.
   f. For **Supported response MIME types**, type the MIME types that your algorithm supports for inference responses.
   g. Choose Next.

7. On the **Validation specifications** page, provide the following information:
   a. For **Publish this algorithm on AWS Marketplace**, choose Yes to publish the algorithm on AWS Marketplace.
   b. For **Validate this resource**, choose Yes if you want SageMaker to run training jobs and/or batch transform jobs that you specify to test the training and/or inference code of your algorithm.  
      
      **Note**  
      To publish your algorithm on AWS Marketplace, your algorithm must be validated.
   c. For **IAM role**, choose an IAM role that has the required permissions to run training jobs and batch transform jobs in SageMaker, or choose *Create a new role* to allow SageMaker to create a role that has the AmazonSageMakerFullAccess managed policy attached. For information, see *SageMaker Roles* (p. 3375).
   d. For **Validation profile**, specify the following:
      
      • A name for the validation profile.
      • A **Training job definition**. This is a JSON block that describes a training job. This is in the same format as the TrainingJobDefinition input parameter of the *CreateAlgorithm* API.
      • A **Transform job definition**. This is a JSON block that describes a batch transform job. This is in the same format as the TransformJobDefinition input parameter of the *CreateAlgorithm* API.
   e. Choose Create algorithm.

**Create an Algorithm Resource (API)**

To create an algorithm resource by using the SageMaker API, call the *CreateAlgorithm* API.

**Create a Model Package Resource**

To create a model package resource that you can use to create deployable models in Amazon SageMaker and publish on AWS Marketplace specify the following information:

• The Docker container that contains the inference code, or the algorithm resource that was used to train the model.
• The location of the model artifacts. Model artifacts can either be packaged in the same Docker container as the inference code or stored in Amazon S3.
• The instance types that your model package supports for both real-time inference and batch transform jobs.
• Validation profiles, which are batch transform jobs that SageMaker runs to test your model package's inference code.

Before listing model packages on AWS Marketplace, you must validate them. This ensures that buyers and sellers can be confident that products work in Amazon SageMaker. You can list products on AWS Marketplace only if validation succeeds.

The validation procedure uses your validation profile and sample data to run the following validations tasks:
1. Create a model in your account using the model package's inference image and the optional model artifacts that are stored in Amazon S3.

   **Note**
   A model package is specific to the region in which you create it. The S3 bucket where the model artifacts are stored must be in the same region where your created the model package.

2. Create a transform job in your account using the model to verify that your inference image works with SageMaker.
3. Create a validation profile.

   **Note**
   In your validation profile, provide only data that you want to expose publicly.

Validation can take up to a few hours. To see the status of the jobs in your account, in the SageMaker console, see the **Transform jobs** pages. If validation fails, you can access the scan and validation reports from the SageMaker console. After fixing issues, recreate the algorithm. When the status of the algorithm is **COMPLETED**, find it in the SageMaker console and start the listing process.

   **Note**
   To publish your model package on AWS Marketplace, at least one validation profile is required.

You can create an model package either by using the SageMaker console or by using the SageMaker API.

**Topics**
- Create a Model Package Resource (Console) (p. 3320)
- Create a Model Package Resource (API) (p. 3322)

**Create a Model Package Resource (Console)**

**To create a model package in the SageMaker console:**

2. From the left menu, choose **Inference**.
3. Choose **Marketplace model packages**, then choose **Create marketplace model package**.
4. On the **Inference specifications** page, provide the following information:
   a. For **Model package name**, type a name for your model package. The model package name must be unique in your account and in the AWS region. The name must have 1 to 64 characters. Valid characters are a-z, A-Z, 0-9, and - (hyphen).
b. Type a description for your model package. This description appears in the SageMaker console and in the AWS Marketplace.

c. For Inference specification options, choose Provide the location of the inference image and model artifacts to create a model package by using an inference container and model artifacts. Choose Provide the algorithm used for training and its model artifacts to create a model package from an algorithm resource that you created or subscribe to from AWS Marketplace.

d. If you chose Provide the location of the inference image and model artifacts for Inference specification options, provide the following information for Container definition and Supported resources:

   i. For Location of inference image, type the path to the image that contains your inference code. The image must be stored as a Docker container in Amazon ECR.

   ii. For Location of model data artifacts, type the location in S3 where your model artifacts are stored.

   iii. For Container DNS host name, type the name of the DNS host to use for your container.

   iv. For Supported instance types for real-time inference, choose the instance types that your model package supports for real-time inference from SageMaker hosted endpoints.

   v. For Supported instance types for batch transform jobs, choose the instance types that your model package supports for batch transform jobs.

   vi. Supported content types, type the content types that your model package expects for inference requests.

   vii. For Supported response MIME types, type the MIME types that your model package uses to provide inferences.

   e. If you chose Provide the algorithm used for training and its model artifacts for Inference specification options, provide the following information:

   i. For Algorithm ARN, type the Amazon Resource Name (ARN) of the algorithm resource to use to create the model package.

   ii. For Location of model data artifacts, type the location in S3 where your model artifacts are stored.

   f. Choose Next.

5. On the Validation and scanning page, provide the following information:

   a. For Publish this model package on AWS Marketplace, choose Yes to publish the model package on AWS Marketplace.

   b. For Validate this resource, choose Yes if you want SageMaker to run batch transform jobs that you specify to test the inference code of your model package.

      Note
      To publish your model package on AWS Marketplace, your model package must be validated.

   c. For IAM role, choose an IAM role that has the required permissions to run batch transform jobs in SageMaker, or choose Create a new role to allow SageMaker to create a role that has the AmazonSageMakerFullAccess managed policy attached. For information, see SageMaker Roles (p. 3375).

d. For Validation profile, specify the following:

   • A name for the validation profile.

   • A Transform job definition. This is a JSON block that describes a batch transform job. This is in the same format as the TransformJobDefinition input parameter of the CreateAlgorithm API.

Create a Model Package Resource (API)

To create a model package by using the SageMaker API, call the `CreateModelPackage` API.

Use Algorithm and Model Package Resources

You can create algorithms and model packages as resources in your Amazon SageMaker account, and you can find and subscribe to algorithms and model packages on AWS Marketplace.

Use algorithms to:

- Run training jobs. For information, see Use an Algorithm to Run a Training Job (p. 3323).
- Run hyperparameter tuning jobs. For information, see Use an Algorithm to Run a Hyperparameter Tuning Job (p. 3325).
- Create model packages. After you use an algorithm resource to run a training job or a hyperparameter tuning job, you can use the model artifacts that these jobs output along with the algorithm to create a model package. For information, see Create a Model Package Resource (p. 3319).

**Note**

If you subscribe to an algorithm on AWS Marketplace, you must create a model package before you can use it to get inferences by creating hosted endpoint or running a batch transform job.
• Create models that you can use to get real-time inference or run batch transform jobs. For information, see Use a Model Package to Create a Model (p. 3328).
• Create hosted endpoints to get real-time inference. For information, see Deploy the Model to SageMaker Hosting Services (p. 84).
• Create batch transform jobs. For information, see (Optional) Make Prediction with Batch Transform (p. 85).

Topics
• Use an Algorithm to Run a Training Job (p. 3323)
• Use an Algorithm to Run a Hyperparameter Tuning Job (p. 3325)
• Use a Model Package to Create a Model (p. 3328)

Use an Algorithm to Run a Training Job

You can create use an algorithm resource to create a training job by using the Amazon SageMaker console, the low-level Amazon SageMaker API, or the Amazon SageMaker Python SDK.

Topics
• Use an Algorithm to Run a Training Job (Console) (p. 3323)
• Use an Algorithm to Run a Training Job (API) (p. 3324)
• Use an Algorithm to Run a Training Job (Amazon SageMaker Python SDK) (p. 3324)

Use an Algorithm to Run a Training Job (Console)

To use an algorithm to run a training job (console)
2. Choose Algorithms.
3. Choose an algorithm that you created from the list on the My algorithms tab or choose an algorithm that you subscribed to on the AWS Marketplace subscriptions tab.
4. Choose Create training job.
   The algorithm you chose will automatically be selected.
5. On the Create training job page, provide the following information:
   a. For Job name, type a name for the training job.
   b. For IAM role, choose an IAM role that has the required permissions to run training jobs in SageMaker, or choose Create a new role to allow SageMaker to create a role that has the AmazonSageMakerFullAccess managed policy attached. For information, see SageMaker Roles (p. 3375).
   c. For Resource configuration, provide the following information:
      i. For Instance type, choose the instance type to use for training.
      ii. For Instance count, type the number of ML instances to use for the training job.
      iii. For Additional volume per instance (GB), type the size of the ML storage volume that you want to provision. ML storage volumes store model artifacts and incremental states.
      iv. For Encryption key, if you want Amazon SageMaker to use an AWS Key Management Service key to encrypt data in the ML storage volume attached to the training instance, specify the key.
      v. For Stopping condition, specify the maximum amount of time in seconds, minutes, hours, or days, that you want the training job to run.
d. For **VPC**, choose a Amazon VPC that you want to allow your training container to access. For more information, see Give SageMaker Training Jobs Access to Resources in Your Amazon VPC (p. 3483).

e. For **Hyperparameters**, specify the values of the hyperparameters to use for the training job.

f. For **Input data configuration**, specify the following values for each channel of input data to use for the training job. You can see what channels the algorithm you're using for training support, and the content type, supported compression type, and supported input modes for each channel, under **Channel specification** section of the **Algorithm summary** page for the algorithm.

   i. For **Channel name**, type the name of the input channel.

   ii. For **Content type**, type the content type of the data that the algorithm expects for the channel.

   iii. For **Compression type**, choose the data compression type to use, if any.

   iv. For **Record wrapper**, choose RecordIO if the algorithm expects data in the RecordIO format.

   v. For **S3 data type**, **S3 data distribution type**, and **S3 location**, specify the appropriate values. For information about what these values mean, see S3DataSource.

   vi. For **Input mode**, choose **File** to download the data from to the provisioned ML storage volume, and mount the directory to a Docker volume. Choose **Pipe** To stream data directly from Amazon S3 to the container.

   vii. To add another input channel, choose **Add channel**. If you are finished adding input channels, choose **Done**.

g. For **Output location**, specify the following values:

   i. For **S3 output path**, choose the S3 location where the training job stores output, such as model artifacts.

      \[\text{Note}\]
      You use the model artifacts stored at this location to create a model or model package from this training job.

   ii. For **Encryption key**, if you want SageMaker to use a AWS KMS key to encrypt output data at rest in the S3 location.

h. For **Tags**, specify one or more tags to manage the training job. Each tag consists of a key and an optional value. Tag keys must be unique per resource.

   i. Choose **Create training job** to run the training job.

**Use an Algorithm to Run a Training Job (API)**

To use an algorithm to run a training job by using the SageMaker API, specify either the name or the Amazon Resource Name (ARN) as the **AlgorithmName** field of the **AlgorithmSpecification** object that you pass to **CreateTrainingJob**. For information about training models in SageMaker, see Train a Model with Amazon SageMaker (p. 9).

**Use an Algorithm to Run a Training Job (Amazon SageMaker Python SDK)**

Use an algorithm that you created or subscribed to on AWS Marketplace to create a training job, create an **AlgorithmEstimator** object and specify either the Amazon Resource Name (ARN) or the name of the algorithm as the value of the **algorithm_arn** argument. Then call the **fit** method of the estimator. For example:

```
from sagemaker import AlgorithmEstimator
data_path = os.path.join(DATA_DIR, 'marketplace', 'training')
```
```python
algo = AlgorithmEstimator(
    role='SageMakerRole',
    instance_count=1,
    instance_type='ml.c4.xlarge',
    sagemaker_session=sagemaker_session,
    base_job_name='test-marketplace')

train_input = algo.sagemaker_session.upload_data(
    path=data_path, key_prefix='integ-test-data/marketplace/train')
algo.fit({'training': train_input})
```

## Use an Algorithm to Run a Hyperparameter Tuning Job

A hyperparameter tuning job finds the best version of a model by running many training jobs on your dataset using the algorithm and ranges of hyperparameters that you specify. It then chooses the hyperparameter values that result in a model that performs the best, as measured by a metric that you choose. For more information, see Perform Automatic Model Tuning with SageMaker (p. 2360).

You can create an algorithm resource to create a hyperparameter tuning job by using the Amazon SageMaker console, the low-level Amazon SageMaker API, or the Amazon SageMaker Python SDK.

### Topics
- Use an Algorithm to Run a Hyperparameter Tuning Job (Console) (p. 3325)
- Use an Algorithm to Run a Hyperparameter Tuning Job (API) (p. 3327)
- Use an Algorithm to Run a Hyperparameter Tuning Job (Amazon SageMaker Python SDK) (p. 3327)

## Use an Algorithm to Run a Hyperparameter Tuning Job (Console)

**To use an algorithm to run a hyperparameter tuning job (console)**

2. Choose Algorithms.
3. Choose an algorithm that you created from the list on the My algorithms tab or choose an algorithm that you subscribed to on the AWS Marketplace subscriptions tab.
4. Choose Create hyperparameter tuning job.
   - The algorithm you chose will automatically be selected.
5. On the Create hyperparameter tuning job page, provide the following information:
   a. For Warm start, choose Enable warm start to use the information from previous hyperparameter tuning jobs as a starting point for this hyperparameter tuning job. For more information, see Run a Warm Start Hyperparameter Tuning Job (p. 2381).
      i. Choose Identical data and algorithm if your input data is the same as the input data for the parent jobs of this hyperparameter tuning job, or choose Transfer learning to use additional or different input data for this hyperparameter tuning job.
      ii. For Parent hyperparameter tuning job(s), choose up to 5 hyperparameter tuning jobs to use as parents to this hyperparameter tuning job.
   b. For Hyperparameter tuning job name, type a name for the tuning job.
   c. For IAM role, choose an IAM role that has the required permissions to run hyperparameter tuning jobs in SageMaker, or choose Create a new role to allow SageMaker to create a role that has the AmazonSageMakerFullAccess managed policy attached. For information, see SageMaker Roles (p. 3375).
d. For VPC, choose a Amazon VPC that you want to allow the training jobs that the tuning job launches to access. For more information, see Give SageMaker Training Jobs Access to Resources in Your Amazon VPC (p. 3483).

e. Choose Next.

f. For Objective metric, choose the metric that the hyperparameter tuning job uses to determine the best combination of hyperparameters, and choose whether to minimize or maximize this metric. For more information, see View the Best Training Job (p. 2379).

g. For Hyperparameter configuration, choose ranges for the tunable hyperparameters that you want the tuning job to search, and set static values for hyperparameters that you want to remain constant in all training jobs that the hyperparameter tuning job launches. For more information, see Define Hyperparameter Ranges (p. 2363).

h. Choose Next.

i. For Input data configuration, specify the following values for each channel of input data to use for the hyperparameter tuning job. You can see what channels the algorithm you're using for hyperparameter tuning supports, and the content type, supported compression type, and supported input modes for each channel, under Channel specification section of the Algorithm summary page for the algorithm.

   i. For Channel name, type the name of the input channel.

   ii. For Content type, type the content type of the data that the algorithm expects for the channel.

   iii. For Compression type, choose the data compression type to use, if any.

   iv. For Record wrapper, choose RecordIO if the algorithm expects data in the RecordIO format.

   v. For S3 data type, S3 data distribution type, and S3 location, specify the appropriate values. For information about what these values mean, see S3DataSource.

   vi. For Input mode, choose File to download the data from to the provisioned ML storage volume, and mount the directory to a Docker volume. Choose Pipe To stream data directly from Amazon S3 to the container.

   vii. To add another input channel, choose Add channel. If you are finished adding input channels, choose Done.

j. For Output location, specify the following values:

   i. For S3 output path, choose the S3 location where the training jobs that this hyperparameter tuning job launches store output, such as model artifacts.

      **Note**
      You use the model artifacts stored at this location to create a model or model package from this hyperparameter tuning job.

   ii. For Encryption key, if you want SageMaker to use a AWS KMS key to encrypt output data at rest in the S3 location.

k. For Resource configuration, provide the following information:

   i. For Instance type, choose the instance type to use for each training job that the hyperparameter tuning job launches.

   ii. For Instance count, type the number of ML instances to use for each training job that the hyperparameter tuning job launches.

   iii. For Additional volume per instance (GB), type the size of the ML storage volume that you want to provision each training job that the hyperparameter tuning job launches. ML storage volumes store model artifacts and incremental states.

   iv. For Encryption key, if you want Amazon SageMaker to use an AWS Key Management Service key to encrypt data in the ML storage volume attached to the training instances, specify the key.
l. For **Resource limits**, provide the following information:

i. For **Maximum training jobs**, specify the maximum number of training jobs that you want the hyperparameter tuning job to launch. A hyperparameter tuning job can launch a maximum of 500 training jobs.

ii. For **Maximum parallel training jobs**, specify the maximum number of concurrent training jobs that the hyperparameter tuning job can launch. A hyperparameter tuning job can launch a maximum of 10 concurrent training jobs.

iii. For **Stopping condition**, specify the maximum amount of time in seconds, minutes, hours, or days, that you want each training job that the hyperparameter tuning job launches to run.

m. For **Tags**, specify one or more tags to manage the hyperparameter tuning job. Each tag consists of a key and an optional value. Tag keys must be unique per resource.

n. Choose **Create jobs** to run the hyperparameter tuning job.

### Use an Algorithm to Run a Hyperparameter Tuning Job (API)

To use an algorithm to run a hyperparameter tuning job by using the SageMaker API, specify either the name or the Amazon Resource Name (ARN) of the algorithm as the **AlgorithmName** field of the **AlgorithmSpecification** object that you pass to the **CreateHyperParameterTuningJob**. For information about hyperparameter tuning in SageMaker, see **Perform Automatic Model Tuning with SageMaker** (p. 2360).

### Use an Algorithm to Run a Hyperparameter Tuning Job (Amazon SageMaker Python SDK)

Use an algorithm that you created or subscribed to on AWS Marketplace to create a hyperparameter tuning job, create an **AlgorithmEstimator** object and specify either the Amazon Resource Name (ARN) or the name of the algorithm as the value of the **algorithm_arn** argument. Then initialize a **HyperparameterTuner** object with the **AlgorithmEstimator** you created as the value of the **estimator** argument. Finally, call the **fit** method of the **AlgorithmEstimator**. For example:

```python
from sagemaker import AlgorithmEstimator
from sagemaker.tuner import HyperparameterTuner

data_path = os.path.join(DATA_DIR, 'marketplace', 'training')

algo = AlgorithmEstimator(
    role='SageMakerRole',
    instance_count=1,
    instance_type='ml.c4.xlarge',
    sagemaker_session=sagemaker_session,
    base_job_name='test-marketplace')

train_input = algo.sagemaker_session.upload_data(
    path=data_path, key_prefix='integ-test-data/marketplace/train')

algo.set_hyperparameters(max_leaf_nodes=10)

tuner = HyperparameterTuner(estimator=algo, base_tuning_job_name='some-name',
    objective_metric_name='validation:accuracy',
    hyperparameter_ranges=hyperparameter_ranges,
    max_jobs=2, max_parallel_jobs=2)

tuner.fit({'training': train_input}, include_cls_metadata=False)
tuner.wait()
```
Use a Model Package to Create a Model

Use a model package to create a deployable model that you can use to get real-time inferences by creating a hosted endpoint or to run batch transform jobs. You can create a deployable model from a model package by using the Amazon SageMaker console, the low-level SageMaker API, or the Amazon SageMaker Python SDK.

Topics
- Use a Model Package to Create a Model (Console) (p. 3328)
- Use a Model Package to Create a Model (API) (p. 3328)
- Use a Model Package to Create a Model (Amazon SageMaker Python SDK) (p. 3329)

Use a Model Package to Create a Model (Console)

To create a deployable model from a model package (console)

2. Choose Model packages.
3. Choose a model package that you created from the list on the My model packages tab or choose a model package that you subscribed to on the AWS Marketplace subscriptions tab.
4. Choose Create model.
5. For Model name, type a name for the model.
6. For IAM role, choose an IAM role that has the required permissions to call other services on your behalf, or choose Create a new role to allow SageMaker to create a role that has the AmazonSageMakerFullAccess managed policy attached. For information, see SageMaker Roles (p. 3375).
7. For VPC, choose a Amazon VPC that you want to allow the model to access. For more information, see Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC (p. 3486).
8. Leave the default values for Container input options and Choose model package.
9. For environment variables, provide the names and values of environment variables you want to pass to the model container.
10. For Tags, specify one or more tags to manage the model. Each tag consists of a key and an optional value. Tag keys must be unique per resource.
11. Choose Create model.

After you create a deployable model, you can use it to set up an endpoint for real-time inference or create a batch transform job to get inferences on entire datasets. For information about hosting endpoints in SageMaker, see Deploy Models for Inference.

Use a Model Package to Create a Model (API)

To use a model package to create a deployable model by using the SageMaker API, specify the name or the Amazon Resource Name (ARN) of the model package as the ModelPackageName field of the ContainerDefinition object that you pass to the CreateModel API.

After you create a deployable model, you can use it to set up an endpoint for real-time inference or create a batch transform job to get inferences on entire datasets. For information about hosted endpoints in SageMaker, see Deploy Models for Inference.
Use a Model Package to Create a Model (Amazon SageMaker Python SDK)

To use a model package to create a deployable model by using the SageMaker Python SDK, initialize a `ModelPackage` object, and pass the Amazon Resource Name (ARN) of the model package as the `model_package_arn` argument. For example:

```python
from sagemaker import ModelPackage
model = ModelPackage(role='SageMakerRole',
                      model_package_arn='training-job-scikit-decision-trees-1542660466-6f92',
                      sagemaker_session=sagemaker_session)
```

After you create a deployable model, you can use it to set up an endpoint for real-time inference or create a batch transform job to get inferences on entire datasets. For information about hosting endpoints in SageMaker, see Deploy Models for Inference.

Sell Amazon SageMaker Algorithms and Model Packages

Selling Amazon SageMaker algorithms and model packages is a three-step process:

1. Develop your algorithm or model, and package it in a Docker container. For information, see Develop Algorithms and Models in Amazon SageMaker (p. 3330).
2. Create an algorithm or model package resource in SageMaker. For information, see Create Algorithm and Model Package Resources (p. 3316).
3. Register as a seller on AWS Marketplace and list your algorithm or model package on AWS Marketplace. For information about registering as a seller, see Getting Started as a Seller in the User Guide for AWS Marketplace Providers. For information about listing and monetizing your algorithms and model packages, see Listing Algorithms and Model Packages in AWS Marketplace for Machine Learning in the User Guide for AWS Marketplace Providers.
Develop Algorithms and Models in Amazon SageMaker

Before you can create algorithm and model package resources to use in Amazon SageMaker or list on AWS Marketplace, you have to develop them and package them in Docker containers.

**Note**
When algorithms and model packages are created for listing on AWS Marketplace, SageMaker scans the containers for security vulnerabilities on supported operating systems. Only the following operating system versions are supported:

- Debian: 6.0, 7, 8, 9, 10
- CentOS: 5, 6, 7
- Oracle Linux: 5, 6, 7
- Alpine: 3.3, 3.4, 3.5
- Amazon Linux

**Develop Algorithms in SageMaker**

An algorithm should be packaged as a docker container and stored in Amazon ECR to use it in SageMaker. The Docker container contains the training code used to run training jobs and, optionally, the inference code used to get inferences from models trained by using the algorithm.

For information about developing algorithms in SageMaker and packaging them as containers, see [Using Docker containers with SageMaker](p. 2999). For a complete example of how to create an algorithm container, see the sample notebook at [https://sagemaker-examples.readthedocs.io/en/latest/advanced_functionality/scikit_bring_your_own/scikit_bring_your_own.html](https://sagemaker-examples.readthedocs.io/en/latest/advanced_functionality/scikit_bring_your_own/scikit_bring_your_own.html). You can also find the sample notebook in a SageMaker notebook instance. The notebook is in the Advanced Functionality section, and is named scikit_bring_your_own.ipynb. For information about using the sample notebooks in a notebook instance, see [Example Notebooks](p. 298).

Always thoroughly test your algorithms before you create algorithm resources to publish on AWS Marketplace.

**Note**
When a buyer subscribes to your containerized product, the Docker containers run in an isolated (internet-free) environment. When you create your containers, do not rely on making outgoing calls over the internet. Calls to AWS services are also not allowed.
Develop Models in SageMaker

A deployable model in SageMaker consists of inference code, model artifacts, an IAM role that is used to access resources, and other information required to deploy the model in SageMaker. Model artifacts are the results of training a model by using a machine learning algorithm. The inference code must be packaged in a Docker container and stored in Amazon ECR. You can either package the model artifacts in the same container as the inference code, or store them in Amazon S3.

You create a model by running a training job in SageMaker, or by training a machine learning algorithm outside of SageMaker. If you run a training job in SageMaker, the resulting model artifacts are available in the ModelArtifacts field in the response to a call to the DescribeTrainingJob operation. For information about how to develop a SageMaker model container, see Use Your Own Inference Code (p. 3037). For a complete example of how to create a model container from a model trained outside of SageMaker, see the sample notebook at https://sagemaker-examples.readthedocs.io/en/latest/advanced_functionality/xgboostbring_your_own_model/xgboostbring_your_own_model.html. You can also find the sample notebook in a SageMaker notebook instance. The notebook is in the Advanced Functionality section, and is named xgboostbring_your_own_model.ipynb. For information about using the sample notebooks in a notebook instance, see Example Notebooks (p. 298).

Always thoroughly test your models before you create model packages to publish on AWS Marketplace.

Note
When a buyer subscribes to your containerized product, the Docker containers run in an isolated (internet-free) environment. When you create your containers, do not rely on making outgoing calls over the internet. Calls to AWS services are also not allowed.

List Your Algorithm or Model Package on AWS Marketplace

After creating and validating your algorithm or model in Amazon SageMaker, list your product on AWS Marketplace. The listing process makes your products available in the AWS Marketplace and the SageMaker console.

To list products on AWS Marketplace, you must be a registered seller. To register, use the self-registration process from the AWS Marketplace Management Portal (AMMP). For information, see Getting Started as a Seller in the User Guide for AWS Marketplace Providers. When you start the product listing process from the Amazon SageMaker console, we check your seller registration status. If you have not registered, we direct you to do so.

To start the listing process, do one of the following:

- From the SageMaker console, choose the product, choose Actions, and choose Publish new ML Marketplace listing. This carries over your product reference, the Amazon Resource Name (ARN), and directs you to the AMMP to create the listing.
- Go to ML listing process, manually enter the Amazon Resource Name (ARN), and start your product listing. This process carries over the product metadata that you entered when creating the product in SageMaker. For an algorithm listing, the information includes the supported instance types and hyperparameters. In addition, you can enter a product description, promotional information, and support information as you would with other AWS Marketplace products.
Find and Subscribe to Algorithms and Model Packages on AWS Marketplace

With AWS Marketplace, you can browse and search for hundreds of machine learning algorithms and models in a broad range of categories, such as computer vision, natural language processing, speech recognition, text, data, voice, image, video analysis, fraud detection, predictive analysis, and more.

To find algorithms on AWS Marketplace

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. Choose Algorithms, then choose Find algorithms.

This takes you to the AWS Marketplace algorithms page. For information about finding and subscribing to algorithms on AWS Marketplace, see Machine Learning Products in the AWS Marketplace User Guide for AWS Consumers.

To find model packages on AWS Marketplace

2. Choose Model packages, then choose Find model packages.

This takes you to the AWS Marketplace model packages page. For information about finding and subscribing to model packages on AWS Marketplace, see Machine Learning Products in the AWS Marketplace User Guide for AWS Consumers.

Use Algorithms and Model Packages

For information about using algorithms and model packages that you subscribe to in SageMaker, see Use Algorithm and Model Package Resources (p. 3322).

Note

When you create a training job, inference endpoint, and batch transform job from an algorithm or model package that you subscribe to on AWS Marketplace, the training and inference containers do not have access to the internet. Because the containers do not have access to the internet, the seller of the algorithm or model package does not have access to your data.
Security in Amazon SageMaker

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the AWS compliance programs. To learn about the compliance programs that apply to Amazon SageMaker, see AWS Services in Scope by Compliance Program.

- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company’s requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using SageMaker. The following topics show you how to configure SageMaker to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your SageMaker resources.

**Topics**
- Access Control (p. 3333)
- Data Protection in Amazon SageMaker (p. 3335)
- Identity and Access Management for Amazon SageMaker (p. 3340)
- Logging and Monitoring (p. 3464)
- Compliance Validation for Amazon SageMaker (p. 3465)
- Resilience in Amazon SageMaker (p. 3465)
- Infrastructure Security in Amazon SageMaker (p. 3465)

Access Control

Amazon SageMaker Studio notebooks and SageMaker notebook instances differ in their runtime environments. The following topics describe how to control root access to these notebooks.

**Topics**
- Access control and SageMaker Studio notebooks (p. 3333)
- Control root access to a SageMaker notebook instance (p. 3335)

Access control and SageMaker Studio notebooks

Amazon SageMaker Studio uses filesystem and container permissions for access control and isolation of Studio users and notebooks. This is one of the major differences between Studio notebooks and SageMaker notebook instances. This topic describes how permissions are set up to avoid security threats, what SageMaker does by default, and how the customer can customize the permissions. For more information about Studio notebooks and their runtime environment, see Use Amazon SageMaker Studio Notebooks (p. 128).

**SageMaker app permissions**
A run-as user is a POSIX user/group which is used to run the JupyterServer app and KernelGateway apps inside the container.

The run-as user for the JupyterServer app is sagemaker-user (1000) by default. This user has sudo permissions to enable the installation of dependencies such as yum packages.

The run-as user for the KernelGateway apps is root (0) by default. This user is able to install dependencies using pip/apt-get/conda.

Due to user remapping, neither user is able to access resources or make changes to the host instance.

User remapping

SageMaker performs user-remapping to map a user inside the container to a user on the host instance outside the container. The range of user IDs (0 - 65535) in the container are mapped to non-privileged user IDs above 65535 on the instance. For example, sagemaker-user (1000) inside the container might map to user (200001) on the instance, where the number in parentheses is the user ID. If the customer creates a new user/group inside the container, it won't be privileged on the host instance regardless of the user/group ID. The root user of the container is also mapped to a non-privileged user on the instance. For more information, see Isolate containers with a user namespace.

Custom image permissions

Customers can bring their own custom SageMaker images. These images can specify a different run-as user/group to launch the KernelGateway app. The customer can implement fine grained permission control inside the image, for example, to disable root access or perform other actions. The same user remapping applies here. For more information, see Bring your own SageMaker image (p. 151).

Container isolation

Docker keeps a list of default capabilities that the container can use. SageMaker doesn't add additional capabilities. SageMaker adds specific route rules to block requests to Amazon EFS and the instance metadata service (IMDS) from the container. Customers can't change these route rules from the container. For more information, see Runtime privilege and Linux capabilities.

App metadata access

Metadata used by running apps are mounted to the container with read-only permission. Customers aren't able to modify this metadata from the container. For the available metadata, see Get Notebook and App Metadata (p. 138).

User isolation on EFS

When you onboard to Studio, SageMaker creates an Amazon Elastic File System (EFS) volume for your domain that is shared by all Studio users in the domain. Each user gets their own private home directory on the EFS volume. This home directory is used to store the user's notebooks, Git repositories, and other data. To prevent other users in the domain from accessing the user's data, SageMaker creates a globally unique user ID for the user's profile and applies it as a POSIX user/group ID for the user's home directory.

EBS access

An Amazon Elastic Block Store (Amazon EBS) volume is attached to the host instance and shared across all images. It's used for the root volume of the notebooks and stores temporary data that's generated inside the container. The storage isn't persisted when the instance running the notebooks is deleted. The root user inside the container can't access the EBS volume.

IMDS access

Due to security concerns, access to the Amazon Elastic Compute Cloud (Amazon EC2) Instance Metadata Service (IMDS) is unavailable in SageMaker Studio. For more information on IMDS, see Instance metadata and user data.
Control root access to a SageMaker notebook instance

By default, when you create a notebook instance, users that log into that notebook instance have root access. Data science is an iterative process that might require the data scientist to test and use different software tools and packages, so many notebook instance users need to have root access to be able to install these tools and packages. Because users with root access have administrator privileges, users can access and edit all files on a notebook instance with root access enabled.

If you don’t want users to have root access to a notebook instance, when you call `CreateNotebookInstance` or `UpdateNotebookInstance` operations, set the `RootAccess` field to `Disabled`. You can also disable root access for users when you create or update a notebook instance in the Amazon SageMaker console. For information, see Step 1: Create an Amazon SageMaker Notebook Instance (p. 74).

**Note**
Lifecycle configurations need root access to be able to set up a notebook instance. Because of this, lifecycle configurations associated with a notebook instance always run with root access even if you disable root access for users.

**Note**
For security reasons, Rootless Docker is installed on root-disabled notebook instances instead of regular Docker. For more information, see Run the Docker daemon as a non-root user (Rootless mode).

Data Protection in Amazon SageMaker

The AWS shared responsibility model applies to data protection in Amazon SageMaker. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. This content includes the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the Data Privacy FAQ. For information about data protection in Europe, see the AWS Shared Responsibility Model and GDPR blog post on the AWS Security Blog.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual user accounts with AWS Identity and Access Management (IAM). That way each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We recommend TLS 1.2 or later.
- Set up API and user activity logging with AWS CloudTrail.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing personal data that is stored in Amazon S3.
- If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-2.

We strongly recommend that you never put confidential or sensitive information, such as your customers’ email addresses, into tags or free-form fields such as a Name field. This includes when you work with Amazon SageMaker or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form fields used for names may be used for billing or
Protect Data at Rest Using Encryption

To protect your Amazon SageMaker Studio notebooks and SageMaker notebook instances, along with your model-building data and model artifacts, SageMaker encrypts the notebooks, as well as output from Training and Batch Transform jobs. SageMaker encrypts these by default using the AWS Managed Key for Amazon S3. This AWS Managed Key for Amazon S3 cannot be shared for cross-account access. For cross-account access, specify your customer managed key while creating SageMaker resources so that it can be shared for cross-account access. For more information on AWS KMS, see What is AWS Key Management Service?

Topics
- Studio notebooks (p. 3336)
- Notebook instances and SageMaker jobs (p. 3336)

Studio notebooks

In Amazon SageMaker Studio, your SageMaker Studio notebooks and data can be stored in the following locations:

- An S3 bucket – When you onboard to Studio and enable shareable notebook resources, SageMaker shares notebook snapshots and metadata in an Amazon Simple Storage Service (Amazon S3) bucket.
- An EFS volume – When you onboard to Studio, SageMaker attaches an Amazon Elastic File System (Amazon EFS) volume to your domain for storing your Studio notebooks and data files. The EFS volume persists after the domain is deleted.
- An EBS volume – When you open a notebook in Studio, an Amazon Elastic Block Store (Amazon EBS) is attached to the instance that the notebook runs on. The EBS volume persists for the duration of the instance.

SageMaker uses the AWS Key Management Service (AWS KMS) to encrypt the S3 bucket and both volumes. By default, it uses an AWS managed key. For more control, you can specify your own customer managed key when you onboard to Studio or through the SageMaker API. For more information, see Onboard to Amazon SageMaker Domain (p. 35) and CreateDomain.

In the CreateDomain API, you use the S3KmsKeyId parameter to specify the customer managed key for shareable notebooks. You use the KmsKeyId parameter to specify the customer managed key for the EFS and EBS volumes. The same customer managed key is used for both volumes. The customer managed key for shareable notebooks can be the same customer managed key as used for the volumes or a different customer managed key.

Notebook instances and SageMaker jobs

To encrypt the machine learning (ML) storage volume that is attached to notebooks, processing jobs, training jobs, hyperparameter tuning jobs, batch transform jobs, and endpoints, you can pass a AWS KMS
key to SageMaker. If you don't specify a KMS key, SageMaker encrypts storage volumes with a transient key and discards it immediately after encrypting the storage volume. For notebook instances, if you don't specify a KMS key, SageMaker encrypts both OS volumes and ML data volumes with a system-managed KMS key.

You can use an AWS managed AWS KMS key to encrypt all instance OS volumes. You can encrypt all ML data volumes for all SageMaker instances with a AWS KMS key that you specify. ML storage volumes are mounted as follows:

- Notebooks - /home/ec2-user/SageMaker
- Processing - /opt/ml/processing and /tmp/
- Training - /opt/ml/ and /tmp/
- Batch - /opt/ml/ and /tmp/
- Endpoints - /opt/ml/ and /tmp/

Processing, batch transform, and training job containers and their storage are ephemeral in nature. When the job completes, output is uploaded to Amazon S3 using AWS KMS encryption with an optional AWS KMS key that you specify and the instance is torn down. If a AWS KMS Key is not provided in the job request, the output is encrypted by default using your AWS Managed Key for Amazon S3.

**Note**
The key policy for an AWS Managed Key for Amazon S3 cannot be edited, so cross-account permissions cannot be granted for these key policies. If the output Amazon S3 bucket for the request is from another account, specify your own AWS KMS Customer Key in the job request and ensure that the job's execution role has permissions to encrypt data with it.

**Important**
Sensitive data that needs to be encrypted with a KMS key for compliance reasons should be stored in the ML storage volume or in Amazon S3, both of which can be encrypted using a KMS key you specify.

When you open a notebook instance, SageMaker saves it and any files associated with it in the SageMaker folder in the ML storage volume by default. When you stop a notebook instance, SageMaker creates a snapshot of the ML storage volume. Any customizations to the operating system of the stopped instance, such as installed custom libraries or operating system level settings, are lost. Consider using a lifecycle configuration to automate customizations of the default notebook instance. When you terminate an instance, the snapshot and the ML storage volume are deleted. Any data that you need to persist beyond the lifespan of the notebook instance should be transferred to an Amazon S3 bucket.

**Note**
Certain Nitro-based SageMaker instances include local storage, depending on the instance type. Local storage volumes are encrypted using a hardware module on the instance. You can't use a KMS key on an instance type with local storage. For a list of instance types that support local instance storage, see [Instance Store Volumes](#). For more information about storage volumes on Nitro-based instances, see [Amazon EBS and NVMe on Linux Instances](#). For more information about local instance storage encryption, see [SSD Instance Store Volumes](#).

**Protecting Data in Transit with Encryption**

All inter-network data in transit supports TLS 1.2 encryption.

Amazon SageMaker ensures that machine learning (ML) model artifacts and other system artifacts are encrypted in transit and at rest. Requests to the SageMaker API and console are made over a secure (SSL) connection. You pass AWS Identity and Access Management roles to SageMaker to provide permissions to access resources on your behalf for training and deployment. You can use encrypted Amazon S3 buckets for model artifacts and data, as well as pass a AWS KMS key to SageMaker instances to encrypt the attached ML storage volumes.
Some intra-network data in-transit (inside the service platform) is unencrypted. This includes:

- Command and control communications between the service control plane and training job instances (not customer data).
- Communications between nodes in distributed processing jobs (intra-network).
- Communications between nodes in distributed training jobs (intra-network).

There are no inter-node communications for batch processing.

You can choose to encrypt communication between nodes in a training cluster. For information about how to do this, see Protect Communications Between ML Compute Instances in a Distributed Training Job (p. 3338). Enabling inter-container traffic encryption can increase training time, especially if you are using distributed deep learning algorithms. For affected algorithms, adding this additional level of security also increases cost. The training time for most SageMaker built-in algorithms, such as XGBoost, DeepAR, and linear learner, typically aren't affected.

FIPS validated endpoints are available for the SageMaker API and request router for hosted models (runtime). For information about FIPS compliant endpoints, see Federal Information Processing Standard (FIPS) 140-2.

Protect Communications Between ML Compute Instances in a Distributed Training Job

By default, Amazon SageMaker runs training jobs in an Amazon Virtual Private Cloud (Amazon VPC) to help keep your data secure. You can add another level of security to protect your training containers and data by configuring a private VPC. Distributed ML frameworks and algorithms usually transmit information that is directly related to the model such as weights, not the training dataset. When performing distributed training, you can further protect data that is transmitted between instances. This can help you to comply with regulatory requirements. To do this, use inter-container traffic encryption.

Enabling inter-container traffic encryption can increase training time, especially if you are using distributed deep learning algorithms. Enabling inter-container traffic encryption doesn't affect training jobs with a single compute instance. However, for training jobs with several compute instances, the effect on training time depends on the amount of communication between compute instances. For affected algorithms, adding this additional level of security also increases cost. The training time for most SageMaker built-in algorithms, such as XGBoost, DeepAR, and linear learner, typically aren't affected.

You can enable inter-container traffic encryption for training jobs or hyperparameter tuning jobs. You can use SageMaker APIs or console to enable inter-container traffic encryption.

For information about running training jobs in a private VPC, see Give SageMaker Training Jobs Access to Resources in Your Amazon VPC (p. 3483).

Enable Inter-Container Traffic Encryption (API)

Before enabling inter-container traffic encryption on training or hyperparameter tuning jobs with APIs, you need to add inbound and outbound rules to your private VPC's security group.

To enable inter-container traffic encryption (API)

1. Add the following inbound and outbound rules in the security group for your private VPC:

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port Range</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>UDP</td>
<td>500</td>
<td>Self Security Group ID</td>
</tr>
</tbody>
</table>

3338
When you send a request to the `CreateTrainingJob` or `CreateHyperParameterTuningJob` API, specify `True` for the `EnableInterContainerTrafficEncryption` parameter.

**Note**
For the ESP 50 protocol, the AWS Security Group Console might display the port range as "All". However, Amazon EC2 ignores the specified port range because it is not applicable for the ESP 50 IP protocol.

---

### Key Management

Customers can specify AWS KMS keys, including bring your own keys (BYOK), to use for envelope encryption with Amazon S3 input/output buckets and machine learning (ML) Amazon EBS volumes. ML volumes for notebook instances and for processing, training, and hosted model Docker containers can be optionally encrypted by using AWS KMS customer-owned keys. All instance OS volumes are encrypted with an AWS-managed AWS KMS key.

**Note**
Certain Nitro-based instances include local storage, dependent on the instance type. Local storage volumes are encrypted using a hardware module on the instance. You can't request a `VolumeKmsKeyId` when using an instance type with local storage.

For a list of instance types that support local instance storage, see [Instance Store Volumes](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-storage.html). For more information about local instance storage encryption, see [SSD Instance Store Volumes](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-storage.html).
Internetwork Traffic Privacy

This topic describes how Amazon SageMaker secures connections from the service to other locations.

Internetwork communications support TLS 1.2 encryption between all components and clients.

Instances can be connected to Customer VPC, providing access to S3 VPC endpoints or customer repositories. Internet egress can be managed through this interface by the customer if service platform internet egress is disabled for notebooks. For training and hosting, egress through the service platform is not available when connected to the customer's VPC.

By default, API calls made to published endpoints traverse the public network to the request router. SageMaker supports Amazon Virtual Private Cloud interface endpoints powered by AWS PrivateLink for private connectivity between the customer's VPC and the request router to access hosted model endpoints. For information about Amazon VPC, see Connect to SageMaker Through a VPC Interface Endpoint (p. 3470)

Identity and Access Management for Amazon SageMaker

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be authenticated (signed in) and authorized (have permissions) to use SageMaker resources. IAM is an AWS service that you can use with no additional charge.

Topics

- Audience (p. 3340)
- Authenticating with Identities (p. 3341)
- Managing Access Using Policies (p. 3343)

- AWS Managed Policies for Amazon SageMaker (p. 3410)
- Troubleshooting Amazon SageMaker Identity and Access (p. 3462)

Audience

How you use AWS Identity and Access Management (IAM) differs, depending on the work that you do in SageMaker.

Service user – If you use the SageMaker service to do your job, then your administrator provides you with the credentials and permissions that you need. As you use more SageMaker features to do your
work, you might need additional permissions. Understanding how access is managed can help you request the right permissions from your administrator. If you cannot access a feature in SageMaker, see Troubleshooting Amazon SageMaker Identity and Access (p. 3462).

**Service administrator** – If you're in charge of SageMaker resources at your company, you probably have full access to SageMaker. It's your job to determine which SageMaker features and resources your service users should access. You must then submit requests to your IAM administrator to change the permissions of your service users. Review the information on this page to understand the basic concepts of IAM. To learn more about how your company can use IAM with SageMaker, see How Amazon SageMaker Works with IAM (p. 3344).

**IAM administrator** – If you're an IAM administrator, you might want to learn details about how you can write policies to manage access to SageMaker. To view example SageMaker identity-based policies that you can use in IAM, see Amazon SageMaker Identity-Based Policy Examples (p. 3347).

## Authenticating with Identities

Authentication is how you sign in to AWS using your identity credentials. For more information about signing in using the AWS Management Console, see Signing in to the AWS Management Console as an IAM user or root user in the IAM User Guide.

You must be authenticated (signed in to AWS) as the AWS account root user, an IAM user, or by assuming an IAM role. You can also use your company's single sign-on authentication or even sign in using Google or Facebook. In these cases, your administrator previously set up identity federation using IAM roles. When you access AWS using credentials from another company, you are assuming a role indirectly.

To sign in directly to the AWS Management Console, use your password with your root user email address or your IAM user name. You can access AWS programmatically using your root user or IAM users access keys. AWS provides SDK and command line tools to cryptographically sign your request using your credentials. If you don't use AWS tools, you must sign the request yourself. Do this using Signature Version 4, a protocol for authenticating inbound API requests. For more information about authenticating requests, see Signature Version 4 signing process in the AWS General Reference.

Regardless of the authentication method that you use, you might also be required to provide additional security information. For example, AWS recommends that you use multi-factor authentication (MFA) to increase the security of your account. To learn more, see Using multi-factor authentication (MFA) in AWS in the IAM User Guide.

### AWS account root user

When you create an AWS account, you begin with one sign-in identity that has complete access to all AWS services and resources in the account. This identity is called the AWS account root user and is accessed by signing in with the email address and password that you used to create the account. We strongly recommend that you do not use the root user for your everyday tasks. Safeguard your root user credentials and use them to perform the tasks that only the root user can perform. For the complete list of tasks that require you to sign in as the root user, see Tasks that require root user credentials in the AWS General Reference.

### IAM Users and Groups

An IAM user is an identity within your AWS account that has specific permissions for a single person or application. An IAM user can have long-term credentials such as a user name and password or a set of access keys. To learn how to generate access keys, see Managing access keys for IAM users in the IAM User Guide. When you generate access keys for an IAM user, make sure you view and securely save the key pair. You cannot recover the secret access key in the future. Instead, you must generate a new access key pair.
An IAM group is an identity that specifies a collection of IAM users. You can't sign in as a group. You can use groups to specify permissions for multiple users at a time. Groups make permissions easier to manage for large sets of users. For example, you could have a group named IAMAdmins and give that group permissions to administer IAM resources.

Users are different from roles. A user is uniquely associated with one person or application, but a role is intended to be assumable by anyone who needs it. Users have permanent long-term credentials, but roles provide temporary credentials. To learn more, see When to create an IAM user (instead of a role) in the IAM User Guide.

IAM Roles

An IAM role is an identity within your AWS account that has specific permissions. It is similar to an IAM user, but is not associated with a specific person. You can temporarily assume an IAM role in the AWS Management Console by switching roles. You can assume a role by calling an AWS CLI or AWS API operation or by using a custom URL. For more information about methods for using roles, see Using IAM roles in the IAM User Guide.

IAM roles with temporary credentials are useful in the following situations:

- **Temporary IAM user permissions** – An IAM user can assume an IAM role to temporarily take on different permissions for a specific task.
- **Federated user access** – Instead of creating an IAM user, you can use existing identities from AWS Directory Service, your enterprise user directory, a web identity provider, or the IAM Identity Center identity store. These identities are known as federated identities. To assign permissions to federated identities, you can create a role and define permissions for the role. When an external identity authenticates, the identity is associated with the role and is granted the permissions that are defined by it. If you use IAM Identity Center, you configure a permission set. IAM Identity Center correlates the permission set to a role in IAM to control what your identities can access after they authenticate. For more information about identity federation, see Creating a role for a third-party Identity Provider in the IAM User Guide. For more information about IAM Identity Center, see What is IAM Identity Center? in the AWS IAM Identity Center (successor to AWS Single Sign-On) User Guide.
- **Cross-account access** – You can use an IAM role to allow someone (a trusted principal) in a different account to access resources in your account. Roles are the primary way to grant cross-account access. However, with some AWS services, you can attach a policy directly to a resource (instead of using a role as a proxy). To learn the difference between roles and resource-based policies for cross-account access, see How IAM roles differ from resource-based policies in the IAM User Guide.
- **Cross-service access** – Some AWS services use features in other AWS services. For example, when you make a call in a service, it's common for that service to run applications in Amazon EC2 or store objects in Amazon S3. A service might do this using the calling principal's permissions, using a service role, or using a service-linked role.
- **Principal permissions** – When you use an IAM user or role to perform actions in AWS, you are considered a principal. Policies grant permissions to a principal. When you use some services, you might perform an action that then triggers another action in a different service. In this case, you must have permissions to perform both actions. To see whether an action requires additional dependent actions in a policy, see Actions, Resources, and Condition Keys for Amazon SageMaker in the Service Authorization Reference.
- **Service role** – A service role is an IAM role that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see Creating a role to delegate permissions to an AWS service in the IAM User Guide.
- **Service-linked role** – A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your IAM account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.
- **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an EC2 instance and making AWS CLI or AWS API requests.
This is preferable to storing access keys within the EC2 instance. To assign an AWS role to an EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the EC2 instance to get temporary credentials. For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the IAM User Guide.

To learn whether to use IAM roles or IAM users, see When to create an IAM role (instead of a user) in the IAM User Guide.

Managing Access Using Policies

You control access in AWS by creating policies and attaching them to AWS identities or resources. A policy is an object in AWS that, when associated with an identity or resource, defines their permissions. AWS evaluates these policies when a principal (user, root user, or role session) makes a request. Permissions in the policies determine whether the request is allowed or denied. Most policies are stored in AWS as JSON documents. For more information about the structure and contents of JSON policy documents, see Overview of JSON policies in the IAM User Guide.

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

Every IAM entity (user or role) starts with no permissions. By default, users can do nothing, not even change their own password. To give a user permission to do something, an administrator must attach a permissions policy to a user. Or the administrator can add the user to a group that has the intended permissions. When an administrator gives permissions to a group, all users in that group are granted those permissions.

IAM policies define permissions for an action regardless of the method that you use to perform the operation. For example, suppose that you have a policy that allows the `iam:GetRole` action. A user with that policy can get role information from the AWS Management Console, the AWS CLI, or the AWS API.

Identity-Based Policies

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see Creating IAM policies in the IAM User Guide.

Identity-based policies can be further categorized as inline policies or managed policies. Inline policies are embedded directly into a single user, group, or role. Managed policies are standalone policies that you can attach to multiple users, groups, and roles in your AWS account. Managed policies include AWS managed policies and customer managed policies. To learn how to choose between a managed policy or an inline policy, see Choosing between managed policies and inline policies in the IAM User Guide.

Resource-Based Policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM role trust policies and Amazon S3 bucket policies. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must specify a principal in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

Resource-based policies are inline policies that are located in that service. You can't use AWS managed policies from IAM in a resource-based policy.
Access Control Lists (ACLs)

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

Amazon S3, AWS WAF, and Amazon VPC are examples of services that support ACLs. To learn more about ACLs, see Access control list (ACL) overview in the Amazon Simple Storage Service Developer Guide.

Other Policy Types

AWS supports additional, less-common policy types. These policy types can set the maximum permissions granted to you by the more common policy types.

- **Permissions boundaries** – A permissions boundary is an advanced feature in which you set the maximum permissions that an identity-based policy can grant to an IAM entity (IAM user or role). You can set a permissions boundary for an entity. The resulting permissions are the intersection of entity’s identity-based policies and its permissions boundaries. Resource-based policies that specify the user or role in the Principal field are not limited by the permissions boundary. An explicit deny in any of these policies overrides the allow. For more information about permissions boundaries, see Permissions boundaries for IAM entities in the IAM User Guide.

- **Service control policies (SCPs)** – SCPs are JSON policies that specify the maximum permissions for an organization or organizational unit (OU) in AWS Organizations. AWS Organizations is a service for grouping and centrally managing multiple AWS accounts that your business owns. If you enable all features in an organization, then you can apply service control policies (SCPs) to any or all of your accounts. The SCP limits permissions for entities in member accounts, including each AWS account root user. For more information about Organizations and SCPs, see How SCPs work in the AWS Organizations User Guide.

- **Session policies** – Session policies are advanced policies that you pass as a parameter when you programmatically create a temporary session for a role or federated user. The resulting session's permissions are the intersection of the user or role's identity-based policies and the session policies. Permissions can also come from a resource-based policy. An explicit deny in any of these policies overrides the allow. For more information, see Session policies in the IAM User Guide.

Multiple Policy Types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see Policy evaluation logic in the IAM User Guide.

How Amazon SageMaker Works with IAM

Before you use IAM to manage access to SageMaker, you should understand what IAM features are available to use with SageMaker. To get a high-level view of how SageMaker and other AWS services work with IAM, see AWS Services That Work with IAM in the IAM User Guide.

Topics

- SageMaker Identity-Based Policies (p. 3344)

SageMaker Identity-Based Policies

With IAM identity-based policies, you can specify allowed or denied actions and resources as well as the conditions under which actions are allowed or denied. SageMaker supports specific actions, resources,
and condition keys. To learn about all of the elements that you use in a JSON policy, see IAM JSON Policy Elements Reference in the IAM User Guide.

Actions

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

The Action element of a JSON policy describes the actions that you can use to allow or deny access in a policy. Policy actions usually have the same name as the associated AWS API operation. There are some exceptions, such as permission-only actions that don't have a matching API operation. There are also some operations that require multiple actions in a policy. These additional actions are called dependent actions.

Include actions in a policy to grant permissions to perform the associated operation.

Policy actions in SageMaker use the following prefix before the action: sagemaker:. For example, to grant someone permission to run a SageMaker training job with the SageMaker CreateTrainingJob API operation, you include the sagemaker:CreateTrainingJob action in their policy. Policy statements must include either an Action or NotAction element. SageMaker defines its own set of actions that describe tasks that you can perform with this service.

To specify multiple actions in a single statement, separate them with commas as follows:

```
"Action": [
   "sagemaker:action1",
   "sagemaker:action2"
]
```

You can specify multiple actions using wildcards (*). For example, to specify all actions that begin with the word Describe, include the following action:

```
"Action": "sagemaker:Describe*"
```

To see a list of SageMaker actions, see Actions, resources, and condition keys for Amazon SageMaker in the Service Authorization Reference.

Resources

SageMaker does not support specifying resource ARNs in a policy.

Condition Keys

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

The Condition element (or Condition block) lets you specify conditions in which a statement is in effect. The Condition element is optional. You can create conditional expressions that use condition operators, such as equals or less than, to match the condition in the policy with values in the request.

If you specify multiple Condition elements in a statement, or multiple keys in a single Condition element, AWS evaluates them using a logical AND operation. If you specify multiple values for a single condition key, AWS evaluates the condition using a logical OR operation. All of the conditions must be met before the statement's permissions are granted.

You can also use placeholder variables when you specify conditions. For example, you can grant an IAM user permission to access a resource only if it is tagged with their IAM user name. For more information, see IAM policy elements: variables and tags in the IAM User Guide.
AWS supports global condition keys and service-specific condition keys. To see all AWS global condition keys, see AWS global condition context keys in the IAM User Guide.

SageMaker defines its own set of condition keys and also supports using some global condition keys. To see all AWS global condition keys, see AWS Global Condition Context Keys in the IAM User Guide.

SageMaker supports a number of service-specific condition keys that you can use for fine-grained access control for the following operations:

- CreateProcessingJob
- CreateTrainingJob
- CreateModel
- CreateEndpointConfig
- CreateTransformJob
- CreateHyperParameterTuningJob
- CreateLabelingJob
- CreateNotebookInstance
- UpdateNotebookInstance

To see a list of SageMaker condition keys, see Condition keys for Amazon SageMaker in the IAM User Guide. To learn with which actions and resources you can use a condition key, see Actions defined by Amazon SageMaker.

For examples of using SageMaker condition keys, see the following: Control Creation of SageMaker Resources with Condition Keys (p. 3357).

Examples

To view examples of SageMaker identity-based policies, see Amazon SageMaker Identity-Based Policy Examples (p. 3347).

SageMaker Resource-Based Policies

SageMaker does not support resource-based policies.

Authorization Based on SageMaker Tags

You can attach tags to SageMaker resources or pass tags in a request to SageMaker. To control access based on tags, you provide tag information in the condition element of a policy using the sagemaker:ResourceTag/key-name, aws:RequestTag/key-name, or aws:TagKeys condition keys. For more information about tagging SageMaker resources, see Control Access to SageMaker Resources by Using Tags (p. 3367).

To view an example identity-based policy for limiting access to a resource based on the tags on that resource, see Control Access to SageMaker Resources by Using Tags (p. 3367).

SageMaker IAM Roles

An IAM role is an entity within your AWS account that has specific permissions.

Using Temporary Credentials with SageMaker

You can use temporary credentials to sign in with federation, assume an IAM role, or to assume a cross-account role. You obtain temporary security credentials by calling AWS STS API operations such as AssumeRole or GetFederationToken.
SageMaker supports using temporary credentials.

**Service-Linked Roles**

SageMaker partially supports service-linked roles. Service-linked roles are currently available for SageMaker Studio and SageMaker training jobs.

**Service Roles**

This feature allows a service to assume a service role on your behalf. This role allows the service to access resources in other services to complete an action on your behalf. Service roles appear in your IAM account and are owned by the account. This means that an IAM administrator can change the permissions for this role. However, doing so might break the functionality of the service.

SageMaker supports service roles.

**Choosing an IAM Role in SageMaker**

When you create a notebook instance, processing job, training job, hosted endpoint, or batch transform job resource in SageMaker, you must choose a role to allow SageMaker to access SageMaker on your behalf. If you have previously created a service role or service-linked role, then SageMaker provides you with a list of roles to choose from. It's important to choose a role that allows access to the AWS operations and resources you need. For more information, see SageMaker Roles (p. 3375).

**Amazon SageMaker Identity-Based Policy Examples**

By default, IAM users and roles don't have permission to create or modify SageMaker resources. They also can't perform tasks using the AWS Management Console, AWS CLI, or AWS API. An IAM administrator must create IAM policies that grant users and roles permission to perform specific API operations on the specified resources they need. The administrator must then attach those policies to the IAM users or groups that require those permissions. To learn how to attach policies to an IAM user or group, see Adding and Removing IAM Identity Permissions in the IAM User Guide.

To learn how to create an IAM identity-based policy using these example JSON policy documents, see Creating Policies on the JSON Tab in the IAM User Guide.

**Topics**

- Policy Best Practices (p. 3347)
- Using the SageMaker Console (p. 3348)
- Allow Users to View Their Own Permissions (p. 3357)
- Control Creation of SageMaker Resources with Condition Keys (p. 3357)
- Control Access to the SageMaker API by Using Identity-based Policies (p. 3364)
- Limit Access to SageMaker API and Runtime Calls by IP Address (p. 3365)
- Limit Access to a Notebook Instance by IP Address (p. 3366)
- Control Access to SageMaker Resources by Using Tags (p. 3367)
- Require the Presence or Absence of Tags for API Calls (p. 3369)

**Policy Best Practices**

Identity-based policies determine whether someone can create, access, or delete SageMaker resources in your account. These actions can incur costs for your AWS account. When you create or edit identity-based policies, follow these guidelines and recommendations:

- **Get started with AWS managed policies and move toward least-privilege permissions** – To get started granting permissions to your users and workloads, use the AWS managed policies that grant
permissions for many common use cases. They are available in your AWS account. We recommend that you reduce permissions further by defining AWS customer managed policies that are specific to your use cases. For more information, see AWS managed policies or AWS managed policies for job functions in the IAM User Guide.

- **Apply least-privilege permissions** – When you set permissions with IAM policies, grant only the permissions required to perform a task. You do this by defining the actions that can be taken on specific resources under specific conditions, also known as least-privilege permissions. For more information about using IAM to apply permissions, see Policies and permissions in IAM in the IAM User Guide.

- **Use conditions in IAM policies to further restrict access** – You can add a condition to your policies to limit access to actions and resources. For example, you can write a policy condition to specify that all requests must be sent using SSL. You can also use conditions to grant access to service actions if they are used through a specific AWS service, such as AWS CloudFormation. For more information, see IAM JSON policy elements: Condition in the IAM User Guide.

- **Use IAM Access Analyzer to validate your IAM policies to ensure secure and functional permissions** – IAM Access Analyzer validates new and existing policies so that the policies adhere to the IAM policy language (JSON) and IAM best practices. IAM Access Analyzer provides more than 100 policy checks and actionable recommendations to help you author secure and functional policies. For more information, see IAM Access Analyzer policy validation in the IAM User Guide.

- **Require multi-factor authentication (MFA)** – If you have a scenario that requires IAM users or root users in your account, turn on MFA for additional security. To require MFA when API operations are called, add MFA conditions to your policies. For more information, see Configuring MFA-protected API access in the IAM User Guide.

For more information about best practices in IAM, see Security best practices in IAM in the IAM User Guide.

### Using the SageMaker Console

To access the Amazon SageMaker console, you must have a minimum set of permissions. These permissions must allow you to list and view details about the SageMaker resources in your AWS account. If you create an identity-based policy that is more restrictive than the minimum required permissions, the console won’t function as intended for entities (IAM users or roles) with that policy.

To ensure that those entities can still use the SageMaker console, also attach the following AWS managed policy to the entities. For more information, see Adding Permissions to a User in the IAM User Guide:

You don't need to allow minimum console permissions for users that are making calls only to the AWS CLI or the AWS API. Instead, allow access to only the actions that match the API operation that you're trying to perform.

### Topics

- Permissions Required to Use the Amazon SageMaker Console (p. 3348)
- Permissions Required to Use the Amazon SageMaker Ground Truth Console (p. 3350)
- Permissions Required to Use the Amazon Augmented AI (Preview) Console (p. 3351)

### Permissions Required to Use the Amazon SageMaker Console

The permissions reference table lists the Amazon SageMaker API operations and shows the required permissions for each operation. For more information about Amazon SageMaker API operations, see Amazon SageMaker API Permissions: Actions, Permissions, and Resources Reference (p. 3393).

To use the Amazon SageMaker console, you need to grant permissions for additional actions. Specifically, the console needs permissions that allow the ec2 actions to display subnets, VPCs, and security groups.
Optionally, the console needs permission to create execution roles for tasks such as CreateNotebook, CreateTrainingJob, and CreateModel. Grant these permissions with the following permissions policy:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "SageMakerApis",
            "Effect": "Allow",
            "Action": [
                "sagemaker:*"
            ],
            "Resource": "*"
        },
        {
            "Sid": "VpcConfigurationForCreateForms",
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeVpcs",
                "ec2:DescribeSubnets",
                "ec2:DescribeSecurityGroups"
            ],
            "Resource": "*"
        },
        {
            "Sid": "KmsKeysForCreateForms",
            "Effect": "Allow",
            "Action": [
                "kms:DescribeKey",
                "kms:ListAliases"
            ],
            "Resource": "*"
        },
        {
            "Sid": "AccessAwsMarketplaceSubscriptions",
            "Effect": "Allow",
            "Action": [
                "aws-marketplace:ViewSubscriptions"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "codecommit:BatchGetRepositories",
                "codecommit:CreateRepository",
                "codecommit:GetRepository",
                "codecommit:ListRepositories",
                "codecommit:ListBranches",
                "secretsmanager:CreateSecret",
                "secretsmanager:DescribeSecret",
                "secretsmanager:ListSecrets"
            ],
            "Resource": "*"
        },
        {
            "Sid": "ListAndCreateExecutionRoles",
            "Effect": "Allow",
            "Action": [
                "iam:ListRoles",
                "iam:CreateRole",
                "iam:CreatePolicy",
                "iam:AttachRolePolicy"
            ]
        }
    ]
}
```
Permissions Required to Use the Amazon SageMaker Ground Truth Console

To use the Amazon SageMaker Ground Truth console, you need to grant permissions for additional resources. Specifically, the console needs permissions for the AWS Marketplace to view subscriptions, Amazon Cognito operations to manage your private workforce, Amazon S3 actions for access to your input and output files, and AWS Lambda actions to list and invoke functions. Grant these permissions with the following permissions policy:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GroundTruthConsole",
      "Effect": "Allow",
      "Action": [
        "aws-marketplace:DescribeListings",
        "aws-marketplace:ViewSubscriptions",
        "cognito-idp:AdminAddUserToGroup",
        "cognito-idp:AdminCreateUser",
        "cognito-idp:AdminDeleteUser",
        "cognito-idp:AdminDisableUser",
        "cognito-idp:AdminEnableUser",
        "cognito-idp:AdminRemoveUserFromGroup",
        "cognito-idp:CreateGroup",
        "cognito-idp:CreateUserPool",
        "cognito-idp:CreateUserPoolClient",
        "cognito-idp:CreateUserPoolDomain",
        "cognito-idp:DescribeUserPool",
        "cognito-idp:DescribeUserPoolClient",
        "cognito-idp:ListGroups",
        "cognito-idp:ListIdentityProviders",
        "cognito-idp:ListUsers",
        "cognito-idp:ListUsersInGroup",
        "cognito-idp:ListUserPoolClients",
        "cognito-idp:ListUserPools",
```
Permissions Required to Use the Amazon Augmented AI (Preview) Console

To use the Augmented AI console, you need to grant permissions for additional resources. Grant these permissions with the following permissions policy:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "sagemaker:*Algorithm",

Allow Users to View Their Own Permissions

This example shows how you might create a policy that allows IAM users to view the inline and managed policies that are attached to their user identity. This policy includes permissions to complete this action on the console or programmatically using the AWS CLI or AWS API.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "ViewOwnUserInfo",
      "Effect": "Allow",
      "Action": [
        "iam:GetUserPolicy",
        "iam:ListGroupsForUser",
        "iam:ListAttachedUserPolicies",
        "iam:ListUserPolicies",
        "iam:GetUser"
      ],
      "Resource": ["arn:aws:iam::*:user/${aws:username}"],
    },
    {
      "Sid": "NavigateInConsole",
      "Effect": "Allow",
      "Action": [
        "iam:GetGroupPolicy",
        "iam:GetPolicyVersion",
        "iam:GetPolicy",
        "iam:ListAttachedGroupPolicies",
        "iam:ListGroupPolicies",
        "iam:ListPolicyVersions",
        "iam:ListPolicies",
        "iam:ListUsers"
      ],
      "Resource": "*"
    }
  ]
}
```

Control Creation of SageMaker Resources with Condition Keys

Control fine-grained access to allow the creation of SageMaker resources by using SageMaker-specific condition keys. For information about using condition keys in IAM policies, see IAM JSON Policy Elements: Condition in the IAM User Guide.

The condition keys, along with related API actions, and links to relevant documentation are listed in Condition Keys for SageMaker in the IAM User Guide.

The following examples show how to use the SageMaker condition keys to control access.

**Topics**

- Control Access to SageMaker Resources by Using File System Condition Keys (p. 3358)
- Restrict Training to a Specific VPC (p. 3359)
- Restrict Access to Workforce Types for Ground Truth Labeling Jobs and Amazon A2I Human Review Workflows (p. 3360)
- Enforce Encryption of Input Data (p. 3361)
- Enforce Encryption of Notebook Instance Storage Volume (p. 3362)
Control Access to SageMaker Resources by Using File System Condition Keys

SageMaker training provides a secure infrastructure for the training algorithm to run in, but for some cases you may want increased defense in depth. For example, you minimize the risk of running untrusted code in your algorithm, or you have specific security mandates in your organization. For these scenarios, you can use the service-specific condition keys in the Condition element of an IAM policy to scope down the user to specific file systems, directories, access modes (read-write, read-only) and security groups.

Topics

- Restrict an IAM User to Specific Directories and Access Modes (p. 3358)
- Restrict an IAM User to a Specific File System (p. 3359)

Restrict an IAM User to Specific Directories and Access Modes

The policy below restricts an IAM user to the `/sagemaker/xgboost-dm/train` and `/sagemaker/xgboost-dm/validation` directories of an EFS file system to `ro` (read-only) AccessMode:

**Note**
When a directory is allowed, all of its subdirectories are also accessible by the training algorithm. POSIX permissions are ignored.

```json
{
   "Version": "2012-10-17",
   "Statement": [
       {
           "Sid": "AccessToElasticFileSystem",
           "Effect": "Allow",
           "Action": [
               "sagemaker:CreateTrainingJob",
               "sagemaker:CreateHyperParameterTuningJob"
           ],
           "Resource": "*",
           "Condition": {
               "StringEquals": {
                   "sagemaker:FileSystemId": "fs-12345678",
                   "sagemaker:FileSystemAccessMode": "ro",
                   "sagemaker:FileSystemType": "EFS",
                   "sagemaker:FileSystemDirectoryPath": "/sagemaker/xgboost-dm/train"
               }
           }
       },
       {
           "Sid": "AccessToElasticFileSystemValidation",
           "Effect": "Allow",
           "Action": [
               "sagemaker:CreateTrainingJob",
               "sagemaker:CreateHyperParameterTuningJob"
           ],
           "Resource": "*",
           "Condition": {
               "StringEquals": {
                   "sagemaker:FileSystemId": "fs-12345678",
                   "sagemaker:FileSystemAccessMode": "ro",
                   "sagemaker:FileSystemType": "EFS",
                   "sagemaker:FileSystemDirectoryPath": "/sagemaker/xgboost-dm/validation"
               }
           }
       }
   ]
}
```
Restrict an IAM User to a Specific File System

To prevent a malicious algorithm using a user space client from accessing any file system directly in your account, you can restrict networking traffic by allowing ingress from a specific security group. In the following example, the IAM user can only use the specified security group to access the file system:

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "AccessToLustreFileSystem",
         "Effect": "Allow",
         "Action": [
            "sagemaker:CreateTrainingJob",
            "sagemaker:CreateHyperParameterTuningJob"
         ],
         "Resource": "*",
         "Condition": {
            "StringEquals": {
               "sagemaker:FileSystemId": "fs-12345678",
               "sagemaker:FileSystemAccessMode": "ro",
               "sagemaker:FileSystemType": "FSxLustre",
               "sagemaker:FileSystemDirectoryPath": "/fsx/sagemaker/xgboost/train"
            },
            "ForAllValues:StringEquals": {
               "sagemaker:VpcSecurityGroupIds": [
                  "sg-12345678"
               ]
            }
         }
      }
   ]
}
```

Although the above example can restrict an algorithm to a specific file system, it does not prevent an algorithm from accessing any directory within that file system using the user space client. To mitigate this, you can:

- Ensure that the file system only contains data that you trust your IAM users to access
- Create an IAM role that restricts your IAM users to launching training jobs with algorithms from approved ECR repositories

For more information on how to use roles with SageMaker, see SageMaker Roles.

Restrict Training to a Specific VPC

Restrict an AWS user to creating training jobs from within a Amazon VPC. When a training job is created within a VPC, you can use VPC flow logs to monitor all traffic to and from the training cluster. For information about using VPC flow logs, see VPC Flow Logs in the Amazon Virtual Private Cloud User Guide.

The following policy enforces that a training job is created by an IAM user calling CreateTrainingJob from within a VPC:
Identity-Based Policy Examples

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowFromVpc",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateTrainingJob",
                "sagemaker:CreateHyperParameterTuningJob"
            ],
            "Resource": "*",
            "Condition": {
                "ForAllValues:StringEquals": {
                    "sagemaker:VpcSubnets": ["subnet-a1234"],
                    "sagemaker:VpcSecurityGroupIds": ["sg12345", "sg-67890"]
                },
                "Null": {
                    "sagemaker:VpcSubnets": "false",
                    "sagemaker:VpcSecurityGroupIds": "false"
                }
            }
        }
    ]
}
```

Restrict Access to Workforce Types for Ground Truth Labeling Jobs and Amazon A2I Human Review Workflows

Amazon SageMaker Ground Truth and Amazon Augmented AI work teams fall into one of three workforce types: public (with Amazon Mechanical Turk), private, and vendor. To restrict IAM user access to a specific work team using one of these types or the work team ARN, use the `sagemaker:WorkteamType` and/or the `sagemaker:WorkteamArn` condition keys. For the `sagemaker:WorkteamType` condition key, use string condition operators. For the `sagemaker:WorkteamArn` condition key, use Amazon Resource Name (ARN) condition operators. If the user attempts to create a labeling job with a restricted work team, SageMaker returns an access denied error.

The policies below demonstrate different ways to use the `sagemaker:WorkteamType` and `sagemaker:WorkteamArn` condition keys with appropriate condition operators and valid condition values.

The following example uses the `sagemaker:WorkteamType` condition key with the `StringEquals` condition operator to restrict access to a public work team. It accepts condition values in the following format: `workforcetype-crowd`, where `workforcetype` can equal public, private, or vendor.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "RestrictWorkteamType",
            "Effect": "Deny",
            "Action": "sagemaker:CreateLabelingJob",
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "sagemaker:WorkteamType": "public-crowd"
                }
            }
        }
    ]
}
```
The following policies show how to restrict access to a public work team using the `sagemaker:WorkteamArn` condition key. The first shows how to use it with a valid IAM regex-variant of the work team ARN and the `ArnLike` condition operator. The second shows how to use it with the `ArnEquals` condition operator and the work team ARN.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "RestrictWorkteamType",
      "Effect": "Deny",
      "Action": "sagemaker:CreateLabelingJob",
      "Resource": "*",
      "Condition": {
        "ArnLike": {
          "sagemaker:WorkteamArn": "arn:aws:sagemaker:*:*:workteam/public-crowd/*"
        }
      }
    }
  ]
}
```

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "RestrictWorkteamType",
      "Effect": "Deny",
      "Action": "sagemaker:CreateLabelingJob",
      "Resource": "*",
      "Condition": {
        "ArnEquals": {
        }
      }
    }
  ]
}
```

**Enforce Encryption of Input Data**

The following policy restricts an IAM user to specify a AWS KMS key to encrypt input data when creating training, hyperparameter tuning, and labeling jobs by using the `sagemaker:VolumeKmsKey` condition key:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "EnforceEncryption",
      "Effect": "Allow",
      "Action": [
        "sagemaker:CreateTrainingJob",
        "sagemaker:CreateHyperParameterTuningJob",
        "sagemaker:CreateLabelingJob",
        "sagemaker:CreateFlowDefinition"
      ],
      "Condition": {
        "ArnLike": {
          "sagemaker:VolumeKmsKey": "*"
        }
      }
    }
  ]
}
```
Identity-Based Policy Examples

Enforce Encryption of Notebook Instance Storage Volume

The following policy restricts an IAM user to specify an AWS KMS key to encrypt the attached storage volume when creating or updating a notebook instance by using the `sagemaker:VolumeKmsKey` condition key:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "EnforceEncryption",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateNotebookInstance"
            ],
            "Resource": "*",
            "Condition": {
                "ArnEquals": {
                    "sagemaker:VolumeKmsKey": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"
                }
            }
        }
    ]
}
```

Enforce Network Isolation for Training Jobs

The following policy restricts an IAM user to enable network isolation when creating training jobs by using the `sagemaker:NetworkIsolation` condition key:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "EnforceIsolation",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateTrainingJob",
                "sagemaker:CreateHyperParameterTuningJob"
            ],
            "Resource": "*",
            "Condition": {
                "Bool": {
                    "sagemaker:NetworkIsolation": "true"
                }
            }
        }
    ]
}
```
Enforce a Specific Instance Type for Training Jobs

The following policy restricts an IAM user to use a specific instance type when creating training jobs by using the `sagemaker:InstanceTypes` condition key:

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "EnforceInstanceType",
         "Effect": "Allow",
         "Action": [
            "sagemaker:CreateTrainingJob",
            "sagemaker:CreateHyperParameterTuningJob"
         ],
         "Resource": "*",
         "Condition": {
            "ForAllValues:StringLike": {
               "sagemaker:InstanceTypes": ["ml.c5.*"]
            }
         }
      }
   ]
}
```

Enforce a Specific EI Accelerator for Training Jobs

The following policy restricts an IAM user to use a specific elastic inference (EI) accelerator, if an accelerator is provided, when creating or updating notebook instances and when creating endpoint configurations by using the `sagemaker:AcceleratorTypes` condition key:

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "EnforceAcceleratorType",
         "Effect": "Allow",
         "Action": [
            "sagemaker:CreateNotebookInstance",
            "sagemaker:UpdateNotebookInstance",
            "sagemaker:CreateEndpointConfig"
         ],
         "Resource": "*",
         "Condition": {
            "ForAllValues:StringEquals": {
               "sagemaker:AcceleratorTypes": ["ml.eia1.medium"]
            }
         }
      }
   ]
}
```

Enforce Disabling Internet Access and Root Access for Creating Notebook Instances

You can disable both internet access and root access to notebook instances to help make them more secure. For information about controlling root access to a notebook instance, see Control root access to a SageMaker notebook instance (p. 3335). For information about disabling internet access for a notebook instance, see Connect a Notebook Instance in a VPC to External Resources (p. 3468).
The following policy requires an IAM user to disable network access when creating instance, and disable root access when creating or updating a notebook instance.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "LockDownCreateNotebookInstance",
         "Effect": "Allow",
         "Action": [
            "sagemaker:CreateNotebookInstance"
         ],
         "Resource": "*",
         "Condition": {
            "StringEquals": {
               "sagemaker:DirectInternetAccess": "Disabled",
               "sagemaker:RootAccess": "Disabled"
            }
         }
      },
      {
         "Sid": "LockDownUpdateNotebookInstance",
         "Effect": "Allow",
         "Action": [
            "sagemaker:UpdateNotebookInstance"
         ],
         "Resource": "*",
         "Condition": {
            "StringEquals": {
               "sagemaker:RootAccess": "Disabled"
            }
         }
      }
   ]
}
```

### Control Access to the SageMaker API by Using Identity-based Policies

To control access to SageMaker API calls and calls to SageMaker hosted endpoints, use identity-based IAM policies.

**Topics**
- [Restrict Access to SageMaker API and Runtime to Calls from Within Your VPC](#)

#### Restrict Access to SageMaker API and Runtime to Calls from Within Your VPC

If you set up an interface endpoint in your VPC, individuals outside the VPC can still connect to the SageMaker API and runtime over the internet unless you attach an IAM policy that restricts access to calls coming from within the VPC to all users and groups that have access to your SageMaker resources. For information about creating a VPC interface endpoint for the SageMaker API and runtime, see [Connect to SageMaker Through a VPC Interface Endpoint](#).

**Important**

If you apply an IAM policy similar to one of the following, users can't access the specified SageMaker APIs through the console.
To restrict access to only connections made from within your VPC, create an AWS Identity and Access Management policy that restricts access to only calls that come from within your VPC. Then add that policy to every AWS Identity and Access Management user, group, or role used to access the SageMaker API or runtime.

Note
This policy allows connections only to callers within a subnet where you created an interface endpoint.

```
{
  "Id": "api-example-1",
  "Version": "2012-10-17",
  "Statement": [
    {
"Sid": "EnableAPIAccess",
"Effect": "Allow",
"Action": [
  "sagemaker:*"
],
"Resource": "*",
"Condition": {
  "StringEquals": {
    "aws:SourceVpc": "vpc-111bbaaa"
  }
}
}
]
}
```

If you want to restrict access to the API to only calls made using the interface endpoint, use the `aws:SourceVpce` condition key instead of `aws:SourceVpc`:

```
{
  "Id": "api-example-1",
  "Version": "2012-10-17",
  "Statement": [
    {
"Sid": "EnableAPIAccess",
"Effect": "Allow",
"Action": [
  "sagemaker:CreatePresignedNotebookInstanceUrl"
],
"Resource": "*",
"Condition": {
  "StringEquals": {
    "aws:sourceVpce": [
      "vpce-111bbccca",
      "vpce-111bbddd"
    ]
  }
}
}
]
}
```

Limit Access to SageMaker API and Runtime Calls by IP Address

To allow access to SageMaker API calls and runtime invocations only from IP addresses in a list that you specify, attach an IAM policy that denies access to the API unless the call comes from an IP address in the list to every AWS Identity and Access Management user, group, or role used to access the API or runtime. For information about creating IAM policies, see Creating IAM Policies in the AWS Identity and Access
Management User Guide. To specify the list of IP addresses that you want to have access to the API call, use the IpAddress condition operator and the aws:SourceIP condition context key. For information about IAM condition operators, see IAM JSON Policy Elements: Condition Operators in the AWS Identity and Access Management User Guide. For information about IAM condition context keys, see AWS Global Condition Context Keys.

For example, the following policy allows access to the CreateTrainingJob only from IP addresses in the ranges 192.0.2.0-192.0.2.255 and 203.0.113.0-203.0.113.255:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "sagemaker:CreateTrainingJob",
      "Resource": "*",
      "Condition": {
        "IpAddress": {
          "aws:SourceIp": [
            "192.0.2.0/24",
            "203.0.113.0/24"
          ]
        }
      }
    }
  ]
}
```

Limit Access to a Notebook Instance by IP Address

To allow access to a notebook instance only from IP addresses in a list that you specify, attach an IAM policy that denies access to CreatePresignedNotebookInstanceUrl unless the call comes from an IP address in the list to every AWS Identity and Access Management user, group, or role used to access the notebook instance. For information about creating IAM policies, see Creating IAM Policies in the AWS Identity and Access Management User Guide. To specify the list of IP addresses that you want to have access to the notebook instance, use the IpAddress condition operator and the aws:SourceIP condition context key. For information about IAM condition context keys, see AWS Global Condition Context Keys.

For example, the following policy allows access to a notebook instance only from IP addresses in the ranges 192.0.2.0-192.0.2.255 and 203.0.113.0-203.0.113.255:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "sagemaker:CreatePresignedNotebookInstanceUrl",
      "Resource": "*",
      "Condition": {
        "IpAddress": {
          "aws:SourceIp": [
            "192.0.2.0/24",
            "203.0.113.0/24"
          ]
        }
      }
    }
  ]
}
```
The policy restricts access to both the call to `CreatePresignedNotebookInstanceUrl` and to the URL that the call returns. The policy also restricts access to opening a notebook instance in the console and is enforced for every HTTP request and WebSocket frame that attempts to connect to the notebook instance.

**Note**
Using this method to filter by IP address is incompatible when connecting to SageMaker through a VPC interface endpoint. For information about restricting access to a notebook instance when connecting through a VPC interface endpoint, see Connect to a Notebook Instance Through a VPC Interface Endpoint (p. 3476).

### Control Access to SageMaker Resources by Using Tags

Control access to groups of SageMaker resources by attaching tags to the resources and specifying `ResourceTag` conditions in IAM policies.

**Note**
Tag-based policies don't work to restrict the following API calls:

- ListAlgorithms
- ListCodeRepositories
- ListCompilationJobs
- ListEndpointConfigs
- ListEndpoints
- ListFlowDefinitions
- ListHumanTaskUis
- ListHyperparameterTuningJobs
- ListLabelingJobs
- ListLabelingJobsForWorkteam
- ListModelPackages
- ListModels
- ListNotebookInstanceLifecycleConfigs
- ListNotebookInstances
- ListSubscribedWorkteams
- ListTags
- ListProcessingJobs
- ListTrainingJobs
- ListTrainingJobsForHyperParameterTuningJob
- ListTransformJobs
- ListWorkteams
- Search

For example, suppose you've defined two different IAM groups, named `DevTeam1` and `DevTeam2`, in your AWS account. Suppose also that you've created 10 notebook instances, 5 of which are used for one project, and 5 of which are used for a second project. You want to allow members of `DevTeam1` to make API calls on notebook instances used for the first project, and members of `DevTeam2` to make API calls on notebook instances used for the second project.
To control access to API calls (example)

1. Add a tag with the key `Project` and value `A` to the notebook instances used for the first project. For information about adding tags to SageMaker resources, see [AddTags](#).

2. Add a tag with the key `Project` and value `B` to the notebook instances used for the second project.

3. Create an IAM policy with a `ResourceTag` condition that denies access to the notebook instances used for the second project, and attach that policy to `DevTeam1`. The following is an example of a policy that denies all API calls on any notebook instance that has a tag with a key of `Project` and a value of `B`:

   ```json
   {
     "Version": "2012-10-17",
     "Statement": [
       {
         "Effect": "Allow",
         "Action": "sagemaker:*",
         "Resource": "*"
       },
       {
         "Effect": "Deny",
         "Action": "sagemaker:*",
         "Resource": "*",
         "Condition": {
           "StringEquals": {
             "sagemaker:ResourceTag/Project": "B"
           }
         }
       },
       {
         "Effect": "Deny",
         "Action": [
           "sagemaker:AddTags",
           "sagemaker:DeleteTags"
         ],
         "Resource": "*"
       }
     ]
   }
   ```

   For information about creating IAM policies and attaching them to identities, see [Controlling Access Using Policies](#) in the AWS Identity and Access Management User Guide.

4. Create an IAM policy with a `ResourceTag` condition that denies access to the notebook instances used for the first project, and attach that policy to `DevTeam2`. The following is an example of a policy that denies all API calls on any notebook instance that has a tag with a key of `Project` and a value of `A`:

   ```json
   {
     "Version": "2012-10-17",
     "Statement": [
       {
         "Effect": "Allow",
         "Action": "sagemaker:*",
         "Resource": "*"
       },
       {
         "Effect": "Deny",
         "Action": "sagemaker:*",
         "Resource": "*",
         "Condition": {
           "StringEquals": {
             "sagemaker:ResourceTag/Project": "A"
           }
         }
       }
     ]
   }
   ```
Cross-Service Confused Deputy Prevention

The confused deputy problem is a security issue where an entity that doesn’t have permission to perform an action can coerce a more-privileged entity to perform the action. In AWS, cross-service impersonation can result in the confused deputy problem. Cross-service impersonation can occur when one service (the calling service) calls another service (the called service). The calling service can be manipulated to use its permissions to act on another customer's resources in a way it should not otherwise have permission to access. To prevent this, AWS provides tools that help you protect your data for all services with service principals that have been given access to resources in your account.

Read on for general guidance or navigate to an example for a specific SageMaker feature:

Topics
- Limit Permissions With Global Condition Keys (p. 3370)
- SageMaker Edge Manager (p. 3370)
- SageMaker Images (p. 3371)
- SageMaker Inference (p. 3371)
- SageMaker Batch Transform Jobs (p. 3372)
- SageMaker Marketplace (p. 3372)
- SageMaker Neo (p. 3373)
Limit Permissions With Global Condition Keys

We recommend using the `aws:SourceArn` and `aws:SourceAccount` global condition keys in resource policies to limit the permissions to the resource that Amazon SageMaker gives another service. If you use both global condition keys and the `aws:SourceArn` value contains the account ID, the `aws:SourceAccount` value and the account in the `aws:SourceArn` value must use the same account ID when used in the same policy statement. Use `aws:SourceArn` if you want only one resource to be associated with the cross-service access. Use `aws:SourceAccount` if you want to allow any resource in that account to be associated with the cross-service use.

The most effective way to protect against the confused deputy problem is to use the `aws:SourceArn` global condition key with the full ARN of the resource. If you don't know the full ARN of the resource or if you are specifying multiple resources, use the `aws:SourceArn` global condition key with wildcards (*) for the unknown portions of the ARN. For example, `arn:aws:sagemaker:*:123456789012:*`.

The following example shows how you can use the `aws:SourceArn` and `aws:SourceAccount` global condition keys in SageMaker to prevent the confused deputy problem.

```json
{
  "Version": "2012-10-17",
  "Statement": {
    "Sid": "ConfusedDeputyPreventionExamplePolicy",
    "Effect": "Allow",
    "Principal": {
      "Service": "sagemaker.amazonaws.com"
    },
    # Specify an action and resource policy for another service
    "Action": ["service:ActionName"],
    "Resource": ["arn:aws:service:::ResourceName/*"],
    "Condition": {
      "ArnLike": {
        "aws:SourceArn": "arn:partition:sagemaker:region:123456789012:*"
      },
      "StringEquals": {
        "aws:SourceAccount": "123456789012"
      }
    }
  }
}
```

SageMaker Edge Manager

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Edge Manager created by account number 123456789012 in the us-west-2 Region.

```json
{
  "Version": "2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Principal": { "Service": "sagemaker.amazonaws.com" },
    "Condition": {
      " ArnLike": {
        "aws:SourceArn": "arn:partition:sagemaker:region:123456789012:*"
      },
      " StringEquals": {
        "aws:SourceAccount": "123456789012"
      }
    }
  }
}
```
You can replace the `aws:SourceArn` in this template with the full ARN of one specific packaging job to further limit permissions.

### SageMaker Images

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Images. Use this template with either `Image` or `ImageVersion`. This example uses an `ImageVersion` record ARN with the account number 123456789012. Note that because the account number is part of the `aws:SourceArn` value, you do not need to specify an `aws:SourceAccount` value.

```json
{
  "Version": "2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Principal": { "Service": "sagemaker.amazonaws.com" },
    "Action": "sts:AssumeRole",
    "Condition": {
      "ArnLike": {
      }
    }
  }
}
```

Do not replace the `aws:SourceArn` in this template with the full ARN of a specific image or image version. The ARN must be in the format provided above and specify either `image` or `image-version`. The partition placeholder should designate either an AWS commercial partition (`aws`) or an AWS in China partition (`aws-cn`), depending on where the image or image version is running. Similarly, the `region` placeholder in the ARN can be any valid `Region` where SageMaker images are available.

### SageMaker Inference

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker real-time, serverless, and asynchronous inference. Note that because the account number is part of the `aws:SourceArn` value, you do not need to specify an `aws:SourceAccount` value.

```json
{
  "Version": "2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Principal": { "Service": "sagemaker.amazonaws.com" },
    "Action": "sts:AssumeRole",
    "Condition": {
      "ArnLike": {
        "aws:SourceArn": "arn:aws:sagemaker:us-west-2:123456789012:*"
      }
    }
  }
}
```
Do not replace the `aws:SourceArn` in this template with the full ARN of a specific model or endpoint. The ARN must be in the format provided above. The asterisk in the ARN template does not stand for wildcard and should not be changed.

**SageMaker Batch Transform Jobs**

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker batch transform jobs created by account number 123456789012 in the `us-west-2` Region. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{
    "Version": "2012-10-17",
    "Statement": [
    {
        "Effect": "Allow",
        "Principal": {
            "Service": "sagemaker.amazonaws.com"
        },
        "Action": "sts:AssumeRole",
        "Condition": {
            "ArnLike": {
            }
        }
    }
    ]
}
```

You can replace the `aws:SourceArn` in this template with the full ARN of one specific batch transform job to further limit permissions.

**SageMaker Marketplace**

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Marketplace resources created by account number 123456789012 in the `us-west-2` Region. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{
    "Version": "2012-10-17",
    "Statement": [
    {
        "Effect": "Allow",
        "Principal": {
            "Service": "sagemaker.amazonaws.com"
        },
        "Action": "sts:AssumeRole",
        "Condition": {
            "ArnLike": {
                "aws:SourceArn": "arn:aws:sagemaker:us-west-2:123456789012:*"
            }
        }
    }
    ]
}
```

Do not replace the `aws:SourceArn` in this template with the full ARN of a specific algorithm or model package. The ARN must be in the format provided above. The asterisk in the ARN template does stand
for wildcard and covers all training jobs, models, and batch transform jobs from validation steps, as well as algorithm and model packages published to SageMaker Marketplace.

**SageMaker Neo**

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Neo compilation jobs created by account number 123456789012 in the us-west-2 Region. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Principal": {  
                "Service": "sagemaker.amazonaws.com"  
            },  
            "Action": "sts:AssumeRole",  
            "Condition": {  
                "ArnLike": {  
                }  
            }  
        }  
    ]
}
```

You can replace the `aws:SourceArn` in this template with the full ARN of one specific compilation job to further limit permissions.

**SageMaker Pipelines**

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Pipelines using pipeline execution records from one or more pipelines. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Principal": {  
                "Service": "sagemaker.amazonaws.com"  
            },  
            "Action": "sts:AssumeRole",  
            "Condition": {  
                "ArnLike": {  
                    "aws:SourceArn": "arn:partition:sagemaker:region:123456789012:pipeline/mypipeline/*"  
                }  
            }  
        }  
    ]
}
```

Do not replace the `aws:SourceArn` in this template with the full ARN of a specific pipeline execution. The ARN must be in the format provided above. The `partition` placeholder should designate either an AWS commercial partition (aws) or an AWS in China partition (aws-cn), depending on where the pipeline
is running. Similarly, the region placeholder in the ARN can be any valid Region where SageMaker Pipelines is available.

The asterisk in the ARN template does stand for wildcard and covers all pipeline executions of a pipeline named mypipeline. If you want to allow the AssumeRole permissions for all pipelines in account 123456789012 rather than one specific pipeline, then the aws:SourceArn would be arn:aws:sagemaker:*:123456789012:pipeline/*.

SageMaker Processing Jobs

The following example shows how you can use the aws:SourceArn global condition key to prevent the cross-service confused deputy problem for SageMaker processing jobs created by account number 123456789012 in the us-west-2 Region. Note that because the account number is part of the ARN, you do not need to specify an aws:SourceAccount value.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "sagemaker.amazonaws.com"
      },
      "Action": "sts:AssumeRole",
      "Condition": {
        "ArnLike": {
        }
      }
    }
  ]
}
```

You can replace the aws:SourceArn in this template with the full ARN of one specific processing job to further limit permissions.

SageMaker Studio

The following example shows how you can use the aws:SourceArn global condition key to prevent the cross-service confused deputy problem for SageMaker Studio created by account number 123456789012 in the us-west-2 Region. Note that because the account number is part of the aws:SourceArn value, you do not need to specify an aws:SourceAccount value.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "sagemaker.amazonaws.com"
      },
      "Action": "sts:AssumeRole",
      "Condition": {
        "ArnLike": {
          "aws:SourceArn": "arn:aws:sagemaker:us-west-2:123456789012:*"
        }
      }
    }
  ]
}
```
Do not replace the `aws:SourceArn` in this template with the full ARN of a specific Studio application, user profile, or domain. The ARN must be in the format provided in the previous example. The asterisk in the ARN template does not stand for wildcard and should not be changed.

**SageMaker Training Jobs**

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker training jobs created by account number 123456789012 in the `us-west-2` Region. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Principal": {
            "Service": "sagemaker.amazonaws.com"
         },
         "Action": "sts:AssumeRole",
         "Condition": {
            "ArnLike": {
            }
         }
      }
   ]
}
```

You can replace the `aws:SourceArn` in this template with the full ARN of one specific training job to further limit permissions.

**Next Up**

For more information on managing execution roles, see [SageMaker Roles](#).

**SageMaker Roles**

As a managed service, Amazon SageMaker performs operations on your behalf on the AWS hardware that is managed by SageMaker. SageMaker can perform only operations that the user permits.

A SageMaker user can grant these permissions with an IAM role (referred to as an execution role).

To create and use a locally available execution role, you can use the following procedures.

**Get execution role**

You can find the IAM execution role in the following ways:

**From the notebook**

When you run a notebook within SageMaker (from the SageMaker console or SageMaker Studio) you can access the execution role with the following code:

```python
sagemaker_session = sagemaker.Session()
role = sagemaker.get_execution_role()
```

**Note**

The execution role is available only when running a notebook within SageMaker. If you run `get_execution_role` in a notebook not on SageMaker, expect a “region” error.
From the SageMaker console

Under Notebook > Notebook instances, select the notebook. The ARN is given in the Permissions and encryption section.

Create execution role

Use the following procedure to create an execution role with the IAM managed policy, AmazonSageMakerFullAccess, attached. If your use case requires more granular permissions, use other sections on this page to create an execution role that meets your business needs.

Important

The IAM managed policy, AmazonSageMakerFullAccess, used in the following procedure only grants the execution role permission to perform certain Amazon S3 actions on buckets or objects with SageMaker, Sagemaker, sagemaker, or aws-glue in the name. To learn how to add an additional policy to an execution role to grant it access to other Amazon S3 buckets and objects, see Add Additional Amazon S3 Permissions to a SageMaker Execution Role (p. 3376).

To create a new role

1. Open the IAM console at https://console.aws.amazon.com/iam/
2. Select Roles and then select Create role.
4. Select Next: Permissions.
5. The IAM managed policy, AmazonSageMakerFullAccess is automatically attached to this role. To see the permissions included in this policy, select the sideways arrow next to the policy name. Select Next: Tags.
6. (Optional) Add tags and select Next: Review.
7. Give the role a name in the text field under Role name and select Create role.
8. On the Roles section of the IAM console, select the role you just created. If needed, use the text box to search for the role using the role name you entered in step 7.
9. On the role summary page, make note of the ARN.

With a known ARN for your role, you can programmatically check the role when running the notebook locally or on SageMaker. Replace RoleName with your known ARN:

```python
try:
    role = sagemaker.get_execution_role()
except ValueError:
    iam = boto3.client('iam')
    role = iam.get_role(RoleName='AmazonSageMaker-ExecutionRole-20201200T100000')['Role']['Arn']
```

Add Additional Amazon S3 Permissions to a SageMaker Execution Role

When you use a SageMaker feature with resources in Amazon S3, such as input data, the execution role you specify in your request (for example CreateTrainingJob) is used to access these resources.

If you attach the IAM managed policy, AmazonSageMakerFullAccess, to an execution role, that role has permission to perform certain Amazon S3 actions on buckets or objects with SageMaker, Sagemaker, sagemaker, or aws-glue in the name. It also has permission to perform the following actions on any Amazon S3 resource:

```
"s3:CreateBucket",
"s3:GetBucketLocation",
```
"s3:ListBucket",
"s3:ListAllMyBuckets",
"s3:GetBucketCors",
"s3:PutBucketCors"

To give an execution role permissions to access one or more specific buckets in Amazon S3, you can attach a policy similar to the following to the role. This policy grants an IAM role permission to perform all actions that AmazonSageMakerFullAccess allows but restricts this access to the buckets DOC-EXAMPLE-BUCKET1 and DOC-EXAMPLE-BUCKET2. Refer to the security documentation for the specific SageMaker feature you are using to learn more about the Amazon S3 permissions required for that feature.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:PutObject",
                "s3:DeleteObject",
                "s3:AbortMultipartUpload"
            ],
            "Resource": [
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET1/*",
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET2/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:CreateBucket",
                "s3:GetBucketLocation",
                "s3:ListBucket",
                "s3:ListAllMyBuckets",
                "s3:GetBucketCors",
                "s3:PutBucketCors"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetBucketAcl",
                "s3:PutObjectAcl"
            ],
            "Resource": [
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET1",
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET2"
            ]
        }
    ]
}
```

Passing Roles

Actions like passing a role between services are a common function within SageMaker. You can find more details on Actions, Resources, and Condition Keys for SageMaker in the IAM User Guide.

You pass the role `iam:PassRole` when making these API calls: CreateAutoMLJob, CreateCompilationJob, CreateDomain, CreateFlowDefinition, CreateHyperParameterTuningJob, CreateImage, CreateLabelingJob, CreateModel,
You attach the following trust policy to the IAM role which grants SageMaker principal permissions to assume the role, and is the same for all of the execution roles:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "sagemaker.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

The permissions that you need to grant to the role vary depending on the API that you call. The following sections explain these permissions.

**Note**
Instead of managing permissions by crafting a permission policy, you can use the AWS-managed AmazonSageMakerFullAccess permission policy. The permissions in this policy are fairly broad, to allow for any actions you might want to perform in SageMaker. For a listing of the policy including information about the reasons for adding many of the permissions, see AWS managed policy: AmazonSageMakerFullAccess (p. 3411). If you prefer to create custom policies and manage permissions to scope the permissions only to the actions you need to perform with the execution role, see the following topics.

**Important**
If you're running into issues, see Troubleshooting Amazon SageMaker Identity and Access (p. 3462).

For more information about IAM roles, see IAM Roles in the IAM User Guide.

**Topics**
- CreateAutoMLJob API: Execution Role Permissions (p. 3378)
- CreateDomain API: Execution Role Permissions (p. 3380)
- CreateImage and UpdateImage APIs: Execution Role Permissions (p. 3381)
- CreateNotebookInstance API: Execution Role Permissions (p. 3381)
- CreateHyperParameterTuningJob API: Execution Role Permissions (p. 3384)
- CreateProcessingJob API: Execution Role Permissions (p. 3386)
- CreateTrainingJob API: Execution Role Permissions (p. 3389)
- CreateModel API: Execution Role Permissions (p. 3391)

**CreateAutoMLJob API: Execution Role Permissions**

For an execution role that you can pass in a CreateAutoMLJob API request, you can attach the following minimum permission policy to the role:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "sagemaker.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```
If you specify a private VPC for your AutoML job, add the following permissions:

```json
{
  "Effect": "Allow",
  "Action": [
    "ec2:CreateNetworkInterface",
    "ec2:CreateNetworkInterfacePermission",
    "ec2:DeleteNetworkInterface",
    "ec2:DeleteNetworkInterfacePermission",
    "ec2:DescribeNetworkInterfaces",
    "ec2:DescribeVpcs",
    "ec2:DescribeDhcpOptions",
    "ec2:DescribeSubnets",
    "ec2:DescribeSecurityGroups"
  ],
  "Resource": "*"
}
```

If your input is encrypted using server-side encryption with an AWS KMS–managed key (SSE-KMS), add the following permissions:

```json
{
  "Effect": "Allow",
  "Action": [
    "sagemaker:DescribeEndpointConfig",
    "sagemaker:DescribeModel",
    "sagemaker:InvokeEndpoint",
    "sagemaker:ListTags",
    "sagemaker:DescribeEndpoint",
    "sagemaker:CreateModel",
    "sagemaker:CreateEndpointConfig",
    "sagemaker:CreateEndpoint",
    "sagemaker:DeleteModel",
    "sagemaker:DeleteEndpointConfig",
    "sagemaker:DeleteEndpoint",
    "cloudwatch:PutMetricData",
    "logs:CreateLogStream",
    "logs:PutLogEvents",
    "logs:CreateLogGroup",
    "logs:DescribeLogStreams",
    "s3:GetObject",
    "s3:PutObject",
    "s3:ListBucket",
    "ecr:GetAuthorizationToken",
    "ecr:BatchCheckLayerAvailability",
    "ecr:GetDownloadUrlForLayer",
    "ecr:BatchGetImage"
  ],
  "Resource": "*"
}
```
If you specify a KMS key in the output configuration of your AutoML job, add the following permissions:

```json
{
  "Effect": "Allow",
  "Action": [
    "kms:Decrypt"
  ]
}
```

If you specify a volume KMS key in the resource configuration of your AutoML job, add the following permissions:

```json
{
  "Effect": "Allow",
  "Action": [
    "kms:Encrypt"
  ]
}
```

**CreateDomain API: Execution Role Permissions**

The execution role for domains with IAM Identity Center and the user/execution role for IAM domains need the following permissions when you pass an AWS KMS customer managed key as the KmsKeyId in the CreateDomain API request. The permissions are enforced during the CreateApp API call.

For an execution role that you can pass in the CreateDomain API request, you can attach the following permission policy to the role:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "kms:CreateGrant",
        "kms:DescribeKey"
      ],
      "Resource": "arn:aws:kms:region:account-id:key/kms-key-id"
    }
  ]
}
```

Alternatively, if the permissions are specified in a KMS policy, you can attach the following policy to the role:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "Allow use of the key",
      "Effect": "Allow",
      "Principal": {
        "AWS": ["arn:aws:kms:region:account-id:"
```
CreateImage and UpdateImage APIs: Execution Role Permissions

For an execution role that you can pass in a CreateImage or UpdateImage API request, you can attach the following permission policy to the role:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ecr:BatchGetImage",
                "ecr:GetDownloadUrlForLayer"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "iam:PassRole"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "iam:PassedToService": "sagemaker.amazonaws.com"
                }
            }
        }
    ]
}
```

CreateNotebookInstance API: Execution Role Permissions

The permissions that you grant to the execution role for calling the CreateNotebookInstance API depend on what you plan to do with the notebook instance. If you plan to use it to invoke SageMaker APIs and pass the same role when calling the CreateTrainingJob and CreateModel APIs, attach the following permissions policy to the role:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "sagemaker:*",
                "ecr:GetAuthorizationToken",
                "ecr:GetDownloadUrlForLayer",
                "ecr:BatchGetImage",
                "ecr:BatchCheckLayerAvailability",
                "sagemaker:CreateModel",
                "sagemaker:CreateTrainingJob",
                "sagemaker:CreatePredictor",
                "sagemaker:StopTrainingJob",
                "sagemaker:CreateModelPackage",
                "sagemaker:CreateModelVersion",
                "sagemaker:CreateEndpointVersion",
                "sagemaker:DeleteEndpointVersion",
                "sagemaker:DeleteModelVersion",
                "sagemaker:DeleteModelPackage",
                "sagemaker:DeleteModel",
                "sagemaker:DeleteEndpoint",
                "sagemaker:StartMonitoringEndpoint",
                "sagemaker:StopMonitoringEndpoint",
                "sagemaker:StartMonitoringSchedule",
                "sagemaker:StopMonitoringSchedule",
                "sagemaker:StartNotebookInstanceLifecycleConfiguration",
                "sagemaker:StartNotebookInstance",
                "sagemaker:StopNotebookInstance",
                "sagemaker:StartNotebookInstanceLifecycleConfiguration",
                "sagemaker:CreateFeatureGroup",
                "sagemaker:DescribeFeatureGroup",
                "sagemaker:DescribeFeatureGroups",
                "sagemaker:CreateForecastExperiment",
                "sagemaker:DescribeForecastExperiment",
                "sagemaker:DescribeForecastExperiments",
                "sagemaker:CreateForecast",
                "sagemaker:DescribeForecast",
                "sagemaker:DescribeForecasts",
                "sagemaker:ListForecastExperiments",
                "sagemaker:CreateFeatureStore",
                "sagemaker:DescribeFeatureStore",
                "sagemaker:DescribeFeatureStores",
                "sagemaker:ListFeatures",
                "sagemaker:CreateModelPackageVersion",
                "sagemaker:CreateModelVersionSummary",
                "sagemaker:GetModelVersionSummary",
                "sagemaker:DescribeModelVersionSummary",
                "sagemaker:DescribeModelVersionSummaryCollection",
                "sagemaker:ListModelVersionSummaries",
                "sagemaker:DeleteFeatureGroup",
                "sagemaker:DeleteForecastExperiment",
                "sagemaker:DeleteForecastExperiments",
                "sagemaker:DeleteForecast",
                "sagemaker:DeleteForecasts",
                "sagemaker:DeleteFeatureStore",
                "sagemaker:DeleteFeatureStoreCollection",
                "sagemaker:DeleteFeatureStoreCollectionSummary",
                "sagemaker:DeleteModelPackageVersion",
                "sagemaker:DeleteModelVersionSummaryCollection",
                "sagemaker:DeleteModelVersionSummaryCollectionSummary",
                "sagemaker:DeleteModelVersionSummaries",
                "sagemaker:DescribeForecastPredictionDataset",
                "sagemaker:DescribeForecastPredictionDatasetCollection",
                "sagemaker:ListForecastPredictionDatasets",
                "sagemaker:StartForecastPredictionDatasetCollection",
                "sagemaker:StopForecastPredictionDatasetCollection",
                "sagemaker:StartFeatureStoreCollection",
                "sagemaker:StopFeatureStoreCollection",
                "sagemaker:SubmitSetLabelingJob",
                "sagemaker:DescribeSetLabelingJob",
                "sagemaker:DescribeSetLabelingJobs",
                "sagemaker:SubmitSetLabelingJobCollection",
                "sagemaker:StopSetLabelingJobCollection",
                "sagemaker:StartSetLabelingJobCollection",
                "sagemaker:StopSetLabelingJobCollection",

                "sagemaker:DescribeFeatureStore",
                "sagemaker:DescribeFeatureStores",
                "sagemaker:ListFeatures",
                "sagemaker:CreateModelPackageVersion",
                "sagemaker:CreateModelVersionSummary",
                "sagemaker:GetModelVersionSummary",
                "sagemaker:DescribeModelVersionSummary",
                "sagemaker:DescribeModelVersionSummaryCollection",
                "sagemaker:ListModelVersionSummaries",
                "sagemaker:DeleteFeatureGroup",
                "sagemaker:DeleteForecastExperiment",
                "sagemaker:DeleteForecastExperiments",
                "sagemaker:DeleteForecast",
                "sagemaker:DeleteForecasts",
                "sagemaker:DeleteFeatureStore",
                "sagemaker:DeleteFeatureStoreCollection",
                "sagemaker:DeleteFeatureStoreCollectionSummary",
                "sagemaker:DeleteModelPackageVersion",
                "sagemaker:DeleteModelVersionSummaryCollection",
                "sagemaker:DeleteModelVersionSummaryCollectionSummary",
                "sagemaker:DeleteModelVersionSummaries",
                "sagemaker:DescribeForecastPredictionDataset",
                "sagemaker:DescribeForecastPredictionDatasetCollection",
                "sagemaker:ListForecastPredictionDatasets",
                "sagemaker:StartForecastPredictionDatasetCollection",
                "sagemaker:StopForecastPredictionDatasetCollection",
                "sagemaker:StartFeatureStoreCollection",
                "sagemaker:StopFeatureStoreCollection",
                "sagemaker:SubmitSetLabelingJob",
                "sagemaker:DescribeSetLabelingJob",
                "sagemaker:DescribeSetLabelingJobs",
                "sagemaker:SubmitSetLabelingJobCollection",
                "sagemaker:StopSetLabelingJobCollection",
                "sagemaker:StartSetLabelingJobCollection",
                "sagemaker:StopSetLabelingJobCollection",
                "sagemaker:StartNotebookInstanceLifecycleConfiguration",
                "sagemaker:StartNotebookInstance",
                "sagemaker:StopNotebookInstance",
                "sagemaker:StartNotebookInstanceLifecycleConfiguration"
            ]
        }
    ]
}
```
To tighten the permissions, limit them to specific Amazon S3 and Amazon ECR resources, by restricting 
"Resource": "*", as follows:
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "sagemaker:*",
        "ecr:GetAuthorizationToken",
        "cloudwatch:PutMetricData",
        "logs:CreateLogGroup",
        "logs:CreateLogStream",
        "logs:DescribeLogStreams",
        "logs:PutLogEvents",
        "logs:GetLogEvents"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "iam:PassRole"
      ],
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "iam:PassedToService": "sagemaker.amazonaws.com"
        }
      }
    },
    {
      "Effect": "Allow",
      "Action": [
        "s3:ListBucket"
      ],
      "Resource": ["arn:aws:s3:::inputbucket"]
    },
    {
      "Effect": "Allow",
      "Action": [
        "s3:GetObject",
        "s3:PutObject",
        "s3:DeleteObject"
      ],
      "Resource": ["arn:aws:s3:::inputbucket/object1",
                    "arn:aws:s3:::outputbucket/path",
                    "arn:aws:s3:::inputbucket/object2",
                    "arn:aws:s3:::inputbucket/object3"
                  ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "ecr:BatchCheckLayerAvailability",
        "ecr:GetDownloadUrlForLayer",
        "ecr:BatchGetImage"
      ],
      "Resource": ["arn:aws:ecr:region::repository/my-repo1",
                    "arn:aws:ecr:region::repository/my-repo2",
                    "arn:aws:ecr:region::repository/my-repo3"
                  ]
    }
  ]
}
If you plan to access other resources, such as Amazon DynamoDB or Amazon Relational Database Service, add the relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- Scope the s3:ListBucket permission to the specific bucket that you specify as 
  InputDataConfig.DataSource.S3DataSource.S3Uri in a CreateTrainingJob request.
- Scope s3:GetObject, s3:PutObject, and s3:DeleteObject permissions as follows:
  Scope to the following values that you specify in a CreateTrainingJob request:
  
  - InputDataConfig.DataSource.S3DataSource.S3Uri
  - OutputDataConfig.S3OutputPath
  - Scope to the following values that you specify in a CreateModel request:
    - PrimaryContainer.ModelDataUrl
    - SupplementalContainers.ModelDataUrl
- Scope ecr permissions as follows:
  - Scope to the AlgorithmSpecification.TrainingImage value that you specify in a 
    CreateTrainingJob request.
  - Scope to the PrimaryContainer.Image value that you specify in a CreateModel request:

The cloudwatch and logs actions are applicable for "*" resources. For more information, see CloudWatch Resources and Operations in the Amazon CloudWatch User Guide.

**CreateHyperParameterTuningJob API: Execution Role Permissions**

For an execution role that you can pass in a CreateHyperParameterTuningJob API request, you can attach the following permission policy to the role:

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "cloudwatch:PutMetricData",
            "logs:CreateLogStream",
            "logs:PutLogEvents",
            "logs:CreateLogGroup",
            "logs:DescribeLogStreams",
            "s3:GetObject",
            "s3:PutObject",
            "s3:ListBucket",
            "ecr:GetAuthorizationToken",
            "ecr:BatchCheckLayerAvailability",
            "ecr:GetDownloadUrlForLayer",
            "ecr:GetDownloadUrlForLayer"
         ],
         "Resource": "*"
      }
   ]
}
```
Instead of specifying "Resource": "*", you could scope these permissions to specific Amazon S3 and Amazon ECR resources:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": ["s3:ListBucket"],
            "Resource": ["arn:aws:s3:::inputbucket"
            ]
        },
        {
            "Effect": "Allow",
            "Action": ["s3:GetObject", "s3:PutObject"],
            "Resource": ["arn:aws:s3:::inputbucket/object", "arn:aws:s3:::outputbucket/path"
            ]
        },
        {
            "Effect": "Allow",
            "Action": ["ecr:BatchCheckLayerAvailability", "ecr:GetDownloadUrlForLayer", "ecr:BatchGetImage"],
            "Resource": "arn:aws:ecr::repository/my-repo"
        }
    ]
}
```

If the training container associated with the hyperparameter tuning job needs to access other data sources, such as DynamoDB or Amazon RDS resources, add relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- Scope the `s3:ListBucket` permission to a specific bucket that you specify as the `InputDataConfig.DataSource.S3DataSource.S3Uri` in a `CreateTrainingJob` request.
- Scope the `s3:GetObject` and `s3:PutObject` permissions to the following objects that you specify in the input and output data configuration in a `CreateHyperParameterTuningJob` request:

```bash
InputDataConfig.DataSource.S3DataSource.S3Uri
```
OutputDataConfig.S3OutputPath

• Scope Amazon ECR permissions to the registry path (AlgorithmSpecification.TrainingImage) that you specify in a CreateHyperParameterTuningJob request.

The cloudwatch and logs actions are applicable for "*" resources. For more information, see CloudWatch Resources and Operations in the Amazon CloudWatch User Guide.

If you specify a private VPC for your hyperparameter tuning job, add the following permissions:

```json
{
"Effect": "Allow",
"Action": ["ec2:CreateNetworkInterface",
"ec2:CreateNetworkInterfacePermission",
"ec2:DeleteNetworkInterface",
"ec2:DeleteNetworkInterfacePermission",
"ec2:DescribeNetworkInterfaces",
"ec2:DescribeVpcs",
"ec2:DescribeDhcpOptions",
"ec2:DescribeSubnets",
"ec2:DescribeSecurityGroups"
]
}
```

If your input is encrypted using server-side encryption with an AWS KMS–managed key (SSE-KMS), add the following permissions:

```json
{
"Effect": "Allow",
"Action": ["kms:Decrypt"
]
}
```

If you specify a KMS key in the output configuration of your hyperparameter tuning job, add the following permissions:

```json
{
"Effect": "Allow",
"Action": ["kms:Encrypt"
]
}
```

If you specify a volume KMS key in the resource configuration of your hyperparameter tuning job, add the following permissions:

```json
{
"Effect": "Allow",
"Action": ["kms:CreateGrant"
]
}
```

**CreateProcessingJob API: Execution Role Permissions**

For an execution role that you can pass in a CreateProcessingJob API request, you can attach the following permission policy to the role:
Instead of specifying "Resource": "*", you could scope these permissions to specific Amazon S3 and Amazon ECR resources:

```json
{
   "Version": "2012-10-17",
   "Statement": [
   {
      "Effect": "Allow",
      "Action": [
         "cloudwatch:PutMetricData",
         "logs:CreateLogStream",
         "logs:PutLogEvents",
         "logs:CreateLogGroup",
         "logs:DescribeLogStreams",
         "s3:GetObject",
         "s3:PutObject",
         "s3:ListBucket",
         "ecr:GetAuthorizationToken",
         "ecr:BatchCheckLayerAvailability",
         "ecr:GetDownloadUrlForLayer",
         "ecr:BatchGetImage"
      ],
      "Resource": "*
   },
   {
      "Effect": "Allow",
      "Action": [
         "s3:ListBucket"
      ],
      "Resource": ["arn:aws:s3:::inputbucket"
   },
   {
      "Effect": "Allow",
      "Action": [
         "s3:GetObject",
         "s3:PutObject"
      ],
      "Resource": ["arn:aws:s3:::inputbucket/object",
                     "arn:aws:s3:::outputbucket/path"
   }]
}
```
If `CreateProcessingJob.AppSpecification.ImageUri` needs to access other data sources, such as DynamoDB or Amazon RDS resources, add relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- **Scope the `s3:ListBucket` permission to a specific bucket that you specify as the `ProcessingInputs` in a `CreateProcessingJob` request.**
- **Scope the `s3:GetObject` and `s3:PutObject` permissions to the objects that will be downloaded or uploaded in the `ProcessingInputs` and `ProcessingOutputConfig` in a `CreateProcessingJob` request.**
- **Scope Amazon ECR permissions to the registry path (`AppSpecification.ImageUri`) that you specify in a `CreateProcessingJob` request.**

The `cloudwatch` and `logs` actions are applicable for "*" resources. For more information, see CloudWatch Resources and Operations in the Amazon CloudWatch User Guide.

If you specify a private VPC for your processing job, add the following permissions:

```json
{
   "Effect": "Allow",
   "Action": [
       "ec2:CreateNetworkInterface",
       "ec2:CreateNetworkInterfacePermission",
       "ec2:DeleteNetworkInterface",
       "ec2:DeleteNetworkInterfacePermission",
       "ec2:DescribeNetworkInterfaces",
       "ec2:DescribeVpcs",
       "ec2:DescribeDhcpOptions",
       "ec2:DescribeSubnets",
       "ec2:DescribeSecurityGroups"
   ]
}
```

If your input is encrypted using server-side encryption with an AWS KMS–managed key (SSE-KMS), add the following permissions:

```json
{
   "Effect": "Allow",
   "Action": [
       "kms:Decrypt"
   ]
}
```

If you specify a KMS key in the output configuration of your processing job, add the following permissions:

```json
{
   "Effect": "Allow",
   "Action": [
       "kms:Encrypt"
   ]
}
```
If you specify a volume KMS key in the resource configuration of your processing job, add the following permissions:

```json
{
    "Effect": "Allow",
    "Action": [ 
        "kms:CreateGrant"
    ]
}
```

**CreateTrainingJob API: Execution Role Permissions**

For an execution role that you can pass in a `CreateTrainingJob` API request, you can attach the following permission policy to the role:

```json
{
    "Version": "2012-10-17",
    "Statement": [ 
        {
            "Effect": "Allow",
                ],
            "Resource": "*"
        }
    ]
}
```

Instead of specifying "Resource": "*", you could scope these permissions to specific Amazon S3 and Amazon ECR resources:

```json
{
    "Version": "2012-10-17",
    "Statement": [ 
        {
            "Effect": "Allow",
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [ "sts:AssumeRole" ]
        }
    ]
}
```
If `CreateTrainingJob.AlgorithmSpecifications.TrainingImage` needs to access other data sources, such as DynamoDB or Amazon RDS resources, add relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- Scope the `s3:ListBucket` permission to a specific bucket that you specify as the `InputDataConfig.DataSource.S3DataSource.S3Uri` in a `CreateTrainingJob` request.
- Scope the `s3:GetObject` and `s3:PutObject` permissions to the following objects that you specify in the input and output data configuration in a `CreateTrainingJob` request:
  - `InputDataConfig.DataSource.S3DataSource.S3Uri`
  - `OutputDataConfig.S3OutputPath`
- Scope Amazon ECR permissions to the registry path (`AlgorithmSpecification.TrainingImage`) that you specify in a `CreateTrainingJob` request.

The `cloudwatch` and `logs` actions are applicable for `*` resources. For more information, see CloudWatch Resources and Operations in the Amazon CloudWatch User Guide.

If you specify a private VPC for your training job, add the following permissions:
If your input is encrypted using server-side encryption with an AWS KMS–managed key (SSE-KMS), add the following permissions:

```json
{
    "Effect": "Allow",
    "Action": [
        "kms:Decrypt"
    ]
}
```

If you specify a KMS key in the output configuration of your training job, add the following permissions:

```json
{
    "Effect": "Allow",
    "Action": [
        "kms:Encrypt"
    ]
}
```

If you specify a volume KMS key in the resource configuration of your training job, add the following permissions:

```json
{
    "Effect": "Allow",
    "Action": [
        "kms:CreateGrant"
    ]
}
```

**CreateModel API: Execution Role Permissions**

For an execution role that you can pass in a CreateModel API request, you can attach the following permission policy to the role:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "cloudwatch:PutMetricData",
                "logs:CreateLogStream",
                "logs:PutLogEvents",
                "logs:CreateLogGroup",
                "logs:DescribeLogStreams",
                "s3:GetObject",
                "s3:ListBucket",
                "ecr:GetAuthorizationToken",
                "ecr:BatchCheckLayerAvailability",
                "ecr:GetDownloadUrlForLayer",
                "ecr:BatchGetImage"
            ],
            "Resource": "*"
        }
    ]
}
```
Instead of specifying "Resource": "*", you can scope these permissions to specific Amazon S3 and Amazon ECR resources:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "cloudwatch:PutMetricData",
                "logs:CreateLogStream",
                "logs:PutLogEvents",
                "logs:CreateLogGroup",
                "logs:DescribeLogStreams",
                "ecr:GetAuthorizationToken"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject"
            ],
            "Resource": [
                "arn:aws:s3:::inputbucket/object"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "ecr:BatchCheckLayerAvailability",
                "ecr:GetDownloadUrlForLayer",
                "ecr:BatchGetImage"
            ],
            "Resource": [
                "arn:aws:ecr:region::repository/my-repo",
                "arn:aws:ecr:region::repository/my-repo"
            ]
        }
    ]
}
```

If `CreateModel.PrimaryContainer.Image` need to access other data sources, such as Amazon DynamoDB or Amazon RDS resources, add relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- Scope S3 permissions to objects that you specify in the `PrimaryContainer.ModelDataUrl` in a `CreateModel` request.
- Scope Amazon ECR permissions to a specific registry path that you specify as the `PrimaryContainer.Image` and `SecondaryContainer.Image` in a `CreateModel` request.

The `cloudwatch` and `logs` actions are applicable for "*" resources. For more information, see `CloudWatch Resources and Operations` in the Amazon CloudWatch User Guide.

If you specify a private VPC for your model, add the following permissions:

```json
{
    "Effect": "Allow",
    "Action": [
        "ec2:CreateNetworkInterface",
        "ec2:CreateNetworkInterfacePermission",
        "ec2:StopNetworkInterface",
        "ec2:DeleteNetworkInterface"
    ],
    "Resource": "*"
}
```
Amazon SageMaker API Permissions: Actions, Permissions, and Resources Reference

When you are setting up access control and writing a permissions policy that you can attach to an IAM identity (an identity-based policy), use the following as a reference. The each Amazon SageMaker API operation, the corresponding actions for which you can grant permissions to perform the action, and the AWS resource for which you can grant the permissions. You specify the actions in the policy's Action field, and you specify the resource value in the policy's Resource field.

**Note**
Except for the ListTags API, resource-level restrictions are not available on List- calls. Any user calling a List- API will see all resources of that type in the account.

To express conditions in your Amazon SageMaker policies, you can use AWS-wide condition keys. For a complete list of AWS-wide keys, see Available Keys in the IAM User Guide.

**Amazon SageMaker API Operations and Required Permissions for Actions**

AWS Managed Policies for Amazon SageMaker

To add permissions to users, groups, and roles, it is easier to use AWS managed policies than to write policies yourself. It takes time and expertise to create IAM customer managed policies that provide your team with only the permissions they need. To get started quickly, you can use our AWS managed policies. These policies cover common use cases and are available in your AWS account. For more information about AWS managed policies, see AWS managed policies in the IAM User Guide.

AWS services maintain and update AWS managed policies. You can't change the permissions in AWS managed policies. Services occasionally add additional permissions to an AWS managed policy to support new features. This type of update affects all identities (users, groups, and roles) to which the policy is attached. Services are most likely to update an AWS managed policy when a new feature is launched or when new operations become available. Services do not remove permissions from an AWS managed policy, so policy updates won't break your existing permissions.
Additionally, AWS supports managed policies for job functions that span multiple services. For example, the `ReadOnlyAccess` AWS managed policy provides read-only access to all AWS services and resources. When a service launches a new feature, AWS adds read-only permissions for new operations and resources. For a list and descriptions of job function policies, see AWS managed policies for job functions in the IAM User Guide.

**Important**
We recommend that you use the most restricted policy that allows you to perform your use case.

The following AWS managed policies, which you can attach to users in your account, are specific to Amazon SageMaker:

- **AmazonSageMakerFullAccess** – Grants full access to Amazon SageMaker resources and the supported operations. This does not provide unrestricted Amazon S3 access, but supports buckets and objects with specific `sagemaker` tags. This policy allows all IAM roles to be passed to Amazon SageMaker, but only allows IAM roles with "AmazonSageMaker" in them to be passed to the AWS Glue, AWS Step Functions, and AWS RoboMaker services.

- **AmazonSageMakerReadOnly** – Grants read-only access to Amazon SageMaker resources.

The following AWS managed policies can be attached to users in your account but are not recommended:

- **AdministratorAccess** – Grants all actions for all AWS services and for all resources in the account.

- **DataScientist** – Grants a wide range of permissions to cover most of the use cases (primarily for analytics and business intelligence) encountered by data scientists.

You can review these permissions policies by signing in to the IAM console and searching for them.

You can also create your own custom IAM policies to allow permissions for Amazon SageMaker actions and resources as you need them. You can attach these custom policies to the IAM users or groups that require them.

**AWS managed policy: AmazonSageMakerFullAccess**

This policy grants administrative permissions that allow a principal full access to all Amazon SageMaker resources and operations. The policy also provides select access to related services. This policy allows all IAM roles to be passed to Amazon SageMaker, but only allows IAM roles with "AmazonSageMaker" in them to be passed to the AWS Glue, AWS Step Functions, and AWS RoboMaker services. This policy does not include permissions to create an Amazon SageMaker domain. For information on the policy needed to create a domain, see Create an IAM Administrator User and Group (p. 34).

**Permissions details**

This policy includes the following permissions.
• application-autoscaling – Allows principals to automatically scale a SageMaker real-time inference endpoint.
• athena – Allows principals to query a list of data catalogs, databases, and table metadata from Amazon Athena.
• aws-marketplace – Allows principals to view AWS AI Marketplace subscriptions. You need this if you want to access SageMaker software subscribed in AWS Marketplace.
• cloudformation – Allows principals to get AWS CloudFormation templates for using SageMaker JumpStart solutions and Pipelines. SageMaker JumpStart creates resources necessary to run end-to-end machine learning solutions that tie SageMaker to other AWS services. SageMaker Pipelines creates new projects that are backed by AWS Service Catalog.
• cloudwatch – Allows principals to post CloudWatch metrics, interact with alarms, and upload logs to CloudWatch Logs in your account.
• codebuild – Allows principals to store AWS CodeBuild artifacts for SageMaker Pipeline and Projects.
• codecommit – Needed for AWS CodeCommit integration with SageMaker notebook instances.
• cognito-idp – Needed for Amazon SageMaker Ground Truth to define private workforce and work teams.
• ec2 – Needed for SageMaker to manage Amazon EC2 resources and network interfaces when you specify an Amazon VPC for your SageMaker jobs, models, endpoints, and notebook instances.
• ecr – Needed to pull and store Docker artifacts for Amazon SageMaker Studio (custom images), training, processing, batch inference, and inference endpoints. This is also required to use your own container in SageMaker. Additional permissions for SageMaker JumpStart solutions are required to create and remove custom images on behalf of users.
• elastic-inference – Allows principals to connect to Amazon Elastic Inference for using SageMaker notebook instances and endpoints.
• elasticfilesystem – Allows principals to access Amazon Elastic File System. This is needed for SageMaker to use data sources in Amazon Elastic File System for training machine learning models.
• fsx – Allows principals to access Amazon FSx. This is needed for SageMaker to use data sources in Amazon FSx for training machine learning models.
• glue – Needed for inference pipeline pre-processing from within SageMaker notebook instances.
• groundtruthlabeling – Needed for Ground Truth labeling jobs. The groundtruthlabeling endpoint is accessed by the Ground Truth console.
• iam – Needed to give the SageMaker console access to available IAM roles and create service-linked roles.
• kms – Needed to give the SageMaker console access to available AWS KMS keys and retrieve them for any specified AWS KMS aliases in jobs and endpoints.
• lambda – Allows principals to invoke and get a list of AWS Lambda functions.
• logs – Needed to allow SageMaker jobs and endpoints to publish log streams.
• redshift – Allows principals to access Amazon Redshift cluster credentials.
• redshift-data – Allows principals to use data from Amazon Redshift to run, describe, and cancel statements; get statement results; and list schemas and tables.
• robomaker – Allows principals to have full access to create, get descriptions, and delete AWS RoboMaker simulation applications and jobs. This is also needed to run reinforcement learning examples on notebook instances.
• s3 – Allows principals to have full access to Amazon S3 resources pertaining to SageMaker, but not all of Amazon S3.
• sagemaker – Allows principals to list tags on Amazon SageMaker user profiles.
• secretsmanager – Allows principals to have full access to AWS Secrets Manager. The principals can securely encrypt, store, and retrieve credentials for databases and other services. This is also needed for SageMaker notebook instances with SageMaker code repositories that use GitHub.
• servicecatalog – Allows principals to use AWS Service Catalog. The principals can create, get a list of, update, or terminate provisioned products, such as servers, databases, websites, or applications.
deployed using AWS resources. This is needed for SageMaker JumpStart and Projects to find and read service catalog products and launch AWS resources in user accounts.

- **sns** – Allows principals to get a list of Amazon SNS topics. This is needed for endpoints with Async Inference enabled for notifying users that their inference has completed.
- **states** – Needed for SageMaker JumpStart and Pipelines to use a service catalog to create step function resources.
- **tag** – Needed for SageMaker Pipelines to render in Studio. Studio needs resources tagged with particular `sagemaker:project-id` tag-key. This requires the `tag:GetResources` permission.

AWS managed policy: AmazonSageMakerReadOnly

This policy grants read-only access to Amazon SageMaker via the AWS Management Console and SDK.

Permissions details

This policy includes the following permissions.

- application-autoscaling – Allows users to browse descriptions of scalable SageMaker real-time inference endpoints.
- aws-marketplace – Allows users to view AWS AI Marketplace subscriptions.
- cloudwatch – Allows users to receive CloudWatch alarms.
- cognito-idp – Needed for Amazon SageMaker Ground Truth to browse descriptions and lists of private workforce and work teams.
- ecr – Needed to read Docker artifacts for training and inference.
AWS managed policies for Amazon SageMaker Canvas

These AWS managed policies add permissions required to use SageMaker Canvas. The policies are available in your AWS account and are used by execution roles created from the SageMaker console.

**Topics**
- AWS managed policy: AmazonSageMakerCanvasForecastAccess (p. 3421)
- Amazon SageMaker updates to Amazon SageMaker Canvas managed policies (p. 3422)

**AWS managed policy: AmazonSageMakerCanvasForecastAccess**

This policy grants permissions commonly needed to use SageMaker Canvas with Amazon Forecast.

**Permissions details**

This AWS managed policy includes the following permissions.
• s3 – Allows principals to add and retrieve objects from Amazon S3 buckets. These objects are limited to those whose case-insensitive name starts with "sagemaker-".

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "s3:GetObject",
            "s3:PutObject"
         ],
         "Resource": [
            "arn:aws:s3:::sagemaker-*/Canvas",
            "arn:aws:s3:::sagemaker-*/canvas"
         ]
      },
      {
         "Effect": "Allow",
         "Action": [
            "s3:ListBucket"
         ],
         "Resource": [
            "arn:aws:s3:::sagemaker-*"
         ]
      }
   ]
}
```

Amazon SageMaker updates to Amazon SageMaker Canvas managed policies

AWS Managed Policies for Amazon SageMaker Ground Truth

These AWS managed policies add permissions required to use SageMaker Ground Truth. The policies are available in your AWS account and are used by execution roles created from the SageMaker console.

**Topics**

- AWS managed policy: AmazonSageMakerGroundTruthExecution (p. 3422)
- AWS managed policy: GroundTruthSyntheticConsoleFullAccess (p. 3425)
- AWS managed policy: GroundTruthSyntheticConsoleReadOnlyAccess (p. 3426)
- Amazon SageMaker updates to SageMaker Ground Truth managed policies (p. 3426)

**AWS managed policy: AmazonSageMakerGroundTruthExecution**

This AWS managed policy grants permissions commonly needed to use SageMaker Ground Truth.

**Permissions details**
This policy includes the following permissions.

- **lambda** – Allows principals to invoke Lambda functions whose name includes "sagemaker" (case-insensitive), "GtRecipe", or "LabelingFunction".
- **s3** – Allows principals to add and retrieve objects from Amazon S3 buckets. These objects are limited to those whose case-insensitive name contains "groundtruth" or "sagemaker", or are tagged with "SageMaker".
- **cloudwatch** – Allows principals to post CloudWatch metrics.
- **logs** – Allows principals to create and access log streams, and post log events.
- **sqs** – Allows principals to create Amazon SQS queues, and send and receive Amazon SQS messages. These permissions are limited to queues whose name includes "GroundTruth".
- **sns** – Allows principals to subscribe to and publish messages to Amazon SNS topics whose case-insensitive name contains "groundtruth" or "sagemaker".
- **ec2** – Allows principals to create, describe, and delete Amazon VPC endpoints whose VPC endpoint service name contains "sagemaker-task-resources" or "labeling".

AWS managed policy: GroundTruthSyntheticConsoleFullAccess

This AWS managed policy grants permissions needed to use most features of the SageMaker Ground Truth synthetic data console. The policy is available in your AWS account. In order to use all features of the console, users must add “s3:GetObject” permissions to allow SageMaker Ground Truth synthetic data console to display data from their S3 buckets. This can be done by attaching the AmazonS3ReadOnlyAccess managed policy to their role or by adding “s3:GetObject” for specific S3 resources to their role.

Permissions details

This policy includes the following permissions.

- **s3** – Allows the retrieval of objects from Amazon S3 buckets to display data in the console.
- **sagemaker-groundtruth-synthetic** – Allows the console to call SageMaker Ground Truth synthetic data APIs.
AWS managed policy: GroundTruthSyntheticConsoleReadOnlyAccess

This AWS managed policy grants read-only access to SageMaker Ground Truth synthetic data via the AWS Management Console. In order to use all features of the console, users must add "s3:GetObject" permissions to allow SageMaker Ground Truth synthetic data console to display data from their S3 buckets. This can be done by attaching the AmazonS3ReadOnlyAccess managed policy to their role or by adding "s3:GetObject" for specific S3 resources to their role.

Permissions details

This policy includes the following permissions.

- **s3** – Allows the retrieval of objects from Amazon S3 buckets to display data in the console.
- **sagemaker-groundtruth-synthetic** – Allows the console to call SageMaker Ground Truth synthetic data ReadOnly APIs.

AWS Managed Policies for SageMaker Pipelines

These AWS managed policies add permissions required to use SageMaker Pipelines. The policies are available in your AWS account and are used by execution roles created from the SageMaker console.

Topics
- AWS managed policy: AmazonSageMakerPipelinesIntegrations (p. 3427)
- Amazon SageMaker updates to SageMaker Pipelines managed policies (p. 3429)

AWS managed policy: AmazonSageMakerPipelinesIntegrations

This AWS managed policy grants permissions commonly needed to use Callback steps and Lambda steps in SageMaker Pipelines. The policy is added to the AmazonSageMaker-ExecutionRole that is created when you onboard to Amazon SageMaker Studio. The policy can be attached to any role used for authoring or executing a pipeline.

This policy grants appropriate AWS Lambda, Amazon Simple Queue Service (Amazon SQS), Amazon EventBridge, and IAM permissions needed when building pipelines that invoke Lambda functions or include callback steps, which can be used for manual approval steps or running custom workloads.

The Amazon SQS permissions allow you to create the Amazon SQS queue needed for receiving callback messages, and also to send messages to that queue.

The Lambda permissions allow you to create, read, update, and delete the Lambda functions used in the pipeline steps, and also to invoke those Lambda functions.

This policy grants the Amazon EMR permissions needed to run a pipelines Amazon EMR step.

Permissions details

This policy includes the following permissions.

- `elasticmapreduce` - Read, add, and cancel steps in a running Amazon EMR cluster.
- `events` - Read, create, update, and add targets to an EventBridge rule named SageMakerPipelineExecutionEMRStepStatusUpdateRule.
- `iam` - Pass an IAM role to the AWS Lambda service.
- `lambda` - Create, read, update, delete, and invoke Lambda functions. These permissions are limited to functions whose name includes "sagemaker".
- `sqs` - Create an Amazon SQS queue; send an Amazon SQS message. These permissions are limited to queues whose name includes "sagemaker".

AWS Managed Policies for SageMaker projects and JumpStart

These AWS managed policies add permissions to use built-in Amazon SageMaker project templates and JumpStart solutions. The policies are available in your AWS account and are used by execution roles created from the SageMaker console.

SageMaker projects and JumpStart use AWS Service Catalog to provision AWS resources in customers' accounts. Some created resources need to assume an execution role. For example, if AWS Service Catalog creates a CodePipeline pipeline on behalf of a customer for a SageMaker machine learning CI/CD project, then that pipeline requires an IAM role.

The AmazonSageMakerServiceCatalogProductsLaunchRole role has the permissions required to launch the SageMaker portfolio of products from AWS Service Catalog. The AmazonSageMakerServiceCatalogProductsUseRole role has the permissions required to use the SageMaker portfolio of products from AWS Service Catalog. The AmazonSageMakerServiceCatalogProductsLaunchRole role passes an AmazonSageMakerServiceCatalogProductsUseRole role to the provisioned AWS Service Catalog product resources.

Topics

- AWS managed policy: AmazonSageMakerAdmin-ServiceCatalogProductsServiceRolePolicy (p. 3430)
- AWS managed policy: AmazonSageMakerServiceCatalogProductsApiGatewayServiceRolePolicy (p. 3437)
- AWS managed policy: AmazonSageMakerServiceCatalogProductsCloudformationServiceRolePolicy (p. 3438)
- AWS managed policy: AmazonSageMakerServiceCatalogProductsCodeBuildServiceRolePolicy (p. 3443)
- AWS managed policy: AmazonSageMakerServiceCatalogProductsCodePipelineServiceRolePolicy (p. 3449)
- AWS managed policy: AmazonSageMakerServiceCatalogProductsEventsServiceRolePolicy (p. 3451)
- AWS managed policy: AmazonSageMakerServiceCatalogProductsFirehoseServiceRolePolicy (p. 3451)
- AWS managed policy: AmazonSageMakerServiceCatalogProductsGlueServiceRolePolicy (p. 3452)
AWS managed policy: AmazonSageMakerAdmin-ServiceCatalogProductsServiceRolePolicy

This service role policy is used by the AWS Service Catalog service to provision products from the Amazon SageMaker portfolio. The policy grants permissions to a set of related AWS services including AWS CodePipeline, AWS CodeBuild, AWS CodeCommit, AWS Glue, AWS CloudFormation, and others.

The AmazonSageMakerAdmin-ServiceCatalogProductsServiceRolePolicy policy is intended to be used by the AmazonSageMakerServiceCatalogProductsLaunchRole role created from the SageMaker console. The policy adds permissions to provision AWS resources for SageMaker projects and JumpStart using AWS Service Catalog to a customer’s account.

Permissions details

This policy includes the following permissions.

- **apigateway** – Allows the role to call API Gateway endpoints that are tagged with `sagemaker:launch-source`.
- **cloudformation** – Allows AWS Service Catalog to create, update and delete CloudFormation stacks.
- **codebuild** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to create, update and delete CodeBuild projects.
- **codecommit** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to create, update and delete CodeCommit repositories.
- **codepipeline** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to create, update and delete CodePipelines.
- **codestar-connections** – Allows the role to pass AWS CodeStar connections.
- **cognito-idp** – Allows the role to create, update, and delete groups and user pools. Also allows tagging resources.
- **ecr** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to create and delete Amazon ECR repositories. Also allows tagging resources.
- **events** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to create and delete EventBridge rules. Used for tying together the various components of the CICD pipeline.
- **firehose** – Allows the role to interact with Kinesis Data Firehose streams.
- **glue** – Allows the role to interact with AWS Glue.
- **iam** – Allows the role to pass roles prepended with `AmazonSageMakerServiceCatalog`. This is needed when Projects provisions a AWS Service Catalog product, as a role needs to be passed to AWS Service Catalog.
- **lambda** – Allows the role to interact with AWS Lambda. Also allows tagging resources.
- **logs** – Allows the role to create, delete and access log streams.
- **s3** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to access Amazon S3 buckets where the Project template code is stored.
- **sagemaker** – Allows the role to interact with various SageMaker services. This is done both in CloudFormation during template provisioning, as well as in CodeBuild during CICD pipeline execution. Also allows tagging the following resources: endpoints, endpoint configurations, models, pipelines, projects, and model packages.
- **states** – Allows the role to create, delete, and update Step Functions prepended with `sagemaker`.

AWS managed policy:
AmazonSageMakerServiceCatalogProductsApiGatewayServiceRolePolicy

This policy is used by Amazon API Gateway within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by API Gateway that require a role.

Permissions details

This policy includes the following permissions.

- **logs** – Create and read CloudWatch Logs groups, streams, and events; update events; describe various resources.

  These permissions are limited to resources whose log group prefix starts with "aws/apigateway/".

```json
{
    "Version": "2012-10-17",
    "Statement": [
      {
        "Effect": "Allow",
      }
    ]
}
```
AWS managed policy:

**AmazonSageMakerServiceCatalogProductsCloudformationServiceRolePolicy**

This policy is used by AWS CloudFormation within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by AWS CloudFormation that require a role.

**Permissions details**

This policy includes the following permissions.

- **sagemaker** – Allow access to various SageMaker resources excluding domains, user-profiles, apps, and flow definitions.
- **iam** – Pass the AmazonSageMakerServiceCatalogProductsCodeBuildRole and AmazonSageMakerServiceCatalogProductsExecutionRole roles.

```json

AWS managed policy:
AmazonSageMakerServiceCatalogProductsCodeBuildServiceRolePolicy

This policy is used by AWS CodeBuild within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by CodeBuild that require a role.

Permissions details

This policy includes the following permissions.

- **sagemaker** – Allow access to various SageMaker resources.
- **codecommit** – Upload CodeCommit archives to CodeBuild pipelines, get upload status, and cancel uploads; get branch and commit information. These permissions are limited to resources whose name starts with "sagemaker-".
- **ecr** – Create Amazon ECR repositories and container images; upload image layers. These permissions are limited to repositories whose name starts with "sagemaker-".

  - **ecr** – Read all resources.
- **iam** – Pass the following roles:
  - AmazonSageMakerServiceCatalogProductsCloudformationRole to AWS CloudFormation.
  - AmazonSageMakerServiceCatalogProductsCodeBuildRole to AWS CodeBuild.
  - AmazonSageMakerServiceCatalogProductsCodePipelineRole to AWS CodePipeline.
  - AmazonSageMakerServiceCatalogProductsEventsRole to Amazon EventBridge.
  - AmazonSageMakerServiceCatalogProductsExecutionRole to Amazon SageMaker.
- **logs** – Create and read CloudWatch Logs groups, streams, and events; update events; describe various resources.
  
  These permissions are limited to resources whose name prefix starts with "aws/codebuild/".
- **s3** – Create, read, and list Amazon S3 buckets. These permissions are limited to buckets whose name starts with "sagemaker-".

AWS managed policy:
AmazonSageMakerServiceCatalogProductsCodePipelineServiceRolePolicy

This policy is used by AWS CodePipeline within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by CodePipeline that require a role.

Permissions details

This policy includes the following permissions.
• cloudformation – Create, read, delete, and update CloudFormation stacks; create, read, delete, and execute change sets; set stack policy. These permissions are limited to resources whose name starts with "sagemaker-".

• s3 – Create, read, list, and delete Amazon S3 buckets; add, read, and delete objects from the buckets; read and set the CORS configuration; read the access control list (ACL); and read the AWS Region the bucket resides in.

These permissions are limited to buckets whose name starts with "sagemaker-" or "aws-glue-".

• iam – Pass the AmazonSageMakerServiceCatalogProductsCloudformationRole role.

• codebuild – Get CodeBuild build information and start builds. These permissions are limited to project and build resources whose name starts with "sagemaker-".

• codecommit – Upload CodeCommit archives to CodeBuild pipelines, get upload status, and cancel uploads; get branch and commit information.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Resource": "arn:aws:cloudformation::*::stack/sagemaker-*"
    },
    {
      "Effect": "Allow",
      "Resource": ["arn:aws:s3:::sagemaker-*"]
    },
    {
      "Effect": "Allow",
      "Action": ["iam:PassRole"],

    },
    {
      "Effect": "Allow",
      "Action": ["codebuild:BatchGetBuilds", "codebuild:StartBuild"]
    }
  ]
}
```
AWS managed policy:
**AmazonSageMakerServiceCatalogProductsEventsServiceRolePolicy**

This policy is used by Amazon EventBridge within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the `AmazonSageMakerServiceCatalogProductsLaunchRole` passes to the AWS resources created by EventBridge that require a role.

**Permissions details**

This policy includes the following permissions.

- **codepipeline** – Start a CodeBuild execution. These permissions are limited to pipelines whose name starts with "sagemaker-".

```json

"Resource": [  
    "arn:aws:codebuild:*:*:project/sagemaker-*",  
    "arn:aws:codebuild:*:*:build/sagemaker-*"
  ],

"Effect": "Allow",
"Action": [  
    "codecommit:CancelUploadArchive",
    "codecommit:GetBranch",
    "codecommit:GetCommit",
    "codecommit:GetUploadArchiveStatus",
    "codecommit:UploadArchive"
  ],

"Resource": "arn:aws:codecommit:*:*:sagemaker-*"

}
```

AWS managed policy:
**AmazonSageMakerServiceCatalogProductsFirehoseServiceRolePolicy**

This policy is used by Amazon Kinesis Data Firehose within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the `AmazonSageMakerServiceCatalogProductsLaunchRole` passes to the AWS resources created by Kinesis Data Firehose that require a role.

**Permissions details**

This policy includes the following permissions.

- **firehose** – Send Kinesis Data Firehose records. These permissions are limited to resources whose delivery stream name starts with "sagemaker-".

```json

{
  "Version": "2012-10-17",
  "Statement": [  
    {
      "Effect": "Allow",
      "Action": "codepipeline:StartPipelineExecution",
      "Resource": "arn:aws:codepipeline:*:*:sagemaker-*"
    }
  ]
}
```

 AWS managed policy:
**AmazonSageMakerServiceCatalogProductsFirehoseServiceRolePolicy**

This policy is used by Amazon Kinesis Data Firehose within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the `AmazonSageMakerServiceCatalogProductsLaunchRole` passes to the AWS resources created by Kinesis Data Firehose that require a role.

**Permissions details**

This policy includes the following permissions.

- **firehose** – Send Kinesis Data Firehose records. These permissions are limited to resources whose delivery stream name starts with "sagemaker-".

```json

{
  "Version": "2012-10-17",
  "Statement": [  
    {
      "Effect": "Allow",
      "Action": "codepipeline:StartPipelineExecution",
      "Resource": "arn:aws:codepipeline:*:*:sagemaker-*"
    }
  ]
}
```
AWS managed policy: 
AmazonSageMakerServiceCatalogProductsGlueServiceRolePolicy

This policy is used by AWS Glue within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by Glue that require a role.

Permissions details

This policy includes the following permissions.

- **glue** – Create, read, and delete AWS Glue partitions, tables, and table versions. These permissions are limited to those resources whose name starts with "sagemaker-". Create and read AWS Glue databases. These permissions are limited to databases whose name is "default", "global_temp", or starts with "sagemaker-". Get user defined functions.

- **s3** – Create, read, list, and delete Amazon S3 buckets; add, read, and delete objects from the buckets; read and set the CORS configuration; read the access control list (ACL), and read the AWS Region the bucket resides in.

  These permissions are limited to buckets whose name starts with "sagemaker-" or "aws-glue-".

- **logs** – Create, read, and delete CloudWatch Logs log group, streams, and deliveries; and create a resource policy.

  These permissions are limited to resources whose name prefix starts with "aws/glue/".

AWS managed policy:  
**AmazonSageMakerServiceCatalogProductsLambdaServiceRolePolicy**

This policy is used by AWS Lambda within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the `AmazonSageMakerServiceCatalogProductsLaunchRole` passes to the AWS resources created by Lambda that require a role.

**Permissions details**

This policy includes the following permissions.

- **sagemaker** – Allow access to various SageMaker resources.
- **ecr** – Create and delete Amazon ECR repositories; create, read, and delete container images; upload image layers. These permissions are limited to repositories whose name starts with "sagemaker-".
- **events** – Create, read, and delete Amazon EventBridge rules; and create and remove targets. These permissions are limited to rules whose name starts with "sagemaker-".
- **s3** – Create, read, list, and delete Amazon S3 buckets; add, read, and delete objects from the buckets; read and set the CORS configuration; read the access control list (ACL), and read the AWS Region the bucket resides in.

These permissions are limited to buckets whose name starts with "sagemaker-" or "aws-glue-".

- **iam** – Pass the `AmazonSageMakerServiceCatalogProductsExecutionRole` role.
- **logs** – Create, read, and delete CloudWatch Logs log group, streams, and deliveries; and create a resource policy.

These permissions are limited to resources whose name prefix starts with "aws/lambda/".

Troubleshooting Amazon SageMaker Identity and Access

Use the following information to help you diagnose and fix common issues that you might encounter when working with SageMaker and IAM.

**Topics**
- I Am Not Authorized to Perform an Action in SageMaker (p. 3463)
- I Am Not Authorized to Perform iam:PassRole (p. 3463)
- I Want to View My Access Keys (p. 3463)
- I'm an Administrator and Want to Allow Others to Access SageMaker (p. 3464)
- I Want to Allow People Outside of My AWS Account to Access My SageMaker Resources (p. 3464)
I Am Not Authorized to Perform an Action in SageMaker

If the AWS Management Console tells you that you're not authorized to perform an action, then you must contact your administrator for assistance. Your administrator is the person that provided you with your user name and password.

The following example error occurs when the mateojackson IAM user tries to use the console to view details about a training job but does not have sagemaker:sagemaker:DescribeTrainingJob permissions.

```
User: arn:aws:iam::123456789012:user/mateojackson is not authorized to perform: sagemaker:DescribeTrainingJob on resource: my-example-widget
```

In this case, Mateo asks his administrator to update his policies to allow him to access the TrainingJob resource using the sagemaker:DescribeTrainingJob action.

I Am Not Authorized to Perform iam:PassRole

If you receive an error that you're not authorized to perform the iam:PassRole action, your policies must be updated to allow you to pass a role to SageMaker.

Some AWS services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named marymajor tries to use the console to perform an action in SageMaker. However, the action requires the service to have permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws:iam::123456789012:user/marymajor is not authorized to perform: iam:PassRole
```

In this case, Mary's policies must be updated to allow her to perform the iam:PassRole action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

I Want to View My Access Keys

After you create your IAM user access keys, you can view your access key ID at any time. However, you can't view your secret access key again. If you lose your secret key, you must create a new access key pair.

Access keys consist of two parts: an access key ID (for example, AKIAIOSFODNN7EXAMPLE) and a secret access key (for example, wJalrXUtnFEMI/K7MDENG/bPxRfiGYyw/EXAMPL3KEXAM3PLEKEY). Like a user name and password, you must use both the access key ID and secret access key together to authenticate your requests. Manage your access keys as securely as you do your user name and password.

**Important**

Do not provide your access keys to a third party, even to help find your canonical user ID. By doing this, you might give someone permanent access to your account.

When you create an access key pair, you are prompted to save the access key ID and secret access key in a secure location. The secret access key is available only at the time you create it. If you lose your secret access key, you must add new access keys to your IAM user. You can have a maximum of two access keys. If you already have two, you must delete one key pair before creating a new one. To view instructions, see Managing access keys in the IAM User Guide.
I'm an Administrator and Want to Allow Others to Access SageMaker

To allow others to access SageMaker, you must create an IAM entity (user or role) for the person or application that needs access. They will use the credentials for that entity to access AWS. You must then attach a policy to the entity that grants them the correct permissions in SageMaker.

To get started right away, see Creating your first IAM delegated user and group in the IAM User Guide.

I Want to Allow People Outside of My AWS Account to Access My SageMaker Resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether SageMaker supports these features, see How Amazon SageMaker Works with IAM (p. 3344).
- To learn how to provide access to your resources across AWS accounts that you own, see Providing access to an IAM user in another AWS account that you own in the IAM User Guide.
- To learn how to provide access to your resources to third-party AWS accounts, see Providing access to AWS accounts owned by third parties in the IAM User Guide.
- To learn how to provide access through identity federation, see Providing access to externally authenticated users (identity federation) in the IAM User Guide.
- To learn the difference between using roles and resource-based policies for cross-account access, see How IAM roles differ from resource-based policies in the IAM User Guide.

Logging and Monitoring

You can monitor Amazon SageMaker using Amazon CloudWatch, which collects raw data and processes it into readable, near real-time metrics. These statistics are kept for 15 months, so that you can access historical information and gain a better perspective on how your web application or service is performing. You can also set alarms that watch for certain thresholds and send notifications or take actions when those thresholds are met. For more information, see Monitor Amazon SageMaker with Amazon CloudWatch (p. 3498).

Amazon CloudWatch Logs enables you to monitor, store, and access your log files from Amazon EC2 instances, AWS CloudTrail, and other sources. You can collect and track metrics, create customized dashboards, and set alarms that notify you or take actions when a specified metric reaches a threshold that you specify. CloudWatch Logs can monitor information in the log files and notify you when certain thresholds are met. You can also archive your log data in highly durable storage. For more information, see Log Amazon SageMaker Events with Amazon CloudWatch (p. 3510).

AWS CloudTrail provides a record of actions taken by a user, role, or an AWS service in SageMaker. Using the information collected by CloudTrail, you can determine the request that was made to SageMaker, the IP address from which the request was made, who made the request, when it was made, and additional details. For more information, Log Amazon SageMaker API Calls with AWS CloudTrail (p. 3511).

Note
CloudTrail does not monitor calls to runtime_InvokeEndpoint.
You can create rules in Amazon CloudWatch Events to react to status changes in status in a SageMaker training, hyperparameter tuning, or batch transform job. For more information, see Automating Amazon SageMaker with Amazon EventBridge (p. 3514).

Compliance Validation for Amazon SageMaker

Third-party auditors assess the security and compliance of Amazon SageMaker as part of multiple AWS compliance programs. These include SOC, PCI, FedRAMP, HIPAA, and others.

For a list of AWS services in scope of specific compliance programs, see AWS Services in Scope by Compliance Program. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact.

Your compliance responsibility when using Amazon SageMaker is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- **Security and Compliance Quick Start Guides** – These deployment guides discuss architectural considerations and provide steps for deploying security- and compliance-focused baseline environments on AWS.
- **Architecting for HIPAA Security and Compliance Whitepaper** – This whitepaper describes how companies can use AWS to create HIPAA-compliant applications.
- **AWS Compliance Resources** – This collection of workbooks and guides might apply to your industry and location.
- **AWS Config** – This AWS service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- **AWS Security Hub** – This AWS service provides a comprehensive view of your security state within AWS that helps you check your compliance with security industry standards and best practices.

Resilience in Amazon SageMaker

The AWS global infrastructure is built around AWS Regions and Availability Zones. AWS Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between Availability Zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see AWS Global Infrastructure.

In addition to the AWS global infrastructure, Amazon SageMaker offers several features to help support your data resiliency and backup needs.

Infrastructure Security in Amazon SageMaker

As a managed service, Amazon SageMaker is protected by the AWS global network security procedures that are described in the Amazon Web Services: Overview of Security Processes whitepaper.

You use AWS published API calls to access Amazon SageMaker through the network. Clients must support Transport Layer Security (TLS) 1.0 or later. We recommend TLS 1.2 or later. Clients must also
support cipher suites with perfect forward secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the AWS Security Token Service (AWS STS) to generate temporary security credentials to sign requests.

- SageMaker Scans AWS Marketplace Training and Inference Containers for Security Vulnerabilities (p. 3466)
- Connect to Resources From Within a VPC (p. 3466)
- Run Training and Inference Containers in Internet-Free Mode (p. 3469)
- Connect to SageMaker Through a VPC Interface Endpoint (p. 3470)
- Give SageMaker Access to Resources in your Amazon VPC (p. 3480)

SageMaker Scans AWS Marketplace Training and Inference Containers for Security Vulnerabilities

To meet our security requirements, algorithms and model packages listed in AWS Marketplace are scanned for Common Vulnerabilities and Exposures (CVE). CVE is a list of publicly known information about security vulnerability and exposure. The National Vulnerability Database (NVD) provides CVE details such as severity, impact rating, and fix information. Both CVE and NVD are available for public consumption and free for security tools and services to use. For more information, see http://cve.mitre.org/about/faqs.html#what_is_cve.

Connect to Resources From Within a VPC

Amazon SageMaker Studio and SageMaker notebook instances allow direct internet access by default. This allows you to download popular packages and notebooks, customize your development environment, and work efficiently. However, this could provide an additional avenue for unauthorized access to your data. For example, if you install malicious code on your computer in the form of a publicly available notebook or a publicly available source code library, it could access your data. You can choose to restrict which traffic can access the internet by launching your Amazon SageMaker Studio and SageMaker notebook instances in a Amazon Virtual Private Cloud (Amazon VPC) of your choosing.

An Amazon Virtual Private Cloud is a virtual network dedicated to your AWS account. With an Amazon VPC, you can control the network access and internet connectivity of your Amazon SageMaker Studio and notebook instances. You can disable direct internet access to add an additional layer of security.

The following topics describe how to connect your SageMaker Studio instances and notebook instances to resources in a VPC.

Topics
- Connect SageMaker Studio Notebooks in a VPC to External Resources (p. 3466)
- Connect a Notebook Instance in a VPC to External Resources (p. 3468)

Connect SageMaker Studio Notebooks in a VPC to External Resources

The following topic gives information on how to connect Studio Notebooks in a VPC to external resources.
Default communication with the internet

By default, SageMaker Studio provides a network interface that allows communication with the internet through a VPC managed by SageMaker. Traffic to AWS services like Amazon S3 and CloudWatch goes through an internet gateway, as does traffic that accesses the SageMaker API and SageMaker runtime. Traffic between the domain and your Amazon EFS volume goes through the VPC that you specified when you onboarded to Studio or called the CreateDomain API. The following diagram shows the default configuration.

VPC only communication with the internet

To prevent SageMaker from providing internet access to your Studio notebooks, you can disable internet access by specifying the VPC only network access type when you onboard to Studio or call the CreateDomain API. As a result, you won’t be able to run a Studio notebook unless your VPC has an interface endpoint to the SageMaker API and runtime, or a NAT gateway with internet access, and your security groups allow outbound connections. The following diagram shows a configuration for using VPC-only mode.

Requirements to use VPC only mode

When you choose VpcOnly, follow these steps:
1. Ensure your subnets have the required number of IP addresses needed. The expected number of IP addresses needed per user can vary based on use case. We recommend between 2 and 4 IP addresses per user. The total IP address capacity for a Studio domain is the sum of available IP addresses for each subnet provided when the domain is created. Ensure that your estimated IP address usage does not exceed the capacity supported by the number of subnets you provide. Additionally, using subnets distributed across many availability zones can aid in IP address availability. For more information, see VPC and subnet sizing for IPv4.

   **Note**
   You can configure only subnets with a default tenancy VPC in which your instance runs on shared hardware. For more information on the tenancy attribute for VPCs, see Dedicated Instances.

2. Set up one or more security groups with inbound and outbound rules that together allow the following traffic:

   - **NFS traffic over TCP on port 2049** between the domain and the Amazon EFS volume.
   - **TCP traffic within the security group.** This is required for connectivity between the JupyterServer app and the KernelGateway apps. You must allow access to at least ports in the range 8192–65535.

3. If you want to allow internet access, you must use a **NAT gateway** with access to the internet, for example through an internet gateway.

4. If you don’t want to allow internet access, create **interface VPC endpoints** (AWS PrivateLink) to allow Studio to access the following services with the corresponding service names. You must also associate the security groups for your VPC with these endpoints.

   - **SageMaker API**: `com.amazonaws.us-east-1.sagemaker.api`
   - **SageMaker runtime**: `com.amazonaws.us-east-1.sagemaker.runtime`. This is required to run Studio notebooks and to train and host models.
   - **Amazon S3**: `com.amazonaws.us-east-1.s3`
   - **To use SageMaker Projects**: `com.amazonaws.us-east-1.servicecatalog`
   - **Any other AWS services you require.**

   **Note**
   For a customer working within VPC mode, company firewalls can cause connection issues with SageMaker Studio or between JupyterServer and the KernelGateway. Make the following checks if you encounter one of these issues when using SageMaker Studio from behind a firewall.

   - Check that the Studio URL is in your networks allowlist.
   - Check that the websocket connections are not blocked. Jupyter uses websocket under the hood. If the KernelGateway application is InService, JupyterServer may not be able to connect to the KernelGateway. You should see this problem when opening System Terminal as well.

For more information

- Securing Amazon SageMaker Studio connectivity using a private VPC.
- Security groups for your VPC
- Connect to SageMaker Through a VPC Interface Endpoint (p. 3470)
- VPC with public and private subnets (NAT)

**Connect a Notebook Instance in a VPC to External Resources**

The following topic gives information on how to connect your notebook instance in a VPC to external resources.
Default communication with the internet

When your notebook allows direct internet access, SageMaker provides a network interface that allows the notebook to communicate with the internet through a VPC managed by SageMaker. Traffic within your VPC's CIDR goes through elastic network interface created in your VPC. All the other traffic goes through the network interface created by SageMaker, which is essentially through the public internet. Traffic to gateway VPC endpoints like Amazon S3 and DynamoDB goes through the public internet, while traffic to interface VPC interface endpoints still goes through your VPC. If you want to use gateway VPC endpoints, you might want to disable direct internet access.

VPC communication with the internet

To disable direct internet access, you can specify a VPC for your notebook instance. By doing so, you prevent SageMaker from providing internet access to your notebook instance. As a result, the notebook instance can't train or host models unless your VPC has an interface endpoint (AWS PrivateLink) or a NAT gateway and your security groups allow outbound connections.

For information about creating a VPC interface endpoint to use AWS PrivateLink for your notebook instance, see Connect to a Notebook Instance Through a VPC Interface Endpoint (p. 3476). For information about setting up a NAT gateway for your VPC, see VPC with Public and Private Subnets (NAT) in the Amazon Virtual Private Cloud User Guide. For information about security groups, see Security Groups for Your VPC. For more information about networking configurations in each networking mode and configuring network on premise, see Understanding Amazon SageMaker notebook instance networking configurations and advanced routing options.

Security and Shared Notebook Instances

A SageMaker notebook instance is designed to work best for an individual user. It is designed to give data scientists and other users the most power for managing their development environment.

A notebook instance user has root access for installing packages and other pertinent software. We recommend that you exercise judgement when granting individuals access to notebook instances that are attached to a VPC that contains sensitive information. For example, you might grant a user access to a notebook instance with an IAM policy, as shown in the following example:

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": "sagemaker:CreatePresignedNotebookInstanceUrl",
      }
   ]
}
```

Run Training and Inference Containers in Internet-Free Mode

SageMaker training and deployed inference containers are internet-enabled by default. This allows containers to access external services and resources on the public internet as part of your training and inference workloads. However, this could provide an avenue for unauthorized access to your data. For example, a malicious user or code that you accidentally install on the container (in the form of a publicly available source code library) could access your data and transfer it to a remote host.
If you use an Amazon VPC by specifying a value for the `VpcConfig` parameter when you call `CreateTrainingJob`, `CreateHyperParameterTuningJob`, or `CreateModel`, you can protect your data and resources by managing security groups and restricting internet access from your VPC. However, this comes at the cost of additional network configuration, and has the risk of configuring your network incorrectly. If you do not want SageMaker to provide external network access to your training or inference containers, you can enable network isolation.

## Network Isolation

You can enable network isolation when you create your training job or model by setting the value of the `EnableNetworkIsolation` parameter to `True` when you call `CreateTrainingJob`, `CreateHyperParameterTuningJob`, or `CreateModel`.

**Note**

Network isolation is required to run training jobs and models using resources from AWS Marketplace.

If you enable network isolation, the containers can't make any outbound network calls, even to other AWS services such as Amazon S3. Additionally, no AWS credentials are made available to the container runtime environment. In the case of a training job with multiple instances, network inbound and outbound traffic is limited to the peers of each training container. SageMaker still performs download and upload operations against Amazon S3 using your SageMaker execution role in isolation from the training or inference container.

The following managed SageMaker containers do not support network isolation because they require access to Amazon S3:

- Chainer
- SageMaker Reinforcement Learning

## Network isolation with a VPC

Network isolation can be used in conjunction with a VPC. In this scenario, the download and upload of customer data and model artifacts are routed through your VPC subnet. However, the training and inference containers themselves continue to be isolated from the network, and do not have access to any resource within your VPC or on the internet.

## Connect to SageMaker Through a VPC Interface Endpoint

You can connect directly to the SageMaker API or to the SageMaker Runtime through an interface endpoint in your Virtual Private Cloud (VPC) instead of connecting over the internet. When you use a VPC interface endpoint, communication between your VPC and the SageMaker API or Runtime is conducted entirely and securely within the AWS network.

The SageMaker API and Runtime support Amazon Virtual Private Cloud (Amazon VPC) interface endpoints that are powered by AWS PrivateLink. Each VPC endpoint is represented by one or more Elastic Network Interfaces with private IP addresses in your VPC subnets.

The VPC interface endpoint connects your VPC directly to the SageMaker API or Runtime without an internet gateway, NAT device, VPN connection, or AWS Direct Connect connection. The instances in your VPC don't need public IP addresses to communicate with the SageMaker API or Runtime.

You can create an interface endpoint to connect to SageMaker or to SageMaker Runtime with either the AWS console or AWS Command Line Interface (AWS CLI) commands. For instructions, see Creating an Interface Endpoint.
Amazon SageMaker Developer Guide

Connect to SageMaker Through a VPC Interface Endpoint

After you have created a VPC endpoint, you can use the following example CLI commands that use the endpoint-url parameter to specify interface endpoints to the SageMaker API or Runtime:

```bash
aws sagemaker list-notebook-instances --endpoint-url VPC_Endpoint_ID.api.sagemaker.Region.vpce.amazonaws.com
aws sagemaker list-training-jobs --endpoint-url VPC_Endpoint_ID.api.sagemaker.Region.vpce.amazonaws.com
aws sagemaker-runtime invoke-endpoint --endpoint-url VPC_Endpoint_ID.runtime.sagemaker.Region.vpce.amazonaws.com
  --endpoint-name Endpoint_Name \ 
  --body "Endpoint_Body" \ 
  --content-type "Content_Type" \ 
  Output_File
```

If you enable private DNS hostnames for your VPC endpoint, you don't need to specify the endpoint URL. The SageMaker API DNS hostname that the CLI and SageMaker SDK use by default (https://api.sagemaker.Region.amazonaws.com) resolves to your VPC endpoint. Similarly, the SageMaker Runtime DNS hostname that the CLI and SageMaker Runtime SDK use by default (https://runtime.sagemaker.Region.amazonaws.com) resolves to your VPC endpoint.

The SageMaker API and Runtime support VPC endpoints in all AWS Regions where both Amazon VPC and SageMaker are available. SageMaker supports making calls to all of its Operations inside your VPC. The result AuthorizedUrl from the CreatePresignedNotebookInstanceUrl is not supported by AWS PrivateLink. For information about how to enable AWS PrivateLink for the authorized URL that users use to connect to a notebook instance, see Connect to a Notebook Instance Through a VPC Interface Endpoint (p. 3476).

To learn more about AWS PrivateLink, see the AWS PrivateLink documentation. Refer to PrivateLink Pricing for the price of VPC endpoints. To learn more about VPC and endpoints, see Amazon VPC. For information about how to use identity-based AWS Identity and Access Management policies to restrict access to the SageMaker API and runtime, see Control Access to the SageMaker API by Using Identity-based Policies (p. 3364).

Create a VPC Endpoint Policy for SageMaker

You can create a policy for Amazon VPC endpoints for SageMaker to specify the following:

- The principal that can perform actions.
- The actions that can be performed.
- The resources on which actions can be performed.

For more information, see Controlling Access to Services with VPC Endpoints in the Amazon VPC User Guide.

**Note**

VPC endpoint policies aren’t supported for Federal Information Processing Standard (FIPS) SageMaker runtime endpoints for runtime_InvokeEndpoint.

The following example VPC endpoint policy specifies that all users who have access to the VPC interface endpoint are allowed to invoke the SageMaker hosted endpoint named myEndpoint.

```json
{
  "Statement": [
    {
      "Action": "sagemaker:InvokeEndpoint",
      "Resource": "arn:aws:sagemaker:Region:my_account:.endpoint/myEndpoint"
    }
  ]
}
```
In this example, the following are denied:

- Other SageMaker API actions, such as `sagemaker:CreateEndpoint` and `sagemaker:CreateTrainingJob`.
- Invoking SageMaker hosted endpoints other than `myEndpoint`.

**Note**

In this example, users can still take other SageMaker API actions from outside the VPC. For information about how to restrict API calls to those from within the VPC, see [Control Access to the SageMaker API by Using Identity-based Policies](https://docs.aws.amazon.com/sagemaker/latest/dg/identify-based-policies.html) (p. 3364).

### Create a VPC Endpoint Policy for Amazon SageMaker Feature Store

To create a VPC Endpoint for Amazon SageMaker Feature Store, use the following endpoint template, substituting your `VPC_Endpoint_ID.api` and `Region`:

```
VPC_Endpoint_ID.api.featurestore-runtime.sagemaker.Region.vpce.amazonaws.com
```

### Connect to SageMaker Studio Through an Interface VPC Endpoint

You can connect to Amazon SageMaker Studio from your Amazon Virtual Private Cloud (Amazon VPC) through an interface endpoint in your VPC instead of connecting over the internet. When you use an interface VPC endpoint (interface endpoint), communication between your VPC and Studio is conducted entirely and securely within the AWS network.

SageMaker Studio supports interface endpoints that are powered by AWS PrivateLink. Each interface endpoint is represented by one or more Elastic network interfaces with private IP addresses in your VPC subnets.

Studio supports interface endpoints in all AWS Regions where both Amazon SageMaker and Amazon VPC are available.

**Topics**

- [Create a VPC Endpoint](#)
- [Create a VPC Endpoint Policy for SageMaker Studio](#)
- [Allow Access Only from Within Your VPC](#)

### Create a VPC Endpoint

You can create an interface endpoint to connect to Studio with either the AWS console or the AWS Command Line Interface (AWS CLI). For instructions, see [Creating an interface endpoint](https://docs.aws.amazon.com/sagemaker/latest/dg/identify-based-policies.html). Make sure that you create interface endpoints for all of the subnets in your VPC from which you want to connect to Studio.
When you create an interface endpoint, ensure that the security groups on your endpoint allow inbound access for HTTPS traffic from the security groups associated with SageMaker Studio. For more information, see Control access to services with VPC endpoints.

**Note**

In addition to creating an interface endpoint to connect to SageMaker Studio, create an interface endpoint to connect to the Amazon SageMaker API. When users call `CreatePresignedDomainUrl` to get the URL to connect to Studio, that call goes through the interface endpoint used to connect to the SageMaker API.

When you create the interface endpoint, specify `aws.sagemaker.Region.studio` as the service name. After you create the interface endpoint, enable private DNS for your endpoint. When you connect to SageMaker Studio from within the VPC using the SageMaker API, the AWS CLI, or the console, you connect through the interface endpoint instead of the public internet. You also need to set up a custom DNS with private hosted zones for the Amazon VPC endpoint so SageMaker Studio can access the SageMaker API using the `api.sagemaker.$region.amazonaws.com` endpoint rather than using the VPC endpoint URL. For instructions on setting up a private hosted zone, see Working with private hosted zones.

**Create a VPC Endpoint Policy for SageMaker Studio**

You can attach an Amazon VPC endpoint policy to the interface VPC endpoints that you use to connect to SageMaker Studio. The endpoint policy controls access to Studio. You can specify the following:

- The principal that can perform actions.
- The actions that can be performed.
- The resources on which actions can be performed.

To use a VPC endpoint with SageMaker Studio, your endpoint policy must allow the `CreateApp` operation on the KernelGateway app type. This allows traffic that is routed to through the VPC endpoint to call the `CreateApp` API. The following example VPC endpoint policy shows how to allow the `CreateApp` operation.

```
{
  "Statement": [
    {
      "Action": "sagemaker:CreateApp",
      "Effect": "Allow",
      "Principal": "*"
    }
  ]
}
```

For more information, see Controlling access to services with VPC endpoints.

The following example of a VPC endpoint policy specifies that all users that have access to the endpoint are allowed to access the user profiles in the SageMaker Studio domain with the specified domain ID. Access to other domains is denied.

```
{
  "Statement": [
    {
      "Action": "sagemaker:CreatePresignedDomainUrl",
      "Effect": "Allow",
      "Principal": "*"
    }
  ]
}
```
Allow Access Only from Within Your VPC

Users outside your VPC can connect to SageMaker Studio over the internet even if you set up an interface endpoint in your VPC.

To allow access to only connections made from within your VPC, create an AWS Identity and Access Management (IAM) policy to that effect. Add that policy to every IAM user, group, or role used to access Studio. This feature is only supported in IAM mode, and is not supported in IAM Identity Center mode. The following examples demonstrate how to create such policies.

**Important**

If you apply an IAM policy similar to one of the following examples, users can't access SageMaker Studio or the specified SageMaker APIs through the SageMaker console. To access Studio, users must use a presigned URL or call the SageMaker APIs directly.

**Example 1: Allow connections only within the subnet of an interface endpoint**

The following policy allows connections only to callers within the subnet where you created the interface endpoint.

```json
{
  "Id": "sagemaker-studio-example-1",
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "Enable SageMaker Studio Access",
      "Effect": "Allow",
      "Action": ["sagemaker:CreatePresignedDomainUrl", "sagemaker:DescribeUserProfile"],
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "aws:SourceVpc": "vpc-111bbaaa"
        }
      }
    }
  ]
}
```

**Example 2: Allow connections only through interface endpoints using aws:sourceVpce**

The following policy allows connections only to those made through the interface endpoints specified by the `aws:sourceVpce` condition key. For example, the first interface endpoint could allow access through the SageMaker Studio Control Panel. The second interface endpoint could allow access through the SageMaker API.

```json
{
  "Id": "sagemaker-studio-example-2",
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "Enable SageMaker Studio Access",
      "Effect": "Allow",
      "Action": ["sagemaker:CreatePresignedDomainUrl", "sagemaker:DescribeUserProfile"],
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "aws:SourceVpce": "vpc-111bbaaa"
        }
      }
    }
  ]
}
```
This policy includes the DescribeUserProfile action. Typically you call DescribeUserProfile to make sure that the status of the user profile is InService before you try to connect to the domain. For example:

```
aws sagemaker describe-user-profile \
  --domain-id domain-id \
  --user-profile-name profile-name
```

Response:

```
{
  "DomainId": "domain-id",
  "UserProfileName": "profile-name",
  "HomeEfsFileSystemUid": "200001",
  "Status": "InService",
  "LastModifiedTime": 1605418785.555,
  "CreationTime": 1605418477.297
}
```

```
aws sagemaker create-presigned-domain-url \
  --domain-id domain-id \
  --user-profile-name profile-name
```

Response:

```
{
  "AuthorizedUrl": "https://domain-id.studio.us-west-2.sagemaker.aws/auth?token=AuthToken"
}
```

For both of these calls, if you are using a version of the AWS SDK that was released before August 13, 2018, you must specify the endpoint URL in the call. For example, the following example shows a call to create-presigned-domain-url:

```
aws sagemaker create-presigned-domain-url \
  --domain-id domain-id \
  --user-profile-name profile-name \
  --endpoint-url vpc-endpoint-id.api.sagemaker.Region.vpce.amazonaws.com
```

Example 3: Allow connections from IP addresses using aws:SourceIp

The following policy allows connections only from the specified range of IP addresses using the aws:SourceIp condition key.

```
Example 4: Allow connections from IP addresses through an interface endpoint using `aws:VpcSourceIp`

If you are accessing SageMaker Studio through an interface endpoint, you can use the `aws:VpcSourceIp` condition key to allow connections only from the specified range of IP addresses within the subnet where you created the interface endpoint as shown in the following policy:

```json
{
    "Id": "sagemaker-studio-example-4",
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Enable SageMaker Studio Access",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreatePresignedDomainUrl",
                "sagemaker:DescribeUserProfile"
            ],
            "Resource": "*",
            "Condition": {
                "IpAddress": {
                    "aws:SourceIp": [
                        "192.0.2.0/24",
                        "203.0.113.0/24"
                    ]
                },
                "StringEquals": {
                    "aws:SourceVpc": "vpc-111bbaaa"
                }
            }
        }
    ]
}
```

Connect to a Notebook Instance Through a VPC Interface Endpoint

You can connect to your notebook instance from your VPC through an interface endpoint in your Virtual Private Cloud (VPC) instead of connecting over the public internet. When you use a VPC interface
endpoint, communication between your VPC and the notebook instance is conducted entirely and securely within the AWS network.

SageMaker notebook instances support Amazon Virtual Private Cloud (Amazon VPC) interface endpoints that are powered by AWS PrivateLink. Each VPC endpoint is represented by one or more Elastic Network Interfaces with private IP addresses in your VPC subnets.

**Note**
Before you create an interface VPC endpoint to connect to a notebook instance, create an interface VPC endpoint to connect to the SageMaker API. That way, when users call CreatePresignedNotebookInstanceUrl to get the URL to connect to the notebook instance, that call also goes through the interface VPC endpoint. For information, see Connect to SageMaker Through a VPC Interface Endpoint (p. 3470).

You can create an interface endpoint to connect to your notebook instance with either the AWS console or AWS Command Line Interface (AWS CLI) commands. For instructions, see Creating an Interface Endpoint. Make sure that you create an interface endpoint for all of the subnets in your VPC from which you want to connect to the notebook instance.

When you create the interface endpoint, specify `aws.sagemaker.region.notebook` as the service name. After you create a VPC endpoint, enable private DNS for your VPC endpoint. Anyone using the SageMaker API, the AWS CLI, or the console to connect to the notebook instance from within the VPC connects to the notebook instance through the VPC endpoint instead of the public internet.

SageMaker notebook instances support VPC endpoints in all AWS Regions where both Amazon VPC and SageMaker are available.

**Topics**
- Connect Your Private Network to Your VPC (p. 3477)
- Create a VPC Endpoint Policy for SageMaker Notebook Instances (p. 3477)
- Restrict Access to Connections from Within Your VPC (p. 3478)

**Connect Your Private Network to Your VPC**

To connect to your notebook instance through your VPC, you either have to connect from an instance that is inside the VPC, or connect your private network to your VPC by using an AWS Virtual Private Network (AWS VPN) or AWS Direct Connect. For information about AWS VPN, see VPN Connections in the Amazon Virtual Private Cloud User Guide. For information about AWS Direct Connect, see Creating a Connection in the AWS Direct Connect User Guide.

**Create a VPC Endpoint Policy for SageMaker Notebook Instances**

You can create a policy for Amazon VPC endpoints for SageMaker notebook instances to specify the following:

- The principal that can perform actions.
- The actions that can be performed.
- The resources on which actions can be performed.

For more information, see Controlling Access to Services with VPC Endpoints in the Amazon VPC User Guide.

The following example of a VPC endpoint policy specifies that all users that have access to the endpoint are allowed to access the notebook instance named `myNotebookInstance`.

```json
{
    "Statement": [
        {
            "Principal": {
                "AWS": "*"
            },
            "Effect": "Allow",
            "Action": "sagemaker:Createpresignednotebookinstanceurl",
        }
    ]
}
```
Access to other notebook instances is denied.

**Restrict Access to Connections from Within Your VPC**

Even if you set up an interface endpoint in your VPC, individuals outside the VPC can connect to the notebook instance over the internet.

**Important**
If you apply an IAM policy similar to one of the following, users can't access the specified SageMaker APIs or the notebook instance through the console.

To restrict access to only connections made from within your VPC, create an AWS Identity and Access Management policy that restricts access to only calls that come from within your VPC. Then add that policy to every AWS Identity and Access Management user, group, or role used to access the notebook instance.

**Note**
This policy allows connections only to callers within a subnet where you created an interface endpoint.

```json
{
    "Id": "notebook-example-1",
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Enable Notebook Access",
            "Effect": "Allow",
            "Action": ["sagemaker:CreatePresignedNotebookInstanceUrl",
                        "sagemaker:DescribeNotebookInstance"],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "aws:SourceVpc": "vpc-111bbaaa"
                }
            }
        }
    ]
}
```

If you want to restrict access to the notebook instance to only connections made using the interface endpoint, use the `aws:SourceVpce` condition key instead of `aws:SourceVpc`:

```json
{
    "Id": "notebook-example-1",
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Enable Notebook Access",
            "Effect": "Allow",
            "Action": ["sagemaker:CreatePresignedNotebookInstanceUrl",
                        "sagemaker:DescribeNotebookInstance",
                        "sagemaker:ListNotebookInstances",
                        "sagemaker:ListNotebookInstanceSnapshots",
                        "sagemaker:ListNotebookInstancePermissions",
                        "sagemaker:DescribeNotebookInstanceSnapshots",
                        "sagemaker:DeleteNotebookInstanceSnapshots",
                        "sagemaker:CreateNotebookInstance"
                ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "aws:SourceVpce": "vpc-111bbaaa"
                }
            }
        }
    ]
}
```
Both of these policy examples assume that you have also created an interface endpoint for the SageMaker API. For more information, see Connect to SageMaker Through a VPC Interface Endpoint (p. 3470). In the second example, one of the values for `aws:SourceVpce` is the ID of the interface endpoint for the notebook instance. The other is the ID of the interface endpoint for the SageMaker API.

The policy examples here include `DescribeNotebookInstance`, because typically you would call `DescribeNotebookInstance` to make sure that the `NotebookInstanceStatus` is `InService` before you try to connect to it. For example:

```bash
aws sagemaker describe-notebook-instance --notebook-instance-name myNotebookInstance
```

```
{
  "NotebookInstanceName": "myNotebookInstance",
  "NotebookInstanceStatus": "InService",
  "Url": "mynotebookinstance.notebook.us-west-2.sagemaker.aws",
  "InstanceType": "ml.m4.xlarge",
  "RoleArn": "arn:aws:iam::1234567890ab:role/service-role/AmazonSageMaker-ExecutionRole-12345678T123456",
  "LastModifiedTime": 1540334777.501,
  "CreationTime": 1523050674.078,
  "DirectInternetAccess": "Disabled"
}
```

```bash
aws sagemaker create-presigned-notebook-instance-url --notebook-instance-name myNotebookInstance
```

```
{
}
```

**Note**

The presigned url generated can be used from anywhere on the internet.

For both of these calls, if you did not enable private DNS hostnames for your VPC endpoint, or if you are using a version of the AWS SDK that was released before August 13, 2018, you must specify the endpoint URL in the call. For example, the call to `create-presigned-notebook-instance-url` is:

```bash
aws sagemaker create-presigned-notebook-instance-url --notebook-instance-name myNotebookInstance --endpoint-url VPC_Endpoint_ID.api.sagemaker.Region.vpce.amazonaws.com
```
Connect Your Private Network to Your VPC

To call the SageMaker API and runtime through your VPC, you have to connect from an instance that is inside the VPC or connect your private network to your VPC by using an AWS Virtual Private Network (AWS VPN) or AWS Direct Connect. For information about AWS VPN, see VPN Connections in the Amazon Virtual Private Cloud User Guide. For information about AWS Direct Connect, see Creating a Connection in the AWS Direct Connect User Guide.

Give SageMaker Access to Resources in your Amazon VPC

SageMaker runs the following job types in an Amazon Virtual Private Cloud by default.

- Processing
- Training
- Model hosting
- Batch transform
- Amazon SageMaker Clarify
- SageMaker Compilation

However, containers for these jobs access AWS resources—such as the Amazon Simple Storage Service (Amazon S3) buckets where you store training data and model artifacts—over the internet.

To control access to your data and job containers, we recommend that you create a private VPC and configure it so that they aren’t accessible over the internet. For information about creating and configuring a VPC, see Getting Started With Amazon VPC in the Amazon VPC User Guide. Using a VPC helps to protect your job containers and data because you can configure your VPC so that it is not connected to the internet. Using a VPC also allows you to monitor all network traffic in and out of your job containers by using VPC flow logs. For more information, see VPC Flow Logs in the Amazon VPC User Guide.

You specify your private VPC configuration when you create jobs by specifying subnets and security groups. When you specify the subnets and security groups, SageMaker creates elastic network interfaces that are associated with your security groups in one of the subnets. Network interfaces allow your job containers to connect to resources in your VPC. For information about network interfaces, see Elastic Network Interfaces in the Amazon VPC User Guide.

Topics

- Give SageMaker Processing Jobs Access to Resources in Your Amazon VPC (p. 3480)
- Give SageMaker Training Jobs Access to Resources in Your Amazon VPC (p. 3483)
- Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC (p. 3486)
- Give Batch Transform Jobs Access to Resources in Your Amazon VPC (p. 3489)

Give SageMaker Processing Jobs Access to Resources in Your Amazon VPC

To control access to your data and processing jobs, we recommend that you create a private Amazon VPC and configure it so that your jobs aren’t accessible over the public internet. For information about
creating and configuring a VPC, see Getting Started With Amazon VPC in the Amazon VPC User Guide. Using a VPC helps to protect your processing containers and data because you can configure your VPC so that it is not connected to the internet. Using a VPC also allows you to monitor all network traffic in and out of your processing containers by using VPC flow logs. For more information, see VPC Flow Logs in the Amazon VPC User Guide.

This document explains how to add Amazon VPC configurations for processing jobs.

Configure a Processing Job for Amazon VPC Access

To specify subnets and security groups in your private VPC, use the NetworkConfig.VpcConfig request parameter of the CreateProcessingJob API, or provide this information when you create a processing job in the SageMaker console. SageMaker uses this information to create network interfaces and attach them to your processing containers. The network interfaces provide your processing containers with a network connection within your VPC that is not connected to the internet. They also enable your processing job to connect to resources in your private VPC.

The following is an example of the VpcConfig parameter that you include in your call to CreateProcessingJob:

```json
VpcConfig: {
  "Subnets": [
    "subnet-0123456789abcdef0",
    "subnet-0123456789abcdef1",
    "subnet-0123456789abcdef2"
  ],
  "SecurityGroupIds": [
    "sg-0123456789abcdef0"
  ]
}
```

Configure Your Private VPC for SageMaker Processing

When configuring the private VPC for your SageMaker processing jobs, use the following guidelines. For information about setting up a VPC, see Working with VPCs and Subnets in the Amazon VPC User Guide.

Topics

- Ensure That Subnets Have Enough IP Addresses (p. 3481)
- Create an Amazon S3 VPC Endpoint (p. 3481)
- Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3482)
- Configure Route Tables (p. 3483)
- Configure the VPC Security Group (p. 3483)
- Connect to Resources Outside Your VPC (p. 3483)

Ensure That Subnets Have Enough IP Addresses

Your VPC subnets should have at least two private IP addresses for each instance in a processing job. For more information, see VPC and Subnet Sizing for IPv4 in the Amazon VPC User Guide.

Create an Amazon S3 VPC Endpoint

If you configure your VPC so that processing containers don't have access to the internet, they can't connect to the Amazon S3 buckets that contain your data unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your processing containers to access the buckets where you store your data. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see Endpoints for Amazon S3.
To create an S3 VPC endpoint:

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose Endpoints, then choose Create Endpoint.
3. For Service Name, choose `com.amazonaws.region.s3`, where `region` is the name of the region where your VPC resides.
4. For VPC, choose the VPC you want to use for this endpoint.
5. For Configure route tables, select the route tables to be used by the endpoint. The VPC service automatically adds a route to each route table you select that points any S3 traffic to the new endpoint.
6. For Policy, choose Full Access to allow full access to the S3 service by any user or service within the VPC. Choose Custom to restrict access further. For information, see Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3482).

Use a Custom Endpoint Policy to Restrict Access to S3

The default endpoint policy allows full access to S3 for any user or service in your VPC. To further restrict access to S3, create a custom endpoint policy. For more information, see Using Endpoint Policies for Amazon S3. You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see Using Amazon S3 Bucket Policies.

Restrict Package Installation on the Processing Container

The default endpoint policy allows users to install packages from the Amazon Linux and Amazon Linux 2 repositories on the processing container. If you don't want users to install packages from that repository, create a custom endpoint policy that explicitly denies access to the Amazon Linux and Amazon Linux 2 repositories. The following is an example of a policy that denies access to these repositories:

```
{
  "Statement": [

    {
      "Sid": "AmazonLinuxAMIRepositoryAccess",
      "Principal": "*",
      "Action": ["s3:GetObject"],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::packages.*.amazonaws.com/*",
        "arn:aws:s3:::repo.*.amazonaws.com/*"
      ]
    }
  ]
}

{
  "Statement": [

    {
      "Sid": "AmazonLinux2AMIRepositoryAccess",
      "Principal": "*",
      "Action": ["s3:GetObject"],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::amazonlinux.*.amazonaws.com/*"
      ]
    }
  ]
}
```
Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, http://s3-aws-region.amazonaws.com/MyBucket) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your processing jobs resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see Routing for Gateway Endpoints in the Amazon VPC User Guide.

Configure the VPC Security Group

In distributed processing, you must allow communication between the different containers in the same processing job. To do that, configure a rule for your security group that allows inbound connections between members of the same security group. For more information, see Security Group Rules.

Connect to Resources Outside Your VPC

If you configure your VPC so that it doesn't have internet access, processing jobs that use that VPC do not have access to resources outside your VPC. If your processing job needs access to resources outside your VPC, provide access with one of the following options:

- If your processing job needs access to an AWS service that supports interface VPC endpoints, create an endpoint to connect to that service. For a list of services that support interface endpoints, see VPC Endpoints in the Amazon VPC User Guide. For information about creating an interface VPC endpoint, see Interface VPC Endpoints (AWS PrivateLink) in the Amazon VPC User Guide.
- If your processing job needs access to an AWS service that doesn't support interface VPC endpoints or to a resource outside of AWS, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see Scenario 2: VPC with Public and Private Subnets (NAT) in the Amazon Virtual Private Cloud User Guide.

Give SageMaker Training Jobs Access to Resources in Your Amazon VPC

**Note**
For training jobs, you can configure only subnets with a default tenancy VPC in which your instance runs on shared hardware. For more information on the tenancy attribute for VPCs, see Dedicated Instances.

Configure a Training Job for Amazon VPC Access

To specify subnets and security groups in your private VPC, use the VpcConfig request parameter of the CreateTrainingJob API, or provide this information when you create a training job in the SageMaker console. SageMaker uses this information to create network interfaces and attach them to your training containers. The network interfaces provide your training containers with a network connection within your VPC that is not connected to the internet. They also enable your training job to connect to resources in your private VPC.

The following is an example of the VpcConfig parameter that you include in your call to CreateTrainingJob:

```json
VpcConfig: {
  "Subnets": [
    "subnet-0123456789abcdef0",
    "subnet-0123456789abcdef1",
    "subnet-0123456789abcdef2"
  ],
  "SecurityGroupIds": [ ...
```
Amazon SageMaker Developer Guide
Give SageMaker Access to Resources in your Amazon VPC

"sg-0123456789abcdef0"
}

Configure Your Private VPC for SageMaker Training

When configuring the private VPC for your SageMaker training jobs, use the following guidelines. For information about setting up a VPC, see Working with VPCs and Subnets in the Amazon VPC User Guide.

Topics
- Ensure That Subnets Have Enough IP Addresses (p. 3484)
- Create an Amazon S3 VPC Endpoint (p. 3484)
- Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3484)
- Configure Route Tables (p. 3485)
- Configure the VPC Security Group (p. 3485)
- Connect to Resources Outside Your VPC (p. 3485)

Ensure That Subnets Have Enough IP Addresses

Your VPC subnets should have at least two private IP addresses for each instance in a training job. For more information, see VPC and Subnet Sizing for IPv4 in the Amazon VPC User Guide.

Create an Amazon S3 VPC Endpoint

If you configure your VPC so that training containers don't have access to the internet, they can't connect to the Amazon S3 buckets that contain your training data unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your training containers to access the buckets where you store your data and model artifacts. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see Endpoints for Amazon S3.

To create an S3 VPC endpoint:

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose Endpoints, then choose Create Endpoint
3. For Service Name, search for com.amazonaws.region.s3, where region is the name of the region where your VPC resides.
4. Choose the Gateway type.
5. For VPC, choose the VPC you want to use for this endpoint.
6. For Configure route tables, select the route tables to be used by the endpoint. The VPC service automatically adds a route to each route table you select that points any S3 traffic to the new endpoint.
7. For Policy, choose Full Access to allow full access to the S3 service by any user or service within the VPC. Choose Custom to restrict access further. For information, see Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3484).

Use a Custom Endpoint Policy to Restrict Access to S3

The default endpoint policy allows full access to S3 for any user or service in your VPC. To further restrict access to S3, create a custom endpoint policy. For more information, see Using Endpoint Policies for Amazon S3. You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see Using Amazon S3 Bucket Policies.
Restrict Package Installation on the Training Container

The default endpoint policy allows users to install packages from the Amazon Linux and Amazon Linux 2 repositories on the training container. If you don't want users to install packages from that repository, create a custom endpoint policy that explicitly denies access to the Amazon Linux and Amazon Linux 2 repositories. The following is an example of a policy that denies access to these repositories:

```
{
  "Statement": [
    {
      "Sid": "AmazonLinuxAMIRepositoryAccess",
      "Principal": "*",
      "Action": [
        "s3:GetObject"
      ],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::packages.*.amazonaws.com/*",
        "arn:aws:s3:::repo.*.amazonaws.com/*"
      ]
    }
  ]
}
{
  "Statement": [
    {
      "Sid": "AmazonLinux2AMIRepositoryAccess",
      "Principal": "*",
      "Action": [
        "s3:GetObject"
      ],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::amazonlinux.*.amazonaws.com/*"
      ]
    }
  ]
}
```

Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, http://s3-aws-region.amazonaws.com/MyBucket) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your training jobs resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see Routing for Gateway Endpoints in the Amazon VPC User Guide.

Configure the VPC Security Group

In distributed training, you must allow communication between the different containers in the same training job. To do that, configure a rule for your security group that allows inbound connections between members of the same security group. For information, see Security Group Rules.

Connect to Resources Outside Your VPC

If you configure your VPC so that it doesn't have internet access, training jobs that use that VPC do not have access to resources outside your VPC. If your training job needs access to resources outside your VPC, provide access with one of the following options:

- If your training job needs access to an AWS service that supports interface VPC endpoints, create an endpoint to connect to that service. For a list of services that support interface endpoints, see VPC
Endpoints in the Amazon VPC User Guide. For information about creating an interface VPC endpoint, see Interface VPC Endpoints (AWS PrivateLink) in the Amazon VPC User Guide.

- If your training job needs access to an AWS service that doesn't support interface VPC endpoints or to a resource outside of AWS, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see Scenario 2: VPC with Public and Private Subnets (NAT) in the Amazon Virtual Private Cloud User Guide.

Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC

Configure a Model for Amazon VPC Access

To specify subnets and security groups in your private VPC, use the VpcConfig request parameter of the CreateModel API, or provide this information when you create a model in the SageMaker console. SageMaker uses this information to create network interfaces and attach them to your model containers. The network interfaces provide your model containers with a network connection within your VPC that is not connected to the internet. They also enable your model to connect to resources in your private VPC.

**Note**

You must create at least two subnets in different availability zones in your private VPC, even if you have only one hosting instance.

The following is an example of the VpcConfig parameter that you include in your call to CreateModel:

```
VpcConfig: {
  "Subnets": [
    "subnet-0123456789abcdef0",
    "subnet-0123456789abcdef1",
    "subnet-0123456789abcdef2"
  ],
  "SecurityGroupIds": [
    "sg-0123456789abcdef0"
  ]
}
```

Configure Your Private VPC for SageMaker Hosting

When configuring the private VPC for your SageMaker models, use the following guidelines. For information about setting up a VPC, see Working with VPCs and Subnets in the Amazon VPC User Guide.

**Topics**

- Ensure That Subnets Have Enough IP Addresses (p. 3486)
- Create an Amazon S3 VPC Endpoint (p. 3487)
- Use a Custom Endpoint Policy to Restrict Access to Amazon S3 (p. 3487)
- Add Permissions for Endpoint Access for Containers Running in a VPC to Custom IAM Policies (p. 3488)
- Configure Route Tables (p. 3488)
- Connect to Resources Outside Your VPC (p. 3488)

Ensure That Subnets Have Enough IP Addresses

Your VPC subnets should have at least two private IP addresses for each model instance. For more information, see VPC and Subnet Sizing for IPv4 in the Amazon VPC User Guide.
Create an Amazon S3 VPC Endpoint

If you configure your VPC so that model containers don’t have access to the internet, they can’t connect to the Amazon S3 buckets that contain your data unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your model containers to access the buckets where you store your data and model artifacts. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see Endpoints for Amazon S3.

To create an Amazon S3 VPC endpoint:
1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose Endpoints, then choose Create Endpoint
3. For Service Name, choose com.amazonaws.region.s3, where region is the name of the AWS Region where your VPC resides.
4. For VPC, choose the VPC that you want to use for this endpoint.
5. For Configure route tables, choose the route tables for the endpoint to use. The VPC service automatically adds a route to each route table that you choose that points Amazon S3 traffic to the new endpoint.
6. For Policy, choose Full Access to allow full access to the Amazon S3 service by any user or service within the VPC. To restrict access further, choose Custom. For more information, see Use a Custom Endpoint Policy to Restrict Access to Amazon S3 (p. 3487).

Use a Custom Endpoint Policy to Restrict Access to Amazon S3

The default endpoint policy allows full access to Amazon Simple Storage Service (Amazon S3) for any user or service in your VPC. To further restrict access to Amazon S3, create a custom endpoint policy. For more information, see Using Endpoint Policies for Amazon S3.

You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see Using Amazon S3 Bucket Policies.

Restrict Package Installation on the Model Container with a Custom Endpoint Policy

The default endpoint policy allows users to install packages from the Amazon Linux and Amazon Linux 2 repositories on the model container. If you don’t want users to install packages from those repositories, create a custom endpoint policy that explicitly denies access to the Amazon Linux and Amazon Linux 2 repositories. The following is an example of a policy that denies access to these repositories:

```json
{
    "Statement": [
        {
            "Sid": "AmazonLinuxAMIRepositoryAccess",
            "Principal": "*",
            "Action": [
                "s3:GetObject"
            ],
            "Effect": "Deny",
            "Resource": [
                "arn:aws:s3:::packages.*.amazonaws.com/*",
                "arn:aws:s3:::repo.*.amazonaws.com/*"
            ]
        }
    ]
}
{
    "Statement": [
        {
            "Sid": "AmazonLinux2AMIRepositoryAccess",
            "Principal": "*",
            "Action": [
                "s3:GetObject"
            ],
            "Effect": "Deny",
            "Resource": [
                "arn:aws:s3:::packages-amazonlinux2.*.amazonaws.com/*",
                "arn:aws:s3:::repo-amazonlinux2.*.amazonaws.com/*"
            ]
        }
    ]
}
```
Add Permissions for Endpoint Access for Containers Running in a VPC to Custom IAM Policies

The SageMakerFullAccess managed policy includes the permissions that you need to use models configured for Amazon VPC access with an endpoint. These permissions allow SageMaker to create an elastic network interface and attach it to model containers running in a VPC. If you use your own IAM policy, you must add the following permissions to that policy to use models configured for VPC access.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeVpcEndpoints",
                "ec2:DescribeDhcpOptions",
                "ec2:DescribeVpcs",
                "ec2:DescribeSubnets",
                "ec2:DescribeSecurityGroups",
                "ec2:DescribeNetworkInterfaces",
                "ec2:DeleteNetworkInterfacePermission",
                "ec2:DeleteNetworkInterface",
                "ec2:CreateNetworkInterfacePermission",
                "ec2:CreateNetworkInterface"
            ],
            "Resource": "*"
        }
    ]
}
```

For more information about the SageMakerFullAccess managed policy, see AWS managed policy: AmazonSageMakerFullAccess (p. 3411).

Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, http://s3-aws-region.amazonaws.com/MyBucket) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your models resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see Routing for Gateway Endpoints in the Amazon VPC User Guide.

Connect to Resources Outside Your VPC

If you configure your VPC so that it doesn't have internet access, models that use that VPC do not have access to resources outside your VPC. If your model needs access to resources outside your VPC, provide access with one of the following options:

- If your model needs access to an AWS service that supports interface VPC endpoints, create an endpoint to connect to that service. For a list of services that support interface endpoints, see VPC Endpoints in the Amazon VPC User Guide. For information about creating an interface VPC endpoint, see Interface VPC Endpoints (AWS PrivateLink) in the Amazon VPC User Guide.
• If your model needs access to an AWS service that doesn't support interface VPC endpoints or to a resource outside of AWS, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see Scenario 2: VPC with Public and Private Subnets (NAT) in the Amazon Virtual Private Cloud User Guide.

Give Batch Transform Jobs Access to Resources in Your Amazon VPC

To control access to your data and batch transform jobs, we recommend that you create a private Amazon VPC and configure it so that your jobs aren't accessible over the public internet. You specify your private VPC configuration when you create a model by specifying subnets and security groups. You then specify the same model when you create a batch transform job. When you specify the subnets and security groups, SageMaker creates elastic network interfaces that are associated with your security groups in one of the subnets. Network interfaces allow your model containers to connect to resources in your VPC. For information about network interfaces, see Elastic Network Interfaces in the Amazon VPC User Guide.

This document explains how to add Amazon VPC configurations for batch transform jobs.

Configure a Batch Transform Job for Amazon VPC Access

To specify subnets and security groups in your private VPC, use the VpcConfig request parameter of the CreateModel API, or provide this information when you create a model in the SageMaker console. Then specify the same model in the ModelName request parameter of the CreateTransformJob API, or in the Model name field when you create a transform job in the SageMaker console. SageMaker uses this information to create network interfaces and attach them to your model containers. The network interfaces provide your model containers with a network connection within your VPC that is not connected to the internet. They also enable your transform job to connect to resources in your private VPC.

The following is an example of the VpcConfig parameter that you include in your call to CreateModel:

```json
VpcConfig: {
    "Subnets": ["subnet-0123456789abcdef0", "subnet-0123456789abcdef1", "subnet-0123456789abcdef2" ],
    "SecurityGroupIds": [ "sg-0123456789abcdef0"
    ]
}
```

If you are creating a model using the CreateModel API operation, the IAM execution role that you use to create your model must include the permissions described in CreateModel API: Execution Role Permissions (p. 3391), including the following permissions required for a private VPC.

When creating a model in the console, if you select Create a new role in the Model Settings section, the AmazonSageMakerFullAccess policy used to create the role already contains these permissions. If you select Enter a custom IAM role ARN or Use existing role, the role ARN that you specify must have an execution policy attached with the following permissions:

```json
{
    "Effect": "Allow",
    "Action": ["ec2:CreateNetworkInterface","ec2:CreateNetworkInterfacePermission",
    ]
}
```
Configure Your Private VPC for SageMaker Batch Transform

When configuring the private VPC for your SageMaker batch transform jobs, use the following guidelines. For information about setting up a VPC, see Working with VPCs and Subnets in the Amazon VPC User Guide.

**Topics**
- Ensure That Subnets Have Enough IP Addresses (p. 3490)
- Create an Amazon S3 VPC Endpoint (p. 3490)
- Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3490)
- Configure Route Tables (p. 3491)
- Configure the VPC Security Group (p. 3491)
- Connect to Resources Outside Your VPC (p. 3491)

**Ensure That Subnets Have Enough IP Addresses**

Your VPC subnets should have at least two private IP addresses for each instance in a transform job. For more information, see VPC and Subnet Sizing for IPv4 in the Amazon VPC User Guide.

**Create an Amazon S3 VPC Endpoint**

If you configure your VPC so that model containers don't have access to the internet, they can't connect to the Amazon S3 buckets that contain your data unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your model containers to access the buckets where you store your data and model artifacts. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see Endpoints for Amazon S3.

**To create an S3 VPC endpoint:**

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose Endpoints, then choose Create Endpoint.
3. For Service Name, choose com.amazonaws.\region.s3, where \region is the name of the region where your VPC resides.
4. For VPC, choose the VPC you want to use for this endpoint.
5. For Configure route tables, select the route tables to be used by the endpoint. The VPC service automatically adds a route to each route table you select that points any S3 traffic to the new endpoint.
6. For Policy, choose Full Access to allow full access to the S3 service by any user or service within the VPC. Choose Custom to restrict access further. For information, see Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3490).

**Use a Custom Endpoint Policy to Restrict Access to S3**

The default endpoint policy allows full access to S3 for any user or service in your VPC. To further restrict access to S3, create a custom endpoint policy. For more information, see Using Endpoint Policies for...
Amazon S3. You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see Using Amazon S3 Bucket Policies.

Restrict Package Installation on the Model Container

The default endpoint policy allows users to install packages from the Amazon Linux and Amazon Linux 2 repositories on the training container. If you don't want users to install packages from that repository, create a custom endpoint policy that explicitly denies access to the Amazon Linux and Amazon Linux 2 repositories. The following is an example of a policy that denies access to these repositories:

```
{
  "Statement": [
    {
      "Sid": "AmazonLinuxAMIRepositoryAccess",
      "Principal": "*",
      "Action": [
        "s3:GetObject"
      ],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::packages.*.amazonaws.com/**",
        "arn:aws:s3:::repo.*.amazonaws.com/**"
      ]
    }
  ]
}
{
  "Statement": [
    {
      "Sid": "AmazonLinux2AMIRepositoryAccess",
      "Principal": "*",
      "Action": [
        "s3:GetObject"
      ],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::amazonlinux.*.amazonaws.com/**"
      ]
    }
  ]
}
```

Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, http://s3-aws-region.amazonaws.com/MyBucket) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your batch transform jobs resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see Routing for Gateway Endpoints in the Amazon VPC User Guide.

Configure the VPC Security Group

In distributed batch transform, you must allow communication between the different containers in the same batch transform job. To do that, configure a rule for your security group that allows inbound connections between members of the same security group. For information, see Security Group Rules.

Connect to Resources Outside Your VPC

If you configure your VPC so that it doesn't have internet access, batch transform jobs that use that VPC do not have access to resources outside your VPC. If your batch transform job needs access to resources outside your VPC, provide access with one of the following options:
• If your batch transform job needs access to an AWS service that supports interface VPC endpoints, create an endpoint to connect to that service. For a list of services that support interface VPC endpoints, see VPC Endpoints in the Amazon VPC User Guide. For information about creating an interface VPC endpoint, see Interface VPC Endpoints (AWS PrivateLink) in the Amazon VPC User Guide.

• If your batch transform job needs access to an AWS service that doesn't support interface VPC endpoints or to a resource outside of AWS, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see Scenario 2: VPC with Public and Private Subnets (NAT) in the Amazon Virtual Private Cloud User Guide.

Give Amazon SageMaker Clarify Jobs Access to Resources in Your Amazon VPC

To control access to your data and SageMaker Clarify jobs, we recommend that you create a private Amazon VPC and configure it so that your jobs aren't accessible over the public internet. For information about creating and configuring an Amazon VPC for processing jobs, see Give SageMaker Processing Jobs Access to Resources in Your Amazon VPC.

This document explains how to add additional Amazon VPC configurations that meet the requirements for SageMaker Clarify jobs.

Topics
• Configure a SageMaker Clarify Job for Amazon VPC Access (p. 3492)
• Configure Your Private Amazon VPC for SageMaker Clarify jobs (p. 3494)

Configure a SageMaker Clarify Job for Amazon VPC Access

You need to specify subnets and security groups when configuring your private Amazon VPC for SageMaker Clarify jobs and to enable the job to get inferences from the SageMaker model when computing post-training bias metrics and feature contributions that help explain model predictions.

Topics
• SageMaker Clarify Job Amazon VPC Subnets and Security Groups (p. 3492)
• Configure a Model Amazon VPC for Inference (p. 3493)

SageMaker Clarify Job Amazon VPC Subnets and Security Groups

Subnets and security groups in your private Amazon VPC can be assigned to a SageMaker Clarify job in various ways, depending on how you create the job.

• SageMaker console: Provide this information when you create the job in the SageMaker Dashboard. From the Processing menu, choose Processing jobs, then choose Create processing job. Select the VPC option in the Network panel and provide the subnets and security groups using the dropdown lists. Make sure network isolation option provided in this panel is set to disabled.

• SageMaker API: Use the NetworkConfig.VpcConfig request parameter of the CreateProcessingJob API, as shown in the following example:

```json
"NetworkConfig": {
  "VpcConfig": {
    "Subnets": [
      "subnet-0123456789abcdef0",
      "subnet-0123456789abcdef1",
      "subnet-0123456789abcdef2"
    ],
    "SecurityGroupIds": [ ]
  }
}
```
• **SageMaker Python SDK**: Use the `NetworkConfig` parameter of the `SageMakerClarifyProcessor` API or `Processor` API, as shown in the following example:

```python
from sagemaker.network import NetworkConfig
network_config = NetworkConfig(
    subnets=[
        "subnet-0123456789abcdef0",
        "subnet-0123456789abcdef1",
        "subnet-0123456789abcdef2",
    ],
    security_group_ids=[
        "sg-0123456789abcdef0",
    ],
)
```

SageMaker uses the information to create network interfaces and attach them to the SageMaker Clarify job. The network interfaces provide a SageMaker Clarify job with a network connection within your Amazon VPC that is not connected to the public internet. They also enable the SageMaker Clarify job to connect to resources in your private Amazon VPC.

### Configure a Model Amazon VPC for Inference

In order to compute post-training bias metrics and explainability, the SageMaker Clarify job needs to get inferences from the SageMaker model that is specified by the `model_name` parameter of the `analysis configuration` for the SageMaker Clarify processing job. Alternatively, if you use the `SageMakerClarifyProcessor` API in the SageMaker Python SDK, the job needs to get the `model_name` specified by the `ModelConfig` class. To accomplish this, the SageMaker Clarify job creates an ephemeral endpoint with the model, known as a **shadow endpoint**, and then applies the Amazon VPC configuration of the model to the shadow endpoint.

**Note**

The network isolation option of both the SageMaker Clarify job and the model must be disabled (by default the option is disabled) so that the SageMaker Clarify job can communicate with the shadow endpoint.

To specify subnets and security groups in your private Amazon VPC to the SageMaker model, use the `VpcConfig` request parameter of the `CreateModel` API or provide this information when you create the model using the SageMaker dashboard in the console. The following is an example of the `VpcConfig` parameter that you include in your call to `CreateModel`:

```json
"VpcConfig": {
    "Subnets": [
        "subnet-0123456789abcdef0",
        "subnet-0123456789abcdef1",
        "subnet-0123456789abcdef2"
    ],
    "SecurityGroupIds": [
        "sg-0123456789abcdef0"
    ]
}
```

You can specify the number of instances of the shadow endpoint to launch with the `initial_instance_count` parameter of the `analysis configuration` for the SageMaker Clarify processing job. Alternatively, if you use the `SageMakerClarifyProcessor` API in the SageMaker Python SDK, the job needs to get the `instance_count` specified by the `ModelConfig` class.
Note
Even if you only request one instance when creating the shadow endpoint, you need at least two subnets in the model's ModelConfig in distinct availability zones. Otherwise the shadow endpoint creation fails with the following error:
ClientError: Error hosting endpoint sagemaker-clarify-endpoint-XXX: Failed. Reason: Unable to locate at least 2 availability zone(s) with the requested instance type YYY that overlap with SageMaker subnets.

If your model requires model files in Amazon S3, then the model Amazon VPC needs to have an Amazon S3 VPC endpoint. For more information about creating and configuring an Amazon VPC for SageMaker models, see Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC (p. 3486).

Configure Your Private Amazon VPC for SageMaker Clarify jobs

In general, you can follow the steps in Configure Your Private VPC for SageMaker Processing to configure your private Amazon VPC for SageMaker Clarify jobs. Here are some highlights and special requirements for SageMaker Clarify jobs.

Topics
- Connect to Resources Outside Your Amazon VPC (p. 3494)
- Configure the Amazon VPC Security Group (p. 3494)

Connect to Resources Outside Your Amazon VPC

If you configure your Amazon VPC so that it does not have public internet access, then some additional setup is required to grant SageMaker Clarify jobs access to resources and services outside of your Amazon VPC. For example, an Amazon S3 VPC endpoint is required because a SageMaker Clarify job needs to load a dataset from an S3 bucket as well as save the analysis results to an S3 bucket. For more information, see Create an Amazon S3 VPC Endpoint for the creation guide. In addition, if a SageMaker Clarify job needs to get inferences from the shadow endpoint, then it needs to call several more AWS services.

- **Create an Amazon SageMaker API service VPC endpoint**: The SageMaker Clarify job needs to call the Amazon SageMaker API service to manipulate the shadow endpoint, or to describe a SageMaker model for Amazon VPC validation. You can follow the guidance provided in the Securing all Amazon SageMaker API calls with AWS PrivateLink blog to create an Amazon SageMaker API VPC endpoint that allows the SageMaker Clarify job to make the service calls. Note that the service name of Amazon SageMaker API service is `com.amazonaws.region.sagemaker.api`, where `region` is the name of the Region where your Amazon VPC resides.

- **Create an Amazon SageMaker Runtime VPC Endpoint**: The SageMaker Clarify job needs to call the Amazon SageMaker runtime service, which routes the invocations to the shadow endpoint. The setup steps are similar to those for the Amazon SageMaker API service. Note that the service name of Amazon SageMaker Runtime service is `com.amazonaws.region.sagemaker.runtime`, where `region` is the name of the Region where your Amazon VPC resides.

Configure the Amazon VPC Security Group

SageMaker Clarify jobs support distributed processing when two or more processing instances are specified in one of the following ways:

- **SageMaker console**: The Instance count is specified in the Resource configuration part of the Job settings panel on the Create processing job page.
- **SageMaker API**: The InstanceCount is specified when you create the job with the CreateProcessingJob API.
- **SageMaker Python SDK**: The instance_count is specified when using the SageMakerClarifyProcessor API or the Processor API.
In distributed processing, you must allow communication between the different instances in the same processing job. To do that, configure a rule for your security group that allows inbound connections between members of the same security group. For information, see Security group rules.

**Give SageMaker Compilation Jobs Access to Resources in Your Amazon VPC**

**Note**
For compilation jobs, you can configure only subnets with a default tenancy VPC in which your job runs on shared hardware. For more information on the tenancy attribute for VPCs, see Dedicated Instances.

**Configure a Compilation Job for Amazon VPC Access**

To specify subnets and security groups in your private VPC, use the VpcConfig request parameter of the CreateCompilationJob API, or provide this information when you create a compilation job in the SageMaker console. SageMaker Neo uses this information to create network interfaces and attach them to your compilation jobs. The network interfaces provide compilation jobs with a network connection within your VPC that is not connected to the internet. They also enable your compilation job to connect to resources in your private VPC. The following is an example of the VpcConfig parameter that you include in your call to CreateCompilationJob:

```
VpcConfig: {
  "Subnets": [
    "subnet-0123456789abcdef0",
    "subnet-0123456789abcdef1",
    "subnet-0123456789abcdef2"
  ],
  "SecurityGroupIds": [
    "sg-0123456789abcdef0"
  ]
}
```

**Configure Your Private VPC for SageMaker Compilation**

When configuring the private VPC for your SageMaker compilation jobs, use the following guidelines. For information about setting up a VPC, see Working with VPCs and Subnets in the Amazon VPC User Guide.

**Topics**
- Ensure That Subnets Have Enough IP Addresses (p. 3495)
- Create an Amazon S3 VPC Endpoint (p. 3495)
- Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3496)
- Configure Route Tables (p. 3497)
- Configure the VPC Security Group (p. 3497)

**Ensure That Subnets Have Enough IP Addresses**

Your VPC subnets should have at least two private IP addresses for each instance in a compilation job. For more information, see VPC and Subnet Sizing for IPv4 in the Amazon VPC User Guide.

**Create an Amazon S3 VPC Endpoint**

If you configure your VPC to block access to the internet, SageMaker Neo can’t connect to the Amazon S3 buckets that contain your models unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your SageMaker Neo compilation jobs to access the buckets where you store your data and model artifacts. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see Endpoints for Amazon S3.
To create an S3 VPC endpoint:

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose Endpoints, then choose Create Endpoint.
3. For Service Name, search for com.amazonaws.region.s3, where region is the name of the region where your VPC resides.
4. Choose the Gateway type.
5. For VPC, choose the VPC you want to use for this endpoint.
6. For Configure route tables, select the route tables to be used by the endpoint. The VPC service automatically adds a route to each route table you select that points any S3 traffic to the new endpoint.
7. For Policy, choose Full Access to allow full access to the S3 service by any user or service within the VPC. Choose Custom to restrict access further. For information, see Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3484).

Use a Custom Endpoint Policy to Restrict Access to S3

The default endpoint policy allows full access to S3 for any user or service in your VPC. To further restrict access to S3, create a custom endpoint policy. For more information, see Using Endpoint Policies for Amazon S3. You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see Using Amazon S3 Bucket Policies. The following is a sample customized policy:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Principal": {
                "AWS": "*",
            },
            "Action": "s3:GetObject",
            "Resource": [
                "arn:aws:s3:::your-sample-bucket",
                "arn:aws:s3:::your-sample-bucket/**
            ],
            "Condition": {
                "StringNotEquals": {
                    "aws:SourceVpce": [
                        "vpce-01234567890123456"
                    ]
                }
            }
        }
    ]
}
```

Add Permissions for Compilation Job Running in a Amazon VPC to Custom IAM Policies

The SageMakerFullAccess managed policy includes the permissions that you need to use models configured for Amazon VPC access with an endpoint. These permissions allow SageMaker Neo to create an elastic network interface and attach it to compilation job running in a Amazon VPC. If you use your own IAM policy, you must add the following permissions to that policy to use models configured for Amazon VPC access.

```json
{"Version": "2012-10-17",
 "Statement": [
  {
    "Effect": "Allow",
```
"Action": [
    "ec2:DescribeVpcEndpoints",
    "ec2:DescribeDhcpOptions",
    "ec2:DescribeVpcs",
    "ec2:DescribeSubnets",
    "ec2:DescribeSecurityGroups",
    "ec2:DescribeNetworkInterfaces",
    "ec2:DeleteNetworkInterfacePermission",
    "ec2:DeleteNetworkInterface",
    "ec2:CreateNetworkInterfacePermission",
    "ec2:CreateNetworkInterface",
    "ec2:ModifyNetworkInterfaceAttribute"
],
"Resource": "*"
}
}

For more information about the SageMakerFullAccess managed policy, see AWS managed policy: AmazonSageMakerFullAccess (p. 3411).

**Configure Route Tables**

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, http://s3-aws-region.amazonaws.com/MyBucket) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your compilation jobs resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see Routing for Gateway Endpoints in the Amazon VPC User Guide.

**Configure the VPC Security Group**

In your security group for the compilation job, you must allow outbound communication to your Amazon S3 Amazon VPC endpoints and the subnet CIDR ranges used for the compilation job. For information, see Security Group Rules and Control access to services with Amazon VPC endpoints.
Monitor Amazon SageMaker

Monitoring is an important part of maintaining the reliability, availability, and performance of SageMaker and your other AWS solutions. AWS provides the following monitoring tools to watch SageMaker, report when something is wrong, and take automatic actions when appropriate:

- **Amazon CloudWatch** monitors your AWS resources and the applications that you run on AWS in real time. You can collect and track metrics, create customized dashboards, and set alarms that notify you or take actions when a specified metric reaches a threshold that you specify. For example, you can have CloudWatch track CPU usage or other metrics of your Amazon EC2 instances and automatically launch new instances when needed. For more information, see the Amazon CloudWatch User Guide.

- **Amazon CloudWatch Logs** enables you to monitor, store, and access your log files from EC2 instances, AWS CloudTrail, and other sources. CloudWatch Logs can monitor information in the log files and notify you when certain thresholds are met. You can also archive your log data in highly durable storage. For more information, see the Amazon CloudWatch Logs User Guide.

- **AWS CloudTrail** captures API calls and related events made by or on behalf of your AWS account and delivers the log files to an Amazon S3 bucket that you specify. You can identify which users and accounts called AWS, the source IP address from which the calls were made, and when the calls occurred. For more information, see the AWS CloudTrail User Guide.

- **CloudWatch Events** delivers a near real-time stream of system events that describe changes in AWS resources. Create CloudWatch Events rules react to a status change in a SageMaker training, hyperparameter tuning, or batch transform job.

**Topics**
- Monitor Amazon SageMaker with Amazon CloudWatch (p. 3498)
- Log Amazon SageMaker Events with Amazon CloudWatch (p. 3510)
- Log Amazon SageMaker API Calls with AWS CloudTrail (p. 3511)
- Automating Amazon SageMaker with Amazon EventBridge (p. 3514)

Monitor Amazon SageMaker with Amazon CloudWatch

You can monitor Amazon SageMaker using Amazon CloudWatch, which collects raw data and processes it into readable, near real-time metrics. These statistics are kept for 15 months, so that you can access historical information and gain a better perspective on how your web application or service is performing. However, the Amazon CloudWatch console limits the search to metrics that were updated in the last 2 weeks. This limitation ensures that the most current jobs are shown in your namespace. To graph metrics without using a search, specify its exact name in the source view. You can also set alarms that watch for certain thresholds, and send notifications or take actions when those thresholds are met. For more information, see the Amazon CloudWatch User Guide.

**SageMaker Metrics and Dimensions**
- SageMaker Endpoint Invocation Metrics (p. 3499)
- SageMaker Multi-Model Endpoint Metrics (p. 3500)
- SageMaker Jobs and Endpoint Metrics (p. 3502)
- SageMaker Ground Truth Metrics (p. 3505)
- Amazon SageMaker Feature Store Metrics (p. 3507)
- SageMaker Pipelines Metrics (p. 3508)
### SageMaker Endpoint Invocation Metrics

The AWS/SageMaker namespace includes the following request metrics from calls to `InvokeEndpoint`. Metrics are available at a 1-minute frequency.

For information about how long CloudWatch metrics are retained for, see `GetMetricStatistics` in the Amazon CloudWatch API Reference.

#### Endpoint Invocation Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invocation4XXErrors</td>
<td>The number of <code>InvokeEndpoint</code> requests where the model returned a 4xx HTTP response code. For each 4xx response, 1 is sent; otherwise, 0 is sent.</td>
</tr>
<tr>
<td>Units: None</td>
<td></td>
</tr>
<tr>
<td>Valid statistics: Average, Sum</td>
<td></td>
</tr>
<tr>
<td>Invocation5XXErrors</td>
<td>The number of <code>InvokeEndpoint</code> requests where the model returned a 5xx HTTP response code. For each 5xx response, 1 is sent; otherwise, 0 is sent.</td>
</tr>
<tr>
<td>Units: None</td>
<td></td>
</tr>
<tr>
<td>Valid statistics: Average, Sum</td>
<td></td>
</tr>
<tr>
<td>Invocations</td>
<td>The number of <code>InvokeEndpoint</code> requests sent to a model endpoint. To get the total number of requests sent to a model endpoint, use the Sum statistic.</td>
</tr>
<tr>
<td>Units: None</td>
<td></td>
</tr>
<tr>
<td>Valid statistics: Sum</td>
<td></td>
</tr>
<tr>
<td>InvocationsPerInstance</td>
<td>The number of invocations sent to a model, normalized by <code>InstanceCount</code> in each <code>ProductionVariant</code>. ( \frac{1}{\text{numberOfInstances}} ) is sent as the value on each request, where <code>numberOfInstances</code> is the number of active instances for the <code>ProductionVariant</code> behind the endpoint at the time of the request.</td>
</tr>
<tr>
<td>Units: None</td>
<td></td>
</tr>
<tr>
<td>Valid statistics: Sum</td>
<td></td>
</tr>
<tr>
<td>ModelLatency</td>
<td>The interval of time taken by a model to respond as viewed from SageMaker. This interval includes the local communication times taken to send the request and to fetch the response from the container of a model and the time taken to complete the inference in the container.</td>
</tr>
<tr>
<td>Units: Microseconds</td>
<td></td>
</tr>
<tr>
<td>Valid statistics: Average, Min, Max, Sample Count</td>
<td></td>
</tr>
<tr>
<td>OverheadLatency</td>
<td>The interval of time added to the time taken to respond to a client request by SageMaker overheads. This interval is measured from the time SageMaker receives the request until it returns a response to the client, minus the <code>ModelLatency</code>. Overhead latency can vary depending on multiple factors, including request and response payload sizes, request frequency, and authentication/authorization of the request.</td>
</tr>
</tbody>
</table>

3499
## Multi-Model Endpoint Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
</table>
| ModelSetupTime     | The time it takes to launch new compute resources for a serverless endpoint. The time can vary depending on the model size, how long it takes to download the model, and the start-up time of the container.  
  
  Units: Microseconds  
  
  Valid statistics: Average, Min, Max, Sample Count                                                                                                                                   |

### Dimensions for Endpoint Invocation Metrics

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EndpointName, VariantName</td>
<td>Filters endpoint invocation metrics for a ProductionVariant of the specified endpoint and variant.</td>
</tr>
</tbody>
</table>

### SageMaker Multi-Model Endpoint Metrics

The AWS/SageMaker namespace includes the following model loading metrics from calls to `InvokeEndpoint`.

Metrics are available at a 1-minute frequency.

For information about how long CloudWatch metrics are retained for, see [GetMetricStatistics](https://docs.aws.amazon.com/AmazonCloudWatch/latest/APIReference/API_GetMetricStatistics.html) in the *Amazon CloudWatch API Reference*.

#### Multi-Model Endpoint Model Loading Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
<th>Units: Microseconds</th>
<th>Valid statistics: Average, Sum, Min, Max, Sample Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>ModelLoadingWaitTime</td>
<td>The interval of time that an invocation request has waited for the target model to be downloaded, or loaded, or both in order to perform inference.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ModelUnloadingTime</td>
<td>The interval of time that it took to unload the model through the container's <code>UnloadModel</code> API call.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ModelDownloadingTime</td>
<td>The interval of time that it took to download the model from Amazon Simple Storage Service (Amazon S3).</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
## Multi-Model Endpoint Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ModelLoadingTime</td>
<td>The interval of time that it took to load the model through the container's LoadModel API call. Units: Microseconds Valid statistics: Average, Sum, Min, Max, Sample Count</td>
</tr>
<tr>
<td>ModelCacheHit</td>
<td>The number of InvokeEndpoint requests sent to the multi-model endpoint for which the model was already loaded. The Average statistic shows the ratio of requests for which the model was already loaded. Units: None Valid statistics: Average, Sum, Sample Count</td>
</tr>
</tbody>
</table>

### Dimensions for Multi-Model Endpoint Model Loading Metrics

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EndpointName, VariantName</td>
<td>Filters endpoint invocation metrics for a ProductionVariant of the specified endpoint and variant.</td>
</tr>
</tbody>
</table>

The /aws/sagemaker/Endpoints namespaces include the following instance metrics from calls to InvokeEndpoint.

Metrics are available at a 1-minute frequency.

For information about how long CloudWatch metrics are retained for, see GetMetricStatistics in the Amazon CloudWatch API Reference.

### Multi-Model Endpoint Model Instance Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LoadedModelCount</td>
<td>The number of models loaded in the containers of the multi-model endpoint. This metric is emitted per instance. The Average statistic with a period of 1 minute tells you the average number of models loaded per instance. The Sum statistic tells you the total number of models loaded across all instances in the endpoint. The models that this metric tracks are not necessarily unique because a model might be loaded in multiple containers at the endpoint. Units: None Valid statistics: Average, Sum, Min, Max, Sample Count</td>
</tr>
</tbody>
</table>

### Dimensions for Multi-Model Endpoint Model Loading Metrics
## SageMaker Jobs and Endpoint Metrics

The `/aws/sagemaker/ProcessingJobs`, `/aws/sagemaker/TrainingJobs`, `/aws/sagemaker/TransformJobs`, and `/aws/sagemaker/Endpoints` namespaces include the following metrics for the training jobs and endpoint instances.

Metrics are available at a 1-minute frequency.

**Note**
Amazon CloudWatch supports high-resolution custom metrics and its finest resolution is 1 second. However, the finer the resolution, the shorter the lifespan of the CloudWatch metrics. For the 1-second frequency resolution, the CloudWatch metrics are available for 3 hours. For more information about the resolution and the lifespan of the CloudWatch metrics, see `GetMetricStatistics` in the Amazon CloudWatch API Reference.

**Tip**
If you want to profile your training job with a finer resolution down to 100-millisecond (0.1 second) granularity and store the training metrics indefinitely in Amazon S3 for custom analysis at any time, consider using Amazon SageMaker Debugger. SageMaker Debugger provides built-in rules to automatically detect common training issues; it detects hardware resource utilization issues (such as CPU, GPU, and I/O bottlenecks) and non-converging model issues (such as overfit, vanishing gradients, and exploding tensors). SageMaker Debugger also provides visualizations through Studio and its profiling report. To explore the Debugger visualizations, see SageMaker Debugger Insights Dashboard Walkthrough, Debugger Profiling Report Walkthrough, and Analyze Data Using the SMDebug Client Library.

### Processing Job, Training Job, Batch Transform Job, and Endpoint Instance Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CPUUtilization</strong></td>
<td>The sum of each individual CPU core's utilization. The CPU utilization of each core range is 0–100. For example, if there are four CPUs, the CPUUtilization range is 0%–400%. For processing jobs, the value is the CPU utilization of the processing container on the instance. For training jobs, the value is the CPU utilization of the algorithm container on the instance. For batch transform jobs, the value is the CPU utilization of the transform container on the instance. For endpoint variants, the value is the sum of the CPU utilization of the primary and supplementary containers on the instance. <strong>Note</strong> For multi-instance jobs, each instance reports CPU utilization metrics. However, the default view in CloudWatch shows the average CPU utilization across all instances.</td>
</tr>
</tbody>
</table>

Units: Percent
<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MemoryUtilization</td>
<td>The percentage of memory that is used by the containers on an instance. This value range is 0%–100%. For processing jobs, the value is the memory utilization of the processing container on the instance.</td>
</tr>
<tr>
<td></td>
<td>For training jobs, the value is the memory utilization of the algorithm container on the instance.</td>
</tr>
<tr>
<td></td>
<td>For batch transform jobs, the value is the memory utilization of the transform container on the instance.</td>
</tr>
<tr>
<td></td>
<td>For endpoint variants, the value is the sum of the memory utilization of the primary and supplementary containers on the instance.</td>
</tr>
<tr>
<td></td>
<td><strong>Units</strong>: Percent</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>For multi-instance jobs, each instance reports memory utilization metrics. However, the default view in CloudWatch shows the average memory utilization across all instances.</td>
</tr>
<tr>
<td>GPUUtilization</td>
<td>The percentage of GPU units that are used by the containers on an instance. The value can range between range is 0–100 and is multiplied by the number of GPUs. For example, if there are four GPUs, the GPUUtilization range is 0%–400%.</td>
</tr>
<tr>
<td></td>
<td>For processing jobs, the value is the GPU utilization of the processing container on the instance.</td>
</tr>
<tr>
<td></td>
<td>For training jobs, the value is the GPU utilization of the algorithm container on the instance.</td>
</tr>
<tr>
<td></td>
<td>For batch transform jobs, the value is the GPU utilization of the transform container on the instance.</td>
</tr>
<tr>
<td></td>
<td>For endpoint variants, the value is the sum of the GPU utilization of the primary and supplementary containers on the instance.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>For multi-instance jobs, each instance reports GPU utilization metrics. However, the default view in CloudWatch shows the average GPU utilization across all instances.</td>
</tr>
<tr>
<td></td>
<td><strong>Units</strong>: Percent</td>
</tr>
</tbody>
</table>
### Jobs and Endpoint Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPUMemoryUtilization</td>
<td>The percentage of GPU memory used by the containers on an instance. The value range is 0–100 and is multiplied by the number of GPUs. For example, if there are four GPUs, the GPUMemoryUtilization range is 0%–400%. For processing jobs, the value is the GPU memory utilization of the processing container on the instance. For training jobs, the value is the GPU memory utilization of the algorithm container on the instance. For batch transform jobs, the value is the GPU memory utilization of the transform container on the instance. For endpoint variants, the value is the sum of the GPU memory utilization of the primary and supplementary containers on the instance. <strong>Note</strong> For multi-instance jobs, each instance reports GPU memory utilization metrics. However, the default view in CloudWatch shows the average GPU memory utilization across all instances. Units: Percent</td>
</tr>
<tr>
<td>DiskUtilization</td>
<td>The percentage of disk space used by the containers on an instance uses. This value range is 0%–100%. This metric is not supported for batch transform jobs. For processing jobs, the value is the disk space utilization of the processing container on the instance. For training jobs, the value is the disk space utilization of the algorithm container on the instance. For endpoint variants, the value is the sum of the disk space utilization of the primary and supplementary containers on the instance. <strong>Note</strong> For multi-instance jobs, each instance reports disk utilization metrics. However, the default view in CloudWatch shows the average disk utilization across all instances.</td>
</tr>
</tbody>
</table>

#### Dimensions for Processing Job, Training Job and Batch Transform Job Instance Metrics

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>For processing jobs, the value for this dimension has the format [processing-job-name]/algo-[instance-number-in-cluster]. Use this dimension to filter instance metrics for the specified processing job and instance. This dimension format is present only in the /aws/sagemaker/ProcessingJobs namespace. For training jobs, the value for this dimension has the format [training-job-name]/algo-[instance-number-in-cluster]. Use this dimension to filter instance metrics for the specified training job and instance. This dimension format is present only in the /aws/sagemaker/TrainingJobs namespace.</td>
</tr>

### SageMaker Ground Truth Metrics

#### Ground Truth Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
</table>
| ActiveWorkers | A single active worker on a private work team submitted, released, or declined a task. To get the total number of active workers, use the Sum statistic. Ground Truth attempts to deliver each individual `ActiveWorkers` event once. If this delivery is unsuccessful, this metric may not report the total number of active workers.  

Units: None  

Valid statistics: Sum, Sample Count |
| DatasetObjectsAutoAnnotated | The number of dataset objects auto-annotated in a labeling job. This metric is only emitted when automated labeling is enabled. To view the labeling job progress, use the Max metric.  

Units: None  

Valid statistics: Max |
| DatasetObjectsHumanAnnotated | The number of dataset objects annotated by a human in a labeling job. To view the labeling job progress, use the Max metric.  

Units: None  

Valid statistics: Max |
| DatasetObjectsLabelingFailed | The number of dataset objects that failed labeling in a labeling job. To view the labeling job progress, use the Max metric.  

Units: None  

Valid statistics: Max |
| JobsFailed | A single labeling job failed. To get the total number of labeling jobs that failed, use the Sum statistic.  

Units: None  

Valid statistics: Sum, Sample Count |
| JobsSucceeded | A single labeling job succeeded. To get the total number of labeling jobs that succeeded, use the Sum statistic.  

Units: None |
<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
<th>Units</th>
<th>Valid statistics: Sum, Sample Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>JobsStopped</td>
<td>A single labeling jobs was stopped. To get the total number of labeling jobs that were stopped, use the Sum statistic.</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TasksAccepted</td>
<td>A single task was accepted by a worker. To get the total number of tasks accepted by workers, use the Sum statistic. Ground Truth attempts to deliver each individual TaskAccepted event once. If this delivery is unsuccessful, this metric may not report the total number of tasks accepted.</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TasksDeclined</td>
<td>A single task was declined by a worker. To get the total number of tasks declined by workers, use the Sum statistic. Ground Truth attempts to deliver each individual TasksDeclined event once. If this delivery is unsuccessful, this metric may not report the total number of tasks declined.</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TasksReturned</td>
<td>A single task was returned. To get the total number of tasks returned, use the Sum statistic. Ground Truth attempts to deliver each individual TasksReturned event once. If this delivery is unsuccessful, this metric may not report the total number of tasks returned.</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TasksSubmitted</td>
<td>A single task was submitted/completed by a private worker. To get the total number of tasks submitted by workers, use the Sum statistic. Ground Truth attempts to deliver each individual TasksSubmitted event once. If this delivery is unsuccessful, this metric may not report the total number of tasks submitted.</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TimeSpent</td>
<td>Time spent on a task completed by a private worker. This metric does not include time when a worker paused or took a break. Ground Truth attempts to deliver each TimeSpent event once. If this delivery is unsuccessful, this metric may not report the total amount of time spent.</td>
<td>Seconds</td>
<td></td>

#### Dimensions for Feature Store Consumption Metrics

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FeatureGroupName, OperationName</td>
<td>Filters feature store runtime consumption metrics of the feature group and the operation that you’ve specified.</td>
</tr>
</tbody>
</table>

### Feature Store Operational Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invocations</td>
<td>The number of requests made to the feature store runtime operations over the specified time period.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td>Metric</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>--------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Operation4XXErrors</strong></td>
<td>The number of requests made to the Feature Store runtime operations where the operation returned a 4xx HTTP response code. For each 4xx response, 1 is sent; otherwise, 0 is sent.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum</td>
</tr>
<tr>
<td><strong>Operation5XXErrors</strong></td>
<td>The number of requests made to the feature store runtime operations where the operation returned a 5xx HTTP response code. For each 5xx response, 1 is sent; otherwise, 0 is sent.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum</td>
</tr>
<tr>
<td><strong>ThrottledRequests</strong></td>
<td>The number of requests made to the feature store runtime operations where the request got throttled. For each throttled request, 1 is sent; otherwise, 0 is sent.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum</td>
</tr>
<tr>
<td><strong>Latency</strong></td>
<td>The time interval to process requests made to the Feature Store runtime operations. This interval is measured from the time SageMaker receives the request until it returns a response to the client.</td>
</tr>
<tr>
<td></td>
<td>Units: Microseconds</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum, Min, Max, Sample Count, Percentiles</td>
</tr>
</tbody>
</table>

### Dimensions for Feature Store Operational Metrics

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FeatureGroupName, OperationName</td>
<td>Filters feature store runtime operational metrics of the feature group and the operation that you've specified. You can use these dimensions for non batch operations, such as GetRecord, PutRecord, and DeleteRecord.</td>
</tr>
<tr>
<td>OperationName</td>
<td>Filters feature store runtime operational metrics for the operation that you've specified. You can use this dimension for batch operations such as BatchGetRecord.</td>
</tr>
</tbody>
</table>

### SageMaker Pipelines Metrics

The **AWS/Sagemaker/ModelBuildingPipeline** namespace includes the following metrics for pipeline executions.

Two categories of Pipelines execution metrics are available:

- **Execution Metrics across All Pipelines** – Account level pipeline execution metrics (for all pipelines in the current account)
• **Execution Metrics by Pipeline** – Pipeline execution metrics per pipeline

Metrics are available at a 1-minute frequency.

**Pipelines Execution Metrics**

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ExecutionStarted</td>
<td>The number of pipeline executions that started.</td>
</tr>
<tr>
<td></td>
<td>Units: Count</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum</td>
</tr>
<tr>
<td>ExecutionFailed</td>
<td>The number of pipeline executions that failed.</td>
</tr>
<tr>
<td></td>
<td>Units: Count</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum</td>
</tr>
<tr>
<td>ExecutionSucceeded</td>
<td>The number of pipeline executions that succeeded.</td>
</tr>
<tr>
<td></td>
<td>Units: Count</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum</td>
</tr>
<tr>
<td>ExecutionStopped</td>
<td>The number of pipeline executions that stopped.</td>
</tr>
<tr>
<td></td>
<td>Units: Count</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum</td>
</tr>
<tr>
<td>ExecutionDuration</td>
<td>The duration in milliseconds that the pipeline execution ran.</td>
</tr>
<tr>
<td></td>
<td>Units: Milliseconds</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum, Min, Max, Sample Count</td>
</tr>
</tbody>
</table>

**Dimensions for Execution Metrics by Pipeline**

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PipelineName</td>
<td>Filters pipeline execution metrics for a specified pipeline.</td>
</tr>
</tbody>
</table>

**Pipelines Step Metrics**

The `AWS/Sagemaker/ModelBuildingPipeline` namespace includes the following metrics for pipeline steps.

Metrics are available at a 1-minute frequency.

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>StepStarted</td>
<td>The number of steps that started.</td>
</tr>
<tr>
<td></td>
<td>Units: Count</td>
</tr>
</tbody>
</table>

3509
Metric | Description
--- | ---
 | Valid statistics: Average, Sum
StepFailed | The number of steps that failed.
 | Units: Count
 | Valid statistics: Average, Sum
StepSucceeded | The number of steps that succeeded.
 | Units: Count
 | Valid statistics: Average, Sum
StepStopped | The number of steps that stopped.
 | Units: Count
 | Valid statistics: Average, Sum
StepDuration | The duration in milliseconds that the step ran.
 | Units: Milliseconds
 | Valid statistics: Average, Sum, Min, Max, Sample Count

Dimensions for Pipelines Step Metrics

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
</table>
| PipelineName, StepName | Filters step metrics for a specified pipeline and step.

Log Amazon SageMaker Events with Amazon CloudWatch

To help you debug your compilation jobs, processing jobs, training jobs, endpoints, transform jobs, notebook instances, and notebook instance lifecycle configurations, anything an algorithm container, a model container, or a notebook instance lifecycle configuration sends to stdout or stderr is also sent to Amazon CloudWatch Logs. In addition to debugging, you can use these for progress analysis.

Logs

The following table lists all of the logs provided by Amazon SageMaker.

<table>
<thead>
<tr>
<th>Log Group Name</th>
<th>Log Stream Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>/aws/sagemaker/CompilationJobs</td>
<td>[compilation-job-name]</td>
</tr>
<tr>
<td>Log Group Name</td>
<td>Log Stream Name</td>
</tr>
<tr>
<td>----------------------------------------------------</td>
<td>---------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>/aws/sagemaker/Endpoints/[EndpointName]</td>
<td>[production-variant-name]/[instance-id]</td>
</tr>
<tr>
<td></td>
<td>[production-variant-name]/[instance-id]/[container-name provided in SageMaker model] (For Inference Pipelines)</td>
</tr>
<tr>
<td>/aws/sagemaker/groundtruth/WorkerActivity</td>
<td>aws/sagemaker/groundtruth/worker-activity/[requester-AWS-Id]-[region]/[timestamp]</td>
</tr>
<tr>
<td>/aws/sagemaker/LabelingJobs</td>
<td>[labeling-job-name]</td>
</tr>
<tr>
<td>/aws/sagemaker/NotebookInstances</td>
<td>[notebook-instance-name]/[LifecycleConfigHook]</td>
</tr>
<tr>
<td></td>
<td>[notebook-instance-name]/jupyter.log</td>
</tr>
<tr>
<td>/aws/sagemaker/ProcessingJobs</td>
<td>[processing-job-name]/[hostname]-[epoch_timestamp]</td>
</tr>
<tr>
<td>/aws/sagemaker/studio</td>
<td>[domain-id]/[user-profile-name]/[app-type]/[app-name]</td>
</tr>
<tr>
<td></td>
<td>[domain-id]/domain-shared/rstudioserverpro/default</td>
</tr>
<tr>
<td>/aws/sagemaker/TrainingJobs</td>
<td>[training-job-name]/algo-[instance-number-in-cluster]-[epoch_timestamp]</td>
</tr>
<tr>
<td>/aws/sagemaker/TransformJobs</td>
<td>[transform-job-name]/[instance-id]-[epoch_timestamp]</td>
</tr>
<tr>
<td></td>
<td>[transform-job-name]/[instance-id]-[epoch_timestamp]/data-log</td>
</tr>
<tr>
<td></td>
<td>[transform-job-name]/[instance-id]-[epoch_timestamp]/[container-name provided in SageMaker model] (For Inference Pipelines)</td>
</tr>
</tbody>
</table>

**Note**
1. The `/aws/sagemaker/NotebookInstances/[LifecycleConfigHook]` log stream is created when you create a notebook instance with a lifecycle configuration. For more information, see [Customize a Notebook Instance Using a Lifecycle Configuration Script (p. 291)](https://docs.aws.amazon.com/sagemaker/latest/dg/using-lifecycle-scripts.html).
2. For Inference Pipelines, if you don't provide container names, the platform uses **container-1, container-2**, and so on, corresponding to the order provided in the SageMaker model.

For more information about logging events with CloudWatch logging, see [What is Amazon CloudWatch Logs?](https://docs.aws.amazon.com/AmazonCloudWatch/latest/logs/) in the Amazon CloudWatch User Guide.

---

**Log Amazon SageMaker API Calls with AWS CloudTrail**

Amazon SageMaker is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in SageMaker. CloudTrail captures all API calls for SageMaker, with the exception of `InvokeEndpoint` and `InvokeEndpointAsync`, as events. The calls captured include calls from the SageMaker console and code calls to the SageMaker API operations. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for SageMaker. If you don't configure a trail, you can still view the most recent events in the CloudTrail.
SageMaker Information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When activity occurs in Amazon SageMaker, that activity is recorded in a CloudTrail event along with other AWS service events in Event history. You can view, search, and download recent events in your AWS account. For more information, see Viewing Events with CloudTrail Event History.

For an ongoing record of events in your AWS account, including events for Amazon SageMaker, create a trail. A trail enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see the following:

- Overview for Creating a Trail
- CloudTrail Supported Services and Integrations
- Configuring Amazon SNS Notifications for CloudTrail
- Receiving CloudTrail Log Files from Multiple Regions and Receiving CloudTrail Log Files from Multiple Accounts

All SageMaker actions, with the exception of InvokeEndpoint and InvokeEndpointAsync, are logged by CloudTrail and are documented in the Operations. For example, calls to the CreateTrainingJob, CreateEndpoint and CreateNotebookInstance actions generate entries in the CloudTrail log files.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root or AWS Identity and Access Management (IAM) user credentials.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another AWS service.

For more information, see the CloudTrail userIdentity Element.

Operations Performed by Automatic Model Tuning

SageMaker supports logging non-API service events to your CloudTrail log files for automatic model tuning jobs. These events are related to your tuning jobs but, are not the direct result of a customer request to the public AWS API. For example, when you create a hyperparameter tuning job by calling CreateHyperParameterTuningJob, SageMaker creates training jobs to evaluate various combinations of hyperparameters to find the best result. Similarly, when you call StopHyperParameterTuningJob to stop a hyperparameter tuning job, SageMaker might stop any of the associated running training jobs. Non-API events for your tuning jobs are logged to CloudTrail to help you improve governance, compliance, and operational and risk auditing of your AWS account.
Log entries that result from non-API service events have an `eventType` of `AwsServiceEvent` instead of `AwsApiCall`.

**Understanding SageMaker Log File Entries**

A trail is a configuration that enables delivery of events as log files to an S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files are not an ordered stack trace of the public API calls, so they do not appear in any specific order.

The following examples a log entry for the `CreateEndpoint` action, which creates an endpoint to deploy a trained model.

```json
{
    "eventVersion": "1.05",
    "userIdentity": {
        "type": "IAMUser",
        "principalId": "AIXDAYQEXAMPLEULYNGL",
        "arn": "arn:aws:iam::123456789012:user:intern",
        "accountId": "123456789012",
        "accessKeyId": "ASXIAGXEXAMPLEQUKNXV",
        "userName": "intern"
    },
    "eventTime": "2018-01-02T13:39:06Z",
    "eventSource": "sagemaker.amazonaws.com",
    "eventName": "CreateEndpoint",
    "awsRegion": "us-west-2",
    "sourceIPAddress": "127.0.0.1",
    "userAgent": "USER_AGENT",
    "requestParameters": {
        "endpointName": "ExampleEndpoint",
        "endpointConfigName": "ExampleEndpointConfig"
    },
    "responseElements": {
        "endpointArn": "arn:aws:sagemaker:us-west-2:123456789012:endpoint/exampleendpoint"
    },
    "requestID": "6b1b42b9-EXAMPLE",
    "eventID": "a6f85b21-EXAMPLE",
    "eventType": "AwsApiCall",
    "recipientAccountId": "444455556666"
}
```

The following example is a log entry for the `CreateModel` action, which creates one or more containers to host a previously trained model.

```json
{
    "eventVersion": "1.05",
    "userIdentity": {
        "type": "IAMUser",
        "principalId": "AIXDAYQEXAMPLEULYNGL",
        "arn": "arn:aws:iam::123456789012:user:intern",
        "accountId": "123456789012",
        "accessKeyId": "ASXIAGXEXAMPLEQUKNXV",
        "userName": "intern"
    },
    "eventTime": "2018-01-02T13:39:06Z",
    "eventSource": "sagemaker.amazonaws.com",
    "eventName": "CreateModel",
    "awsRegion": "us-west-2",
    "sourceIPAddress": "127.0.0.1",
    "requestID": "6b1b42b9-EXAMPLE",
    "eventID": "a6f85b21-EXAMPLE",
    "eventType": "AwsApiCall",
    "recipientAccountId": "444455556666"
}
```
Automating Amazon SageMaker with Amazon EventBridge

Amazon EventBridge monitors status change events in Amazon SageMaker. EventBridge enables you to automate SageMaker and respond automatically to events such as a training job status change or endpoint status change. Events from SageMaker are delivered to EventBridge in near real time. You can write simple rules to indicate which events are of interest to you, and what automated actions to take when an event matches a rule. For an example of how to create a rule, see Schedule a Pipeline with Amazon EventBridge (p. 3085).

Some examples of the actions that can be automatically triggered include the following:

- Invoking an AWS Lambda function
- Invoking Amazon EC2 Run Command
- Relaying the event to Amazon Kinesis Data Streams
- Activating an AWS Step Functions state machine
- Notifying an Amazon SNS topic or an AWS SMS queue

SageMaker events monitored by EventBridge

- Pipeline step state change (p. 3521)
- SageMaker image state change (p. 3522)
- SageMaker image version state change (p. 3522)
- Endpoint deployment state change (p. 3523)
Training job state change

Indicates a change in the status of a SageMaker training job.

If the value of TrainingJobStatus is Failed, the event contains the FailureReason field, which provides a description of why the training job failed.

}
```
Transform job state change

Indicates a change in the status of a SageMaker batch transform job.

If the value of TransformJobStatus is Failed, the event contains the FailureReason field, which provides a description of why the training job failed.
Endpoint state change

Indicates a change in the status of a SageMaker hosted real-time inference endpoint.

The following shows an event with an endpoint in the IN_SERVICE state.

```json
{
    "version": "0",
    "id": "d2921b5a-b0ad-cace-a8e3-0f159d018e06",
    "detail-type": "SageMaker Endpoint State Change",

      }
    },
    "RoleArn": "arn:aws:iam::123456789012:role/SageMakerRole",
    "FeatureGroupStatus": "Active",
    "Tags": {}
  }
}
```

Model package state change

Indicates a change in the status of a SageMaker model package.

```
{
  "version": "0",
  "id": "844e2571-85d4-695f-b930-0153b71db42",
  "detail-type": "SageMaker Model Package State Change",
  "source": "aws.sagemaker",
}
```
Pipeline execution state change

Indicates a change in the status of a SageMaker pipeline execution.
Pipeline step state change

Indicates a change in the status of a SageMaker pipeline step.

If there is a cache hit, the event contains the `cacheHitResult` field.

If the value of `currentStepStatus` is `Failed`, the event contains the `failureReason` field, which provides a description of why the step failed.
SageMaker image state change

Indicates a change in the status of a SageMaker image.

```json
{
  "version": "0",
  "id": "cee033a3-17d8-49f8-865f-b9ebf485d9ee",
  "detail-type": "SageMaker Image State Change",
  "source": "aws.sagemaker",
  "account": "123456789012",
  "time": "2021-04-29T01:29:59Z",
  "region": "us-east-1",
  "resources": ["arn:aws:sagemaker:us-west-2:123456789012:image/cee033a3-17d8-49f8-865f-b9ebf485d9ee"],
  "detail": {
    "ImageName": "cee033a3-17d8-49f8-865f-b9ebf485d9ee",
    "ImageArn": "arn:aws:sagemaker:us-west-2:123456789012:image/cee033a3-17d8-49f8-865f-b9ebf485d9ee",
    "ImageStatus": "Creating",
    "Version": 1.0,
    "Tags": {}
  }
}
```

SageMaker image version state change

Indicates a change in the status of a SageMaker image version.

```json
{
  "version": "0",
  "id": "07fc4615-ebd7-15fc-1746-243411f09f04",
  "detail-type": "SageMaker Image Version State Change",
  "source": "aws.sagemaker",
  "account": "123456789012",
  "time": "2021-04-29T01:29:59Z",
  "region": "us-east-1",
  "resources": ["arn:aws:sagemaker:us-west-2:123456789012:image-version/07800032-2d29-48b7-8f82-5129225b2a85"],
  "detail": {
    "ImageArn": "arn:aws:sagemaker:us-west-2:123456789012:image-version/07800032-2d29-48b7-8f82-5129225b2a85",
    "ImageVersionStatus": "Creating",
    "Version": 1.0,
    "Tags": {}
  }
}
```

For more information about the status values and their meanings for SageMaker jobs, endpoints, and pipelines, see the following links:

- AlgorithmStatus
- EndpointStatus
- FeatureGroupStatus
- HyperParameterTuningJobStatus
- LabelingJobStatus
- ModelPackageStatus
For more information, see the Amazon EventBridge User Guide.

**Endpoint deployment state change**

**Important**
The following examples may not work for all endpoints. For a list of features that may exclude your endpoint, see the Exclusions (p. 2832) page.

Indicates a state change for an endpoint deployment. The following example shows an endpoint updating with a blue/green canary deployment.

```json
{
  "version": "0",
  "id": "0bd4a141-0a02-9d8a-f977-3924c3fb295c",
  "detail-type": "SageMaker Endpoint Deployment State Change",
  "source": "aws.sagemaker",
  "account": "123456789012",
  "time": "2021-10-25T01:52:12Z",
  "region": "us-west-2",
  "resources": [
  ],
  "detail": {
    "EndpointName": "sample-endpoint",
    "EndpointConfigName": "sample-endpoint-config-1",
    "ProductionVariants": [
      {
        "VariantName": "AllTraffic",
        "CurrentWeight": 1,
        "DesiredWeight": 1,
        "CurrentInstanceCount": 3,
        "DesiredInstanceCount": 3
      }
    ],
    "EndpointStatus": "UPDATING",
    "CreationTime": 1635195148181,
    "LastModifiedTime": 1635195148181,
    "Tags": {},
    "PendingDeploymentSummary": {
      "EndpointConfigName": "sample-endpoint-config-2",
      "StartTime": Timestamp,
      "ProductionVariants": [
        {
          "VariantName": "AllTraffic",
          "CurrentWeight": 1,
          "DesiredWeight": 1,
          "CurrentInstanceCount": 1,
          "DesiredInstanceCount": 3,
          "VariantStatus": [
            {
              "Status": "Baking",
              "StatusMessage": "Baking for 600 seconds (TerminationWaitInSeconds) with traffic enabled on canary capacity of 1 instance(s)."
            }
          ]
        }
      ]
    }
  }
}``
The following example indicates a state change for an endpoint deployment, which is being updated with new capacity on an existing endpoint configuration.

```json
{
    "version": "0",
    "id": "0bd4a141-0a02-9d8a-f977-3924c3fb259c",
    "detail-type": "SageMaker Endpoint Deployment State Change",
    "source": "aws.sagemaker",
    "account": "123456789012",
    "time": "2021-10-25T01:52:12Z",
    "region": "us-west-2",
    "resources": [
    ],
    "detail": {
        "EndpointName": "sample-endpoint",
        "EndpointConfigName": "sample-endpoint-config-1",
        "ProductionVariants": [
            {
                "VariantName": "AllTraffic",
                "CurrentWeight": 1,
                "DesiredWeight": 1,
                "CurrentInstanceCount": 3,
                "DesiredInstanceCount": 6,
                "VariantStatus": [
                    {
                        "Status": "Updating",
                        "StatusMessage": "Scaling out desired instance count to 6.",
                        "StartTime": 1635195269181,
                    }
                ]
            }
        ],
        "EndpointStatus": "UPDATING",
        "CreationTime": 1635195148181,
        "LastModifiedTime": 1635195148181,
        "Tags": {}
    }
}
```

The following secondary deployment statuses are also available for endpoints (found in the VariantStatus object.

- **Creating**: creating instances for the production variant.
  
  Example message: "Launching X instance(s)."

- **Deleting**: terminating instances for the production variant.
  
  Example message: "Terminating X instance(s)."

- **Updating**: updating capacity for the production variant.
  
  Example messages: "Launching X instance(s).", "Scaling out desired instance count to X."
• ActivatingTraffic: turning on traffic for the production variant.

  Example message: "Activating traffic on canary capacity of X instance(s)."

• Baking: waiting period to monitor the CloudWatch alarms in the auto-rollback configuration.

  Example message: "Baking for X seconds (TerminationWaitInSeconds) with traffic enabled on full capacity of Y instance(s)."
API Reference Guide for Amazon SageMaker

Overview

Amazon SageMaker provides APIs, SDKs, and a command line interface that you can use to create and manage notebook instances and train and deploy models.

- Amazon SageMaker Python SDK (Recommended)
- Amazon SageMaker API Reference
- Amazon Augmented AI API Reference
- AWS Command Line Interface
- AWS SDK for .NET
- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for JavaScript
- AWS SDK for PHP
- AWS SDK for Python (Boto)
- AWS SDK for Ruby
- Amazon SageMaker Spark

You can also get code examples from the Amazon SageMaker example notebooks GitHub repository.

- Example notebooks

Programming Model for Amazon SageMaker

Making API calls directly from code is cumbersome, and requires you to write code to authenticate your requests. Amazon SageMaker provides the following alternatives:

- Use the SageMaker console—With the console, you don’t write any code. You use the console UI to start model training or deploy a model. The console works well for simple jobs, where you use a built-in training algorithm and you don’t need to preprocess training data.

- Modify the example Jupyter notebooks—SageMaker provides several Jupyter notebooks that train and deploy models using specific algorithms and datasets. Start with a notebook that has a suitable algorithm and modify it to accommodate your data source and specific needs.

- Write model training and inference code from scratch—SageMaker provides multiple AWS SDK languages (listed in the overview) and the Amazon SageMaker Python SDK, a high-level Python library that you can use in your code to start model training jobs and deploy the resulting models.
• **The SageMaker Python SDK**—This Python library simplifies model training and deployment. In addition to authenticating your requests, the library abstracts platform specifics by providing simple methods and default parameters. For example:

• To deploy your model, you call only the `deploy()` method. The method creates a SageMaker model artifact, an endpoint configuration, then deploys the model on an endpoint.

• If you use a custom framework script for model training, you call the `fit()` method. The method creates a .gzip file of your script, uploads it to an Amazon S3 location, and then runs it for model training, and other tasks. For more information, see Use Machine Learning Frameworks, Python, and R with Amazon SageMaker (p. 13).

• **The AWS SDKs**—The SDKs provide methods that correspond to the SageMaker API (see [Operations](#)). Use the SDKs to programmatically start a model training job and host the model in SageMaker. SDK clients authenticate your requests by using your access keys, so you don’t need to write authentication code. They are available in multiple languages and platforms. For more information, see the preceeding list in the overview.

In [Get Started with Amazon SageMaker (p. 33)](#), you train and deploy a model using an algorithm provided by SageMaker. That exercise shows how to use both of these libraries. For more information, see [Get Started with Amazon SageMaker (p. 33)](#).

• **Integrate SageMaker into your Apache Spark workflow**—SageMaker provides a library for calling its APIs from Apache Spark. With it, you can use SageMaker-based estimators in an Apache Spark pipeline. For more information, see [Use Apache Spark with Amazon SageMaker (p. 14)](#).
