What Is Amazon SageMaker?

Amazon SageMaker is a fully managed machine learning service. With SageMaker, data scientists and developers can quickly and easily build and train machine learning models, and then directly deploy them into a production-ready hosted environment. It provides an integrated Jupyter authoring notebook instance for easy access to your data sources for exploration and analysis, so you don't have to manage servers. It also provides common machine learning algorithms that are optimized to run efficiently against extremely large data in a distributed environment. With native support for bring-your-own-algorithms and frameworks, SageMaker offers flexible distributed training options that adjust to your specific workflows. Deploy a model into a secure and scalable environment by launching it with a few clicks from SageMaker Studio or the SageMaker console. Training and hosting are billed by minutes of usage, with no minimum fees and no upfront commitments.

This guide includes information and tutorials on SageMaker features. For additional information, see Amazon SageMaker developer resources.

Topics

- Amazon SageMaker Features (p. 1)
- Amazon SageMaker Pricing (p. 3)
- Are You a First-time User of Amazon SageMaker? (p. 3)

Amazon SageMaker Features

Amazon SageMaker includes the following features:

SageMaker Studio (p. 59)

An integrated machine learning environment where you can build, train, deploy, and analyze your models all in the same application.

SageMaker Model Registry (p. 2075)

Versioning, artifact and lineage tracking, approval workflow, and cross account support for deployment of your machine learning models.

SageMaker Projects (p. 2313)

Create end-to-end ML solutions with CI/CD by using SageMaker projects.

SageMaker Model Building Pipelines (p. 2257)

Create and manage machine learning pipelines integrated directly with SageMaker jobs.

SageMaker ML Lineage Tracking (p. 2337)

Track the lineage of machine learning workflows.

SageMaker Data Wrangler (p. 606)

Import, analyze, prepare, and featurize data in SageMaker Studio. You can integrate Data Wrangler into your machine learning workflows to simplify and streamline data pre-processing and feature engineering using little to no coding. You can also add your own Python scripts and transformations to customize your data prep workflow.
SageMaker Feature Store (p. 715)

A centralized store for features and associated metadata so features can be easily discovered and reused. You can create two types of stores, an Online or Offline store. The Online Store can be used for low latency, real-time inference use cases and the Offline Store can be used for training and batch inference.

SageMaker JumpStart (p. 120)

Learn about SageMaker features and capabilities through curated 1-click solutions, example notebooks, and pretrained models that you can deploy. You can also fine-tune the models and deploy them.

SageMaker Clarify (p. 6)

Improve your machine learning models by detecting potential bias and help explain the predictions that models make.

SageMaker Edge Manager (p. 2159)

Optimize custom models for edge devices, create and manage fleets and run models with an efficient runtime.

SageMaker Ground Truth (p. 189)

High-quality training datasets by using workers along with machine learning to create labeled datasets.

Amazon Augmented AI (p. 2398)

Build the workflows required for human review of ML predictions. Amazon A2I brings human review to all developers, removing the undifferentiated heavy lifting associated with building human review systems or managing large numbers of human reviewers.

SageMaker Studio Notebooks (p. 66)

The next generation of SageMaker notebooks that include AWS Single Sign-On (AWS SSO) integration, fast start-up times, and single-click sharing.

SageMaker Experiments (p. 1603)

Experiment management and tracking. You can use the tracked data to reconstruct an experiment, incrementally build on experiments conducted by peers, and trace model lineage for compliance and audit verifications.

SageMaker Debugger (p. 1630)

Inspect training parameters and data throughout the training process. Automatically detect and alert users to commonly occurring errors such as parameter values getting too large or small.

SageMaker Autopilot (p. 164)

Users without machine learning knowledge can quickly build classification and regression models.

SageMaker Model Monitor (p. 2028)

Monitor and analyze models in production (endpoints) to detect data drift and deviations in model quality.

SageMaker Neo (p. 2094)

Train machine learning models once, then run anywhere in the cloud and at the edge.

SageMaker Elastic Inference (p. 1935)

Speed up the throughput and decrease the latency of getting real-time inferences.

Reinforcement Learning (p. 1596)

Maximize the long-term reward that an agent receives as a result of its actions.
Preprocessing (p. 706)
Analyze and preprocess data, tackle feature engineering, and evaluate models.

Batch Transform (p. 1960)
Preprocess datasets, run inference when you don’t need a persistent endpoint, and associate input records with inferences to assist the interpretation of results.

Amazon SageMaker Pricing
As with other AWS products, there are no contracts or minimum commitments for using Amazon SageMaker. For more information about the cost of using SageMaker, see SageMaker Pricing.

Are You a First-time User of Amazon SageMaker?
If you are a first-time user of SageMaker, we recommend that you do the following:

1. Read How Amazon SageMaker Works (p. 3) – This section provides an overview of SageMaker, explains key concepts, and describes the core components involved in building AI solutions with SageMaker. We recommend that you read this topic in the order presented.

2. Set Up Amazon SageMaker (p. 33) – This section explains how to set up your AWS account and onboard to SageMaker Studio.

3. Amazon SageMaker Autopilot simplifies the machine learning experience by automating machine learning tasks. If you are new to SageMaker, it provides the easiest learning path. It also serves as an excellent ML learning tool that provides visibility into the code with notebooks generated for each of the automated ML tasks. For an introduction to its capabilities, see Automate model development with Amazon SageMaker Autopilot (p. 164). To get started building, training, and deploying machine learning models, Autopilot provides:
   • Samples: Explore modeling with Amazon SageMaker Autopilot (p. 165)
   • Videos: Use Autopilot to automate and explore the machine learning process (p. 166)
   • Tutorials: Get started with Amazon SageMaker Autopilot (p. 167)

4. Get Started with Amazon SageMaker (p. 33) – This section walks you through training your first model using SageMaker Studio, or the SageMaker console and the SageMaker API. You use training algorithms provided by SageMaker.

5. Explore other topics – Depending on your needs, do the following:
   • Submit Python code to train with deep learning frameworks – In SageMaker, you can use your own training scripts to train models. For information, see Use Machine Learning Frameworks, Python, and R with Amazon SageMaker (p. 14).
   • Use SageMaker directly from Apache Spark – For information, see Use Apache Spark with Amazon SageMaker (p. 15).
   • Use SageMaker to train and deploy your own custom algorithms – Package your custom algorithms with Docker so you can train and/or deploy them in SageMaker. To learn how SageMaker interacts with Docker containers, and for the SageMaker requirements for Docker images, see Using Docker containers with SageMaker (p. 2208).

6. View the API Reference – This section describes the SageMaker API operations.

How Amazon SageMaker Works
SageMaker is a fully managed service that enables you to quickly and easily integrate machine learning-based models into your applications. This section provides an overview of machine learning and explains
how SageMaker works. If you are a first-time user of SageMaker, we recommend that you read the following sections in order:

1. Machine Learning with Amazon SageMaker (p. 4)
2. Explore, Analyze, and Process Data (p. 5)
3. Train a Model with Amazon SageMaker (p. 8)
4. Deploy a Model in Amazon SageMaker (p. 10)
5. Use Machine Learning Frameworks, Python, and R with Amazon SageMaker (p. 14)
6. Get Started with Amazon SageMaker (p. 33)

Machine Learning with Amazon SageMaker

This section describes a typical machine learning workflow and summarizes how you accomplish those tasks with Amazon SageMaker.

In machine learning, you “teach” a computer to make predictions, or inferences. First, you use an algorithm and example data to train a model. Then you integrate your model into your application to generate inferences in real time and at scale. In a production environment, a model typically learns from millions of example data items and produces inferences in hundreds to less than 20 milliseconds.

The following diagram illustrates the typical workflow for creating a machine learning model:

As the diagram illustrates, you typically perform the following activities:

1. **Generate example data**—To train a model, you need example data. The type of data that you need depends on the business problem that you want the model to solve (the inferences that you want the model to generate). For example, suppose that you want to create a model to predict a number given an input image of a handwritten digit. To train such a model, you need example images of handwritten numbers.

   Data scientists often spend a lot of time exploring and preprocessing, or “wrangling,” example data before using it for model training. To preprocess data, you typically do the following:
   a. **Fetch the data**—You might have in-house example data repositories, or you might use datasets that are publicly available. Typically, you pull the dataset or datasets into a single repository.
b. **Clean the data** — To improve model training, inspect the data and clean it as needed. For example, if your data has a country name attribute with values United States and US, you might want to edit the data to be consistent.

c. **Prepare or transform the data** — To improve performance, you might perform additional data transformations. For example, you might choose to combine attributes. If your model predicts the conditions that require de-icing an aircraft, instead of using temperature and humidity attributes separately, you might combine those attributes into a new attribute to get a better model.

In SageMaker, you preprocess example data in a Jupyter notebook on your notebook instance. You use your notebook to fetch your dataset, explore it, and prepare it for model training. For more information, see **Explore, Analyze, and Process Data** (p. 5). For more information about preparing data in AWS Marketplace, see data preparation.

2. **Train a model** — Model training includes both training and evaluating the model, as follows:

   • **Training the model** — To train a model, you need an algorithm. The algorithm you choose depends on a number of factors. For a quick, out-of-the-box solution, you might be able to use one of the algorithms that SageMaker provides. For a list of algorithms provided by SageMaker and related considerations, see Use Amazon SageMaker Built-in Algorithms (p. 762).

   You also need compute resources for training. Depending on the size of your training dataset and how quickly you need the results, you can use resources ranging from a single general-purpose instance to a distributed cluster of GPU instances. For more information, see Train a Model with Amazon SageMaker (p. 8).

   • **Evaluating the model** — After you’ve trained your model, you evaluate it to determine whether the accuracy of the inferences is acceptable. In SageMaker, you use either the AWS SDK for Python (Boto) or the high-level Python library that SageMaker provides to send requests to the model for inferences.

   You use a Jupyter notebook in your SageMaker notebook instance to train and evaluate your model.

3. **Deploy the model** — You traditionally re-engineer a model before you integrate it with your application and deploy it. With SageMaker hosting services, you can deploy your model independently, decoupling it from your application code. For more information, see Deploy a Model on SageMaker Hosting Services (p. 10).

Machine learning is a continuous cycle. After deploying a model, you monitor the inferences, collect “ground truth,” and evaluate the model to identify drift. You then increase the accuracy of your inferences by updating your training data to include the newly collected ground truth. You do this by retraining the model with the new dataset. As more and more example data becomes available, you continue retraining your model to increase accuracy.

---

**Explore, Analyze, and Process Data**

Before using a dataset to train a model, data scientists typically explore, analyze, and preprocess it.

To pre-process data, use one of the following methods:

• Use a Jupyter notebook on an Amazon SageMaker notebook instance to do the following:
  • Write code to create model training jobs
  • Deploy models to SageMaker hosting
• Test or validate your models

For a Get Started guide about training and deploying a model in the SageMaker Notebook instances, see Get Started with Amazon SageMaker Notebook Instances (p. 41).

For more information about the SageMaker Notebook instances, see Use Amazon SageMaker Notebook Instances (p. 139).

• You can use a model to transform data by using SageMaker batch transform. For more information, see (Optional) Make Prediction with Batch Transform (p. 54).

Amazon SageMaker Processing enables running jobs to preprocess and postprocess data, perform feature engineering, and evaluate models on SageMaker easily and at scale. When combined with the other critical machine learning tasks provided by SageMaker, such as training and hosting, Processing provides you with the benefits of a fully managed machine learning environment, including all the security and compliance support built into SageMaker. With Processing, you have the flexibility to use the built-in data processing containers or to bring your own containers and submit custom jobs to run on managed infrastructure. After you submit a job, SageMaker launches the compute instances, processes and analyzes the input data, and releases the resources upon completion. For more information, see Process Data (p. 706).

• For information about how to run your own data processing scripts, see Data Processing with scikit-learn (p. 708).

• For information about how to build your own processing container to run scripts, see Build Your Own Processing Container (Advanced Scenario) (p. 710).

What Is Fairness and Model Explainability for Machine Learning Predictions?

Amazon SageMaker Clarify helps improve your machine learning (ML) models by detecting potential bias and helping explain the predictions that models make. It helps you identify various types of bias in pretraining data and in posttraining that can emerge during model training or when the model is in production. SageMaker Clarify helps explain how these models make predictions using a feature attribution approach. It also monitors inferences models make in production for bias or feature attribution drift. The fairness and explainability functionality provided by SageMaker Clarify provides components that help AWS customers build less biased and more understandable machine learning models. It also provides tools to help you generate model governance reports that you can use to inform risk and compliance teams, and external regulators.

Machine learning models and data-driven systems are being increasingly used to help make decisions across domains such as financial services, healthcare, education, and human resources. Machine learning applications provide benefits such as improved accuracy, increased productivity, and cost savings to help meet regulatory requirements, improve business decisions, and provide better insights into data science procedures.

• Regulatory – In many situations, it is important to understand why an ML model made a specific prediction and also whether the prediction it made was impacted by any bias, either during training or at inference. Recently, policymakers, regulators, and advocates have raised awareness about the ethical and policy challenges posed by ML and data-driven systems. In particular, they have expressed concerns about the potentially discriminatory impact of such systems (for example, inadvertently encoding of bias into automated decisions).

• Business – The adoption of AI systems in regulated domains requires trust, which can be built by providing reliable explanations of the behavior of trained models and how the deployed models make predictions. Model explainability may be particularly important to certain industries with reliability,
safety, and compliance requirements, such as financial services, human resources, healthcare, and automated transportation. To take a common financial example, lending applications that incorporate the use of ML models might need to provide explanations about how those models made certain predictions to internal teams of loan officers, customer service representatives, and forecasters, in addition to end users/customers.

- **Data Science** – Data scientists and ML engineers need tools to generate the insights required to debug and improve ML models through better feature engineering, to determine whether a model is making inferences based on noisy or irrelevant features, and to understand the limitations of their models and failure modes their models may encounter.

For a blog that shows how to architect and build a complete machine learning use case involving fraudulent automobile claims that integrates SageMaker Clarify into a SageMaker pipeline, see the *Architect and build the full machine learning lifecycle with AWS: An end-to-end Amazon SageMaker demo*. This blog discusses how to assess pre and post training bias, how to mitigate the bias, and how the data features impact the prediction. There are links to the relevant code for each task in the ML lifecycle, including the creation of an automated workflow that integrates the fairness and explainability functionality of SageMaker Clarify into a SageMaker Pipeline.

### Best Practices for Evaluating Fairness and Explainability in the ML Lifecycle

**Fairness as a Process** – The notions of bias and fairness are highly dependent on the application. Further, the choice of the attributes for which bias is to be measured, as well as the choice of the bias metrics, may need to be guided by social, legal, and other non-technical considerations. Building consensus and achieving collaboration across key stakeholders (such as product, policy, legal, engineering, and AI/ML teams, as well as end users and communities) is a prerequisite for the successful adoption of fairness-aware ML approaches in practice.

**Fairness and Explainability by Design in the ML Lifecycle** – You should consider fairness and explainability during each stage of the ML lifecycle: problem formation, dataset construction, algorithm selection, model training process, testing process, deployment, and monitoring/feedback. It is important to have the right tools to do this analysis. To encourage engaging with these considerations, here are a few example questions we recommend you ask during each of these stages.

### Sample Notebooks

Amazon SageMaker Clarify provides the following sample notebooks:
• Explainability and bias detection with Amazon SageMaker Clarify – Use SageMaker Clarify to create a processing job for the detecting bias and explaining model predictions with feature attributions.

• Monitoring bias drift and feature attribution drift Amazon SageMaker Clarify – Use Amazon SageMaker Model Monitor to monitor bias drift and feature attribution drift over time.

• Fairness and Explainability with SageMaker Clarify (Bring Your Own Container) – This sample notebook introduces key terms and concepts needed to understand SageMaker Clarify, and it walks you through an end-to-end data science workflow demonstrating how to build your own model and container that can work seamlessly with your Clarify jobs, use the model and SageMaker Clarify to measure bias, explain the importance of the various input features on the model's decision and then access the reports through SageMaker Studio if you have an instance set up.

• Fairness and Explainability with SageMaker Clarify - Spark Distributed Processing – This sample notebook walks you through key terms and concepts needed to understand SageMaker Clarify, measures the pre-training bias of a dataset and post-training bias of a model, explains the importance of the various input features on the model's decision, and accesses the reports through SageMaker Studio if you have an instance set up.

• Mitigate Bias, Train another unbiased Model and Put in the Model Registry – This notebook describes how to detect bias using SageMaker Clarify, mitigate it with Synthetic Minority Over-sampling Technique (SMOTE), train another model, then put it in the Model Registry along with all the lineage of the artifacts created along the way: data, code and model metadata. This notebook forms part of a series that shows how to integrate SageMaker Clarify into a SageMaker Pipeline that is described in the Architect and build the full machine learning lifecycle with AWS blog.

These notebooks have been verified to run in Amazon SageMaker Studio only. If you need instructions on how to open a notebook in Amazon SageMaker Studio, see Create or Open an Amazon SageMaker Studio Notebook (p. 70). If you're prompted to choose a kernel, choose Python 3 (Data Science).

Guide to the SageMaker Clarify Documentation

Bias can occur and be measured in the data at each stage of the machine learning lifecycle: before training a model and after model training. SageMaker Clarify can provide feature attribution explanations of model predictions for trained models and for models deployed to production, where models can be monitored for any drift from their baseline explanatory attributions. Clarify calculates baselines when needed. The documentation for SageMaker Clarify is embedding throughout the larger SageMaker documentation set at the relevant ML stages as follows:

• For further information on detecting bias in preprocessing data before it's used to train a model, see Detect Pretraining Data Bias (p. 590).

• For further information on detecting posttraining data and model bias, see Detect Posttraining Data and Model Bias (p. 1875).

• For further information on the model-agnostic feature attribution approach to explain model predictions after training, see Model Explainability (p. 1907).

• For further information on monitoring for bias in production model inferences due to the drift of data away from the baseline used to train the model, see Monitor Bias Drift for Models in Production (p. 2042).

• For further information on monitoring for the drift of features' contributions away from the baseline that was established during model training, see Monitor Feature Attribution Drift for Models in Production (p. 2045).

Train a Model with Amazon SageMaker

The following diagram shows how you train and deploy a model with Amazon SageMaker:
The area labeled SageMaker highlights the two components of SageMaker: model training and model deployment.

To train a model in SageMaker, you create a training job. The training job includes the following information:

- The URL of the Amazon Simple Storage Service (Amazon S3) bucket where you've stored the training data.
- The compute resources that you want SageMaker to use for model training. Compute resources are ML compute instances that are managed by SageMaker.
- The URL of the S3 bucket where you want to store the output of the job.
- The Amazon Elastic Container Registry path where the training code is stored. For more information, see Docker Registry Paths and Example Code (p. 769).

You have the following options for a training algorithm:

- **Use an algorithm provided by SageMaker**—SageMaker provides training algorithms. If one of these meets your needs, it's a great out-of-the-box solution for quick model training. For a list of algorithms
Model Deployment

provided by SageMaker, see Use Amazon SageMaker Built-in Algorithms (p. 762). To try an exercise that uses an algorithm provided by SageMaker, see Get Started with Amazon SageMaker (p. 33).

- **Use SageMaker Debugger**—to inspect training parameters and data throughout the training process when working with the TensorFlow, PyTorch, and Apache MXNet learning frameworks or the XGBoost algorithm. Debugger automatically detects and alerts users to commonly occurring errors such as parameter values getting too large or small. For more information about using Debugger, see Amazon SageMaker Debugger (p. 1630). Debugger sample notebooks are available at Amazon SageMaker Debugger Samples.

- **Use Apache Spark with SageMaker**—SageMaker provides a library that you can use in Apache Spark to train models with SageMaker. Using the library provided by SageMaker is similar to using Apache Spark MLLib. For more information, see Use Apache Spark with Amazon SageMaker (p. 15).

- **Submit custom code to train with deep learning frameworks**—You can submit custom Python code that uses TensorFlow, PyTorch, or Apache MXNet for model training. For more information, see Use TensorFlow with Amazon SageMaker (p. 30), Use PyTorch with Amazon SageMaker (p. 26), and Use Apache MXNet with Amazon SageMaker (p. 14).

- **Use your own custom algorithms**—Put your code together as a Docker image and specify the registry path of the image in a SageMaker CreateTrainingJob API call. For more information, see Using Docker containers with SageMaker (p. 2208).

- **Use an algorithm that you subscribe to from AWS Marketplace**—For information, see Find and Subscribe to Algorithms and Model Packages on AWS Marketplace (p. 2500).

After you create the training job, SageMaker launches the ML compute instances and uses the training code and the training dataset to train the model. It saves the resulting model artifacts and other output in the S3 bucket you specified for that purpose.

You can create a training job with the SageMaker console or the API. For information about creating a training job with the API, see the CreateTrainingJob API.

When you create a training job with the API, SageMaker replicates the entire dataset on ML compute instances by default. To make SageMaker replicate a subset of the data on each ML compute instance, you must set the S3DataDistributionType field to ShardedByS3Key. You can set this field using the low-level SDK. For more information, see S3DataDistributionType in S3DataSource.

**Important**

To prevent your algorithm container from contending for memory, we reserve memory for our SageMaker critical system processes on your ML compute instances and therefore you cannot expect to see all the memory for your instance type.

## Deploy a Model in Amazon SageMaker

After you train your model, you can deploy it using Amazon SageMaker to get predictions in any of the following ways:

- To set up a persistent endpoint to get one prediction at a time, use SageMaker hosting services.
- To get predictions for an entire dataset, use SageMaker batch transform.

### Topics

- Deploy a Model on SageMaker Hosting Services (p. 10)

## Deploy a Model on SageMaker Hosting Services

For an example of how to deploy a model to the SageMaker hosting service, see Deploy the Model to SageMaker Hosting Services (p. 53).
Or, if you prefer, watch the following video tutorial:

**Deploy Your ML Models to Production at Scale with Amazon SageMaker**

SageMaker provides model hosting services for model deployment, as shown in the following diagram. SageMaker provides an HTTPS endpoint where your machine learning model is available to provide inferences.

---

**Get Inferences for an Entire Dataset with Batch Transform**

To get inferences for an entire dataset, use batch transform. With batch transform, you create a batch transform job using a trained model and the dataset, which must be stored in Amazon S3. Amazon SageMaker saves the inferences in an S3 bucket that you specify when you create the batch transform job. Batch transform manages all of the compute resources required to get inferences. This includes launching instances and deleting them after the batch transform job has completed. Batch transform
manages interactions between the data and the model with an object within the instance node called an agent.

Use batch transform when you:

• Want to get inferences for an entire dataset and index them to serve inferences in real time
• Don't need a persistent endpoint that applications (for example, web or mobile apps) can call to get inferences
• Don't need the subsecond latency that SageMaker hosted endpoints provide

You can also use batch transform to preprocess your data before using it to train a new model or generate inferences.

The following diagram shows the workflow of a batch transform job:

To perform a batch transform, create a batch transform job using either the SageMaker console or the API. Provide the following:

• The path to the S3 bucket where you've stored the data that you want to transform.
• The compute resources that you want SageMaker to use for the transform job. Compute resources are machine learning (ML) compute instances that are managed by SageMaker.
• The path to the S3 bucket where you want to store the output of the job.
• The name of the SageMaker model that you want to use to create inferences. You must use a model that you have already created either with the CreateModel operation or the console.

The following is an example of what a dataset file might look like.

<table>
<thead>
<tr>
<th>An example of input file content:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record1-Attribute1, Record1-Attribute2, Record1-Attribute3, ..., Record1-AttributeM</td>
</tr>
<tr>
<td>Record2-Attribute1, Record2-Attribute2, Record2-Attribute3, ..., Record2-AttributeM</td>
</tr>
<tr>
<td>Record3-Attribute1, Record3-Attribute2, Record3-Attribute3, ..., Record3-AttributeM</td>
</tr>
<tr>
<td>...</td>
</tr>
<tr>
<td>RecordN-Attribute1, RecordN-Attribute2, RecordN-Attribute3, ..., RecordN-AttributeM</td>
</tr>
</tbody>
</table>

A record is a single input data unit. For information about how to delimit records for batch transform jobs, see SplitType.
For an example of how to use batch transform, see (Optional) Make Prediction with Batch Transform (p. 54).

Validate a Machine Learning Model

After training a model, evaluate it to determine whether its performance and accuracy enable you to achieve your business goals. You might generate multiple models using different methods and evaluate each. For example, you could apply different business rules for each model, and then apply various measures to determine each model's suitability. You might consider whether your model needs to be more sensitive than specific (or vice versa).

You can evaluate your model using historical data (offline) or live data:

- **Offline testing**—Use historical, not live, data to send requests to the model for inferences.
  
  Deploy your trained model to an alpha endpoint, and use historical data to send inference requests to it. To send the requests, use a Jupyter notebook in your Amazon SageMaker notebook instance and either the AWS SDK for Python (Boto) or the high-level Python library provided by SageMaker.

- **Online testing with live data**—SageMaker supports A/B testing for models in production by using production variants. Production variants are models that use the same inference code and are deployed on the same SageMaker endpoint. You configure the production variants so that a small portion of the live traffic goes to the model that you want to validate. For example, you might choose to send 10% of the traffic to a model variant for evaluation. After you are satisfied with the model's performance, you can route 100% traffic to the updated model. For an example of testing models in production, see Test models in production (p. 2019).

For more information, see articles and books about how to evaluate models, for example, Evaluating Machine Learning Models.

Options for offline model evaluation include:

- **Validating using a holdout set**—Machine learning practitioners often set aside a part of the data as a "holdout set." They don't use this data for model training.
  
  With this approach, you evaluate how well your model provides inferences on the holdout set. You then assess how effectively the model generalizes what it learned in the initial training, as opposed to using model memory. This approach to validation gives you an idea of how often the model is able to infer the correct answer.

In some ways, this approach is similar to teaching elementary school students. First, you provide them with a set of examples to learn, and then test their ability to generalize from their learning. With homework and tests, you pose problems that were not included in the initial learning and determine whether they are able to generalize effectively. Students with perfect memories could memorize the problems, instead of learning the rules.

Typically, the holdout dataset is of 20-30% of the training data.

- **k-fold validation**—In this validation approach, you split the example dataset into k parts. You treat each of these parts as a holdout set for k training runs, and use the other k-1 parts as the training set for that run. You produce k models using a similar process, and aggregate the models to generate your final model. The value k is typically in the range of 5-10.
Monitoring a Model in Production

After you deploy a model into your production environment, use Amazon SageMaker model monitor to continuously monitor the quality of your machine learning models in real time. Amazon SageMaker model monitor enables you to set up an automated alert triggering system when there are deviations in the model quality, such as data drift and anomalies. Amazon CloudWatch Logs collects log files of monitoring the model status and notifies when the quality of your model hits certain thresholds that you preset. CloudWatch stores the log files to an Amazon S3 bucket you specify. Early and pro-active detection of model deviations through AWS model monitor products enables you to take prompt actions to maintain and improve the quality of your deployed model.

For more information about SageMaker model monitoring products, see Amazon SageMaker Model Monitor (p. 2028).

To start your machine learning journey with SageMaker, sign up for an AWS account at Set Up SageMaker.

Use Machine Learning Frameworks, Python, and R with Amazon SageMaker

You can use Python and R natively in Amazon SageMaker notebook kernels. There are also kernels that support specific frameworks. A very popular way to get started with SageMaker is to use the Amazon SageMaker Python SDK. It provides open source Python APIs and containers that make it easy to train and deploy models in SageMaker, as well as examples for use with several different machine learning and deep learning frameworks.

For information about using specific frameworks or how to use R in SageMaker, see the following topics.

Languages SDKs and user guides:
- Amazon SageMaker Python SDK
- R (p. 27)
- API Reference Guide for Amazon SageMaker (p. 2649)

Machine learning and deep learning frameworks guides:
- Apache MXNet (p. 14)
- Apache Spark (p. 15)
- Chainer (p. 24)
- Hugging Face (p. 24)
- PyTorch (p. 26)
- Scikit-learn (p. 29)
- SparkML Serving (p. 30)
- TensorFlow (p. 30)

Use Apache MXNet with Amazon SageMaker

You can use SageMaker to train and deploy a model using custom MXNet code. The Amazon SageMaker Python SDK MXNet estimators and models and the SageMaker open-source MXNet container make writing a MXNet script and running it in SageMaker easier.
What do you want to do?

I want to train a custom MXNet model in SageMaker.

For a sample Jupyter notebook, see the MXNet example notebooks in the Amazon SageMaker Examples GitHub repository.

For documentation, see Train a Model with MXNet.

I have an MXNet model that I trained in SageMaker, and I want to deploy it to a hosted endpoint.

For more information, see Deploy MXNet models.

I have an MXNet model that I trained outside of SageMaker, and I want to deploy it to a SageMaker endpoint.

For more information, see Deploy Endpoints from Model Data.

I want to see the API documentation for Amazon SageMaker Python SDK MXNet classes.

For more information, see MXNet Classes.

I want to find the SageMaker MXNet container repository.

For more information, see SageMaker MXNet Container GitHub repository.

I want to find information about MXNet versions supported by AWS Deep Learning Containers.

For more information, see Available Deep Learning Container Images.

For general information about writing MXNet script mode training scripts and using MXNet script mode estimators and models with SageMaker, see Using MXNet with the SageMaker Python SDK.

Use Apache Spark with Amazon SageMaker

This section provides information for developers who want to use Apache Spark for preprocessing data and Amazon SageMaker for model training and hosting. For information about supported versions of Apache Spark, see the Getting SageMaker Spark page in the SageMaker Spark GitHub repository.

SageMaker provides an Apache Spark library, in both Python and Scala, that you can use to easily train models in SageMaker using org.apache.spark.sql.DataFrame data frames in your Spark clusters. After model training, you can also host the model using SageMaker hosting services.

The SageMaker Spark library, com.amazonaws.services.sagemaker.sparksdk, provides the following classes, among others:

- SageMakerEstimator—Extends the org.apache.spark.ml.Estimator interface. You can use this estimator for model training in SageMaker.

Download the SageMaker Spark Library

You have the following options for downloading the Spark library provided by SageMaker:

- You can download the source code for both PySpark and Scala libraries from the SageMaker Spark GitHub repository.
- For the Python Spark library, you have the following additional options:
• Use pip install:

```
$ pip install sagemaker_pyspark
```

• In a notebook instance, create a new notebook that uses either the Sparkmagic (PySpark) or the Sparkmagic (PySpark3) kernel and connect to a remote Amazon EMR cluster.

  **Note**
  The EMR cluster must be configured with an IAM role that has the AmazonSageMakerFullAccess policy attached. For information about configuring roles for an EMR cluster, see Configure IAM Roles for Amazon EMR Permissions to AWS Services in the Amazon EMR Management Guide.

• You can get the Scala library from Maven. Add the Spark library to your project by adding the following dependency to your pom.xml file:

```xml
<dependency>
  <groupId>com.amazonaws</groupId>
  <artifactId>sagemaker-spark_2.11</artifactId>
  <version>spark_2.2.0-1.0</version>
</dependency>
```

Integrate Your Apache Spark Application with SageMaker

The following is high-level summary of the steps for integrating your Apache Spark application with SageMaker.

1. Continue data preprocessing using the Apache Spark library that you are familiar with. Your dataset remains a DataFrame in your Spark cluster. Load your data into a DataFrame and preprocess it so that you have a features column with `org.apache.spark.ml.linalg.Vector` of Doubles, and an optional label column with values of `Double` type.

2. Use the estimator in the SageMaker Spark library to train your model. For example, if you choose the k-means algorithm provided by SageMaker for model training, you call the `KMeansSageMakerEstimator.fit` method.

   Provide your DataFrame as input. The estimator returns a `SageMakerModel` object.

   **Note**
   `SageMakerModel` extends the `org.apache.spark.ml.Model`.

   The `fit` method does the following:

   a. Converts the input DataFrame to the protobuf format by selecting the features and label columns from the input DataFrame and uploading the protobuf data to an Amazon S3 bucket. The protobuf format is efficient for model training in SageMaker.

   b. Starts model training in SageMaker by sending a SageMaker `CreateTrainingJob` request. After model training has completed, SageMaker saves the model artifacts to an S3 bucket.

   SageMaker assumes the IAM role that you specified for model training to perform tasks on your behalf. For example, it uses the role to read training data from an S3 bucket and to write model artifacts to a bucket.

   c. Creates and returns a `SageMakerModel` object. The constructor does the following tasks, which are related to deploying your model to SageMaker.

      i. Sends a `CreateModel` request to SageMaker.
ii. Sends a CreateEndpointConfig request to SageMaker.

iii. Sends a CreateEndpoint request to SageMaker, which then launches the specified resources, and hosts the model on them.

3. You can get inferences from your model hosted in SageMaker with the SageMakerModel.transform method.

Provide an input DataFrame with features as input. The transform method transforms it to a DataFrame containing inferences. Internally, the transform method sends a request to the InvokeEndpoint SageMaker API to get inferences. The transform method appends the inferences to the input DataFrame.

Example 1: Use Amazon SageMaker for Training and Inference with Apache Spark

Topics

- Use Custom Algorithms for Model Training and Hosting on Amazon SageMaker with Apache Spark (p. 21)
- Use the SageMakerEstimator in a Spark Pipeline (p. 22)

Amazon SageMaker provides an Apache Spark library (in both Python and Scala) that you can use to integrate your Apache Spark applications with SageMaker. For example, you might use Apache Spark for data preprocessing and SageMaker for model training and hosting. For more information, see Use Apache Spark with Amazon SageMaker (p. 15). This section provides example code that uses the Apache Spark Scala library provided by SageMaker to train a model in SageMaker using DataFrames in your Spark cluster. The example also hosts the resulting model artifacts using SageMaker hosting services. Specifically, this example does the following:

- Uses the KMeansSageMakerEstimator to fit (or train) a model on data

Because the example uses the k-means algorithm provided by SageMaker to train a model, you use the KMeansSageMakerEstimator. You train the model using images of handwritten single-digit numbers (from the MNIST dataset). You provide the images as an input DataFrame. For your convenience, SageMaker provides this dataset in an S3 bucket.

In response, the estimator returns a SageMakerModel object.

- Obtains inferences using the trained SageMakerModel

To get inferences from a model hosted in SageMaker, you call the SageMakerModel.transform method. You pass a DataFrame as input. The method transforms the input DataFrame to another DataFrame containing inferences obtained from the model.

For a given input image of a handwritten single-digit number, the inference identifies a cluster that the image belongs to. For more information, see K-Means Algorithm (p. 1464).
This is the example code:

```scala
import org.apache.spark.sql.SparkSession
import com.amazonaws.services.sagemaker.sparksdk.IAMRole
import com.amazonaws.services.sagemaker.sparksdk.algorithms
import com.amazonaws.services.sagemaker.sparksdk.algorithms.KMeansSageMakerEstimator

val spark = SparkSession.builder.getOrCreate

// load mnist data as a dataframe from libsvm
val region = "us-east-1"
val trainingData = spark.read.format("libsvm")
  .option("numFeatures", "784")
  .load(s"s3://sagemaker-sample-data-$region/spark/mnist/train/"
val testData = spark.read.format("libsvm")
  .option("numFeatures", "784")
  .load(s"s3://sagemaker-sample-data-$region/spark/mnist/test/"

val roleArn = "arn:aws:iam::account-id:role/rolename"

val estimator = new KMeansSageMakerEstimator(
  sagemakerRole = IAMRole(roleArn),
  trainingInstanceType = "ml.p2.xlarge",
  trainingInstanceCount = 1,
  endpointInstanceType = "ml.c4.xlarge",
  endpointInitialInstanceCount = 1)
  .setK(10).setFeatureDim(784)

// train
val model = estimator.fit(trainingData)
val transformedData = model.transform(testData)
transformedData.show
```

The code does the following:

- Loads the MNIST dataset from an S3 bucket provided by SageMaker (`awsai-sparksdk-dataset`) into a Spark DataFrame (`mnistTrainingDataFrame`):

  ```scala
  // Load mnist data as a dataframe from libsvm
  val trainingData = spark.read.format("libsvm")
    .option("numFeatures", "784")
    .load(s"s3://sagemaker-sample-data-$region/spark/mnist/train/"
val testData = spark.read.format("libsvm")
  .option("numFeatures", "784")
  .load(s"s3://sagemaker-sample-data-$region/spark/mnist/test/"
  trainingData.show()
  ```

The `show` method displays the first 20 rows in the data frame:

```
+-----+--------------------+
<table>
<thead>
<tr>
<th>label</th>
<th>features</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0</td>
<td>(784,[152,153,154...</td>
</tr>
<tr>
<td>0.0</td>
<td>(784,[127,128,129...</td>
</tr>
</tbody>
</table>
```
In each row:

- The **label** column identifies the image's label. For example, if the image of the handwritten number is the digit 5, the label value is 5.
- The **features** column stores a vector (org.apache.spark.ml.linalg.Vector) of **Double** values. These are the 784 features of the handwritten number. (Each handwritten number is a 28 x 28-pixel image, making 784 features.)

- Creates a SageMaker estimator (**KMeansSageMakerEstimator**)

The **fit** method of this estimator uses the k-means algorithm provided by SageMaker to train models using an input **DataFrame**. In response, it returns a **SageMakerModel** object that you can use to get inferences.

**Note**

The **KMeansSageMakerEstimator** extends the **SageMaker SageMakerEstimator**, which extends the Apache Spark Estimator.

```scala
val estimator = new KMeansSageMakerEstimator(
  sagemakerRole = IAMRole(roleArn),
  trainingInstanceType = "ml.p2.xlarge",
  trainingInstanceCount = 1,
  endpointInstanceType = "ml.c4.xlarge",
  endpointInitialInstanceCount = 1)
  .setK(10).setFeatureDim(784)
```

The constructor parameters provide information that is used for training a model and deploying it on SageMaker:

- **trainingInstanceType** and **trainingInstanceCount**—Identify the type and number of ML compute instances to use for model training.

- **endpointInstanceType**—Identifies the ML compute instance type to use when hosting the model in SageMaker. By default, one ML compute instance is assumed.
• **endpointInitialInstanceCount**—Identifies the number of ML compute instances initially backing the endpoint hosting the model in SageMaker.

• **sagemakerRole**—SageMaker assumes this IAM role to perform tasks on your behalf. For example, for model training, it reads data from S3 and writes training results (model artifacts) to S3.

**Note**

This example implicitly creates a SageMaker client. To create this client, you must provide your credentials. The API uses these credentials to authenticate requests to SageMaker. For example, it uses the credentials to authenticate requests to create a training job and API calls for deploying the model using SageMaker hosting services.

• After the `KMeansSageMakerEstimator` object has been created, you set the following parameters, are used in model training:
  • The number of clusters that the k-means algorithm should create during model training. You specify 10 clusters, one for each digit, 0 through 9.
  • Identifies that each input image has 784 features (each handwritten number is a 28 x 28-pixel image, making 784 features).

• **Calls the estimator fit method**

```scala
// train
val model = estimator.fit(trainingData)
```

You pass the input `DataFrame` as a parameter. The model does all the work of training the model and deploying it to SageMaker. For more information see, [Integrate Your Apache Spark Application with SageMaker](#). In response, you get a `SageMakerModel` object, which you can use to get inferences from your model deployed in SageMaker.

You provide only the input `DataFrame`. You don't need to specify the registry path to the k-means algorithm used for model training because the `KMeansSageMakerEstimator` knows it.

• **Calls the SageMakerModel.transform method to get inferences from the model deployed in SageMaker.**

The `transform` method takes a `DataFrame` as input, transforms it, and returns another `DataFrame` containing inferences obtained from the model.

```scala
val transformedData = model.transform(testData)
transformedData.show
```

For simplicity, we use the same `DataFrame` as input to the `transform` method that we used for model training in this example. The `transform` method does the following:

• Serializes the `features` column in the input `DataFrame` to protobuf and sends it to the SageMaker endpoint for inference.

• Deserializes the protobuf response into the two additional columns (`distance_to_cluster` and `closest_cluster`) in the transformed `DataFrame`.

The `show` method gets inferences to the first 20 rows in the input `DataFrame`:
You can interpret the data, as follows:

- A handwritten number with the label 5 belongs to cluster 4 (closest_cluster).
- A handwritten number with the label 0 belongs to cluster 5.
- A handwritten number with the label 4 belongs to cluster 9.
- A handwritten number with the label 1 belongs to cluster 6.

For more information on how to run these examples, see https://github.com/aws/sagemaker-spark/blob/master/README.md on GitHub.

Use Custom Algorithms for Model Training and Hosting on Amazon SageMaker with Apache Spark

In Example 1: Use Amazon SageMaker for Training and Inference with Apache Spark (p. 17), you use the kMeansSageMakerEstimator because the example uses the k-means algorithm provided by Amazon SageMaker for model training. You might choose to use your own custom algorithm for model training instead. Assuming that you have already created a Docker image, you can create your own SageMakerEstimator and specify the Amazon Elastic Container Registry path for your custom image.

The following example shows how to create a KMeansSageMakerEstimator from the SageMakerEstimator. In the new estimator, you explicitly specify the Docker registry path to your training and inference code images.
hyperParameters = Map("k" -> "10", "feature_dim" -> "784"),
sagemakerRole = IAMRole(roleArn),
trainingInstanceType = "ml.p2.xlarge",
trainingInstanceCount = 1,
endpointInstanceType = "ml.c4.xlarge",
endpointInitialInstanceCount = 1,
trainingSparkDataFormat = "sagemaker")

In the code, the parameters in the SageMakerEstimator constructor include:

- **trainingImage** — Identifies the Docker registry path to the training image containing your custom code.
- **modelImage** — Identifies the Docker registry path to the image containing inference code.
- **requestRowSerializer** — Implements com.amazonaws.services.sagemaker.sparksdk.transformation.RequestRowSerializer. This parameter serializes rows in the input DataFrame to send them to the model hosted in SageMaker for inference.
- **responseRowDeserializer** — Implements com.amazonaws.services.sagemaker.sparksdk.transformation.ResponseRowDeserializer. This parameter deserializes responses from the model, hosted in SageMaker, back into a DataFrame.
- **trainingSparkDataFormat** — Specifies the data format that Spark uses when uploading training data from a DataFrame to S3. For example, "sagemaker" for protobuf format, "csv" for comma-separated values, and "libsvm" for LibSVM format.

You can implement your own RequestRowSerializer and ResponseRowDeserializer to serialize and deserialize rows from a data format that your inference code supports, such as .libsvm or .csv.

**Use the SageMakerEstimator in a Spark Pipeline**

You can use org.apache.spark.ml.Estimator estimators and org.apache.spark.ml.Model models, and SageMakerEstimator estimators and SageMakerModel models in org.apache.spark.ml.Pipeline pipelines, as shown in the following example:

```scala
import org.apache.spark.ml.Pipeline
import org.apache.spark.ml.feature.PCA
import org.apache.spark.sql.SparkSession
import com.amazonaws.services.sagemaker.sparksdk.IAMRole
import com.amazonaws.services.sagemaker.sparksdk.algorithms.KMeansSageMakerEstimator

val spark = SparkSession.builder.getOrCreate

// load mnist data as a dataframe from libsvm
val region = "us-east-1"
val trainingData = spark.read.format("libsvm")
  .option("numFeatures", "784")
  .load(s"s3://sagemaker-sample-data-$region/spark/mnist/train")
val testData = spark.read.format("libsvm")
  .option("numFeatures", "784")
  .load(s"s3://sagemaker-sample-data-$region/spark/mnist/test")

// substitute your SageMaker IAM role here
val roleArn = "arn:aws:iam::account-id:role/rolename"

val pcaEstimator = new PCA()
  .setInputCol("features")
  .setOutputCol("projectedFeatures")
```
```scala
.setK(50)
val kMeansSageMakerEstimator = new KMeansSageMakerEstimator(
sagemakerRole = IAMRole(integTestingRole),
requestRowSerializer =
    new ProtobufRequestRowSerializer(featuresColumnName = "projectedFeatures"),
trainingSparkDataFormatOptions = Map("featuresColumnName" -> "projectedFeatures"),
trainingInstanceType = "ml.p2.xlarge",
trainingInstanceCount = 1,
endpointInstanceType = "ml.c4.xlarge",
endpointInitialInstanceCount = 1)
.setK(10).setFeatureDim(50)
val pipeline = new Pipeline().setStages(Array(pcaEstimator, kMeansSageMakerEstimator))

// train
val pipelineModel = pipeline.fit(trainingData)
val transformedData = pipelineModel.transform(testData)
transformedData.show()
```

The parameter `trainingSparkDataFormatOptions` configures Spark to serialize to protobuf the "projectedFeatures" column for model training. Additionally, Spark serializes to protobuf the "label" column by default.

Because we want to make inferences using the "projectedFeatures" column, we pass the column name into the ProtobufRequestRowSerializer.

The following example shows a transformed DataFrame:

<table>
<thead>
<tr>
<th>label</th>
<th>features</th>
<th>projectedFeatures</th>
<th>distance_to_cluster</th>
<th>closest_cluster</th>
</tr>
</thead>

SDK examples: Use Amazon SageMaker with Apache Spark

The following list is a subset of available examples. Visit the examples website to see more.

* sagemaker-spark: a Spark library for SageMaker
* SageMaker PySpark K-Means Clustering MNIST Example
* Distributed Data Processing using Apache Spark and SageMaker Processing
• Feature processing with Spark, training with XGBoost and deploying as Inference Pipeline

**Note**
To run the notebooks on a notebook instance, see Example Notebooks (p. 152). To run the notebooks on Studio, see Create or Open an Amazon SageMaker Studio Notebook (p. 70).

**Use Chainer with Amazon SageMaker**

You can use SageMaker to train and deploy a model using custom Chainer code. The SageMaker Python SDK Chainer estimators and models and the SageMaker open-source Chainer container make writing a Chainer script and running it in SageMaker easier.

**What do you want to do?**

I want to train a custom Chainer model in SageMaker.

For a sample Jupyter notebook, see the Chainer example notebooks in the Amazon SageMaker Examples GitHub repository.

For documentation, see Train a Model with Chainer.

I have a Chainer model that I trained in SageMaker, and I want to deploy it to a hosted endpoint.

For more information, see Deploy Chainer models.

I have a Chainer model that I trained outside of SageMaker, and I want to deploy it to a SageMaker endpoint.

For more information, see Deploy Endpoints from Model Data.

I want to see the API documentation for Amazon SageMaker Python SDK Chainer classes.

For more information, see Chainer Classes.

I want to find information about SageMaker Chainer containers.

For more information, see the SageMaker Chainer Container GitHub repository.

For information about supported Chainer versions, and for general information about writing Chainer training scripts and using Chainer estimators and models with SageMaker, see Using Chainer with the SageMaker Python SDK.

**Use Hugging Face with Amazon SageMaker**

Amazon SageMaker enables customers to train, fine-tune, and run inference using Hugging Face models for Natural Language Processing (NLP) on SageMaker. You can use Hugging Face for both training and inference. This functionality is available through the development of Hugging Face AWS Deep Learning Containers. These containers include Hugging Face Transformers, Tokenizers and the Datasets library, which allows you to use these resources for your training and inference jobs. For a list of the available Deep Learning Containers images, see Available Deep Learning Containers Images. These Deep Learning Containers images are maintained and regularly updated with security patches.

To use the Hugging Face Deep Learning Containers with the SageMaker Python SDK for training, see the Hugging Face SageMaker Estimator. With the Hugging Face Estimator, you can use the Hugging Face models as you would any other SageMaker Estimator. However, using the SageMaker Python SDK is optional. You can also orchestrate your use of the Hugging Face Deep Learning Containers with the AWS CLI and AWS SDK for Python (Boto3).

For more information on Hugging Face and the models available in it, see the Hugging Face documentation.
Training

To run training, you can use any of the thousands of models available in Hugging Face and fine-tune them for your specific use case with additional training. With SageMaker, you can use standard training or take advantage of SageMaker Distributed Data and Model Parallel training. As with other SageMaker training jobs using custom code, you can capture your own metrics by passing a metrics definition to the SageMaker Python SDK as shown in Defining Training Metrics (SageMaker Python SDK). The captured metrics are then accessible via CloudWatch and as a Pandas DataFrame via the TrainingJobAnalytics method. Once your model is trained and fine-tuned, you can use it like any other model to run inference jobs.

How to run training with the Hugging Face Estimator

You can implement the Hugging Face Estimator for training jobs using the SageMaker Python SDK. The SageMaker Python SDK is an open source library for training and deploying machine learning models on SageMaker. For more information on the Hugging Face Estimator, see the SageMaker Python SDK documentation.

With the SageMaker Python SDK, you can run training jobs using the Hugging Face Estimator in the following environments:

- **SageMaker Studio**: Amazon SageMaker Studio is the first fully integrated development environment (IDE) for machine learning (ML). SageMaker Studio provides a single, web-based visual interface where you can perform all ML development steps required to prepare, build, train and tune, deploy and manage models. For information on using Jupyter Notebooks in Studio, see Use Amazon SageMaker Studio Notebooks.
- **SageMaker Notebook Instances**: An Amazon SageMaker notebook instance is a machine learning (ML) compute instance running the Jupyter Notebook App. This app lets you run Jupyter Notebooks in your notebook instance to prepare and process data, write code to train models, deploy models to SageMaker hosting, and test or validate your models without SageMaker Studio features like Debugger, Model Monitoring, and a web-based IDE.
- **Locally**: If you have connectivity to AWS and have appropriate SageMaker permissions, you can use the SageMaker Python SDK locally to launch remote training and inference jobs for Hugging Face in SageMaker on AWS. This works on your local machine, as well as other AWS services with a connected SageMaker Python SDK and appropriate permissions.

Inference

For inference, you can use your trained Hugging Face model or one of the pretrained Hugging Face models to deploy an inference job with SageMaker. With this collaboration, you only need one line of code to deploy both your trained models and pre-trained models with SageMaker. You can also run inference jobs without having to write any custom inference code. With custom inference code, you can customize the inference logic by providing your own Python script.

How to deploy an inference job using the Hugging Face Deep Learning Containers

You have two options for running inference with SageMaker. You can run inference using a model that you trained, or deploy a pre-trained Hugging Face model.

- **Run inference with your trained model**: You have two options for running inference with your own trained model. You can run inference with a model that you trained using an existing Hugging Face model with the SageMaker Hugging Face Deep Learning Containers, or you can bring your own existing Hugging Face model and deploy it using SageMaker. When you run inference with a model that you trained with the SageMaker Hugging Face Estimator, you can deploy the model immediately after training completes or you can upload the trained model to an Amazon S3 bucket and ingest it when
running inference later. If you bring your own existing Hugging Face model, you must upload the trained model to an Amazon S3 bucket and ingest that bucket when running inference as shown in Deploy your Hugging Face Transformers for inference example.

- **Run inference with a pre-trained HuggingFace model:** You can use one of the thousands of pre-trained Hugging Face models to run your inference jobs with no additional training needed. To run inference, you select the pre-trained model from the list of Hugging Face models, as outlined in Deploy pre-trained Hugging Face Transformers for inference example.

**What do you want to do?**

The following Jupyter Notebooks in the Hugging Face notebooks repository illustrate how to use the Hugging Face Deep Learning Containers with SageMaker in various use cases.

- I want to train and deploy a text classification model using Hugging Face in SageMaker with PyTorch. For a sample Jupyter Notebook, see the PyTorch Getting Started Demo.
- I want to train and deploy a text classification model using Hugging Face in SageMaker with TensorFlow. For a sample Jupyter Notebook, see the TensorFlow Getting Started example.
- I want to run distributed training with data parallelism using Hugging Face and SageMaker Distributed. For a sample Jupyter Notebook, see the Distributed Training example.
- I want to run distributed training with model parallelism using Hugging Face and SageMaker Distributed. For a sample Jupyter Notebook, see the Model Parallelism example.
- I want to use a spot instance to train and deploy a model using Hugging Face in SageMaker. For a sample Jupyter Notebook, see the Spot Instances example.
- I want to capture custom metrics and use SageMaker Checkpointing when training a text classification model using Hugging Face in SageMaker. For a sample Jupyter Notebook, see the Training with Custom Metrics example.
- I want to train a distributed question-answering TensorFlow model using Hugging Face in SageMaker. For a sample Jupyter Notebook, see the Distributed TensorFlow Training example.
- I want to train a distributed summarization model using Hugging Face in SageMaker. For a sample Jupyter Notebook, see the Distributed Summarization Training example.
- I want to train an image classification model using Hugging Face in SageMaker. For a sample Jupyter Notebook, see the Vision Transformer Training example.
- I want to deploy my trained Hugging Face model in SageMaker. For a sample Jupyter Notebook, see the Deploy your Hugging Face Transformers for inference example.
- I want to deploy a pre-trained Hugging Face model in SageMaker. For a sample Jupyter Notebook, see the Deploy pre-trained Hugging Face Transformers for inference example.

**Use PyTorch with Amazon SageMaker**

You can use Amazon SageMaker to train and deploy a model using custom PyTorch code. The SageMaker Python SDK PyTorch estimators and models and the SageMaker open-source PyTorch container make writing a PyTorch script and running it in SageMaker easier.
**What do you want to do?**

I want to train a custom PyTorch model in SageMaker.

For a sample Jupyter notebook, see the [PyTorch example notebook](https://github.com/aws-samples/sagemaker-examples) in the Amazon SageMaker Examples GitHub repository.

For documentation, see [Train a Model with PyTorch](https://docs.aws.amazon.com/sagemaker/latest/dg/using-pytorch.html).

I have a PyTorch model that I trained in SageMaker, and I want to deploy it to a hosted endpoint.

For more information, see [Deploy PyTorch models](https://docs.aws.amazon.com/sagemaker/latest/dg/deploy-pytorch-models.html).

I have a PyTorch model that I trained outside of SageMaker, and I want to deploy it to a SageMaker endpoint.

For more information, see [Deploy Endpoints from Model Data](https://docs.aws.amazon.com/sagemaker/latest/dg/deploy-endpoints-from-model-data.html).

I want to see the API documentation for Amazon SageMaker Python SDK PyTorch classes.

For more information, see [PyTorch Classes](https://docs.aws.amazon.com/sagemaker/latest/dg/pytorch-classes.html).

I want to find the SageMaker PyTorch container repository.

For more information, see [SageMaker PyTorch Container GitHub repository](https://github.com/aws-samples/sagemaker-examples/tree/main/PyTorch-Examples).

I want to find information about PyTorch versions supported by AWS Deep Learning Containers.

For more information, see [Available Deep Learning Container Images](https://docs.aws.amazon.com/sagemaker/latest/dg/deploy-endpoints-from-model-data.html).

For general information about writing PyTorch training scripts and using PyTorch estimators and models with SageMaker, see [Using PyTorch with the SageMaker Python SDK](https://docs.aws.amazon.com/sagemaker/latest/dg/using-pytorch.html).

---

**R User Guide to Amazon SageMaker**

This document will walk you through ways of leveraging Amazon SageMaker features using R. This guide introduces SageMaker’s built-in R kernel, how to get started with R on SageMaker, and finally several example notebooks.

The examples are organized in three levels, Beginner, Intermediate, and Advanced. They start from [Getting Started with R on SageMaker](https://docs.aws.amazon.com/sagemaker/latest/dg/getting-started-r.html), continue to end-to-end machine learning with R on SageMaker, and then finish with more advanced topics such as SageMaker Processing with R script, and Bring-Your-Own (BYO) R algorithm to SageMaker.

For information on how to bring your own custom R image to Studio, see [Bring your own SageMaker image](https://docs.aws.amazon.com/sagemaker/latest/dg/bring-your-own-image.html). For a similar blog article, see [Bringing your own R environment to Amazon SageMaker Studio](https://aws.amazon.com/blogs/machine-learning/bring-your-own-R-environment-to-amazon-sagemaker-studio/).

**R Kernel in SageMaker**

SageMaker notebook instances support R using a pre-installed R kernel. Also, the R kernel has the reticulate library, an R to Python interface, so you can use the features of SageMaker Python SDK from within an R script.

- `reticulate` library: provides an R interface to the Amazon SageMaker Python SDK. The reticulate package translates between R and Python objects.
Get Started with R in SageMaker

- Create a Notebook Instance using the t2.medium instance type and default storage size. You can pick a faster instance and more storage if you plan to continue using the instance for more advanced examples, or create a bigger instance later.
- Wait until the status of the notebook is In Service, and then click Open Jupyter.

- Create a new notebook with R kernel from the list of available environments.
- When the new notebook is created, you should see an R logo in the upper right corner of the notebook environment, and also R as the kernel under that logo. This indicates that SageMaker has successfully launched the R kernel for this notebook.
- Alternatively, when you are in a Jupyter notebook, you can use Kernel menu, and then select R from Change Kernel option.
Example Notebooks

Prerequisites

Getting Started with R on SageMaker: This sample notebook describes how you can develop R scripts using Amazon SageMaker’s R kernel. In this notebook you set up your SageMaker environment and permissions, download the abalone dataset from the UCI Machine Learning Repository, do some basic processing and visualization on the data, then save the data as .csv format to S3.

Beginner Level

SageMaker Batch Transform using R Kernel: This sample Notebook describes how to conduct a batch transform job using SageMaker’s Transformer API and the XGBoost algorithm. The notebook also uses the Abalone dataset.

Intermediate Level

Hyperparameter Optimization for XGBoost in R: This sample notebook extends the previous beginner notebooks that use the abalone dataset and XGBoost. It describes how to do model tuning with hyperparameter optimization. You will also learn how to use batch transform for batching predictions, as well as how to create a model endpoint to make real-time predictions.

Amazon SageMaker Processing with R: SageMaker Processing lets you preprocess, post-process and run model evaluation workloads. This example shows you how to create an R script to orchestrate a Processing job.

Advanced Level

Train and Deploy Your Own R Algorithm in SageMaker: Do you already have an R algorithm, and you want to bring it into SageMaker to tune, train, or deploy it? This example walks you through how to customize SageMaker containers with custom R packages, all the way to using a hosted endpoint for inference on your R-origin model.

Use Scikit-learn with Amazon SageMaker

You can use Amazon SageMaker to train and deploy a model using custom Scikit-learn code. The SageMaker Python SDK Scikit-learn estimators and models and the SageMaker open-source Scikit-learn container make writing a Scikit-learn script and running it in SageMaker easier.

What do you want to do?

I want to use Scikit-learn for data processing, feature engineering, or model evaluation in SageMaker.

For a sample Jupyter notebook, see https://github.com/awslabs/amazon-sagemaker-examples/tree/master/sagemaker_processing/scikit_learn_data_processing_and_model_evaluation.
For documentation, see ReadTheDocs.

I want to train a custom Scikit-learn model in SageMaker.

For documentation, see Train a Model with Scikit-learn.

I have a Scikit-learn model that I trained in SageMaker, and I want to deploy it to a hosted endpoint.

For more information, see Deploy Scikit-learn models.

I have a Scikit-learn model that I trained outside of SageMaker, and I want to deploy it to a SageMaker endpoint.

For more information, see Deploy Endpoints from Model Data.

I want to see the API documentation for Amazon SageMaker Python SDK Scikit-learn classes.

For more information, see Scikit-learn Classes.

I want to see information about SageMaker Scikit-learn containers.

For more information, see SageMaker Scikit-learn Container GitHub repository.

For general information about writing Scikit-learn training scripts and using Scikit-learn estimators and models with SageMaker, see Using Scikit-learn with the SageMaker Python SDK.

Scikit-learn versions supported by the Amazon SageMaker Scikit-learn container: 0.20.0, 0.23-1.

Use SparkML Serving with Amazon SageMaker

The Amazon SageMaker Python SDK SparkML Serving model and predictor and the Amazon SageMaker open-source SparkML Serving container support deploying Apache Spark ML pipelines serialized with MLeap in SageMaker to get inferences.

For information about using the SparkML Serving container to deploy models to SageMaker, see SageMaker Spark ML Container GitHub repository. For information about the Amazon SageMaker Python SDK SparkML Serving model and predictors, see the SparkML Serving Model and Predictor API documentation.

Use TensorFlow with Amazon SageMaker

Use TensorFlow Version 1.11 and Later

For TensorFlow versions 1.11 and later, the Amazon SageMaker Python SDK supports script mode training scripts.

What do you want to do?

I want to train a custom TensorFlow model in SageMaker.

For a sample Jupyter notebook, see TensorFlow script mode training and serving.

For documentation, see Train a Model with TensorFlow.
I have a TensorFlow model that I trained in SageMaker, and I want to deploy it to a hosted endpoint.

For more information, see Deploy TensorFlow Serving models.

I have a TensorFlow model that I trained outside of SageMaker, and I want to deploy it to a SageMaker endpoint.

For more information, see Deploying directly from model artifacts.

I want to see the API documentation for Amazon SageMaker Python SDK TensorFlow classes.

For more information, see TensorFlow Estimator.

I want to find the SageMaker TensorFlow container repository.

For more information, see SageMaker TensorFlow Container GitHub repository.

I want to find information about TensorFlow versions supported by AWS Deep Learning Containers.

For more information, see Available Deep Learning Container Images.

For general information about writing TensorFlow script mode training scripts and using TensorFlow script mode estimators and models with SageMaker, see Using TensorFlow with the SageMaker Python SDK.

Use TensorFlow Legacy Mode for Versions 1.11 and Earlier

The Amazon SageMaker Python SDK provides a legacy mode that supports TensorFlow versions 1.11 and earlier. Use legacy mode TensorFlow training scripts to run TensorFlow jobs in SageMaker if:

- You have existing legacy mode scripts that you do not want to convert to script mode.
- You want to use a TensorFlow version earlier than 1.11.

For information about writing legacy mode TensorFlow scripts to use with the SageMaker Python SDK, see TensorFlow SageMaker Estimators and Models.

Supported Regions and Quotas

For the AWS Regions supported by Amazon SageMaker and the Amazon Elastic Compute Cloud (Amazon EC2) instance types that are available in each Region, see Amazon SageMaker Pricing.

For a list of the SageMaker service endpoints for each Region and the SageMaker service quotas for each instance type, see Amazon SageMaker endpoints and quotas.

Note
The following SageMaker features aren't available in the Asia Pacific (Osaka) Region:

- Amazon SageMaker Autopilot
- Clarify
- SageMaker Edge Manager
- Ground Truth
- Hyperparameter tuning (HPO)
- JumpStart
- Amazon SageMaker Model Monitor
- Reinforcement learning
Amazon SageMaker Studio is available in all the AWS Regions supported by Amazon SageMaker except the AWS GovCloud (US) Regions. In the supported Regions, Studio is available in the same Availability Zones as notebook instances.

Amazon SageMaker Pipelines is available in all the AWS Regions supported by AWS except the AWS GovCloud (US) Regions. SageMaker Projects is available in the AWS regions where CodePipeline is available. For more information about CodePipeline region availability, see the AWS Regional Services List.

For the Availability Zones supported by SageMaker, see Availability Zones (p. 2648).

About service quotas

Depending on your activities and resource usage over time, your SageMaker quotas might be different from the default SageMaker quotas listed on Amazon SageMaker endpoints and quotas in the AWS General Reference. If you encounter error messages that you've exceeded your quota and you need to scale up your SageMaker resources, follow the steps in the Request a service quota increase for SageMaker resources (p. 32) procedure on this page to request a quota increase from AWS Support. The SageMaker service team reviews and evaluates requests on case-by-case basis. For additional information, see How do I resolve the ResourceLimitExceeded error in Amazon SageMaker? in the AWS Support Knowledge Center and AWS Service Quotas in the AWS General Reference.

Request a service quota increase for SageMaker resources

Follow the steps in this procedure to request a quota (also known as limit) increase for SageMaker resources.

To request a service quota increase

1. Sign in to the AWS Support console at AWS Support Center.
2. In the left navigation pane, choose Your support cases, and then choose Create case.
3. For Limit type in the Case details section, choose the specific SageMaker component.
4. For Request 1 in the Requests section, choose Region, Resource Type, and Limit for a resource which you want to increase the quota.
5. For New limit value, type an integer value for a new quota.
6. For Case description, include the following items:
   a. The error message showing the current quota. For example, the error message should look like the following:

   ```
   ResourceLimitExceeded: An error occurred (ResourceLimitExceeded) when calling the CreateTrainingJob operation: The account-level service limit ‘ml.p3dn.24xlarge for training job usage’ is 0 Instances, with current utilization of 0 Instances and a request delta of 1 Instances. Please contact AWS support to request an increase for this limit.
   ```
   b. A brief description of your use case that requires the service quota increase.
7. If you want to add more quota increase requests for other resources, choose Add another request and repeat the previous steps.
8. Choose Submit to finish the request.
Get Started with Amazon SageMaker

This video shows you how to setup and use SageMaker Studio. (Length: 19:14)

Before you can use Amazon SageMaker, you must sign up for an AWS account and create an IAM admin user.

After you complete these tasks, try out the Get Started guides. The guides walk you through training your first model using SageMaker Studio, or the SageMaker console and the SageMaker API.

Topics
- Set Up Amazon SageMaker (p. 33)
- Onboard to Amazon SageMaker Studio (p. 34)
- Get Started with Amazon SageMaker Notebook Instances (p. 41)

Set Up Amazon SageMaker

In this section, you sign up for an AWS account, create an IAM admin user, and onboard to Amazon SageMaker Studio.

If you're new to SageMaker, we recommend that you read How Amazon SageMaker Works (p. 3).

Topics
- Create an AWS Account (p. 33)
- Create an IAM Administrator User and Group (p. 33)

Create an AWS Account

In this section, you sign up for an AWS account. If you already have an AWS account, skip this step.

When you sign up for Amazon Web Services (AWS), your AWS account is automatically signed up for all AWS services, including SageMaker. You are charged only for the services that you use.

To create an AWS account

2. Follow the online instructions.
   Part of the sign-up procedure involves receiving a phone call and entering a verification code on the phone keypad.

Write down your AWS account ID because you'll need it for the next task.

Create an IAM Administrator User and Group

When you create an AWS account, you get a single sign-in identity that has complete access to all of the AWS services and resources in the account. This identity is called the AWS account root user. Signing in
to the AWS console using the email address and password that you used to create the account gives you complete access to all of the AWS resources in your account.

We strongly recommend that you not use the root user for everyday tasks, even the administrative ones. Instead, adhere to the Create Individual IAM Users, an AWS Identity and Access Management (IAM) administrator user. Then securely lock away the root user credentials and use them to perform only a few account and service management tasks.

To create an administrator user

- Create an administrator user in your AWS account. For instructions, see Creating Your First IAM User and Administrators Group in the IAM User Guide.

  Note
  
  We assume that you use administrator user credentials for the exercises and procedures in this guide. If you choose to create and use another IAM user, grant that user minimum permissions. For more information, see Authenticating with Identities (p. 2509).

Onboard to Amazon SageMaker Studio

To use Amazon SageMaker Studio and Amazon SageMaker Studio Notebooks, you must complete the Studio onboarding process using the SageMaker console.

When onboarding, you can choose to use either AWS Single Sign-On (AWS SSO) or AWS Identity and Access Management (IAM) for authentication methods. When you use IAM authentication, you can choose either the Quick start or the Standard setup procedure.

  Note
  
  If you onboard using IAM authentication and want to switch to AWS SSO authentication later, you must delete the domain created for you by SageMaker Studio. Then, you need to manually re-import all notebooks and other user data that you created. For more information, see Delete an Amazon SageMaker Studio Domain (p. 40).

The simplest way to create a Amazon SageMaker Studio account is to follow the Quick start procedure. Quick start uses the same default settings as the Standard setup procedures. These settings include shareable notebooks and public internet access. For more control, including the option of using AWS SSO authentication, use the Standard setup procedures.

AWS SSO Authentication

To use AWS SSO authentication with Amazon SageMaker Studio, you must onboard to an AWS SSO organization.

  Note
  
  The SSO organization account must be in the same AWS Region as Amazon SageMaker Studio.

AWS SSO authentication provides the following benefits over IAM authentication:

- Members given access to Studio have a unique sign-in URL that directly opens Studio, and they sign in with their SSO credentials. When you use IAM authentication, you must sign in through the SageMaker console.
- Organizations manage their members in AWS SSO instead of Studio. You can assign multiple members access to Studio at the same time. When you use IAM authentication, you must add and manage members manually one at time using the Studio Control Panel.

Topics
Onboard to Amazon SageMaker Studio Using Quick Start

This topic describes how to onboard to Amazon SageMaker Studio using the Quick start procedure, which uses AWS Identity and Access Management (IAM) authentication. For information on how to onboard using the standard IAM procedure, see Onboard Using IAM (p. 37).

For information on how to onboard using AWS Single Sign-On (AWS SSO), see Onboard Using SSO (p. 36).

To onboard to Studio using Quick start

1. Open the SageMaker console.
2. Choose Amazon SageMaker Studio at the top left of the page.
3. On the SageMaker Studio page, under Get started, choose Quick start.
4. For User name, keep the default name or create a new name. The name can be up to 63 characters. Valid characters: A-Z, a-z, 0-9, and - (hyphen).
5. For Execution role, choose an option from the role selector.
   - If you choose Enter a custom IAM role ARN, the role must have at a minimum, an attached trust policy that grants SageMaker permission to assume the role. For more information, see SageMaker Roles (p. 2537).
   - If you choose Create a new role, the Create an IAM role dialog opens:
     - For S3 buckets you specify, specify additional S3 buckets that users of your notebooks can access. If you don't want to add access to more buckets, choose None.
     - Choose Create role. SageMaker creates a new IAM AmazonSageMaker-ExecutionPolicy role with the AmazonSageMakerFullAccess policy attached.
6. For Projects, see SageMaker Studio Permissions Required to Use Projects (p. 2317). For more control, use the standard setup procedure.
7. Choose Submit.

   Note
   If you receive an error message that you need to create a VPC, see Choose a VPC (p. 39).

   On the SageMaker Studio Control Panel, under Studio Summary, wait for Status to change to Ready.

   When Status is Ready, the user name that you specified is enabled and chosen. The Add user and Delete user buttons, and the Open Studio link are also enabled.

Now that you've onboarded to SageMaker Studio, use the following steps to access Studio later.
To access Studio after you onboard

1. Open the SageMaker console.
2. Choose Amazon SageMaker Studio at the top left of the page.
3. On the Amazon SageMaker Studio Control Panel, choose your user name and then choose Open Studio.

To add more users

1. On the Amazon SageMaker Studio Control Panel, choose Add user.
2. Repeat steps 4 and 5 from the first procedure, "To onboard to Studio using Quick start."
3. Choose Submit.

For information about using SageMaker Studio, see SageMaker Studio (p. 59).

Onboard to Amazon SageMaker Studio Using AWS SSO

This topic describes how to onboard to Amazon SageMaker Studio using AWS SSO authentication. For information on how to onboard using AWS Identity and Access Management (IAM) authentication, see Onboard Using Quick Start (p. 35) or Onboard Using IAM (p. 37).

To onboard to Studio using AWS SSO

1. Open the SageMaker console.
2. Choose Amazon SageMaker Studio at the top left of the page.
5. If you don't have an AWS SSO account in the same Region as your SageMaker Studio Domain, you must create an AWS SSO account in the same Region as your SageMaker Studio Domain before proceeding. To continue to onboard without creating a new AWS SSO account, choose the AWS Identity and Access Management (IAM) authentication method or the Quick start procedure, which also uses IAM.

   For information about setting up AWS SSO for use with Studio, see Set Up AWS SSO for Use with Amazon SageMaker Studio (p. 37).

6. Under Permission, for Execution role for all users, choose an option from the role selector.

   If you choose Enter a custom IAM role ARN, the role must have at a minimum, an attached trust policy that grants SageMaker permission to assume the role. For more information, see SageMaker Roles (p. 2537).

   If you choose Create a new role, the Create an IAM role dialog opens:

   a. For S3 buckets you specify, specify additional S3 buckets that users of your notebooks can access. If you don't want to add access to more buckets, choose None.
   b. Choose Create role. SageMaker creates a new IAM AmazonSageMaker-ExecutionPolicy role with the AmazonSageMakerFullAccess policy attached.

7. For Projects, see SageMaker Studio Permissions Required to Use Projects (p. 2317).
8. Under Network and storage, specify the following:
   - Your VPC information – For more information, see Choose a VPC (p. 39).
• (Optional) **Storage encryption key** – SageMaker uses an AWS KMS key to encrypt your Amazon Elastic File System (Amazon EFS) and Amazon Elastic Block Store (Amazon EBS) file systems. By default, it uses an AWS managed key. To use a customer managed key, enter its key ID or Amazon Resource Name (ARN). For more information, see [Protect Data at Rest Using Encryption](p. 2504).

9. Choose **Assign users**. The **Assign users** page opens and displays a list of your organization's members.

10. To assign users access to SageMaker Studio, choose the check box next to their user name and choose **Assign users**.

11. Send each assigned user the **Studio address** link shown under **Studio Summary**. Your AWS SSO users go to this address to access Studio.

**To access Studio after onboarding**

After you are given access to Studio, you are sent an email inviting you to create a password and activate your AWS SSO account. The email also contains the URL to sign in to Studio.

After you activate your account, go to the Studio URL, sign in, and wait for your user profile to be created. On subsequent visits, you only need to wait for Studio to load.

Bookmark the Studio URL. The URL is also available in the Studio Control Panel.

For information about using SageMaker Studio, see [SageMaker Studio](p. 59).

**Set Up AWS SSO for Use with Amazon SageMaker Studio**

To use AWS SSO authentication, you must belong to an AWS SSO organization. If you don't belong to an AWS SSO organization, you can create one with the following procedure.

**To create an AWS SSO organization**

1. On the **SageMaker Studio** page, under **Get started**, choose **Standard setup**.
2. Choose the **set up an account** link to open the AWS Single Sign-On (AWS SSO) console.
3. Choose **Enable AWS SSO**, and then choose **Create AWS organization**.

   When your organization has been created, the AWS SSO dashboard opens. AWS also sends you email to verify the email address associated with the organization.
4. To add a user to your AWS SSO organization, in the navigation pane, choose **Users**.
5. On the **Users** page, choose **Add user**. Under **User details**, specify all required fields. For **Password**, choose **Send an email to the user**.
6. Choose **Next: Groups** and then **Add user**. AWS sends an email to the user inviting them to create a password and activate their AWS SSO account.
7. To add more users, repeat steps 4 through 6.

Return to SageMaker Studio to continue to onboard using AWS SSO authentication.

**Onboard to Amazon SageMaker Studio Using IAM**

This topic describes how to onboard to Amazon SageMaker Studio using the standard setup procedure for AWS Identity and Access Management (IAM) authentication. To onboard faster using IAM, see Onboard Using Quick Start (p. 35).

For information on how to onboard using AWS Single Sign-On (AWS SSO), see Onboard Using SSO (p. 36).
To onboard to Studio using IAM

1. Open the SageMaker console.
2. Choose Amazon SageMaker Studio at the top left of the page.
4. For Authentication method, choose AWS Identity and Access Management (IAM).
5. Under Permission, for Execution role for all users, choose an option from the role selector.

   If you choose Enter a custom IAM role ARN, the role must have at a minimum, an attached trust policy that grants SageMaker permission to assume the role. For more information, see SageMaker Roles (p. 2537).

   If you choose Create a new role, the Create an IAM role dialog opens:
   a. For S3 buckets you specify, specify additional S3 buckets that users of your notebooks can access. If you don't want to add access to more buckets, choose None.
   b. Choose Create role. SageMaker creates a new IAM AmazonSageMaker-ExecutionPolicy role with the AmazonSageMakerFullAccess policy attached.
6. For Projects, see SageMaker Studio Permissions Required to Use Projects (p. 2317).
7. Under Network and storage, specify the following:
   
   • Your VPC information – For more information, see Choose a VPC (p. 39).
   • (Optional) Storage encryption key – SageMaker uses an AWS KMS key to encrypt your Amazon Elastic File System (Amazon EFS) and Amazon Elastic Block Store (Amazon EBS) file systems. By default, it uses an AWS managed key. To use a customer managed key, enter its key ID or Amazon Resource Name (ARN). For more information, see Protect Data at Rest Using Encryption (p. 2504).
8. Choose Submit.
   
   On the Amazon SageMaker Studio Control Panel, under Studio Summary, wait for Status to change to Ready and the Add user button to be enabled.
9. Choose Add user.
10. On the Add user page, keep the default name or create a new name. A name can be up to 63 characters. Valid characters: A-Z, a-z, 0-9, and - (hyphen).
   
   For Execution role, choose an option from the role selector.
11. Choose Submit. The Amazon SageMaker Studio Control Panel opens with the new user listed. The Delete user button and the Open Studio link are both enabled.
12. To add more users, repeat steps 7 through 9.
   
   When multiple users are listed, none of the users in the user list is chosen. Choose a user and the Delete user button and the Open Studio link for that user are enabled.
   
   When SageMaker Studio opens, you can start using Studio.

Now that you've onboarded to SageMaker Studio, use the following steps to subsequently access Studio.

Access Studio after you onboard

1. Open the SageMaker console.
2. Choose Amazon SageMaker Studio at the top left of the page.
3. On the Amazon SageMaker Studio Control Panel, choose your user name and then choose Open Studio.
Choose a VPC

This topic provides detailed information on choosing an Amazon Virtual Private Cloud (VPC) when you onboard to Amazon SageMaker Studio. For more information on onboarding to SageMaker Studio, see Onboard to Amazon SageMaker Studio (p. 34).

By default, SageMaker Studio uses two VPCs. One VPC is managed by Amazon SageMaker and provides direct internet access. You specify the other VPC, which provides encrypted traffic between the domain and your Amazon Elastic File System (EFS) volume.

You can change this behavior so that Studio sends all traffic over your specified VPC. When you choose this option, you must provide the subnets, security groups, and interface endpoints that are necessary to communicate with the SageMaker API and SageMaker runtime, and various AWS services, such as Amazon Simple Storage Service (Amazon S3) and Amazon CloudWatch, that are used by Studio and your Studio notebooks.

When you onboard to Studio, you tell Studio to send all traffic over your VPC by setting the network access type to **VPC only**.

To specify the VPC information

When you specify the VPC entities (that is, the VPC, subnet, or security group) in the following procedure, one of three options is presented based on the number of entities you have in the current AWS Region. The behavior is as follows:

- One entity – Studio uses that entity. This can’t be changed.
- Multiple entities – You must choose the entities from the dropdown list.
- No entities – You must create one or more entities in order to use Studio. Choose Create <entity> to open the VPC console in a new browser tab. After you create the entities, return to the Studio Get started page to continue the onboarding process.

This procedure is part of the SageMaker Studio onboarding process when you choose **Standard setup**. Your VPC information is specified under the **Network** section.

1. Choose the VPC.
2. Choose one or more subnets. If you don't choose any subnets, SageMaker uses all the subnets in the VPC.
3. Select the network access type.
   - **Public internet only** – Non-EFS traffic goes through a SageMaker managed VPC, which allows internet access. Traffic between the domain and your Amazon EFS volume is through the specified VPC.
   - **VPC only** – All Studio traffic is through the specified VPC and subnets. Internet access is disabled by default.
4. Choose the security groups. If you chose **Public internet only**, this step is optional. If you chose **VPC only**, this step is required.

   **Note**
   
   For the maximum number of allowed security groups, see UserSettings.

For VPC requirements in **VPC only** mode, see Connect SageMaker Studio Notebooks to Resources in a VPC (p. 2593).
Delete an Amazon SageMaker Studio Domain

When you onboard to Amazon SageMaker Studio using IAM authentication, Studio creates a domain for your account. A domain consists of a list of authorized users, configuration settings, and an Amazon Elastic File System (Amazon EFS) volume, which contains data for the users, including notebooks, resources, and artifacts. A user can have multiple applications (apps) which support the reading and execution experience of the user’s notebooks, terminals, and consoles. For more information on the EFS volume, see Manage Your EFS Storage Volume in SageMaker Studio (p. 116).

To return Studio to the state it was in before you onboarded, you must delete this domain. You can delete the domain by using the Studio Control Panel, the AWS Command Line Interface (AWS CLI), or the SageMaker SDK. When you use the Studio Control Panel to delete the domain, the Amazon EFS volume is detached but not deleted. The same behavior occurs by default when you use the AWS CLI or the SDK to delete the domain. However, when you use the AWS CLI or the SDK, you can set the RetentionPolicy to HomeEfsFileSystem=Delete to delete the EFS volume along with the domain.

You must delete the domain if you want to switch authentication modes from IAM to AWS SSO.

To delete a domain, the domain cannot contain any user profiles. To delete a user profile, the profile cannot contain any non-failed apps.

When you delete these resources, the following occurs:

- **App** – The data (files and notebooks) in a user's home directory is saved. Unsaved notebook data is lost.
- **User profile** – The user is no longer able to sign in to Studio and loses access to their home directory but the data is not deleted. An admin can retrieve the data from the Amazon EFS volume where it is stored under the user's AWS account.

**Note**

You must have admin permission to delete a domain.

You can only delete an app whose status is InService, which is displayed as Ready in Studio. An app whose status is Failed doesn't need to be deleted to delete the containing domain. In Studio, an attempt to delete an app in the failed state results in an error.

Topics
- Delete a SageMaker Studio Domain (Studio) (p. 40)
- Delete a SageMaker Studio Domain (CLI) (p. 41)

Delete a SageMaker Studio Domain (Studio)

To delete a domain

1. Open the SageMaker console.
2. Choose Amazon SageMaker Studio at the top left of the page to open the Amazon SageMaker Studio Control Panel.
3. Repeat the following steps for each user in the User name list.
   a. Choose the user.
   b. On the User Details page, for each non-failed app in the Apps list, choose Delete app.
   c. On the Delete app dialog, choose Yes, delete app, type delete in the confirmation field, and then choose Delete.
   d. When the Status for all apps show as Deleted, choose Delete user.
Important
When a user is deleted, they lose access to the Amazon EFS volume that contains their data, including notebooks and other artifacts. The data is not deleted and can be accessed by an administrator.

4. When all users are deleted, choose Delete Studio.
5. On the Delete Studio dialog, choose Yes, delete Studio, type delete in the confirmation field, and then choose Delete.

Delete a SageMaker Studio Domain (CLI)

To delete a domain
1. Retrieve the list of domains in your account.

   ```bash
   aws --region Region sagemaker list-domains
   ```

2. Retrieve the list of applications for the domain to be deleted.

   ```bash
   aws --region Region sagemaker list-apps --domain-id-equals DomainId
   ```

3. Delete each application in the list.

   ```bash
   aws --region Region sagemaker delete-app --domain-id DomainId --app-name AppName --app-type AppType --user-profile-name UserProfileName
   ```

4. Retrieve the list of user profiles in the domain.

   ```bash
   aws --region Region sagemaker list-user-profiles --domain-id-equals DomainId
   ```

5. Delete each user profile in the list.

   ```bash
   aws --region Region sagemaker delete-user-profile --domain-id DomainId --user-profile-name UserProfileName
   ```

6. Delete the domain. To also delete the Amazon EFS volume, specify HomeEfsFileSystem=Delete.

   ```bash
   aws --region Region sagemaker delete-domain --domain-id DomainId --retention-policy HomeEfsFileSystem=Retain
   ```

Get Started with Amazon SageMaker Notebook Instances

One of the best ways for machine learning (ML) practitioners to use Amazon SageMaker is to train and deploy ML models using SageMaker notebook instances. The SageMaker notebook instances help create
the environment by initiating Jupyter servers on Amazon Elastic Compute Cloud (Amazon EC2) and providing preconfigured kernels with the following packages: the Amazon SageMaker Python SDK, AWS SDK for Python (Boto3), AWS Command Line Interface (AWS CLI), Conda, Pandas, deep learning framework libraries, and other libraries for data science and machine learning.

Machine Learning with the SageMaker Python SDK

To train, validate, deploy, and evaluate an ML model in a SageMaker notebook instance, use the SageMaker Python SDK. The SageMaker Python SDK abstracts AWS SDK for Python (Boto3) and SageMaker API operations. It enables you to integrate with and orchestrate other AWS services, such as Amazon Simple Storage Service (Amazon S3) for saving data and model artifacts, Amazon Elastic Container Registry (ECR) for importing and servicing the ML models, Amazon Elastic Compute Cloud (Amazon EC2) for training and inference.

You can also take advantage of SageMaker features that help you deal with every stage of a complete ML cycle: data labeling, data preprocessing, model training, model deployment, evaluation on prediction performance, and monitoring the quality of model in production.

If you're a first-time SageMaker user, we recommend you to use the SageMaker Python SDK, following the end-to-end ML tutorial. To find the open source documentation, see the Amazon SageMaker Python SDK.

Tutorial Overview

This Get Started tutorial walks you through how to create a SageMaker notebook instance, open a Jupyter notebook with a preconfigured kernel with the Conda environment for machine learning, and start a SageMaker session to run an end-to-end ML cycle. You'll learn how to save a dataset to a default Amazon S3 bucket automatically paired with the SageMaker session, submit a training job of an ML model to Amazon EC2, and deploy the trained model for prediction by hosting or batch inferencing through Amazon EC2.

This tutorial explicitly shows a complete ML flow of training the XGBoost model from the SageMaker built-in model pool. You use the US Adult Census dataset, and you evaluate the performance of the trained SageMaker XGBoost model on predicting individuals' income.

- **SageMaker XGBoost** – The XGBoost model is adapted to the SageMaker environment and preconfigured as Docker containers. SageMaker provides a suite of built-in algorithms that are prepared for using SageMaker features. To learn more about what ML algorithms are adapted to SageMaker, see Choose an Algorithm and Use Amazon SageMaker Built-in Algorithms. For the SageMaker built-in algorithm API operations, see First-Party Algorithms in the Amazon SageMaker Python SDK.

- **Adult Census dataset** – The dataset from the 1994 Census bureau database by Ronny Kohavi and Barry Becker (Data Mining and Visualization, Silicon Graphics). The SageMaker XGBoost model is trained using this dataset to predict if an individual makes over $50,000 a year or less.

Topics

- **Step 1: Create an Amazon SageMaker Notebook Instance** (p. 43)
- **Step 2: Create a Jupyter Notebook** (p. 44)
- **Step 3: Download, Explore, and Transform a Dataset** (p. 45)
- **Step 4: Train a Model** (p. 49)
- **Step 5: Deploy the Model to Amazon EC2** (p. 53)
- **Step 6: Evaluate the Model** (p. 55)
- **Step 7: Clean Up** (p. 58)
Step 1: Create an Amazon SageMaker Notebook Instance

An Amazon SageMaker notebook instance is a fully managed machine learning (ML) Amazon Elastic Compute Cloud (Amazon EC2) compute instance that runs the Jupyter Notebook App. You use the notebook instance to create and manage Jupyter notebooks for preprocessing data and to train and deploy machine learning models.

To create a SageMaker notebook instance

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. Choose Notebook instances, and then choose Create notebook instance.
3. On the Create notebook instance page, provide the following information (if a field is not mentioned, leave the default values):
   a. For Notebook instance name, type a name for your notebook instance.
   b. For Instance type, choose ml.t2.medium. This is the least expensive instance type that notebook instances support, and it suffices for this exercise. If a ml.t2.medium instance type isn't available in your current AWS Region, choose ml.t3.medium.
   c. For IAM role, choose Create a new role, and then choose Create role. This IAM role automatically gets permissions to access any S3 bucket that has sagemaker in the name. It gets these permissions through the AmazonSageMakerFullAccess policy, which SageMaker attaches to the role.

      Note
      If you want to grant the IAM role permission to access S3 buckets without sagemaker in the name, you need to attach the S3FullAccess policy or limit the permissions to specific S3 buckets to the IAM role. For more information and examples of adding bucket policies to the IAM role, see Bucket Policy Examples.
   d. Choose Create notebook instance.

      In a few minutes, SageMaker launches an ML compute instance—in this case, a notebook instance—and attaches a 5 GB of Amazon EBS storage volume to it. The notebook instance has a preconfigured Jupyter notebook server, SageMaker and AWS SDK libraries, and a set of Anaconda libraries.

      For more information about creating a SageMaker notebook instance, see Create a Notebook Instance.

(Optional) Change SageMaker Notebook Instance Settings

If you want to change the ML compute instance type or the size of the Amazon EBS storage of a SageMaker notebook instance that's already created, you can edit the notebook instance settings.

To change and update the SageMaker Notebook instance type and the EBS volume

1. On the Notebook instances page in the SageMaker console, choose your notebook instance.
2. Choose Actions, choose Stop, and then wait until the notebook instance fully stops.
3. After the notebook instance status changes to Stopped, choose Actions, and then choose Update setting.
   a. For Notebook instance type, choose a different ML instance type.
   b. For Volume size in GB, type a different integer to specify a new EBS volume size.
Step 2: Create a Jupyter Notebook

To start scripting for training and deploying your model, create a Jupyter notebook in the SageMaker notebook instance. Using the Jupyter notebook, you can conduct machine learning (ML) experiments for training and inference while accessing the SageMaker features and the AWS infrastructure.

To create a Jupyter notebook

1. Open the notebook instance as follows:
   b. On the Notebook instances page, open your notebook instance by choosing either Open JupyterLab for the JupyterLab interface or Open Jupyter for the classic Jupyter view.

   **Note**
   If the notebook instance status shows Pending in the Status column, your notebook instance is still being created. The status will change to InService when the notebook instance is ready for use.

2. Create a notebook as follows:
   - If you opened the notebook in the JupyterLab view, on the File menu, choose New, and then choose Notebook. For Select Kernel, choose conda_python3. This preinstalled environment includes the default Anaconda installation and Python 3.
   - If you opened the notebook in the classic Jupyter view, on the Files tab, choose New, and then choose conda_python3. This preinstalled environment includes the default Anaconda installation and Python 3.

3. Save the notebooks as follows:
   - In the JupyterLab view, choose File, choose Save Notebook As..., and then rename the notebook.
   - In the Jupyter classic view, choose File, choose Save as..., and then rename the notebook.

For more information about updating SageMaker notebook instance settings, see Update a Notebook Instance.

(Optional) Advanced Settings for SageMaker Notebook Instances

The following tutorial video shows how to set up and use SageMaker notebook instances through the SageMaker console with advanced options, such as SageMaker lifecycle configuration and importing GitHub repositories. (Length: 26:04)

For complete documentation about SageMaker notebook instance, see Use Amazon SageMaker notebook instances.
Step 3: Download, Explore, and Transform Data

In this step, you load the Adult Census dataset to your notebook instance using the SHAP (SHapley Additive exPlanations) Library, review the dataset, transform it, and upload it to Amazon S3.

To run the following example, paste the sample code into a cell in your notebook instance.

Load Adult Census Dataset Using SHAP

Using the SHAP library, import the Adult Census dataset as shown following:

```python
import shap
X, y = shap.datasets.adult()
X_display, y_display = shap.datasets.adult(display=True)
feature_names = list(X.columns)
feature_names
```

**Note**

If the current Jupyter kernel does not have the SHAP library, install it by running the following conda command:

```
%conda install -c conda-forge shap
```

If you're using JupyterLab, you must manually refresh the kernel after the installation and updates have completed. Run the following IPython script to shut down the kernel (the kernel will restart automatically):

```
import IPython
IPython.Application.instance().kernel.do_shutdown(True)
```

The feature_names list object should return the following list of features:

```
['Age',
 'Workclass',
 'Education-Num',
 'Marital Status',
 'Occupation',
 'Relationship',
 'Race',
 'Sex',
 'Capital Gain',
 'Capital Loss',
 'Hours per week',
 'Country']
```

**Tip**

If you're starting with unlabeled data, you can use Amazon SageMaker Ground Truth to create a data labeling workflow in minutes. To learn more, see Label Data.

Overview the Dataset

Run the following script to display the statistical overview of the dataset and histograms of the numeric features.

```
display(X.describe())
```
Step 3: Download, Explore, and Transform Data

```python
hist = X.hist(bins=30, sharey=True, figsize=(20, 10))
```

**Tip**

If you want to use a dataset that needs to be cleaned and transformed, you can simplify and streamline data preprocessing and feature engineering using Amazon SageMaker Data Wrangler. To learn more, see Prepare ML Data with Amazon SageMaker Data Wrangler.

### Split the Dataset into Train, Validation, and Test Datasets

Using Sklearn, split the dataset into a training set and a test set. The dataset is randomly sorted with the fixed random seed: 80 percent of the dataset for training set and 20 percent of it for a test set.

```python
from sklearn.model_selection import train_test_split
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=1)
X_train_display = X_display.loc[X_train.index]
```

Split the training set to separate out a validation set. 75 percent of the training set becomes the final training set, and the rest is the validation set.

```python
X_train, X_val, y_train, y_val = train_test_split(X_train, y_train, test_size=0.25, random_state=1)
X_train_display = X_display.loc[X_train.index]
X_val_display = X_display.loc[X_val.index]
```

Using the pandas package, explicitly align each dataset by concatenating the numeric features with the true labels.

```python
import pandas as pd
```
train = pd.concat([pd.Series(y_train, index=X_train.index, name='Income>50K', dtype=int), X_train], axis=1)
validation = pd.concat([pd.Series(y_val, index=X_val.index, name='Income>50K', dtype=int), X_val], axis=1)
test = pd.concat([pd.Series(y_test, index=X_test.index, name='Income>50K', dtype=int), X_test], axis=1)

Check if the dataset is split and structured as expected:

test

```
Convert the Train and Validation Datasets to CSV Files

Convert the train and validation dataframe objects to CSV files to match the input file format for the XGBoost algorithm.

```python
# Use 'csv' format to store the data
# The first column is expected to be the output column
train.to_csv('train.csv', index=False, header=False)
validation.to_csv('validation.csv', index=False, header=False)
```

Upload the Datasets to Amazon S3

Using the SageMaker and Boto3, upload the training and validation datasets to the default Amazon S3 bucket. The datasets in the S3 bucket will be used by a compute-optimized SageMaker instance on Amazon EC2 for training.

The following code sets up the default S3 bucket URI for your current SageMaker session, creates a new demo-sagemaker-xgboost-adult-income-prediction folder, and uploads the training and validation datasets to the data subfolder.

```python
import sagemaker, boto3, os
bucket = sagemaker.Session().default_bucket()
prefix = "demo-sagemaker-xgboost-adult-income-prediction"
boto3.Session().resource('s3').Bucket(bucket).Object(os.path.join(prefix, 'data/train.csv')).upload_file('train.csv')
boto3.Session().resource('s3').Bucket(bucket).Object(os.path.join(prefix, 'data/validation.csv')).upload_file('validation.csv')
```

Run the following AWS CLI to check if the CSV files are successfully uploaded to the S3 bucket.

```bash
aws s3 ls {bucket}/{prefix}/data --recursive
```

This should return the following output:

```
2021-01-14 17:52:09  786285 demo-sagemaker-xgboost-adult-income-prediction/data/train.csv
2021-01-14 17:52:10  262122 demo-sagemaker-xgboost-adult-income-prediction/data/validation.csv
```
Step 4: Train a Model

The Amazon SageMaker Python SDK provides framework estimators and generic estimators to train your model while orchestrating the machine learning (ML) lifecycle accessing the SageMaker features for training and the AWS infrastructures, such as Amazon Elastic Container Registry (Amazon ECR), Amazon Elastic Compute Cloud (Amazon EC2), Amazon Simple Storage Service (Amazon S3). For more information about SageMaker built-in framework estimators and algorithm estimators, see Frameworks and First-Party Algorithms respectively in the Amazon SageMaker Python SDK documentation.

Topics
- Choose the Training Algorithm (p. 49)
- Create and Run a Training Job (p. 49)

Choose the Training Algorithm

To choose the right algorithm for your dataset, you typically need to evaluate different models to find the most suitable models to your data. For simplicity, the SageMaker XGBoost Algorithm (p. 1568) built-in algorithm is used throughout this tutorial without the pre-evaluation of models.

Tip
If you want SageMaker to find an appropriate model for your tabular dataset, use Amazon SageMaker Autopilot that automates a machine learning solution. For more information, see Automate model development with Amazon SageMaker Autopilot (p. 164).

Create and Run a Training Job

After you figured out which model to use, start constructing a SageMaker estimator for training. This tutorial uses the XGBoost built-in algorithm for the SageMaker generic estimator.

To run a model training job

1. Import the Amazon SageMaker Python SDK and start by retrieving the basic information from your current SageMaker session.

   ```python
   import sagemaker
   region = sagemaker.Session().boto_region_name
   print("AWS Region: {}").format(region))
   role = sagemaker.get_execution_role()
   print("RoleArn: {}").format(role))
   ```

   This returns the following information:
   - region – The current AWS Region where the SageMaker notebook instance is running.
   - role – The IAM role used by the notebook instance.

   Note
   Check the SageMaker Python SDK version by running sagemaker.__version__. This tutorial is based on sagemaker>=2.20. If the SDK is outdated, install the latest version by running the following command:

   ```bash
   ! pip install -qU sagemaker
   ```

49
If you run this installation in your exiting SageMaker Studio or notebook instances, you need to manually refresh the kernel to finish applying the version update.

2. Create an XGBoost estimator using the sagemaker.estimator.Estimator class. In the following example code, the XGBoost estimator is named `xgb_model`.

```python
from sagemaker.debugger import Rule, rule_configs
from sagemaker.session import TrainingInput
s3_output_location='s3://{}/{}/{}'.format(bucket, prefix, 'xgboost_model')
container=sagemaker.image_uris.retrieve("xgboost", region, "1.2-1")
print(container)

xgb_model=sagemaker.estimator.Estimator(
    image_uri=container,
    role=role,
    instance_count=1,
    instance_type='ml.m4.xlarge',
    train_volume_size=5,
    output_path=s3_output_location,
    sagemaker_session=sagemaker.Session(),
    rules=[Rule.sagemaker(rule_configs.create_xgboost_report())]
)
```

To construct the SageMaker estimator, specify the following parameters:

- **image_uri** – Specify the training container image URI. In this example, the SageMaker XGBoost training container URI is specified using `sagemaker.image_uris.retrieve`.

- **role** – The AWS Identity and Access Management (IAM) role that SageMaker uses to perform tasks on your behalf (for example, reading training results, call model artifacts from Amazon S3, and writing training results to Amazon S3).

- **instance_count** and **instance_type** – The type and number of Amazon EC2 ML compute instances to use for model training. For this training exercise, you use a single `ml.m4.xlarge` instance, which has 4 CPUs, 16 GB of memory, an Amazon Elastic Block Store (Amazon EBS) storage, and a high network performance. For more information about EC2 compute instance types, see Amazon EC2 Instance Types. For more information about billing, see Amazon SageMaker pricing.

- **volume_size** – The size, in GB, of the EBS storage volume to attach to the training instance. This must be large enough to store training data if you use File mode (File mode is on by default).

- **output_path** – The path to the S3 bucket where SageMaker stores the model artifact and training results.

- **sagemaker_session** – The session object that manages interactions with SageMaker API operations and other AWS service that the training job uses.

- **rules** – Specify a list of SageMaker Debugger built-in rules. In this example, the `create_xgboost_report()` rule creates an XGBoost report that provides insights into the training progress and results. For more information, see SageMaker Debugger XGBoost Training Report (p. 1763).

**Tip**

If you want to run distributed training of large sized deep learning models, such as convolutional neural networks (CNN) and natural language processing (NLP) models, use SageMaker Distributed for data parallelism or model parallelism. For more information, see Amazon SageMaker Distributed Training Libraries (p. 1823).
3. Set the hyperparameters for the XGBoost algorithm by calling the `set_hyperparameters` method of the estimator. For a complete list of XGBoost hyperparameters, see XGBoost Hyperparameters (p. 1575).

```python
xgb_model.set_hyperparameters(
    max_depth = 5,
    eta = 0.2,
    gamma = 4,
    min_child_weight = 6,
    subsample = 0.7,
    objective = "binary:logistic",
    num_round = 1000
)
```

**Tip**
You can also tune the hyperparameters using the SageMaker hyperparameter optimization feature. For more information, see Perform Automatic Model Tuning with SageMaker (p. 1797).

4. Use the `TrainingInput` class to configure a data input flow for training. The following example code shows how to configure `TrainingInput` objects to use the training and validation datasets you uploaded to Amazon S3 in the Split the Dataset into Train, Validation, and Test Datasets (p. 46) section.

```python
from sagemaker.session import TrainingInput

train_input = TrainingInput(
    "s3://{}/{}/data/train.csv".format(bucket, prefix), content_type="csv"
)

validation_input = TrainingInput(
    "s3://{}/{}/data/validation.csv".format(bucket, prefix), content_type="csv"
)
```

5. To start model training, call the estimator's `fit` method with the training and validation datasets. By setting `wait=True`, the `fit` method displays progress logs and waits until training is complete.

```python
xgb_model.fit({"train": train_input, "validation": validation_input}, wait=True)
```

For more information about model training, see Train a Model with Amazon SageMaker (p. 8). This tutorial training job might take up to 10 minutes.

After the training job has done, you can download an XGBoost training report and a profiling report generated by SageMaker Debugger. The XGBoost training report offers you insights into the training progress and results, such as the loss function with respect to iteration, feature importance, confusion matrix, accuracy curves, and other statistical results of training. For example, you can find the following loss curve from the XGBoost training report which clearly indicates that there is an overfitting problem.
Run the following code to specify the S3 bucket URI where the Debugger training reports are generated and check if the reports exist.

```python
rule_output_path = xgb_model.output_path + "" + xgb_model.latest_training_job.name + "/rule-output"
! aws s3 ls {rule_output_path} --recursive
```

Download the Debugger XGBoost training and profiling reports to the current workspace:

```bash
! aws s3 cp {rule_output_path} ./ --recursive
```

Run the following IPython script to get the file link of the XGBoost training report:

```python
from IPython.display import FileLink, FileLinks
display("Click link below to view the XGBoost Training report", FileLink("CreateXgboostReport/xgboost_report.html"))
```

The following IPython script returns the file link of the Debugger profiling report that shows summaries and details of the EC2 instance resource utilization, system bottleneck detection results, and python operation profiling results:

```python
profiler_report_name = [rule["RuleConfigurationName"]
    for rule in xgb_model.latest_training_job.rule_job_summary()
    if "Profiler" in rule["RuleConfigurationName"]][0]
profiler_report_name
display("Click link below to view the profiler report", FileLink(profiler_report_name + "/profiler-output/profiler-report.html"))
```
Step 5: Deploy the Model

You now have a trained XGBoost model. SageMaker stores the model artifact in your S3 bucket. To find the location of the model artifact, run the following code to print the model_data attribute of the xgb_model estimator:

```python
xgb_model.model_data
```

**Tip**
To measure biases that can occur during each stage of the ML lifecycle (data collection, model training and tuning, and monitoring of ML models deployed for prediction), use SageMaker Clarify. For more information, see Model Explainability (p. 1907). For an end-to-end example of it, see the Fairness and Explainability with SageMaker Clarify example notebook.

**Step 5: Deploy the Model to Amazon EC2**

To get predictions, deploy your model to Amazon EC2 using Amazon SageMaker.

**Topics**
- Deploy the Model to SageMaker Hosting Services (p. 53)
- (Optional) Use SageMaker Predictor to Reuse the Hosted Endpoint (p. 54)
- (Optional) Make Prediction with Batch Transform (p. 54)

**Deploy the Model to SageMaker Hosting Services**

To host a model through Amazon EC2 using Amazon SageMaker, deploy the model that you trained in Create and Run a Training Job (p. 49) by calling the `deploy` method of the `xgb_model` estimator. When you call the `deploy` method, you must specify the number and type of EC2 ML instances that you want to use for hosting an endpoint.

```python
import sagemaker
from sagemaker.serializers import CSVSerializer
xgb_predictor=xgb_model.deploy(
    initial_instance_count=1,
    instance_type='ml.t2.medium',
    serializer=CSVSerializer()
)
```

- `initial_instance_count` (int) – The number of instances to deploy the model.
- `instance_type` (str) – The type of instances that you want to operate your deployed model.
- `serializer` (int) – Serialize input data of various formats (a NumPy array, list, file, or buffer) to a CSV-formatted string. We use this because the XGBoost algorithm accepts input files in CSV format.

The `deploy` method creates a deployable model, configures the SageMaker hosting services endpoint, and launches the endpoint to host the model. For more information, see the SageMaker generic
Estimator's deploy class method in the Amazon SageMaker Python SDK. To retrieve the name of endpoint that's generated by the deploy method, run the following code:

```python
xgb_predictor.endpoint_name
```

This should return the endpoint name of the xgb_predictor. The format of the endpoint name is "sagemaker-xgboost-YYYY-MM-DD-HH-MM-SS-SSS". This endpoint stays active in the ML instance, and you can make instantaneous predictions at any time unless you shut it down later. Copy this endpoint name and save it to reuse and make real-time predictions elsewhere in SageMaker Studio or SageMaker notebook instances.

**Tip**
To learn more about compiling and optimizing your model for deployment to Amazon EC2 instances or edge devices, see Compile and Deploy Models with Neo.

(Optional) Use SageMaker Predictor to Reuse the Hosted Endpoint

After you deploy the model to an endpoint, you can set up a new SageMaker predictor by pairing the endpoint and continuously make real-time predictions in any other notebooks. The following example code shows how to use the SageMaker Predictor class to set up a new predictor object using the same endpoint. Re-use the endpoint name that you used for the xgb_predictor.

```python
import sagemaker
xgb_predictor_reuse=sagemaker.predictor.Predictor(
    endpoint_name="sagemaker-xgboost-YYYY-MM-DD-HH-MM-SS-SSS",
    sagemaker_session=sagemaker.Session(),
    serializer=sagemaker.serializers.CSVSerializer()
)
```

The xgb_predictor_reuse Predictor behaves exactly the same as the original xgb_predictor. For more information, see the SageMaker Predictor class in the Amazon SageMaker Python SDK.

(Optional) Make Prediction with Batch Transform

Instead of hosting an endpoint in production, you can run a one-time batch inference job to make predictions on a test dataset using the SageMaker batch transform. After your model training has completed, you can extend the estimator to a transformer object, which is based on the SageMaker Transformer class. The batch transformer reads in input data from a specified S3 bucket and makes predictions.

**To run a batch transform job**

1. Run the following code to convert the feature columns of the test dataset to a CSV file and uploads to the S3 bucket:

   ```python
   X_test.to_csv('test.csv', index=False, header=False)
   boto3.Session().resource('s3').Bucket(bucket).Object(os.path.join(prefix, 'test/test.csv')).upload_file('test.csv')
   ```

2. Specify S3 bucket URIs of input and output for the batch transform job as shown following:

   ```python
   # The location of the test dataset
   batch_input = 's3:///{}/test'.format(bucket, prefix)
   # The location to store the results of the batch transform job
   batch_output = 's3:///{}/batch-prediction'.format(bucket, prefix)
   ```
3. Create a transformer object specifying the minimal number of parameters: the `instance_count` and `instance_type` parameters to run the batch transform job, and the `output_path` to save prediction data as shown following:

```python
transformer = xgb_model.transformer(
    instance_count=1,
    instance_type='ml.m4.xlarge',
    output_path=batch_output
)
```

4. Initiate the batch transform job by executing the `transform()` method of the `transformer` object as shown following:

```python
transformer.transform(
    data=batch_input,
    data_type='S3Prefix',
    content_type='text/csv',
    split_type='Line'
)  
transformer.wait()
```

5. When the batch transform job is complete, SageMaker creates the `test.csv.out` prediction data saved in the `batch_output` path, which should be in the following format: `s3://sagemaker-<region>-111122223333/demo-sagemaker-xgboost-adult-income-prediction/batch-prediction`. Run the following AWS CLI to download the output data of the batch transform job:

```bash
! aws s3 cp {batch_output} ./ --recursive
```

This should create the `test.csv.out` file under the current working directory. You'll be able to see the float values that are predicted based on the logistic regression of the XGBoost training job.

## Step 6: Evaluate the Model

Now that you have trained and deployed a model using Amazon SageMaker, evaluate the model to ensure that it generates accurate predictions on new data. For model evaluation, use the test dataset that you created in Step 3: Download, Explore, and Transform a Dataset (p. 45).

### Evaluate the Model Deployed to SageMaker Hosting Services

To evaluate the model and use it in production, invoke the endpoint with the test dataset and check whether the inferences you get returns a target accuracy you want to achieve.

#### To evaluate the model

1. Set up the following function to predict each line of the test set. In the following example code, the `rows` argument is to specify the number of lines to predict at a time. You can change the value of it to perform a batch inference that fully utilizes the instance's hardware resource.

```python
import numpy as np

def predict(data, rows=1000):
    split_array = np.array_split(data, int(data.shape[0] / float(rows) + 1))
    predictions = ''
    for array in split_array:
        predictions = ', '.join([predictions, xgb_predictor.predict(array).decode('utf-8')])
    return np.fromstring(predictions[1:], sep=',')
```
2. Run the following code to make predictions of the test dataset and plot a histogram. You need to take only the feature columns of the test dataset, excluding the 0th column for the actual values.

```python
import matplotlib.pyplot as plt

predictions = predict(test.to_numpy()[:, 1:])
plt.hist(predictions)
plt.show()
```

3. The predicted values are float type. To determine True or False based on the float values, you need to set a cutoff value. As shown in the following example code, use the Scikit-learn library to return the output confusion metrics and classification report with a cutoff of 0.5.

```python
import sklearn
cutoff = 0.5
print(sklearn.metrics.confusion_matrix(test.iloc[:, 0], np.where(predictions > cutoff, 1, 0)))
print(sklearn.metrics.classification_report(test.iloc[:, 0], np.where(predictions > cutoff, 1, 0)))
```

This should return the following confusion matrix:

```
[[4670  356]
 [ 480 1007]]
```

<table>
<thead>
<tr>
<th>precision</th>
<th>recall</th>
<th>f1-score</th>
<th>support</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0.91</td>
<td>0.93</td>
<td>5026</td>
</tr>
<tr>
<td>1</td>
<td>0.74</td>
<td>0.68</td>
<td>1487</td>
</tr>
</tbody>
</table>

- accuracy: 0.87
- macro avg: 0.82
- weighted avg: 0.87

4. To find the best cutoff with the given test set, compute the log loss function of the logistic regression. The log loss function is defined as the negative log-likelihood of a logistic model that returns prediction probabilities for its ground truth labels. The following example code numerically and iteratively calculates the log loss values (-\(y \times \log(p) + (1-y) \times \log(1-p)\)), where \(y\) is the true label and \(p\) is a probability estimate of the corresponding test sample. It returns a log loss versus cutoff graph.

```python
import matplotlib.pyplot as plt
cutoffs = np.arange(0.01, 1, 0.01)
log_loss = []
```
5. Find the minimum points of the error curve using the NumPy `argmin` and `min` functions:

```python
print('Log loss is minimized at a cutoff of {}, cutoffs[np.argmin(log_loss)],
     ', and the log loss value at the minimum is {}, np.min(log_loss)
   )
```

This should return: Log loss is minimized at a cutoff of 0.53, and the log loss value at the minimum is 4.348539186773897.

Instead of computing and minimizing the log loss function, you can estimate a cost function as an alternative. For example, if you want to train a model to perform a binary classification for a business problem such as a customer churn prediction problem, you can set weights to the elements of confusion matrix and calculate the cost function accordingly.

You have now trained, deployed, and evaluated your first model in SageMaker.

**Tip**
To monitor model quality, data quality, and bias drift, use Amazon SageMaker Model Monitor and SageMaker Clarify. To learn more, see Amazon SageMaker Model Monitor, Monitor Data Quality, Monitor Model Quality, Monitor Bias Drift, and Monitor Feature Attribution Drift.

**Tip**
To get human review of low confidence ML predictions or a random sample of predictions, use Amazon Augmented AI human review workflows. For more information, see Using Amazon Augmented AI for Human Review.
Step 7: Clean Up

To avoid incurring unnecessary charges, use the AWS Management Console to delete the endpoints and resources that you created while running the exercises.

**Note**
Training jobs and logs cannot be deleted and are retained indefinitely.

**Note**
If you plan to explore other exercises in this guide, you might want to keep some of these resources, such as your notebook instance, S3 bucket, and IAM role.

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/ and delete the following resources:
   - The endpoint. Deleting the endpoint also deletes the ML compute instance or instances that support it.
     1. Under **Inference**, choose **Endpoints**.
     2. Choose the endpoint that you created in the example, choose **Actions**, and then choose **Delete**.
   - The endpoint configuration.
     1. Under **Inference**, choose **Endpoint configurations**.
     2. Choose the endpoint configuration that you created in the example, choose **Actions**, and then choose **Delete**.
   - The model.
     1. Under **Inference**, choose **Models**.
     2. Choose the model that you created in the example, choose **Actions**, and then choose **Delete**.
   - The notebook instance. Before deleting the notebook instance, stop it.
     1. Under **Notebook**, choose **Notebook instances**.
     2. Choose the notebook instance that you created in the example, choose **Actions**, and then choose **Stop**. The notebook instance takes several minutes to stop. When the **Status** changes to **Stopped**, move on to the next step.
     3. Choose **Actions**, and then choose **Delete**.

2. Open the Amazon S3 console at https://console.aws.amazon.com/s3/, and then delete the bucket that you created for storing model artifacts and the training dataset.

3. Open the Amazon CloudWatch console at https://console.aws.amazon.com/cloudwatch/, and then delete all of the log groups that have names starting with /aws/sagemaker/.
Amazon SageMaker Studio

Amazon SageMaker Studio is a web-based, integrated development environment (IDE) for machine learning that lets you build, train, debug, deploy, and monitor your machine learning models. SageMaker Studio provides all the tools you need to take your models from experimentation to production while boosting your productivity. In a single unified visual interface, customers can perform the following tasks:

- Write and execute code in Jupyter notebooks
- Build and train machine learning models
- Deploy the models and monitor the performance of their predictions
- Track and debug the machine learning experiments

For information on the onboarding steps to sign in to SageMaker Studio, see Onboard to Amazon SageMaker Studio (p. 34).

For the AWS Regions supported by SageMaker Studio, see Supported Regions and Quotas (p. 31).

Amazon SageMaker Studio UI Overview

Amazon SageMaker Studio extends the JupyterLab interface. Previous users of JupyterLab will notice the similarity of the user interface, including the workspace. Studio adds many additions to the interface. The most prominent additions are detailed in the following sections. For an overview of the basic JupyterLab interface, see The JupyterLab Interface.

The following image shows SageMaker Studio with the file browser open and the Studio Launcher displayed.
At the top of the screen is the **menu bar**. At the left of the screen is the **left sidebar** which contains icons to open file browsers, resource browsers, and tools. At the right of the screen is the **right sidebar**, represented by the **Settings** icon (⚙️), which displays contextual property settings when open. At the bottom of the screen is the **status bar**.

Above the **Settings** icon, there's a button to provide feedback about your experiences with SageMaker Studio.

To the left of the **Feedback** button there's the notification icon. Choose the icon to view notifications from Studio such as new Studio versions and new SageMaker features. To update to a new version of Studio, see [Update SageMaker Studio and Studio Apps](p. 117).

The main work area is divided horizontally into two panes. The left pane is the **file and resource browser**. The right pane contains one or more tabs for resources such as notebooks, terminals, metrics, and graphs.

**Topics**

- Left sidebar (p. 60)
- File and resource browser (p. 61)
- Main work area (p. 62)
- Settings (p. 62)

**Left sidebar**

The left sidebar includes the following icons. When you hover over an icon, a tooltip displays the icon name. When you choose an icon, the file and resource browser displays the described functionality. For hierarchical entries, a selectable breadcrumb at the top of the browser shows your location in the hierarchy.
<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
</table>
| ![File Browser](image) | **File Browser**  
Choose the **Upload Files** icon (![](image)) to add files to Studio.  
Double-click a file to open the file in a new tab.  
To have adjacent files open, choose a tab that contains a notebook, Python, or text file, then choose **New View for File**.  
Choose the plus (+) sign on the menu at the top of the file browser to open the Studio Launcher. |
| ![Running Terminals and Kernels](image) | **Running Terminals and Kernels**  
For more information, see [Shut Down Resources](p. 81). |
| ![Git](image) | **Git**  
You can connect to a Git repository and then access a full range of Git tools and operations. For more information, see [Clone a Git Repository in SageMaker Studio](p. 114). |
| ![Commands](image) | **Commands (Ctrl + Shift + C)**  
The majority of the menu commands are available here. |
| ![Notebook Tools](image) | **Notebook Tools**  
You can access a notebook's metadata through the **Advanced Tools** section. This icon is displayed only when a notebook is open. |
| ![Open Tabs](image) | **Open Tabs**  
Provides a list of open tabs, which is useful if you have multiple open tabs. |
| ![SageMaker Jumpstart](image) | **SageMaker Jumpstart**  
Provides a list of solutions, model endpoints, or training jobs created with SageMaker Jumpstart. |
| ![SageMaker Components and registries](image) | **SageMaker Components and registries**  
Provides a list of projects, data wrangler flows, pipelines, experiments, trials, models, or endpoints, or access to the feature store. |

**File and resource browser**

The file and resource browser displays lists of your notebooks, experiments, trials, trial components, and endpoints. On the menu at the top of the file browser, choose the plus (+) sign to open the Studio Launcher. The Launcher allows you to create a notebook, launch a Python interactive shell, or open a terminal.
Main work area

The main work area consists of multiple tabs that contain your open notebooks and terminals, and detailed information about your experiments and endpoints. One commonly used tab is the Trial Component List. This list is referred to as the Leaderboard because it's where you can compare experiments and trials. For more information, see View and Compare Amazon SageMaker Experiments, Trials, and Trial Components (p. 1609).

Settings

The settings pane allows you to adjust table and chart properties. By default, the pane is hidden on the far right of the screen. To open the pane, choose the Settings icon (⚙️) on the top right of the screen.

Use the Amazon SageMaker Studio Launcher

You can use the Amazon SageMaker Studio Launcher to create notebooks and text files, and launch terminals and interactive Python shells.

You can open Studio Launcher in any of the following ways:

- Choose Amazon SageMaker Studio at the top-left of Studio.
- Use the keyboard shortcut Ctrl + Shift + L.
- From the Studio menu, choose File and then choose New Launcher.
- If the Studio file browser is open, choose the plus (+) sign on the Studio file browser menu.

The Launcher opens in a new tab in Studio. Your screen should look similar to the following:
The Launcher consists of following sections:

- **Get started** – Provides material to get started using SageMaker Studio, such as videos and tutorials, and one-click solutions for machine learning problems.
- **ML tasks and components** – Create machine learning tasks and components, such as new feature groups, data flows, and projects.
- **Notebooks and compute resources** – Create a notebook, open an image terminal, or open a Python console.
- **Utilities and files** – Show contextual help from a notebook, create files, or open a system terminal.

Topics

- Notebooks and compute resources (p. 63)
- Utilities and files (p. 63)

**Notebooks and compute resources**

To create or launch an item, choose the SageMaker image that you want the item to run in from the SageMaker image dropdown menu. You can also select the Lifecycle Configuration script that you want to run. For more information, see Use Lifecycle Configurations with Amazon SageMaker Studio (p. 101).

Next, choose the item. When you choose an item from this section, you might incur additional usage charges. For more information, see Usage Metering (p. 83).

The following items are available:

- **Notebook**
  
  Launches the notebook in a kernel session on the chosen SageMaker image. For more information, see Change a Kernel (p. 78).

  Creates the notebook in the folder that you have currently selected in the file browser. To view the file browser, in the left sidebar of Studio, choose the File Browser icon ( )

- **Console**
  
  Launches the shell in a kernel session on the chosen SageMaker image.

  Opens the shell in the folder that you have currently selected in the file browser.

- **Image terminal**
  
  Launches the terminal in a terminal session on the chosen SageMaker image.

  Opens the terminal in the root folder for the user (as shown by the Home folder in the file browser).

**Utilities and files**

Items in this section run in the context of SageMaker Studio and don't incur usage charges.

The following items are available:

- **Show Contextual Help**
  
  Opens a new tab that displays contextual help for functions in a Studio notebook. To display the help, choose a function in an active notebook. To make it easier to see the help in context, drag the help tab
so that it's adjacent to the notebook tab. To open the help tab from within a notebook, press Ctrl + I.

The following screenshot shows the contextual help for the `Experiment.create` method.

*System terminal*

Opens a bash shell in the root folder for the user (as shown by the Home folder in the file browser).

*Text File* and *Markdown File*

Creates a file of the associated type in the folder that you have currently selected in the file browser.

To view the file browser, in the left sidebar, choose the **File Browser** icon ( ).

**Studio Entity Status**

Amazon SageMaker Studio creates the following entities for various purposes.

* **Domain**: A SageMaker Studio domain consists of an associated Amazon Elastic File System (Amazon EFS) volume; a list of authorized users; and a variety of security, application, policy, and Amazon Virtual Private Cloud (Amazon VPC) configurations. An AWS account is limited to one domain per Region. Users within a domain can share notebook files and other artifacts with each other.

* **UserProfile**: A user profile represents a single user within a domain, and is the main way to reference a user for the purposes of sharing, reporting, and other user-oriented features. This entity is created when a user onboards to SageMaker Studio.

* **App**: An app represents an application that supports the reading and execution experience of the user's notebooks, terminals, and consoles. Apps can be either a JupyterServer or a KernelGateway. This operation is automatically invoked by SageMaker Studio upon access to the associated Domain,
and when new kernel configurations are selected by the user. A user may have multiple Apps active simultaneously.

The following tables describe the status values for the Domain, UserProfile, and App entities. Where applicable, they also give troubleshooting steps.

**Domain status values**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pending</td>
<td>Ongoing creation of Domain.</td>
</tr>
<tr>
<td>InService</td>
<td>Successful creation of Domain.</td>
</tr>
<tr>
<td>Updating</td>
<td>Ongoing update of Domain.</td>
</tr>
<tr>
<td>Deleting</td>
<td>Ongoing deletion of Domain.</td>
</tr>
<tr>
<td>Failed</td>
<td>Unsuccessful creation of Domain. Call the DescribeDomain API to see the failure reason for Domain creation. Delete the failed Domain and recreate the Domain after fixing the error mentioned in FailureReason.</td>
</tr>
<tr>
<td>Update_Failed</td>
<td>Unsuccessful update of Domain. Call the DescribeDomain API to see the failure reason for Domain update. Call the UpdateDomain API after fixing the error mentioned in FailureReason.</td>
</tr>
<tr>
<td>Delete_Failed</td>
<td>Unsuccessful deletion of Domain. Call the DescribeDomain API to see the failure reason for Domain deletion. Because deletion failed, you might have some resources that are still running, but you cannot use or update the Domain. Call the DeleteDomain API again after fixing the error mentioned in FailureReason.</td>
</tr>
</tbody>
</table>

**UserProfile status values**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pending</td>
<td>Ongoing creation of UserProfile.</td>
</tr>
<tr>
<td>InService</td>
<td>Successful creation of UserProfile.</td>
</tr>
<tr>
<td>Updating</td>
<td>Ongoing update of UserProfile.</td>
</tr>
<tr>
<td>Deleting</td>
<td>Ongoing deletion of UserProfile.</td>
</tr>
<tr>
<td>Failed</td>
<td>Unsuccessful creation of UserProfile. Unsuccessful creation of UserProfile. Call the DescribeUserProfile API to see the failure reason for UserProfile creation. Delete the failed UserProfile and recreate it after fixing the error mentioned in FailureReason.</td>
</tr>
<tr>
<td>Update_Failed</td>
<td>Unsuccessful update of UserProfile. Call the DescribeUserProfile API to see the error reason after fixing the error mentioned in FailureReason.</td>
</tr>
</tbody>
</table>
Use Amazon SageMaker Studio Notebooks

Amazon SageMaker Studio notebooks are collaborative notebooks that you can launch quickly because you don’t need to set up compute instances and file storage beforehand. A set of instance types, known as Fast launch types are designed to launch in under two minutes. SageMaker Studio notebooks provide persistent storage, which enables you to view and share notebooks even if the instances that the notebooks run on are shut down.

You can share your notebooks with others, so that they can easily reproduce your results and collaborate while building models and exploring your data. You provide access to a read-only copy of the notebook through a secure URL. Dependencies for your notebook are included in the notebook’s metadata. When your colleagues copy the notebook, it opens in the same environment as the original notebook.

A SageMaker Studio notebook runs in an environment defined by the following:

- EC2 instance type – The hardware configuration the notebook runs on. The configuration includes the number and type of processors (vCPU and GPU), and the amount and type of memory. The instance type determines the pricing rate.
- SageMaker image – A container image that is compatible with SageMaker Studio. The image consists of the kernels, language packages, and other files required to run a notebook in Studio. There can be multiple images in an instance. For more information, see Bring your own SageMaker image (p. 86).
- KernelGateway app – A SageMaker image runs as a KernelGateway app. The app provides access to the kernels in the image. There is a one-to-one correspondence between a SageMaker image and a SageMaker app.
• Kernel – The process that inspects and runs the code contained in the notebook. A kernel is defined by a *kernel spec* in the image. There can be multiple kernels in an image.

You can change any of these resources from within the notebook.

The following diagram outlines how a notebook kernel runs in relation to the KernelGateway App, User, and SageMaker Studio Domain.

Sample SageMaker Studio notebooks are available in the `aws_sagemaker_studio` folder of the Amazon SageMaker example GitHub repository. Each notebook comes with the necessary SageMaker image that opens the notebook with the appropriate kernel.

We recommend that you familiarize yourself with the SageMaker Studio interface and the Studio notebook toolbar before creating or using a Studio notebook. For more information, see Amazon SageMaker Studio UI Overview (p. 59) and Use the SageMaker Studio Notebook Toolbar (p. 71).

How Are Amazon SageMaker Studio Notebooks Different from Notebook Instances?

When you're starting a new notebook, we recommend that you create the notebook in Amazon SageMaker Studio instead of launching a notebook instance from the Amazon SageMaker console. There are many benefits to using a SageMaker Studio notebook, including the following:

- Starting a Studio notebook is faster than launching an instance-based notebook. Typically, it is 5-10 times faster than instance-based notebooks.
- Notebook sharing is an integrated feature in SageMaker Studio. Users can generate a shareable link that reproduces the notebook code and also the SageMaker image required to execute it, in just a few clicks.
- SageMaker Studio notebooks come pre-installed with the latest Amazon SageMaker Python SDK.
- SageMaker Studio notebooks are accessed from within Studio. This enables you to build, train, debug, track, and monitor your models without leaving Studio.
- Each member of a Studio team gets their own home directory to store their notebooks and other files. The directory is automatically mounted onto all instances and kernels as they're started, so their notebooks and other files are always available. The home directories are stored in Amazon Elastic File System (Amazon EFS) so that you can access them from other services.
- When using AWS SSO, you use your SSO credentials through a unique URL to directly access SageMaker Studio. You don’t have to interact with the AWS Management Console to run your notebooks.
- Studio notebooks are equipped with a set of predefined SageMaker image settings to get you started faster.

Note

Studio notebooks don't support local mode. However, you can use a notebook instance to train a sample of your dataset locally, and then use the same code in a Studio notebook to train on the full dataset.

When you open a notebook in SageMaker Studio, the view is an extension of the JupyterLab interface. The primary features are the same, so you'll find the typical features of a Jupyter notebook and JupyterLab. For more information about the Studio interface, see Amazon SageMaker Studio UI Overview (p. 59).

Get Started

To get started, you or your organization’s administrator need to complete the Amazon SageMaker Studio onboarding process. For more information, see Onboard to Amazon SageMaker Studio (p. 34).

You can access an SageMaker Studio notebook in any of the following ways:

- You receive an email invitation to access Studio through your organization's AWS SSO account, which includes a direct link to login to Studio without having to use the Amazon SageMaker console. You can proceed to the the section called “Next Steps” (p. 69).
- You receive a link to a shared Studio notebook, which includes a direct link to log in to Studio without having to use the SageMaker console. You can proceed to the the section called “Next Steps” (p. 69).
- You onboard to Studio and then log in to the SageMaker console. For more information, see Onboard to Amazon SageMaker Studio (p. 34).
Log In from the Amazon SageMaker console

To log in from the SageMaker console

1. Onboard to Amazon SageMaker Studio following the instructions on Onboard to Amazon SageMaker Studio (p. 34). If you’ve already onboarded, skip to the next step.
2. Open the SageMaker console.
3. Choose Amazon SageMaker Studio.
4. The Amazon SageMaker Studio Control Panel opens.
5. In the Amazon SageMaker Studio Control Panel, you’ll see a list of user names. Next to your user name, choose Open Studio.

Next Steps

Now that you’re in Studio, you can try any of the following options:

- Create a SageMaker Studio notebook – Continue to the next section.
- Familiarize yourself with the SageMaker Studio interface – See Amazon SageMaker Studio UI Overview (p. 59).
- Explore Studio end-to-end tutorial notebooks – See Amazon SageMaker Studio Tour (p. 69).

Amazon SageMaker Studio Tour

For a walkthrough that takes you on a tour of the main features of Amazon SageMaker Studio, see the xgboost_customer_churn_studio.ipynb sample notebook from the aws/amazon-sagemaker-examples repository. The code in the notebook trains multiple models and sets up the SageMaker Debugger and SageMaker Model Monitor. The walkthrough shows you how to view the trials, compare the resulting models, show the debugger results, and deploy the best model using the SageMaker Studio UI. You don't need to understand the code to follow this walkthrough.

For a series of videos that shows how to use the main features of SageMaker Studio, see NEW! Amazon SageMaker Studio on YouTube.

Prerequisites

To run the notebook for this tour, you need:

- An AWS SSO or IAM account to sign in to Studio. For information, see Onboard to Amazon SageMaker Studio (p. 34).
- Basic familiarity with the Studio user interface and Jupyter notebooks. For information, see Amazon SageMaker Studio UI Overview (p. 59).
- A copy of the aws/amazon-sagemaker-examples repository in your Studio environment.

To clone the repository

1. Sign in to SageMaker Studio. For AWS SSO users, sign in using the URL from your invitation email. For IAM users, follow these steps.
   a. Sign in to the SageMaker console.
   b. Choose Amazon SageMaker Studio in the left navigation pane.
   c. Choose Open Studio in the row next to your user name.
2. On the top menu, choose **File** then **New** then **Terminal**.
3. At the command prompt, run the following command to clone the **aws/amazon-sagemaker-examples** repository.

   ```bash
   git clone https://github.com/aws/amazon-sagemaker-examples.git
   ```

   **Note**
   If you encounter an error when you run the sample notebook, and some time has passed from when you cloned the repository, review the notebook on the remote repository for updates.

### Create or Open an Amazon SageMaker Studio Notebook

When you create a notebook in Amazon SageMaker Studio or open a non-shared notebook in Studio for the first time, you have to select a SageMaker image and kernel for the notebook. SageMaker launches the notebook on a default instance of a type based on the chosen SageMaker image. For CPU based images, the default instance type is `ml.t3.medium` (available as part of the **AWS Free Tier**). For GPU based images, the default instance type is `ml.g4dn.xlarge`.

If you create or open additional notebooks that use the same instance type, whether or not the notebooks use the same kernel, the notebooks run on the same instance of that instance type.

After a notebook is launched, you can change its instance type, and SageMaker image and kernel from within the notebook. For more information, see **Change an Instance Type** (p. 77) and **Change a Kernel** (p. 78).

You can have only one instance of each instance type. Each instance can have multiple SageMaker images running on it. Each SageMaker image can run multiple kernels or terminal instances.

Billing occurs per instance and starts when the first instance of a given instance type is launched. If you want to create or open a notebook without the risk of incurring charges, open the notebook from the **File** menu and choose **No Kernel** from the **Select Kernel** dialog. You can read and edit a notebook without a running kernel but you can't run cells.

Billing ends when the SageMaker image for the instance is shut down. For more information, see **Usage Metering** (p. 83).

For information on shutting down the notebook, see **Shut Down Resources** (p. 81).

**Topics**
- Open a Studio notebook (p. 70)
- Create a Notebook from the File Menu (p. 71)
- Create a Notebook from the Launcher (p. 71)

### Open a Studio notebook

SageMaker Studio can only open notebooks listed in the Studio file browser. For instructions on uploading a notebook to the file browser, see **Upload Files to SageMaker Studio** (p. 113) or **Clone a Git Repository in SageMaker Studio** (p. 114).

To open a notebook

1. In the left sidebar, choose the **File Browser** icon ( webpack ) to display the file browser.
2. Browse to a notebook file and double-click it to open the notebook in a new tab.
Create a Notebook from the File Menu

To create a notebook from the File menu

1. From the Studio menu, choose File, choose New, and then choose Notebook.
2. On the Select Kernel dialog, to use the default kernel, Python 3 (Data Science), choose Select. Otherwise, use the dropdown menu to select a different kernel.

For a list of the available kernels, see Available Amazon SageMaker Kernels (p. 85).

Create a Notebook from the Launcher

To create a notebook from the Launcher

1. To open the Launcher, use the keyboard shortcut Ctrl + Shift + L.
   Alternatively, from the File Browser, choose the plus (+) sign on the left of the menu.
2. On the Launcher, keep the default SageMaker image, Data Science, or use the dropdown menu to select a different image.

For a list of the available images, see Available Amazon SageMaker Images (p. 85).

After you choose the kernel or image, your notebook launches and opens in a new Studio tab. To view the notebook’s kernel session, in the left sidebar, choose the Running Terminals, Kernels, and Images icon ( ). You can stop the notebook’s kernel session from this view.

Use the SageMaker Studio Notebook Toolbar

Amazon SageMaker Studio notebooks extend the JupyterLab interface. For an overview of the basic JupyterLab interface, see The JupyterLab Interface.

The following image shows the toolbar and an empty cell from a SageMaker Studio notebook.

When you pause on a toolbar icon, a tooltip displays the icon function. Additional notebook commands are found in the Studio main menu. For a list of available notebook commands and shortcuts, in the left sidebar of Studio, choose the Commands icon ( ), and then scroll to the NOTEBOOK CELL OPERATIONS and NOTEBOOK OPERATIONS sections. The toolbar includes the following icons:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![save_and_checkpoint_icon]</td>
<td>Save and checkpoint</td>
</tr>
<tr>
<td>![save_and_checkpoint_icon]</td>
<td>Saves the notebook and updates the checkpoint file. For more information, see Get the Difference Between the Last Checkpoint (p. 76).</td>
</tr>
<tr>
<td>Icon</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| ![Insert cell](image) | **Insert cell**  
Inserts a code cell below the current cell. The current cell is noted by the blue vertical marker in the left margin. |
| ![Cut, copy, and paste cells](image) | **Cut, copy, and paste cells**  
Cuts, copies, and pastes the selected cells. |
| ![Run cells](image) | **Run cells**  
Runs the selected cells and then makes the cell that follows the last selected cell the new selected cell. |
| ![Interrupt kernel](image) | **Interrupt kernel**  
Interrupts the kernel, which cancels the currently running operation. The kernel remains active. |
| ![Restart kernel](image) | **Restart kernel**  
Restarts the kernel. Variables are reset. Unsaved information is not affected. |
| ![Cell type](image) | **Cell type**  
Displays or changes the current cell type. The cell types are:  
- Code – Code that the kernel runs.  
- Markdown – Text rendered as markdown.  
- Raw – Content, including Markdown markup, that’s displayed as text. |
| ![Launch terminal](image) | **Launch terminal**  
Launches a terminal in the SageMaker image hosting the notebook. For an example, see Get App Metadata (p. 75). |
| ![Checkpoint diff](image) | **Checkpoint diff**  
Opens a new tab that displays the difference between the notebook and the checkpoint file. For more information, see Get the Difference Between the Last Checkpoint (p. 76). |
| ![Git diff](image) | **Git diff**  
Only enabled if the notebook is opened from a Git repository. Opens a new tab that displays the difference between the notebook and the last Git commit. For more information, see Get the Difference Between the Last Commit (p. 77). |
<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
</table>
| 2 vCPU + 4 GiB | **Instance type**
Displays or changes the instance type the notebook runs in. The format is as follows:
\[
\text{number of vCPUs} + \text{amount of memory} + \text{number of GPUs}
\]
Unknown indicates the notebook was opened without specifying a kernel. The notebook runs on the SageMaker Studio instance and doesn't accrue runtime charges. You can't assign the notebook to an instance type. You must specify a kernel and then Studio assigns the notebook to a default type.
For more information, see Create or Open an Amazon SageMaker Studio Notebook (p. 70) and Change an Instance Type (p. 77).

| Python 3 (Data Science) | **Kernel and SageMaker Image**
Displays or changes the kernel that processes the cells in the notebook. The format is as follows:
\[
\text{Kernel (SageMaker Image)}
\]
No Kernel indicates the notebook was opened without specifying a kernel. You can edit the notebook but you can't run any cells.
For more information, see Change a Kernel (p. 78).

| Kernel: CPU: 0.00% MEM: 2.81% | **CPU and memory of the kernel or instance**
Displays the CPU usage and memory usage. Double-click to toggle between the current kernel and the current instance.

| | **Kernel busy status**
Displays the busy status of the kernel. When the edge of the circle and its interior are the same color, the kernel is busy. The kernel is busy when it is starting and when it is processing cells. Additional kernel states are displayed in the status bar at the bottom-left corner of SageMaker Studio.

| Share | **Share notebook**
Shares the notebook. For more information, see Share and Use an Amazon SageMaker Studio Notebook (p. 73).

To select multiple cells, click in the left margin outside of a cell. Hold down the Shift key and use K or the Up key to select previous cells, or use J or the Down key to select following cells.

**Share and Use an Amazon SageMaker Studio Notebook**

You can share your Amazon SageMaker Studio notebooks with your colleagues. The shared notebook is a copy. After you share your notebook, any changes you make to your original notebook aren't reflected in the shared notebook and any changes your colleague’s make in their shared copies of the notebook.
aren't reflected in your original notebook. If you want to share your latest version, you must create a new snapshot and then share it.

Topics
- Share a Notebook (p. 74)
- Use a Shared Notebook (p. 74)

Share a Notebook

The following screenshot shows the menu from a Studio notebook.

To share a notebook
1. In the upper-right corner of the notebook, choose Share.
2. (Optional) In Create shareable snapshot, choose any of the following items:
   - Include Git repo information – Includes a link to the Git repository that contains the notebook. This enables you and your colleague to collaborate and contribute to the same Git repository.
   - Include output – Includes all notebook output that has been saved.

   Note
   If you're an AWS SSO user and you don't see these options, your AWS SSO administrator probably disabled the feature. Contact your administrator.
3. Choose Create.
4. After the snapshot is created, choose Copy link and then choose Close.
5. Share the link with your colleague.

After selecting your sharing options, you are provided with a URL. You can share this link with users that have access to Amazon SageMaker Studio. When the user opens the URL, they're prompted to log in using AWS SSO or IAM authentication. This shared notebook becomes a copy, so changes made by the recipient will not be reproduced in your original notebook.

Use a Shared Notebook

You use a shared notebook in the same way you would with a notebook that you created yourself. When you click a link to a shared notebook for the first time, a read-only version of the notebook opens. To edit the shared notebook, choose Create a Copy. This copies the shared notebook to your personal storage.

The copied notebook launches on an instance of the instance type and SageMaker image that the notebook was using when the sender shared it. If you aren't currently running an instance of the instance type, a new instance is started. Customization to the SageMaker image isn't shared. You can also inspect the notebook snapshot by choosing Snapshot Details.

The following are some important considerations about sharing and authentication:

- If you have an active session, you see a read-only view of the notebook until you choose Create a Copy.
- If you don't have an active session, you need to log in.
• If you use IAM to login, after you login, select your user profile then choose Open SageMaker Studio. Then you need to choose the link you were sent.
• If you use SSO to login, after you login the shared notebook is opened automatically in Studio.

Get Notebook and App Metadata

You can access notebook metadata and App metadata using the Amazon SageMaker UI.

Topics
• Get Notebook Metadata (p. 75)
• Get App Metadata (p. 75)

Get Notebook Metadata

Jupyter notebooks contain optional metadata that you can access through the Amazon SageMaker UI.

To view the notebook metadata

1. In the left sidebar, choose the Notebook Tools icon ( ).
2. Open the Advanced Tools section.

The metadata should look similar to the following.

```json
{
  "instance_type": "ml.t3.medium",
  "kernelspec": {
    "display_name": "Python 3 (Data Science)",
    "language": "python",
    "name": "python3__SAGEMAKER_INTERNAL__arn:aws:sagemaker:us-west-2:<acct-id>:image/datascience-1.0"
  },
  "language_info": {
    "codemirror_mode": {
      "name": "ipython",
      "version": 3
    },
    "file_extension": ".py",
    "mimetype": "text/x-python",
    "name": "python",
    "nbconvert_exporter": "python",
    "pygments_lexer": "ipython3",
    "version": "3.7.6"
  }
}
```

Get App Metadata

When you create a notebook in Amazon SageMaker Studio, the App metadata is written to a file named resource-metadata.json in the folder /opt/ml/metadata/. You can get the App metadata by opening an Image terminal from within the notebook. The metadata gives you the following information, which includes the SageMaker image and instance type the notebook runs in:

• AppType – KernelGateway
• DomainId – Same as the StudioID
- **UserProfileName** – The profile name of the current user
- **ResourceArn** – The Amazon Resource Name (ARN) of the App, which includes the instance type
- **ResourceName** – The name of the SageMaker image

Additional metadata might be included for internal use by Studio and is subject to change.

### To get the App metadata

1. In the center of the notebook menu, choose the **Launch Terminal** icon (нстру). This opens a terminal in the SageMaker image that the notebook runs in.
2. Run the following commands to display the contents of the `resource-metadata.json` file.

   ```bash
   cd /opt/ml/metadata/
cat resource-metadata.json
   ```

   The file should look similar to the following.

   ```json
   {
   "AppType": "KernelGateway",
   "DomainId": "d-xxxxxxxxxxxx",
   "UserProfileName": "profile-name",
   "ResourceName": "datascience--1-0-ml"
   }
   ```

### Get Notebook Differences

You can display the difference between the current notebook and the last checkpoint or the last Git commit using the Amazon SageMaker UI.

The following screenshot shows the menu from a Studio notebook.

#### Topics

- Get the Difference Between the Last Checkpoint (p. 76)
- Get the Difference Between the Last Commit (p. 77)

### Get the Difference Between the Last Checkpoint

When you create a notebook, a hidden checkpoint file that matches the notebook is created. You can view changes between the notebook and the checkpoint file or revert the notebook to match the checkpoint file.

By default, a notebook is auto-saved every 120 seconds and also when you close the notebook. However, the checkpoint file isn't updated to match the notebook. To save the notebook and update the checkpoint file to match, you must choose the **Save notebook and create checkpoint** icon (нстру) on the left of the notebook menu or use the **Ctrl + S** keyboard shortcut.
To view the changes between the notebook and the checkpoint file, choose the **Checkpoint diff** icon (FileNotFoundException) in the center of the notebook menu.

To revert the notebook to the checkpoint file, from the main Studio menu, choose **File** then **Revert Notebook to Checkpoint**.

**Get the Difference Between the Last Commit**

If a notebook is opened from a Git repository, you can view the difference between the notebook and the last Git commit.

To view the changes in the notebook from the last Git commit, choose the **Git diff** icon (FileNotFoundException) in the center of the notebook menu.

**Manage Resources**

You can change the instance type, and SageMaker image and kernel from within an Amazon SageMaker Studio notebook. To create a custom kernel to use with your notebooks, see Bring your own SageMaker image (p. 86).

**Topics**

- Change an Instance Type (p. 77)
- Change a Kernel (p. 78)
- Shut Down Resources (p. 81)

**Change an Instance Type**

When you open a new notebook for the first time, you are assigned a default Amazon Elastic Compute Cloud (Amazon EC2) instance type to run the notebook. When you open additional notebooks on the same instance type, the notebooks run on the same instance as the first notebook, even if the notebooks use different kernels.

You can change the instance type that your notebook runs on from within the notebook.

**Important**

If you change the instance type, unsaved information and existing settings for the notebook are lost, and installed packages must be re-installed. The previous instance type continues to run even if no kernel sessions or apps are active. You must explicitly stop the instance to stop accruing charges. To stop the instance, see Shut Down Resources (p. 81).

The following screenshot shows the menu from a Studio notebook. The processor and memory of the instance type powering the notebook are displayed as **2 vCPU + 4 GiB**.

![Instance Type Menu](image)

**To change the instance type**

1. Choose the instance type.
2. In **Select instance**, choose one of the fast launch instance types that are listed. Or to see all instance types, switch off **Fast launch only**. The list can be sorted by any column.
3. After choosing a type, choose **Save and continue**.
4. Wait for the new instance to become enabled, and then the new instance type information is displayed.

For a list of the available instance types, see Available SageMaker Studio Instance Types (p. 84).

**Change a Kernel**

With Amazon SageMaker Studio notebooks, you can change the notebook's kernel from within the notebook.

The following screenshot shows the menu from a Studio notebook. The current SageMaker kernel and image are displayed as **Python 3 (Data Science)**, where Python 3 denotes the kernel and Data Science denotes the SageMaker image that contains the kernel. The color of the circle to the right indicates the kernel is idle or busy. The kernel is busy when the center and the edge of the circle are the same color.
To change a notebook's kernel

1. Choose the kernel name.
2. From the drop-down list, choose a kernel.
3. After choosing a kernel, choose Select.
4. Wait for the kernel's status to show as idle, which indicates the kernel has started.

For a list of available SageMaker kernels, see Available Amazon SageMaker Kernels (p. 85).

Shut Down Resources

You can shut down individual resources, including notebooks, terminals, kernels, apps, and instances. You can also shut down all resources in one of these categories at the same time.

Topics
- Shut Down an Open Notebook (p. 81)
- Shut Down Resources (p. 81)

Shut Down an Open Notebook

You can shut down an open notebook from the Amazon SageMaker Studio File menu or from the Running Terminal and Kernels pane.

Note
When you shut down a notebook, any unsaved information in the notebook is lost. The notebook is not deleted.

To shut down an open notebook from the File menu
1. Optionally, save the notebook contents by choosing the Disk icon on the left of the notebook menu.
2. Choose File then Close and Shutdown Notebook.
3. Choose OK.

Shut Down Resources

You can reach the Running Terminals and Kernels pane on the left side of Amazon SageMaker Studio with the icon. The Running Terminals and Kernels pane consists of four sections. Each section lists all the resources of that type. You can shut down each resource individually or shut down all the resources in a section at the same time.
When you choose to shut down all resources in a section, the following occurs:

- **RUNNING INSTANCES/RUNNING APPS** – All instances, apps, notebooks, kernel sessions, consoles/shells, and image terminals are shut down. System terminals aren’t shut down. Choose this option to stop the accrual of all charges.
- **KERNEL SESSIONS** – All kernels, notebooks and consoles/shells are shut down.
- **TERMINAL SESSIONS** – All image terminals and system terminals are shut down.

**To shut down resources**

1. In the left sidebar, choose the **Running Terminals and Kernels** icon (投降).
2. Do either of the following:
   - To shut down a specific resource, choose the **SHUT DOWN** icon (投降) on the same row as the resource.

For running instances, a confirmation dialog lists all the resources that will be shut down. For running apps, a confirmation dialog is displayed. Choose **Shut down all** to proceed.

**Note**

No confirmation dialog is displayed for kernel sessions or terminal sessions.

- To shut down all resources in a section, choose the X to the right of the section label. A confirmation dialog is displayed. Choose **Shut down all** to proceed.
Usage Metering

There is no additional charge for using Amazon SageMaker Studio. The costs incurred for running Amazon SageMaker Studio notebooks, interactive shells, consoles, and terminals are based on Amazon Elastic Compute Cloud (Amazon EC2) instance usage.

When you run the following resources, you must choose a SageMaker image and kernel:

**From the Studio Launcher**
- Notebook
- Interactive Shell
- Image Terminal

**From the File menu**
- Notebook
- Console

When launched, the resource is run on an Amazon EC2 instance of an instance type based on the chosen SageMaker image and kernel. If an instance of that type was previously launched and is available, the resource is run on that instance.

For CPU based images, the default instance type is `ml.t3.medium`. For GPU based images, the default instance type is `ml.g4dn.xlarge`.

The costs incurred are based on the instance type. You are billed separately for each instance.

Metering starts when an instance is created. Metering ends when all the apps on the instance are shut down, or the instance is shut down. For information on how to shut down an instance, see [Shut Down Resources](#).  

**Important**
You must shut down the instance to stop incurring charges. If you shut down the notebook running on the instance but don’t shut down the instance, you will still incur charges.

When you open multiple notebooks on the same instance type, the notebooks run on the same instance even if they're using different kernels. You are billed only for the time that one instance is running.

You can change the instance type from within the notebook after you open it. For more information, see [Change an Instance Type](#).

For information about billing along with pricing examples, see [Amazon SageMaker Pricing](#).

Available Resources

The following sections list the available resources for Amazon SageMaker Studio notebooks.

**Topics**
- Available SageMaker Studio Instance Types
- Available Amazon SageMaker Images
- Available Amazon SageMaker Kernels
Available SageMaker Studio Instance Types

The following Amazon Elastic Compute Cloud (Amazon EC2) instance types are available for use with SageMaker Studio notebooks.

For detailed information on which instance types fit your use case, and their performance capabilities, see Amazon Elastic Compute Cloud Instance types.

For information on available Amazon SageMaker Notebook Instance types, see CreateNotebookInstance.

**Note**
For most use cases, you should use a ml.t3.medium. This is the default instance type for CPU-based SageMaker images, and is available as part of the AWS Free Tier.

>> *Fast launch* instances types are optimized to start in under two minutes.

**Default instance types**
- CPU-based images: ml.t3.medium >> *Fast launch*
- GPU-based images: ml.g4dn.xlarge >> *Fast launch*

**General purpose (no GPUs)**
- ml.t3.medium >> *Fast launch*
- ml.t3.large
- ml.t3.xlarge
- ml.t3.2xlarge
- ml.m5.large >> *Fast launch*
- ml.m5.xlarge
- ml.m5.2xlarge
- ml.m5.4xlarge
- ml.m5.8xlarge
- ml.m5.12xlarge
- ml.m5.16xlarge
- ml.m5.24xlarge

**Compute optimized (no GPUs)**
- ml.c5.large >> *Fast launch*
- ml.c5.xlarge
- ml.c5.2xlarge
- ml.c5.4xlarge
- ml.c5.9xlarge
- ml.c5.12xlarge
- ml.c5.18xlarge
- ml.c5.24xlarge

**Accelerated computing (1+ GPUs)**
- ml.p3.2xlarge
- ml.p3.8xlarge
Available Resources

- ml.p3.16xlarge
- ml.g4dn.xlarge **Fast launch**
- ml.g4dn.2xlarge
- ml.g4dn.4xlarge
- ml.g4dn.8xlarge
- ml.g4dn.12xlarge
- ml.g4dn.16xlarge

Available Amazon SageMaker Images

The following SageMaker images are available in Amazon SageMaker Studio. SageMaker images contain the latest Amazon SageMaker Python SDK and the latest version of the kernel. The name in brackets ([ ]) is the resource identifier of the SageMaker image as specified in the Amazon Resource Name (ARN) for the SageMaker image. For more information, see Deep Learning Containers Images.

- Data Science [datascience-1.0]

  Data Science is a Conda image with the most commonly used Python packages and libraries, such as NumPy and SciKit Learn.

  - Base Python [python-3.6]
  - MXNet (optimized for CPU) [mxnet-1.6-cpu-py36]
  - MXNet (optimized for GPU) [mxnet-1.6-gpu-py36]
  - PyTorch (optimized for CPU) [pytorch-1.4-cpu-py36]
  - PyTorch (optimized for GPU) [pytorch-1.4-gpu-py36]
  - TensorFlow (optimized for CPU) [tensorflow-1.15-cpu-py36]
  - TensorFlow (optimized for GPU) [tensorflow-1.15-gpu-py36]
  - TensorFlow 2 (optimized for CPU) [tensorflow-2.1-cpu-py36]
  - TensorFlow 2 (optimized for GPU) [tensorflow-2.1-gpu-py36]

Available Amazon SageMaker Kernels

The following Amazon SageMaker kernels are available in SageMaker Studio. The name in parentheses is the SageMaker image hosting the kernel.

Data Science is a Conda image with the most commonly used Python packages and libraries, such as NumPy and scikit-learn.

- Python 3 (Data Science)
- PySpark (SparkMagic)
- Python 3 (Base Python)
- Python 3 (MXNet 1.6 Python 3.6 CPU Optimized)
- Python 3 (MXNet 1.6 Python 3.6 GPU Optimized)
- Python 3 (MXNet 1.8 Python 3.7 CPU Optimized)
- Python 3 (MXNet 1.8 Python 3.7 GPU Optimized)
- Python 3 (PyTorch 1.4 Python 3.6 CPU Optimized)
- Python 3 (PyTorch 1.4 Python 3.6 GPU Optimized)
- Python 3 (PyTorch 1.6 Python 3.6 CPU Optimized)
- Python 3 (PyTorch 1.6 Python 3.6 GPU Optimized)
- Python 3 (SageMaker JumpStart Data Science 1.0)
Python 3 (SageMaker JumpStart MXNet 1.0)
Python 3 (SageMaker JumpStart PyTorch 1.0)
Python 3 (SageMaker JumpStart TensorFlow 1.0)
Python 3 (TensorFlow 1.15 Python 3.6 CPU Optimized)
Python 3 (TensorFlow 1.15 Python 3.6 GPU Optimized)
Python 3 (TensorFlow 1.15 Python 3.7 CPU Optimized)
Python 3 (TensorFlow 1.15 Python 3.7 GPU Optimized)
Python 3 (TensorFlow 2.1 Python 3.6 CPU Optimized)
Python 3 (TensorFlow 2.1 Python 3.6 GPU Optimized)
Python 3 (TensorFlow 2.3 Python 3.7 CPU Optimized)
Python 3 (TensorFlow 2.3 Python 3.7 GPU Optimized)

Customize Amazon SageMaker Studio

There are two options for customizing your Amazon SageMaker Studio environment. You bring your own SageMaker image or use a Lifecycle Configuration script. These two options can be used individually or together.

- **Bring your own SageMaker image**: A SageMaker image is a file that identifies the kernels, language packages, and other dependencies required to run a Jupyter notebook in Amazon SageMaker Studio. Amazon SageMaker provides many built-in images for you to use. If you need different functionality, you can bring your own custom images to Studio.

- **Use Lifecycle Configurations with Amazon SageMaker Studio**: Lifecycle Configurations are shell scripts triggered by Amazon SageMaker Studio lifecycle events, such as starting a new Studio notebook. You can use Lifecycle Configurations to automate customization for your Studio environment. For example, you can install custom packages, configure notebook extensions, preload datasets, and set up source code repositories.

The following topics show how to use these two options to customize your Amazon SageMaker Studio environment.

**Topics**
- Bring your own SageMaker image (p. 86)
- Use Lifecycle Configurations with Amazon SageMaker Studio (p. 101)

**Bring your own SageMaker image**

A SageMaker image is a file that identifies the kernels, language packages, and other dependencies required to run a Jupyter notebook in Amazon SageMaker Studio. These images are used to create an environment that you then run the Jupyter notebooks from. Amazon SageMaker provides many built-in images for you to use. If you need different functionality, you can bring your own custom images to Studio. For the list of built-in images, see Available Amazon SageMaker Images (p. 85).

A SageMaker image is a holder for a set of SageMaker image versions. An image version represents a container image that is compatible with SageMaker Studio and stored in an Amazon Elastic Container Registry (ECR) repository. Each image version is immutable.

To make a custom SageMaker image available to all users within a domain, you attach the image to the domain. To make an image available to a single user, you attach the image to the user's profile. When you attach an image, SageMaker uses the latest image version by default. You can also attach a specific
image version. After you attach the version, you can choose the version from the SageMaker Launcher or the image selector when you launch a notebook.

You can create images and image versions, and attach image versions to your domain, using the SageMaker Studio control panel, the AWS SDK for Python (Boto3), and the AWS Command Line Interface (AWS CLI). You can also create images and image versions using the SageMaker console, even if you haven't onboarded to Studio.

SageMaker provides sample Dockerfiles to use as a starting point for your custom SageMaker images in the SageMaker Studio Custom Image Samples repository. These include Dockerfiles for the following images:

- Julia
- R
- Scala
- Tensorflow 2

The following topics explain how to bring your own image using the SageMaker console and then launch the image in SageMaker Studio. A more comprehensive tutorial additionally shows you how to build a custom container image from a supplied R Dockerfile. For a similar blog article, see Bringing your own R environment to Amazon SageMaker Studio.

Topics

- Create a custom SageMaker image (Console) (p. 87)
- Attach a custom SageMaker image (Control Panel) (p. 88)
- Launch a custom SageMaker image in SageMaker Studio (p. 89)
- Bring your own custom SageMaker image tutorial (p. 92)
- Custom SageMaker image specifications (p. 100)

Create a custom SageMaker image (Console)

This topic describes how you can create a custom SageMaker image using the SageMaker console. You can also create the image using the SageMaker Studio control panel. The steps are the same. For information on using the Studio control panel, see Attach a custom SageMaker image (Control Panel) (p. 88).

When you create an image, SageMaker also creates an initial image version. The image version represents a container image in Amazon Elastic Container Registry (ECR). The container image must satisfy the requirements to be used in Amazon SageMaker Studio. For more information, see Custom SageMaker image specifications (p. 100).

For information on testing your image locally and resolving common issues, see the SageMaker Studio Custom Image Samples repo.

To create an image

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the left navigation pane, choose Images.
3. On the Custom images page, choose Create image.
4. For Image source, enter the registry path to the container image in Amazon ECR. The path is in the following format:

   acct-id.dkr.ecr.region.amazonaws.com/repo-name[:tag] or [@digest]

5. Choose Next.
6. **Under Image properties**, enter the following:
   - **Image name** – The name must be unique to your account in the current AWS Region.
   - **(Optional) Display name** – The name displayed in the Studio user interface. When not provided, the image name is displayed.
   - **(Optional) Description** – A description of the image.
   - **IAM role** – The role must have the AmazonSageMakerFullAccess policy attached. Use the dropdown menu to choose one of the following options:
     - Create a new role – Specify any additional Amazon Simple Storage Service (Amazon S3) buckets that you want users of your notebooks to have access to. If you don’t want to allow access to additional buckets, choose None. SageMaker attaches the AmazonSageMakerFullAccess policy to the role. The role allows users of your notebooks access to the S3 buckets listed next to the checkmarks.
     - Enter a custom IAM role ARN – Enter the Amazon Resource Name (ARN) of your IAM role.
     - Use existing role – Choose one of your existing roles from the list.
   - **(Optional) Image tags** – Choose Add new tag. You can add up to 50 tags. Tags are searchable using the Studio user interface, the SageMaker console, or the SageMaker Search API.

7. Choose **Submit**.

The new image is displayed in the **Custom images** list and briefly highlighted. After the image has been successfully created, you can choose the image name to view its properties or choose Create version to create another version.

**To create another image version**

1. Choose Create version on the same row as the image.
2. For **Image source**, enter the registry path to the ECR container image. The container image shouldn't be the same image as used in a previous version of the SageMaker image.

To use the custom image in Studio, you must attach it to your domain. For more information, see **Attach a custom SageMaker image (Control Panel)** (p. 88).

**Attach a custom SageMaker image (Control Panel)**

To use a custom SageMaker image, you must attach a version of the image to your domain. When you attach an image version, it appears in the SageMaker Studio Launcher and is available in the Select image dropdown list, which users use to launch an activity or change the image used by a notebook.

There is a limit to the number of image versions that can be attached at any given time. After you reach the limit, you must detach a version in order to attach another version of the image.

**Attach an existing image version to your domain**

This topic describes how you can attach an existing custom SageMaker image version to your domain using the SageMaker Studio control panel. You can also create a custom SageMaker image and image version, and then attach that version to your domain.

The steps to create an image and image version are the same whether you use the Studio control panel or the SageMaker console. For the procedure to create an image and image version, see **Create a custom SageMaker image (Console)** (p. 87).

**To attach an existing image**

2. In the left navigation pane, choose **Amazon SageMaker Studio**.
3. On the **SageMaker Studio Control Panel**, under **Custom images attached to domain**, choose **Attach image**.
4. For **Image source**, choose **Existing image**.
5. Choose an existing image from the list.
6. Choose a version of the image from the list.
7. Choose **Next**.
8. Choose the IAM role. For more information, see Create a custom SageMaker image (Console) (p. 87).
9. Choose **Next**.
10. Under **Studio configuration**, enter or change the following settings. For information on how to get the kernel information from the image, see DEVELOPMENT in the SageMaker Studio Custom Image Samples repository.
    - **EFS mount path** – The path within the image to mount the user's Amazon Elastic File System (EFS) home directory.
    - **Kernel**:
      - For **Kernel name**, enter the name of an existing kernel in the image.
      - (Optional) For **Kernel display name**, enter the display name for the kernel.
      - Choose **Add kernel**.
      - (Optional) Configuration tags – Choose **Add new tag** and then add a configuration tag.

    **Note**
    For more information, see the **Kernel discovery** and **User data** sections of Custom SageMaker image specifications (p. 100).
11. Choose **Submit**

Wait for the image version to be attached to the domain. When attached, the version is displayed in the **Custom images** list and briefly highlighted.

**Detach a custom SageMaker image**

When you detach an image from a domain, all versions of the image are detached. When an image is detached, all users of the domain lose access to the image versions.

A running notebook that has a kernel session on an image version when the version is detached, continues to run. When the notebook is stopped or the kernel is shut down the image version becomes unavailable.

**To detach an image**

1. In the SageMaker Studio control panel, under **Custom images attached to domain**, choose the image and then choose **Detach**.
2. (Optional) To delete the image and all versions from SageMaker, select **Also delete the selected images**. This does not delete the associated container images from Amazon ECR.
3. Choose **Detach**.

**Launch a custom SageMaker image in SageMaker Studio**

After you create your custom SageMaker image and attach it to your domain, the image appears in the image selector dialog box of the SageMaker Studio Launcher, and the kernel appears in the kernel selector dialog box.
To launch and select your custom image

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. Use the keyboard shortcut Ctrl + Shift + L to open Studio Launcher.
3. Open the Select a SageMaker image dropdown menu.
4. Choose your custom image.
5. Launch a notebook or interactive shell in the custom image.

6. In an open notebook, you can switch to the custom kernel by choosing a different kernel in the Select Kernel dialog box.
Bring your own custom SageMaker image tutorial

In this tutorial, you create a custom SageMaker image and attach a version of the image to your domain for use in Amazon SageMaker Studio. The image version contains a selection of R packages, along with the AWS SDK for Python (Boto3) and the Amazon SageMaker Python SDK. After you complete this tutorial, you can select the version in Studio and use R to access the SDKs using the RStudio reticulate package. For more information on the reticulate package, see R Interface to Python. For a blog article similar to this tutorial, see Bringing your own R environment to Amazon SageMaker Studio.

Two methods are presented to attach the image version to your domain. In the first method, you create a new domain with the version attached. This method is simpler but you need to specify the Amazon Virtual Private Cloud (VPC) information and execution role that's required to create the domain.

If you have onboarded to Studio, you can use the second method to attach the image version to your current domain. In this case, you don't need to specify the VPC information and execution role. After you attach the version, you must delete all the apps in your domain and reopen Studio.

You can't run this tutorial from Studio because you can't create or update a domain from within Studio.
Prerequisites

- The Docker application. For information about setting up Docker, see Orientation and setup.
- A local copy of the Dockerfile for creating a Studio compatible R image from the SageMaker Studio custom image samples repository.

  **Note**
  Building the R image from the Dockerfile installs dependencies that may be licensed under copyleft licenses such as GPLv3. You should review the license terms and make sure they are acceptable for your use case before proceeding and building this image.
- Permissions to access the Amazon Elastic Container Registry (Amazon ECR) service. For more information, see Amazon ECR Managed Policies.
- An AWS Identity and Access Management execution role that has the AmazonSageMakerFullAccess policy attached. If you have onboarded to Amazon SageMaker Studio, you can get the role from the Studio Summary section of the SageMaker Studio control panel.

Links

- Amazon Elastic Container Registry API Reference

- Dockerfile reference

Topics

- Add a Studio-compatible container image to Amazon ECR (p. 93)
- Create a SageMaker image from the ECR container image (p. 94)
- Attach the SageMaker image to a new domain (p. 96)
- Attach the SageMaker image to your current domain (p. 97)
- View the attached image in the Studio control panel (p. 99)
- Clean up resources (p. 99)

Add a Studio-compatible container image to Amazon ECR

You perform the following steps to add a container image to Amazon ECR:

- Create an Amazon ECR repository.
- Authenticate to Amazon ECR.
- Build a Studio-compatible container image.
- Push the image to the Amazon ECR repository.

  **Note**
  The Amazon ECR repository must be in the same AWS Region as SageMaker Studio.

To build and add a container image to Amazon ECR

1. Create an Amazon ECR repository using the AWS CLI. To create the repository using the Amazon ECR console, see Creating a repository.

   ```shell
   aws ecr create-repository \
   --repository-name smstudio-custom \
   --image-scanning-configuration scanOnPush=true
   ```

   Response:
2. Install the SageMaker Studio image build CLI by following the steps in SageMaker Docker Build. This CLI enables you to build a Dockerfile using AWS CodeBuild.

3. Build the R image Dockerfile using the Studio image build CLI. The period (.) specifies that the Dockerfile should be in the context of the build command. This command builds the image, creates an ECR repo, and uploads the built image to the ECR repo. It then outputs the image URI.

   ```
   $ sm-docker build . -t smstudio-r -t <acct-id>.dkr.ecr.<region>.amazonaws.com/smstudio-custom:r
   
   Response:
   Image URI: <acct-id>.dkr.ecr.<region>.amazonaws.com/<image_name>
   ```

---

Create a SageMaker image from the ECR container image

You perform the following steps to create a SageMaker image from the container image:

- Create an Image.
- Create an ImageVersion.
- Create a configuration file.
- Create an AppImageConfig.

To create the SageMaker image entities

1. Create a SageMaker image.

   ```
   $ aws sagemaker create-image \
   --image-name r-image \
   --role-arn arn:aws:iam::<acct-id>:role/service-role/<execution-role>
   
   Response:
   
   ```

   ```
   { 
   "ImageArn": "arn:aws:sagemaker:us-east-2:<acct-id>:image/r-image"
   }
   ```

2. Create a SageMaker image version from the container image.

   ```
   $ aws sagemaker create-image-version \
   --image-name r-image \
   --base-image <acct-id>.dkr.ecr.<region>.amazonaws.com/smstudio-custom:r
   
   Response:
   ```
3. Check that the image version was successfully created.

```bash
aws sagemaker describe-image-version \
--image-name r-image \
--version 1
```

Response:

```json
{
  "ImageVersionStatus": "CREATED"
}
```

**Note**

If the response is "ImageVersionStatus": "CREATED_FAILED", the response also includes the failure reason. A permissions issue is a common cause of failure. You also can check your Amazon CloudWatch logs. The name of the log group is /aws/sagemaker/studio. The name of the log stream is $domainID/$userProfileName/KernelGateway/$appName.

4. Create a configuration file, named `app-image-config-input.json`. The `Name` value of `KernelSpecs` must match the name of the kernelSpec available in the image associated with this AppImageConfig. This value is case sensitive. You can find the available kernelSpecs in an image by running `jupyter-kernelspec list` from a shell inside the container. `MountPath` is the path within the image to mount your Amazon Elastic File System (Amazon EFS) home directory. It needs to be different from the path you use inside the container because that path will be overridden when your Amazon EFS home directory is mounted. For information on testing your image locally before using it in Studio, see DEVELOPMENT in the SageMaker Studio Custom Image Samples repository.

**Note**

The following `DefaultUID` and `DefaultGID` combinations are the only accepted values:

- DefaultUID: 1000 and DefaultGID: 100
- DefaultUID: 0 and DefaultGID: 0

```json
{
  "AppImageConfigName": "r-image-config",
  "KernelGatewayImageConfig": {
    "KernelSpecs": [
      {
        "Name": "ir",
        "DisplayName": "R (Custom R Image)"
      }
    ],
    "FileSystemConfig": {
      "MountPath": "/home/sagemaker-user",
      "DefaultUid": 1000,
      "DefaultGid": 100
    }
  }
}
```

5. Create the AppImageConfig using the file created in the previous step.
aws sagemaker create-app-image-config \
   --cli-input-json file://app-image-config-input.json

Response:

{
}

**Attach the SageMaker image to a new domain**

To use this method, you need to specify an execution role that has the `AmazonSageMakerFullAccess` policy attached.

**Note**
You can have only one domain. If you have onboarded to SageMaker Studio, you must delete your current domain before you can use this method. For more information, see Delete an Amazon SageMaker Studio Domain (p. 40).

You perform the following steps to create the domain and attach the custom SageMaker image:

1. Get your default VPC ID and subnet IDs.
2. Create the configuration file for the domain, which specifies the image.
3. Create the domain with the configuration file.

**To add the custom SageMaker image to your domain**

1. Get your default VPC ID.

   ```bash
   aws ec2 describe-vpcs \
      --filters Name=isDefault,Values=true \
      --query "Vpcs[0].VpcId" --output text
   
   Response:

   vpc-xxxxx
   ```

2. Get your default subnet IDs using the VPC ID from the previous step.

   ```bash
   aws ec2 describe-subnets \
      --filters Name=vpc-id,Values=<vpc-id> \
      --query "Subnets[*].SubnetId" --output json
   
   Response:

   ["subnet-b55171dd", "subnet-8a5f99c6", "subnet-e88d1392"]
   ```
3. Create a configuration file named `create-domain-input.json`. Insert the VPC ID, subnet IDs, ImageName, and AppImageConfigName from the previous steps. Because ImageVersionNumber isn't specified, the latest version of the image is used, which is the only version in this case.

```json
{
    "DomainName": "domain-with-custom-r-image",
    "VpcId": "<vpc-id>",
    "SubnetIds": [
        "<subnet-ids>"
    ],
    "DefaultUserSettings": {
        "ExecutionRole": "<execution-role>"
    },
    "KernelGatewayAppSettings": {
        "CustomImages": [
            {
                "ImageName": "r-image",
                "AppImageConfigName": "r-image-config"
            }
        ]
    }
},
"AuthMode": "IAM"
}
```

4. Create the domain with the attached custom SageMaker image.

```bash
aws sagemaker create-domain --cli-input-json file://create-domain-input.json
```

Response:

```json
{
    "Url": "https://d-xxxxxxxxxxxx.studio.us-east-2.sagemaker.aws/..."
}
```

**Attach the SageMaker image to your current domain**

This method presumes you've already onboarded to Amazon SageMaker Studio. For more information, see [Onboard to Amazon SageMaker Studio](#). For information about deleting the apps, see [Delete an Amazon SageMaker Studio Domain](#).

**Note**
You must delete all the apps in your domain before you update the domain with the new image version. For information about deleting the apps, see [Delete an Amazon SageMaker Studio Domain](#).

You perform the following steps to add the SageMaker image to your current domain.

- Get your DomainID from SageMaker Studio.
- Use the DomainID to get the DefaultUserSettings for the domain.
- Add the ImageName and AppImageConfig as a CustomImage to the DefaultUserSettings.
- Update your domain to include the custom image.

**To add the custom SageMaker image to your domain**

2. From the top left of the navigation pane, choose [Amazon SageMaker Studio](#).
3. From the Studio Control Panel, under **Studio Summary**, find the **Studio ID**, which is also your **DomainId**. The ID is in the following format: *d-xxxxxxxxxxxx*.

4. Use the domain ID to get the description of the domain.

   ```bash
   aws sagemaker describe-domain
   --domain-id <d-xxxxxxxxxxxx>
   ```

   Response:

   ```json
   {
     "DomainId": "d-xxxxxxxxxxxx",
     "DefaultUserSettings": {
       "KernelGatewayAppSettings": {
         "CustomImages": [],
         ...
       }
     }
   }
   ```

5. Save the default user settings section of the response to a file named `default-user-settings.json`.

6. Insert the **ImageName** and **AppImageConfigName** from the previous steps as a custom image. Because **ImageVersionNumber** isn't specified, the latest version of the image is used, which is the only version in this case.

   ```json
   {
     "DefaultUserSettings": {
       "KernelGatewayAppSettings": {
         "CustomImages": [
           {
             "ImageName": "string",
             "AppImageConfigName": "string"
           }
         ]
       }
     }
   }
   ```
7. Use the domain ID and default user settings file to update your domain.

```bash
aws sagemaker update-domain \
  --domain-id <d-xxxxxxxxxxxx> \
  --cli-input-json file://default-user-settings.json
```

Response:

```
{
  "DomainArn": "arn:aws:sagemaker:us-east-2:acct-id:domain/d-xxxxxxxxxxxx"
}
```

**View the attached image in the Studio control panel**

After you create the custom SageMaker image and attach it to your domain, the image appears in the custom images list in the SageMaker Studio control panel.

For information about how to launch the image in Amazon SageMaker Studio, see Launch a custom SageMaker image in SageMaker Studio (p. 89).

**Clean up resources**

You perform the following steps to clean up the resources you created in the previous sections:

- Detach the image and image versions from your domain.
- Delete the image, image version, and app image config.
- Delete the container image and repository from Amazon ECR. For more information, see Deleting a repository.

**To clean up resources**

1. Detach the image and image versions from your domain by passing an empty custom image list to the domain. Open the `default-user-settings.json` file you created in Attach the image to a current domain (p. 97).
2. Delete the custom images and then save the file.

```json
"DefaultUserSettings": {
  "KernelGatewayAppSettings": {
    "CustomImages": [ 
    ]
  }
}
```
3. Use the domain ID and default user settings file to update your domain.

```bash
aws sagemaker update-domain \
  --domain-id <d-xxxxxxxxxxxx> \
  --cli-input-json file://default-user-settings.json
```

Response:

```
{
  "DomainArn": "arn:aws:sagemaker:us-east-2:acct-id:domain/d-xxxxxxxxxxxx"
}
```

4. Delete the app image config.

```bash
aws sagemaker delete-app-image-config \
  --app-image-config-name r-image-config
```

5. Delete the SageMaker image, which also deletes all image versions. The container images in ECR that are represented by the image versions are not deleted.

```bash
aws sagemaker delete-image \
  --image-name r-image
```

## Custom SageMaker image specifications

The following specifications apply to the container image that is represented by a SageMaker image version.

### Running the image

ENTRYPOINT and CMD instructions are overridden to enable the image to run as a KernelGateway app.

Port 8888 in the image is reserved for running the KernelGateway web server.

### Stopping the image

The DeleteApp API issues the equivalent of a docker stop command. Other processes in the container won't get the SIGKILL/SIGTERM signals.

### Kernel discovery

SageMaker recognizes kernels as defined by Jupyter kernel specs.

You can specify a list of kernels to display before running the image. If not specified, python3 is displayed. Use the DescribeAppImageConfig API to view the list of kernels.

Conda environments are recognized as kernel specs by default.

### File system

The /opt/.sagemakerinternal and /opt/ml directories are reserved. Any data in these directories might not be visible at runtime.
User data

Each user in a Studio domain gets a user directory on a shared Amazon Elastic File System volume in the image. The location of the current user's directory on the Amazon EFS volume is configurable. By default, the location of the directory is /home/sagemaker-user.

SageMaker configures POSIX UID/GID mappings between the image and the host. This defaults to mapping the root user's UID/GID (0/0) to the UID/GID on the host.

You can specify these values using the CreateAppImageConfig API.

GID/UID Limits

SageMaker Studio only supports UID and GID values in the range between 0 and 65535. This limit applies to files in every layer of the image.

Metadata

A metadata file is located at /opt/ml/metadata/resource-metadata.json. No additional environment variables are added to the variables defined in the image. For more information, see Get App Metadata (p. 75).

GPU

On a GPU instance, the image is run with the --gpus option. Only the CUDA toolkit should be included in the image not the NVIDIA drivers. For more information, see NVIDIA User Guide.

Metrics and Logging

Logs from the KernelGateway process are sent to Amazon CloudWatch in the customer's account. The name of the log group is /aws/sagemaker/studio. The name of the log stream is $domainID/$userName/KernelGateway/$appName.

Image size

Limited to 11 GB.

Use Lifecycle Configurations with Amazon SageMaker Studio

Lifecycle Configurations are shell scripts triggered by Amazon SageMaker Studio lifecycle events, such as starting a new Studio notebook. You can use Lifecycle Configurations to automate customization for your Studio environment. This customization includes installing custom packages, configuring notebook extensions, preloading datasets, and setting up source code repositories.

Using Lifecycle Configurations gives you flexibility and control to configure Studio to meet your specific needs. For example, you can create a minimal set of base container images with the most commonly used packages and libraries, then use Lifecycle Configurations to install additional packages for specific use cases across your data science and machine learning teams.

For example Lifecycle Configuration scripts, see the Studio Lifecycle Configuration examples repo. For a blog on implementing Lifecycle Configurations, see Customize Amazon SageMaker Studio using Lifecycle Configurations.

Topics

- Creating and Associating a Lifecycle Configuration (p. 102)
- Setting Default Lifecycle Configurations (p. 107)
- Debugging Lifecycle Configurations (p. 109)
Creating and Associating a Lifecycle Configuration

Amazon SageMaker Studio apps are interactive applications that enable Studio's visual interface, code authoring, and execution experience. App types can be either JupyterServer or KernelGateway.

- **JupyterServer apps**: This app type enables access to the visual interface for Studio. Every user in Studio gets their own JupyterServer app.
- **KernelGateway apps**: This app type enables access to the code execution environment and kernels for your Studio notebooks and terminals. For more information, see Jupyter Kernel Gateway.

For more information about Studio's architecture and Studio apps, see Use Amazon SageMaker Studio Notebooks.

Topics
- Prerequisites (p. 102)
- Step 1: Create a new Lifecycle Configuration (p. 102)
- Step 2: Attach the Lifecycle Configuration to your Studio Domain or UserProfile (p. 103)
- Step 3: Choose a Lifecycle Configuration while launching a new App (p. 103)
- Step 4: View logs for a Lifecycle Configuration (p. 105)

Prerequisites
- Ensure your AWS CLI is up to date using the steps in Installing the current AWS CLI Version.
- From your local machine, run `aws configure` and provide your AWS credentials. For information on AWS credentials, see Understanding and getting your AWS credentials.
- Onboard to Amazon SageMaker Studio. For more information, see Onboard to Amazon SageMaker Studio.

Step 1: Create a new Lifecycle Configuration

The following procedure shows how to create a Lifecycle Configuration script that prints Hello World.

1. From your local machine, create a file named `my-script.sh` with the following content.

```bash
#!/bin/bash
set -eux
echo 'Hello World!
```

2. Convert your `my-script.sh` file into Base64 format. This requirement prevents errors due to the encoding of spacing and line breaks.

```
LCC_CONTENT=`openssl base64 -in my-script.sh`
```

3. Create a Studio Lifecycle Configuration. The following command creates a Lifecycle Configuration that runs on launch of an associated KernelGateway App.

```
aws sagemaker create-studio-lifecycle-config \
--region <your-region> \
--studio-lifecycle-config-name my-studio-lcc \
```

Page 102
Note the ARN of the newly created Lifecycle Configuration that is returned. This ARN is required to attach the Lifecycle Configuration to your App.

**Step 2: Attach the Lifecycle Configuration to your Studio Domain or UserProfile**

You need to update the UserSettings for your Studio Domain or an individual UserProfile to attach the Lifecycle Configuration. Lifecycle Configuration scripts associated at the Domain level are inherited by all users, while those associated at the UserProfile level are scoped to a specific user.

The following example shows how to create a new UserProfile with the Lifecycle Configuration attached. If you want to update an existing UserProfile, use the `update-user-profile` command instead.

Add the Lifecycle Configuration ARN from the previous step to the settings for the appropriate AppType. For example, place it in the `JupyterServerAppSettings` of the user. You can add multiple Lifecycle Configurations at a time by using a list of Lifecycle Configurations.

```bash
aws sagemaker create-user-profile --domain-id <DOMAIN-ID> \
--user-profile-name <USERPROFILE-NAME> \
--region <YOUR-REGION> \
--user-settings '{
    "JupyterServerAppSettings": {
        "LifecycleConfigArns": [
            "<LIFECYCLE-CONFIGURATION-ARN-LIST>"
        ]
    }
}
```

**Step 3: Choose a Lifecycle Configuration while launching a new App**

After you have attached a Lifecycle Configuration to a UserProfile, the user can select it when launching an App. The two methods for launching an App are using the AWS CLI and via the Studio Launcher. The following sections describe how to launch an app using these two methods.

**Launching an App using the AWS CLI**

Launch the app and specify the Lifecycle Configuration ARN in the `ResourceSpec` argument of the `CreateApp` API.

- The following example shows how to create a JupyterServer App. When creating a JupyterServer app, the app-name must be default.

```bash
aws sagemaker create-app --domain-id <DOMAIN-ID> \
--region <YOUR-REGION> \
--user-profile-name <USERPROFILE-NAME> \
--app-type JupyterServer \
--resource-spec LifecycleConfigArn=<LIFECYCLE-CONFIGURATION-ARN> \
--app-name default
```

- The following example shows how to create a KernelGateway App.

```bash
aws sagemaker create-app --domain-id <DOMAIN-ID> \
--region <YOUR-REGION> \
--user-profile-name <USERPROFILE-NAME> \
--resource-spec LifecycleConfigArn=<LIFECYCLE-CONFIGURATION-ARN>,SageMakerImageArn=<SAGEMAKER-IMAGE-ARN>,InstanceType=<INSTANCE-TYPE>
```
Launch a KernelGateway App using the Studio Launcher

1. Launch the Studio Domain. For more information, see Use the Amazon SageMaker Studio Launcher (p. 62).
2. In the launcher, navigate to the Notebooks and compute resources section.
4. Select a start-up script. If there is no default Lifecycle Configuration, this value defaults to No script. Otherwise, this value is equal to your default Lifecycle Configuration. Once you select a Lifecycle Configuration, you can view the entire script.
5. Select Notebook to launch a new notebook kernel with your selected image and Lifecycle Configuration.

Step 4: View logs for a Lifecycle Configuration

You can view the logs for your Lifecycle Configuration after it has been attached to a Studio Domain or UserProfile.

1. To view the CloudWatch logs for your Lifecycle Configuration, you must first provide access to CloudWatch for your IAM role. You need read permissions for the following log group /aws/sagemaker/studio and the following log stream {Domain}/{UserProfile}/{AppType}/{AppName}/LifecycleConfigOnStart. For information on adding permissions, see Enabling logging from certain AWS services.
2. To monitor a Lifecycle Configuration, navigate to the Running instances tab.

3. Select an app from the list of running apps. Apps with attached Lifecycle Configurations have an attached indicator icon.

4. Click the indicator icon for your app. This opens a new panel that lists the Lifecycle Configurations.
5. From the new panel, select View logs. This opens a new tab that displays the logs.

**Setting Default Lifecycle Configurations**

To set a Lifecycle Configuration as the default for your Domain or UserProfile programatically, you can create a new resource or update an existing resource. To associate a Lifecycle Configuration as a default, you'll first need to create a Lifecycle Configuration following the steps in Creating and Associating a Lifecycle Configuration (p. 102). Default Lifecycle Configurations set up at the domain level are inherited by all users, while those set up at the user level are scoped to a specific user.

**Note**
User level defaults override defaults set up at the domain level.

To set up a default Lifecycle Configuration, it must be added to the DefaultResourceSpec of the appropriate app type. The behavior of your Lifecycle Configuration depends on whether it is added to the DefaultResourceSpec of a JupyterServer or KernelGateway app.

- **JupyterServer apps:** When added to the DefaultResourceSpec of a JupyterServer app, the default Lifecycle Configuration script runs automatically when the user logs into Studio for the first time or restarts Studio. This can be used to automate one-time set-up actions for the Studio developer environment, such as installing notebook extensions or setting up a GitHub repo. For an example of this, see Customize Amazon SageMaker Studio using Lifecycle Configurations.
- **KernelGateway apps:** When added to the `DefaultResourceSpec` of a KernelGateway app, Studio defaults to selecting the Lifecycle Configuration script from the Studio launcher. Users can launch a notebook or terminal with the default script selected or they can select a different one from the list of Lifecycle Configurations.

**Note**
A default KernelGateway Lifecycle Configuration specified in `DefaultResourceSpec` applies to all KernelGateway images in the Studio Domain unless the user selects a different script from the list presented in the Studio launcher. The default script also runs if `No Script` is selected by the user. For more information on selecting a script, see Step 3: Choose a Lifecycle Configuration while launching a new App (p. 103).

### Associate a default Lifecycle Configuration when creating a new Domain or User Profile

To associate a Lifecycle Configuration when creating a new Studio Domain or User Profile, you need the ARN of the Lifecycle Configuration that you created. This ARN is passed to one of the following API calls:

- `create-user-profile`
- `create-domain`

For example, the following API call creates a new UserProfile with an associated Lifecycle Configuration.

```bash
aws sagemaker create-user-profile --domain-id <DOMAIN-ID> \  --user-profile-name <USER-PROFILE-NAME> \  --region <REGION> \  --user-settings '{"KernelGatewayAppSettings": {"DefaultResourceSpec": {"InstanceType": "ml.t3.medium", "LifecycleConfigArn": "<LIFECYCLE-CONFIGURATION-ARN>"}}}'
```

### Associate a default Lifecycle Configuration when updating a Domain or User Profile

To associate a Lifecycle Configuration when updating an existing Studio Domain or User Profile, you need the ARN of the Lifecycle Configuration that you created. This ARN is passed to one of the following API calls:

- `update-user-profile`
- `update-domain`

The Lifecycle Configuration ARN should be placed in 2 places, the `DefaultResourceSpec` and the `LifecycleConfigArns` list in `KernelGatewayAppSettings`. For example, the following API call updates a UserProfile with an associated Lifecycle Configuration.

```bash
aws sagemaker update-user-profile --domain-id <DOMAIN-ID> \  --user-profile-name <USER-PROFILE-NAME> \  --region <REGION> \  --user-settings '{"KernelGatewayAppSettings": {"DefaultResourceSpec": {"InstanceType": "ml.t3.medium", "LifecycleConfigArn": "<LIFECYCLE-CONFIGURATION-ARN>"}}}'
```
Debugging Lifecycle Configurations

The following topics show how to get information about and debug your Lifecycle Configurations.

Topics

- Verify Lifecycle Configuration Process from Amazon CloudWatch Logs (p. 109)
- JupyterServer App failure (p. 109)
- KernelGateway App failure (p. 110)
- Lifecycle Config timeout (p. 110)

Verify Lifecycle Configuration Process from Amazon CloudWatch Logs

Lifecycle Configurations only log STDOUT and STDERR. STDOUT is the default output for bash scripts, while STDERR can be written to by appending `>&2` to the end of a bash command. For example, `echo 'hello'>&2`. Logs for your Lifecycle Configurations are published to your AWS Account via CloudWatch. These logs can be found in the `/aws/sagemaker/studio` Log Stream from the AWS CloudWatch console.

2. Select Logs from the left side. From the dropdown menu, select Log Groups.
4. On the `aws/sagemaker/studio` Log Group screen, navigate to the Log Streams tab.
5. To find the logs for a specific app, search Log Streams using the following format:

   `<DomainId>/<UserProfileName>/<AppType>/<AppName>`

   For example, to find the Lifecycle Configuration logs for Domain `d-m85lcu8vbqmz`, UserProfile `i-sonic-js`, Apptype JupyterServer and AppName `test-lcc-echo`, use the following search string:

   `d-m85lcu8vbqmz/i-sonic-js/JupyterServer/test-lcc-echo`

6. Select the log stream appended with LifecycleConfigOnStart to view the script execution logs.

JupyterServer App failure

If your JupyterServer App crashes because of an issue with the attached Lifecycle Configuration, Studio displays the following error message on the Studio startup screen.

```
Failed to create SageMaker Studio due to start-up script failure
```

Click the View script logs link to view the CloudWatch logs for your JupyterServer app.

In the case where the faulty Lifecycle Configuration is specified in the DefaultResourceSpec of your Studio Domain or UserProfile, Studio continues to use the Lifecycle Configuration even after restarting Studio.

To resolve this error, follow the steps in Setting Default Lifecycle Configurations (p. 107) to remove the Lifecycle Configuration script from the DefaultResourceSpec or select another script using the AWS CLI. Then launch a new JupyterServer app.
KernelGateway App failure

If your KernelGateway App crashes because of an issue with the attached Lifecycle Configuration, Studio displays the error message in your Studio Notebook.

Click the View script logs link to view the CloudWatch logs for your KernelGateway app.

In this case, your Lifecycle Configuration is specified in the Studio Launcher when launching a new Studio Notebook.

To resolve this error, use the Studio launcher to select a different Lifecycle Configuration or select No script.

Note
A default KernelGateway Lifecycle Configuration specified in DefaultResourceSpec applies to all KernelGateway images in the Studio Domain unless the user selects a different script from the list presented in the Studio launcher. The default script also runs if No script is selected by the user. For more information on selecting a script, see Step 3: Choose a Lifecycle Configuration while launching a new App (p. 103).

Lifecycle Config timeout

There is a Lifecycle Configuration timeout limitation of 5 minutes. If a Lifecycle Configuration script takes longer than 5 minutes to run, Studio throws an error.

To resolve this error, ensure that your Lifecycle Configuration script completes in less than 5 minutes.

Updating and deleting Lifecycle Configurations

A Lifecycle Configuration script cannot be changed after it has been created. To update your script, you must create a new Lifecycle Configuration script and use the update-domain and update-user-profile APIs to attach the Lifecycle Configuration script to the respective Domain or UserProfile. For more information, see Creating and Associating a Lifecycle Configuration (p. 102).

To delete an existing Lifecycle Configuration, use the DeleteStudioLifecycleConfig API. To successfully delete a Lifecycle Configuration, no running Apps can be using it.

Set Up a Connection to an Amazon EMR Cluster

Amazon EMR is a big data platform for processing vast amounts of data. The central component of Amazon EMR is the cluster. A cluster is a collection of Amazon EC2 instances. Apache Spark is a distributed processing framework that runs on Amazon EMR. For more information, see What Is Amazon EMR? and Apache Spark.

Amazon SageMaker Studio comes with a SageMaker SparkMagic image that contains a PySpark kernel. The SparkMagic image also contains an AWS CLI utility, sm-sparkmagic, that you can use to create the configuration files required for the PySpark kernel to connect to the Amazon EMR cluster. After creating the configuration files, the utility displays the steps required to finish the setup.

For added security, you can specify that the connection to the EMR cluster uses Kerberos authentication. For more information, see Use Kerberos Authentication.

Prerequisites

- Access to SageMaker Studio that’s set up to use Amazon VPC mode. To connect to Amazon EMR, Studio must be configured as Amazon VPC only mode. For more information, see Connect SageMaker
Studio Notebooks to Resources in a VPC (p. 2593). All subnets used by SageMaker Studio must be private subnets.

- If you use the `sm-sparkmagic` utility to configure the sparkmagic kernel, ensure that the VPC interface endpoint is attached to all of the subnets used by SageMaker Studio or ensure that all of the subnets used by SageMaker Studio are routed to use a NAT gateway. For more information, see NAT gateways.

- An Amazon EMR cluster in the same VPC as Studio or in a VPC that's connected to the same VPC as Studio. This cluster must have Spark and Livy installed.

- The security group used for Amazon SageMaker Studio and the Amazon EMR security group must allow access to and from each other.

- Your Amazon EMR security group must open port 8998, so Amazon SageMaker Studio can communicate with the Spark cluster via Livy. For more information on setting up the security group, see Build SageMaker notebooks backed by Spark in Amazon EMR.

- If you use the `sm-sparkmagic` utility, the IAM execution role associated with your Studio user profile must contain the following extra permissions. To find the execution role, choose your user name in the SageMaker Studio Control Panel.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "elasticmapreduce:DescribeCluster",
                "elasticmapreduce:DescribeSecurityConfiguration",
                "elasticmapreduce:ListInstances"
            ],
            "Resource": [
                "arn:aws:elasticmapreduce:*:*:cluster/*"
            ]
        }
    ]
}
```

To set up a connection to an EMR cluster

1. Open SageMaker Studio.
2. In the upper-left corner of Studio, choose Amazon SageMaker Studio to open Studio Launcher.
3. On the Launcher page, choose Notebooks and compute resources.
4. For Select a SageMaker image, choose the SparkMagic image.
5. Choose Notebook to create a Studio notebook in the SparkMagic image.

6. Run the following code in a notebook cell to create the configuration files used to connect to the EMR cluster. `%%local` ensures that the code runs in the local image instead of on Spark.

   **Note**
   The `sm-sparkmagic` utility does not support generating configuration files when your Amazon EMR cluster and Studio Domain are using two different Amazon VPCs and the Amazon VPCs have different DHCPOptions.

   - If the EMR cluster is not configured for Kerberos authentication, run the following command:

     ```
     %%local
     ! sm-sparkmagic connect --cluster-id "cluster-id"
     ```

     The output should be similar to the following:

     ```
     Successfully read emr cluster(cluster-id) details
     SparkMagic config file location: /etc/sparkmagic/config.json
     ```

   - If the EMR cluster is configured for Kerberos authentication, run the following command:

     ```
     ! sm-sparkmagic connect --cluster-id "cluster-id" --user-name "user-name"
     ```

     The output should be similar to the following:

     ```
     Successfully read emr cluster(cluster-id) details
     SparkMagic config file location: /etc/sparkmagic/config.json
     Kerberos configuration file location: /etc/krb5.conf
     ```

7. To complete the setup, do one of the following:
• For EMR clusters that are not configured for Kerberos authentication, go to step 8.
• For EMR clusters that are configured for Kerberos authentication, do the following:
  1. In the notebook toolbar, choose the Launch terminal icon to open a terminal in the same SparkMagic image as the notebook.
  2. Run the following command in the terminal to get the Kerberos ticket:

```
  kinit user-name
```
  3. Enter your password when prompted.

8. In the notebook toolbar, choose the Restart kernel icon to complete the setup.
9. To verify that the connection was set up correctly, run the following command in a notebook cell:

```
  %%info
```

The output should be similar to the following:

```
Current session configs:{'driverMemory': '1000M', 'executorCores': 2, 'kind': 'pyspark'}
No active sessions.
```

For more information
• Perform interactive data processing using Spark in Amazon SageMaker Studio Notebooks.

Perform Common Tasks in Amazon SageMaker Studio

The following sections describe how to perform common tasks in Amazon SageMaker Studio. For an overview of the Studio interface, see Amazon SageMaker Studio UI Overview (p. 59).

Topics
• Upload Files to SageMaker Studio (p. 113)
• Clone a Git Repository in SageMaker Studio (p. 114)
• Stop a Training Job in SageMaker Studio (p. 114)
• Use TensorBoard in Amazon SageMaker Studio (p. 115)
• Manage Your EFS Storage Volume in SageMaker Studio (p. 116)
• Provide Feedback on SageMaker Studio (p. 117)
• Update SageMaker Studio and Studio Apps (p. 117)

Upload Files to SageMaker Studio

When you onboard to Amazon SageMaker Studio, a home directory is created for you in the Amazon Elastic File System (Amazon EFS) volume that was created for your team. Studio can open only files that have been uploaded to your directory. The Studio file browser maps to your home directory.
To upload files to your home directory

1. In the left sidebar, choose the File Browser icon ( 文件).
2. In the file browser, choose the Upload Files icon ( 上传).
3. Select the files you want to upload and then choose Open.
4. Double-click a file to open the file in a new tab in Studio.

Clone a Git Repository in SageMaker Studio

Amazon SageMaker Studio can connect only to a local repository. In this example, you clone the aws/amazon-sagemaker-examples repository (repo).

To clone the repo

1. In the left sidebar, choose the File Browser icon ( 文件).
2. Choose the root folder or the folder you want to clone the repo into.
3. In the left sidebar, choose the Git icon ( Git).
4. Choose Clone a Repository.
5. Enter the URI for the SageMaker examples repo https://github.com/aws/amazon-sagemaker-examples.git.
6. Choose CLONE.
7. If the repo requires credentials, you are prompted to enter your username and personal access token.
8. Wait for the download to finish. After the repo has been cloned, the File Browser opens to display the cloned repo.
9. Double click the repo to open it.
10. Choose the Git icon to view the Git user interface which now tracks the examples repo.
11. To track a different repo, open the repo in the file browser and then choose the Git icon.

Stop a Training Job in SageMaker Studio

You can stop a training job with the Amazon SageMaker Studio UI. When you stop a training job, its status changes to Stopping at which time billing ceases. An algorithm can delay termination in order to save model artifacts after which the job status changes to Stopped. For more information, see the stop_training_job method in the AWS SDK for Python (Boto3).

To stop a training job

1. Follow the View and Compare Experiments, Trials, and Trial Components (p. 1609) procedure on this page until you open the Describe Trial Component tab.
2. At the upper-right side of the tab, choose Stop training job. The Status at the top left of the tab changes to Stopped.
3. To view the training time and billing time, choose AWS Settings.
Use TensorBoard in Amazon SageMaker Studio

The following doc outlines how to install and run TensorBoard in Amazon SageMaker Studio.

Prerequisites

This tutorial requires an Amazon SageMaker Studio Domain.

Set Up TensorBoardCallback

1. Launch Studio.
2. In the Amazon SageMaker Studio Launcher under Notebooks and compute resources, select the TensorFlow 2.3 Python 3.7(optimized for CPU) Studio Image.
3. Launch a notebook.
4. Import the required packages.

```python
import os
import datetime
import tensorflow as tf
```
5. Create your Keras model.

```python
mnist = tf.keras.datasets.mnist
(x_train, y_train),(x_test, y_test) = mnist.load_data()
x_train, x_test = x_train / 255.0, x_test / 255.0

def create_model():
    return tf.keras.models.Sequential([
        tf.keras.layers.Flatten(input_shape=(28, 28)),
        tf.keras.layers.Dense(512, activation='relu'),
        tf.keras.layers.Dropout(0.2),
        tf.keras.layers.Dense(10, activation='softmax')
    ])
```
6. Create a directory for your TensorBoard logs

```python
LOG_DIR = os.path.join(os.getcwd(), "logs/fit/" + datetime.datetime.now().strftime("%Y %m%d-%H%M%S"))
```
7. Run training with TensorBoard.

```python
model = create_model()
model.compile(optimizer='adam',
              loss='sparse_categorical_crossentropy',
              metrics=['accuracy'])
tensorboard_callback = tf.keras.callbacks.TensorBoard(log_dir=LOG_DIR, histogram_freq=1)
model.fit(x=x_train,
y=y_train,
          epochs=5,
          validation_data=(x_test, y_test),
          callbacks=[tensorboard_callback])
```
8. Generate the EFS path for the TensorBoard logs. You use this path to set up your logs from the terminal.
Install TensorBoard

1. Click on the Amazon SageMaker Studio button on the top left corner of Studio to open the Amazon SageMaker Studio Launcher. This launcher must be opened from your root directory.
2. In the Launcher under Utilities and files, click System terminal.
3. From the terminal, run the following commands. Copy EFS\_PATH\_LOG\_DIR from the Jupyter notebook. You must run this from the /home/sagemaker-user root directory.

```bash
pip install tensorboard
tensorboard --logdir <EFS_PATH_LOG_DIR>
```

Launch TensorBoard

1. To launch TensorBoard, copy your Studio URL and replace lab? with proxy/6006/ as follows. You must include the trailing / character.

```
https://<YOUR_URL>.studio.region.sagemaker.aws/jupyter/default/proxy/6006/
```
2. Navigate to the URL to examine your results.

Manage Your EFS Storage Volume in SageMaker Studio

The first time a user on your team onboards to Amazon SageMaker Studio, Amazon SageMaker creates an Amazon Elastic File System (Amazon EFS) volume for the team. A home directory is created in the volume for each user who onboards to Studio as part of your team. Notebook files and data files are stored in these directories. Users don't have access to other team member's home directories.

**Important**
Don't delete the Amazon EFS volume. If you delete it, the domain will no longer function and all of your users will lose their work.

**To find your Amazon EFS volume**

1. From the SageMaker Studio Control Panel, under Studio Summary, find the Studio ID. The ID will be in the following format: d-xxxxxxxxxxxx.
2. Pass the Studio ID, as DomainId, to the describe_domain method.
3. In the response from describe_domain, note the value for the HomeEfsFileSystemId key. This is the Amazon EFS file system ID.
4. Open the Amazon EFS console. Make sure the AWS Region is the same Region that's used by Studio.
5. Under File systems, choose the file system ID from the previous step.
6. To verify that you've chosen the correct file system, select the Tags heading. The value corresponding to the ManagedByAmazonSageMakerResourceId key should match the Studio ID.

For information on how to access the Amazon EFS volume, see Using file systems in Amazon EFS.
To delete the Amazon EFS volume, see Deleting an Amazon EFS file system.

Provide Feedback on SageMaker Studio

Amazon SageMaker takes your feedback seriously. We encourage you to provide feedback.

To provide feedback

1. At the upper-right of SageMaker Studio, choose Feedback.
2. Choose a smiley emoji to let us know how satisfied you are with SageMaker Studio and add any feedback you’d care to share with us.
3. Decide whether to share your identity with us, then choose Submit.

Update SageMaker Studio and Studio Apps

Amazon SageMaker Studio provides a notification icon ( unfolds) in the upper-right corner. The number of unread notices is displayed in the icon. To read the notices, select the icon. Two types of notifications are provided:

- Upgrade – Displayed when Studio or one of the Studio apps have released a new version. To update, see Update SageMaker Studio and Studio Apps (p. 117).
- Information – Displayed for new features and other information.

To reset the notification icon, you must select the link in each notice.

The following procedures show you how to update Amazon SageMaker Studio and SageMaker Studio apps to their latest versions.

To learn how to update Amazon SageMaker Data Wrangler, see Update Studio Apps (p. 118).

Topics

- Update SageMaker Studio (p. 117)
- Update Studio Apps (p. 118)

Update SageMaker Studio

To update Amazon SageMaker Studio to the latest release, you must shut down the JupyterServer app. Any unsaved notebook information is lost in the process. The user data in the Amazon EFS volume isn’t impacted.

After the JupyterServer app is shut down, you must reopen Studio through the SageMaker Studio Control Panel which creates a new version of the JupyterServer app.

You can shut down the JupyterServer app from the Studio Control Panel or from within Studio.

Some of the services within Studio, like Data Wrangler, run on their own app. To update these services you must delete the app for that service. To learn more, see Update Studio Apps (p. 118).

Note

A JupyterServer app is associated with a single Studio user. When you update the app for one user it doesn’t affect other users.

To shut down the JupyterServer app from the Studio Control Panel

1. Choose your user name.
2. Under Apps, in the row displaying JupyterServer, choose Delete app.
3. Choose Yes, delete app.
4. Type delete in the confirmation box.
5. Choose Delete.

To shut down the JupyterServer app from inside Studio
1. (Optional) View the current Studio version number.
   a. Open the Studio Launcher. Choose Amazon SageMaker Studio in the top-left of Studio.
   b. Open Utilities and files.
   c. Choose System terminal.
   d. Run the following command: jupyter labextension list
      The version is specified similar to @amzn/sagemaker-ui v2.13.1.
2. On the top menu, choose File then Shut Down.
3. Choose one of the following options:
   a. Shutdown Server – Shuts down the JupyterServer app. Terminal sessions, kernel sessions,
      SageMaker images, and instances aren’t shut down. These resources continue to accrue charges.
   b. Shutdown All – Shuts down all apps, terminal sessions, kernel sessions, SageMaker images, and
      instances. These resources no longer accrue charges.
4. Close the window.

Update Studio Apps
To update an Amazon SageMaker Studio app to the latest release, you must first shut down the
 corresponding KernelGateway app from the SageMaker Studio Control Panel. After the KernelGateway
 app is shut down, you must reopen it through SageMaker Studio by running a new kernel. The kernel
 automatically updates. Any unsaved notebook information is lost in the process. The user data in the
 Amazon EFS volume isn’t impacted.

Note
A KernelGateway app is associated with a single Studio user. When you update the app for one
 user it doesn’t effect other users.

To shut down the KernelGateway app
1. Choose your user name.
2. Under Apps, in the row displaying the App name, choose Delete app.
   To update Data Wrangler, delete the app that starts with sagemaker-data-wrang.
3. Choose Yes, delete app.
4. Type delete in the confirmation box.
5. Choose Delete.

Amazon SageMaker Studio Pricing
When the first member of your team onboards to Amazon SageMaker Studio, Amazon SageMaker
 creates an Amazon Elastic File System (Amazon EFS) volume for the team. In the SageMaker Studio
 Control Panel, when the Studio Status displays as Ready, the Amazon EFS volume has been created.
When this member, or any member of the team, opens Studio, a home directory is created in the volume for the member. A storage charge is incurred for this directory. Subsequently, additional storage charges are incurred for the notebooks and data files stored in the member's home directory. For pricing information on Amazon EFS, see Amazon EFS Pricing.

Additional costs are incurred when other operations are run inside Studio, for example, creating an Amazon SageMaker Autopilot job, running a notebook, running training jobs, and hosting a model.

For information on the costs associated with using Studio notebooks, see Usage Metering (p. 83).

For information about billing along with pricing examples, see Amazon SageMaker Pricing.

**Troubleshooting Amazon SageMaker Studio**

The following are common errors that you might run into when using Amazon SageMaker Studio. Each error is followed by a solution to the error.

- **SageMaker Studio core functionalities are not available.**

  If you get this error message when opening Studio, it might due to Python package version conflicts. This occurs if you used the following commands in a notebook or terminal to install Python packages that have version conflicts with SageMaker package dependencies.

  ```bash
  !pip install
  pip install --user
  ```

  To resolve this issue, complete the following steps:
  1. Uninstall recently installed Python packages. If you’re not sure which package to uninstall, reach out using the feedback button on the lower left of the AWS Management Console.
  2. Restart Studio:
     - a. Shut down Studio from the File menu.
     - b. Wait for 1 minute.
     - c. Re-open Studio by refreshing the page or opening it from the AWS Management Console.

  The problem should be resolved if you have uninstalled the package which caused the conflict. To install packages without causing this issue again, use `pip install` without the `--user` flag.

  If the issue persists, create a new user profile and set up your environment with that user profile.

  If these solutions don't fix the issue, reach out using the feedback button on the lower left of the AWS Management Console.
SageMaker JumpStart

**Important**
To use new features with an existing notebook instance or Studio app, you must restart the notebook instance or the Studio app to get the latest updates.

You can use SageMaker JumpStart to learn about SageMaker features and capabilities through curated 1-click solutions, example notebooks, and pretrained models that you can deploy. You can also fine-tune the models and deploy them.

To access JumpStart, you must first launch SageMaker Studio. JumpStart features are not available in SageMaker notebook instances, and you can't access them through SageMaker APIs or the AWS CLI.

Open JumpStart by using the JumpStart launcher in the **Get Started** section or by choosing the JumpStart icon in the left sidebar.

In the **file and resource browser** (the left pane), you can find JumpStart options. From here you can choose to browse JumpStart for solutions, models, notebooks, and other resources, or you can view your currently launched solutions, endpoints, and training jobs.

To see what JumpStart has to offer, choose the JumpStart icon, and then choose **Browse JumpStart**. JumpStart opens in a new tab in the main work area. Here you can browse 1-click solutions, models, example notebooks, blogs, and video tutorials.

Important
Amazon SageMaker JumpStart makes certain content available from third-party sources. This content may be subject to separate license terms. You are responsible for reviewing and complying with any applicable license terms and making sure they are acceptable for your use case before downloading or using the content.

Using JumpStart

At the top of the JumpStart page you can use search to look for topics of interest.

You can find JumpStart resources by using search, or by browsing each category that follows the search panel:

- **Solutions** – Launch end-to-end machine learning solutions that tie SageMaker to other AWS services with one click.
- **Text models** – Deploy and fine-tune pretrained transformers for various natural language processing use cases.
• **Vision models** – Deploy and fine-tune pretrained models for image classification and object detection with one click.
• **SageMaker algorithms** – Train and deploy SageMaker built-in Algorithms for various problem types with these example notebooks.
• **Example notebooks** – Run example notebooks that use SageMaker features like spot instance training and experiments over a large variety of model types and use cases.
• **Blogs** – Read deep dives and solutions from machine learning experts hosted by Amazon.
• **Video tutorials** – Watch video tutorials for SageMaker features and machine learning use cases from machine learning experts hosted by Amazon.

**Solutions**

When you choose a solution, JumpStart shows a description of the solution and a **Launch** button. When you click **Launch**, JumpStart creates all of the resources necessary to run the solution, including training and model hosting instances. After JumpStart launches the solution, JumpStart shows an **Open Notebook** button. You can click the button to use the provided notebooks and explore the solution’s features. As artifacts are generated during launch or after running the provided notebooks, they are listed in the **Generated Artifacts** table. You can delete individual Artifacts with the Trash icon (Trash). You can delete all of the solution’s resources by choosing **Delete solution resources**.

**Models**

Models are available for quick deployment directly from JumpStart. You can also fine-tune some of these models. When you browse the models, you can scroll to the deploy and fine-tune sections to the **Description** section. In the **Description** section, you can learn more about the model, including what it can do with the model, what kind of inputs and outputs are expected, and the kind of data you need if you want to use transfer learning to fine-tune the model.

The following tables list the models currently offered in JumpStart. The available models are sorted by their model type and task. To view other model sets, click the task tab for those models.

**Deploy a model**

When you deploy a model from JumpStart, SageMaker hosts the model and deploys an endpoint that you can use for inference. JumpStart also provides an example notebook that you can use to access the model after it's deployed.

**Model Deployment Configuration**

After you choose a model, the **Deploy Model** pane opens. Choose **Deployment Configuration** to configure your model deployment.
The default **Machine Type** for deploying a model depends on the model. The machine type is the hardware that the training job runs on. In the following example, the `ml.m5.large` instance is the default for this particular BERT model.

You can also change the **Endpoint Name**.
Fine-Tune a Model

Fine-tuning trains a pretrained model on a new dataset without training from scratch. This process, also known as transfer learning, can produce accurate models with smaller datasets and less training time.

Fine-Tuning Data Source

When you fine-tune a model, you can use the default dataset or choose your own data, which is located in an S3 bucket.
Fine-tune the Model on a New Dataset

The model can be fine-tuned to any given dataset comprising images belonging to any number of classes.

The model available for fine-tuning attaches a classification layer to the corresponding feature extractor model available on TensorFlow, and initializes the layer parameters to random values. The dimension of the classification layer is determined based on the number of classes in the new dataset. During the fine-tuning step, fine-tunes the classification layer parameters while keeping the parameters of the feature extractor model frozen, and returns the fine-tuned model. The objective is to minimize the classification error on the input data. The model returned by fine-tuning can be further deployed for inference. Below are the instructions for how the training data should be formatted for input to the model.

- **Input:** A directory with as many sub-directories as the number of classes.
  - Each sub-directory should have images belonging to that class in .jpg format.
- **Output:** A trained model that can be deployed for inference.
  - A label mapping file is saved along with the trained model file on the s3 bucket.

We provide the tf_flowers dataset as a default dataset for fine-tuning the model. tf_flowers is a sample dataset of five types of flowers. The dataset has been downloaded from TensorFlow GitHub. 

Citation: @ONLINE {tfflowers, author = "The TensorFlow Team", title = "Flowers", month = "2019", url = "http://download.tensorflow.org/example_images/flower_photos.tgz" }
To browse the buckets available to you, choose **Find S3 bucket**. These buckets are limited by the permissions used to set up your Studio account. You can also specify an S3 URI by choosing **Enter S3 bucket location**.

**Fine-tune Model**

Create a training job to fine-tune this pretrained model to fit your own data. Fine-tuning the model on a new dataset without training from scratch. It can produce accurate models with less training time. **Learn more.**

**DataSource**

Select the default dataset, or use your own data to fine-tune this model.

- Default dataset
- Find S3 bucket
- Enter S3 bucket location

This option will fit the model to the default dataset. **Learn more.**

**Deployment Configuration**

**Hyper-parameters**

**Tip**

To find out how to format the data in your bucket, choose **Learn more**. Also, the description section for the model has detailed information about inputs and outputs.

For text models:

- The bucket must have a data.csv file.
- The first column must be a unique integer for the class label. For example: 1, 2, 3, 4, n.
- The second column must be a string.
- The second column should have the corresponding text that matches the type and language for the model.
For vision models:

- The bucket must have as many subdirectories as the number of classes.
- Each subdirectory should contain images that belong to that class in .jpg format.

**Note**

The S3 bucket must be in the same AWS Region where you're running SageMaker Studio because SageMaker doesn't allow cross-region requests.

---

**Fine-Tuning deployment configuration**

The p3 family is recommended as the fastest for deep learning training, and this is recommended for fine-tuning a model. The following chart shows the number of GPUs in each instance type. There are other available options that you can choose from, including p2 and g4 instance types.

<table>
<thead>
<tr>
<th>Instance type</th>
<th>GPUs</th>
</tr>
</thead>
<tbody>
<tr>
<td>p3.2xlarge</td>
<td>1</td>
</tr>
<tr>
<td>p3.8xlarge</td>
<td>4</td>
</tr>
<tr>
<td>p3.16xlarge</td>
<td>8</td>
</tr>
<tr>
<td>p3dn.24xlarge</td>
<td>8</td>
</tr>
</tbody>
</table>

**Hyperparameters**

You can customize the hyperparameters of the training job that are used to fine-tune the model.

If you use the default dataset for text models without changing the hyperparameters, you get a nearly identical model as a result. For vision models, the default dataset is different from the dataset used to train the pretrained models, so your model is different as a result.

You have the following hyperparameter options:

- **Epochs** – One epoch is one cycle through the entire dataset. Multiple intervals complete a batch, and multiple batches eventually complete an epoch. Multiple epochs are run until the accuracy of the model reaches an acceptable level, or in other words, when the error rate drops below an acceptable level.

- **Learning rate** – The amount that values should be changed between epochs. As the model is refined, its internal weights are being nudged and error rates are checked to see if the model improves. A typical learning rate is 0.1 or 0.01, where 0.01 is a much smaller adjustment and could cause the training to take a long time to converge, whereas 0.1 is much larger and can cause the training to overshoot. It is one of the primary hyperparameters that you might adjust for training your model. Note that for text models, a much smaller learning rate (5e-5 for BERT) can result in a more accurate model.

- **Batch size** – The number of records from the dataset that to be selected for each interval to send to the GPUs available in training. In an image example, you might send out 32 images per GPU, so 32 would be your batch size. If you choose an instance type with more than one GPU, the batch is divided by the number of GPUs. Suggested batch size varies depending on the data and the model that you are using. For example, how you optimize for image data differs from how you handle language data. In the instance type chart in the deployment configuration section, you can see the number of GPUs per instance type. Start with a standard recommended batch size (for example, 32 for a vision model).
Then, multiply this by the number of GPUs in the instance type that you selected. For example, if you're using a p3.8xlarge, this would be 32(batch size)*4(GPUs), for a total of 128 as your batch size adjusted for the number of GPUs. For a text model like BERT, try starting with a batch size of 64, and then reduce as needed.

**Hyper-parameters**

Customize the hyper-parameters for the training job from the default values we have set.

**Epochs**

| Epochs | 3 |

**Learning Rate**

| Learning Rate | 0.00002 |

**Batch Size**

| Batch Size | 8 |

[Reset to default]

**Training Output**

When the fine-tuning process is complete, JumpStart provides information about the model: parent model, training job name, training job Amazon Resource Name (ARN), training time, and output path. The output path is where you can find your new model in an S3 bucket. The folder structure uses the model name you provided and the model file is in an /output subfolder and it's always named model.tar.gz.

Example: s3://bucket/model-name/output/model.tar.gz
Use Amazon SageMaker Notebook Instances

An Amazon SageMaker notebook instance is a machine learning (ML) compute instance running the Jupyter Notebook App. SageMaker manages creating the instance and related resources. Use Jupyter notebooks in your notebook instance to prepare and process data, write code to train models, deploy models to SageMaker hosting, and test or validate your models.

SageMaker also provides sample notebooks that contain complete code walkthroughs. These walkthroughs show how to use SageMaker to perform common machine learning tasks. For more information, see Example Notebooks (p. 152).

This video shows you how to setup and use SageMaker notebook instances. (Length: 26:04)

This video is a deep dive on how to use SageMaker notebook instances. (Length: 16:44)

Amazon Linux 2 vs Amazon Linux notebook instances

Amazon SageMaker notebook instances currently support Amazon Linux 2 (AL2) and Amazon Linux (AL1) operating systems. You can select the operating system that your notebook instances is based on when you create the notebook instance. Notebook instances created before 08/18/2021 automatically run on AL1. Notebook instances based on AL1 will enter a maintenance phase as of 04/18/2022. To replace AL1, customers now have the option to create Amazon SageMaker notebook instances with AL2. The AL1 maintenance phase also coincides with the deprecation of Python 2 and Chainer. Notebooks based on AL2 do not have managed Python 2 and Chainer kernels.

AL1 Maintenance Phase Plan

The following table outlines the timeline for AL1 entering its extended maintenance phase.

<table>
<thead>
<tr>
<th>Date</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>08/18/2021</td>
<td>Notebook instances based on AL2 are launched. Newly launched notebook instances still default to AL1. AL1 is supported with security patches</td>
</tr>
</tbody>
</table>

**Migrating to Amazon Linux 2**

Your existing notebook instance is not automatically migrated to Amazon Linux 2. To upgrade your notebook instance to Amazon Linux 2, you must create a new notebook instance, replicate your code and environment, and delete your old notebook instance. For more information, see the Amazon Linux 2 migration blog.

**Create a Notebook Instance**

An Amazon SageMaker notebook instance is a ML compute instance running the Jupyter Notebook App. SageMaker manages creating the instance and related resources. Use Jupyter notebooks in your...
notebook instance to prepare and process data, write code to train models, deploy models to SageMaker hosting, and test or validate your models.

To create a notebook instance, use either the SageMaker console or the CreateNotebookInstance API.

The notebook instance type you choose depends on how you use your notebook instance. You want to ensure that your notebook instance is not bound by memory, CPU, or IO. If you plan to load a dataset into memory on the notebook instance for exploration or preprocessing, we recommend that you choose an instance type with enough RAM memory for your dataset. This would require an instance with at least 16 GB of memory (xlarge or larger). If you plan to use the notebook for compute intensive preprocessing, we recommend you choose a compute-optimized instance such as a c4 or c5.

A best practice when using a SageMaker notebook is to use the notebook instance to orchestrate other AWS services. For example, you can use the notebook instance to manage large dataset processing by making calls to AWS Glue for ETL (extract, transform, and load) services or Amazon EMR for mapping and data reduction using Hadoop. You can use AWS services as temporary forms of computation or storage for your data.

You can store and retrieve your training and test data using an Amazon S3 bucket. You can then use SageMaker to train and build your model, so the instance type of your notebook would have no bearing on the speed of your model training and testing.

After receiving the request, SageMaker does the following:

- **Creates a network interface**—If you choose the optional VPC configuration, SageMaker creates the network interface in your VPC. It uses the subnet ID that you provide in the request to determine which Availability Zone to create the subnet in. SageMaker associates the security group that you provide in the request with the subnet. For more information, see Connect a Notebook Instance to Resources in a VPC (p. 2595).

- **Launches an ML compute instance**—SageMaker launches an ML compute instance in a SageMaker VPC. SageMaker performs the configuration tasks that allow it to manage your notebook instance, and if you specified your VPC, it enables traffic between your VPC and the notebook instance.

- **Installs Anaconda packages and libraries for common deep learning platforms**—SageMaker installs all of the Anaconda packages that are included in the installer. For more information, see Anaconda package list. In addition, SageMaker installs the TensorFlow and Apache MXNet deep learning libraries.

- **Attaches an ML storage volume**—SageMaker attaches an ML storage volume to the ML compute instance. You can use the volume as a working area to clean up the training dataset or to temporarily store validation, test, or other data. Choose any size between 5 GB and 16384 GB, in 1 GB increments, for the volume. The default is 5 GB. ML storage volumes are encrypted, so SageMaker can't determine the amount of available free space on the volume. Because of this, you can increase the volume size when you update a notebook instance, but you can't decrease the volume size. If you want to decrease the size of the ML storage volume in use, create a new notebook instance with the desired size.

Only files and data saved within the /home/ec2-user/SageMaker folder persist between notebook instance sessions. Files and data that are saved outside this directory are overwritten when the notebook instance stops and restarts. Each notebook instance's /tmp directory provides a minimum of 10 GB of storage in an instance store. An instance store is temporary, block-level storage that isn't persistent. When the instance is stopped or restarted, SageMaker deletes the directory's contents. This temporary storage is part of the root volume of the notebook instance.

- **Copies example Jupyter notebooks**— These Python code examples illustrate model training and hosting exercises using various algorithms and training datasets.

To create a SageMaker notebook instance:

2. Choose Notebook instances, then choose Create notebook instance.
3. On the Create notebook instance page, provide the following information:
   a. For Notebook instance name, type a name for your notebook instance.
   b. For Notebook instance type, choose an instance size suitable for your use case. For a list of supported instance types and quotas, see Amazon SageMaker Service Quotas.
   c. For Elastic Inference, choose an inference accelerator type to associate with the notebook instance if you plan to conduct inferences from the notebook instance, or choose none. For information about elastic inference, see Use Amazon SageMaker Elastic Inference (EI) (p. 1935).
   d. For Platform Identifier, choose a platform type to create the notebook instance on. This platform type dictates the Operating System that your notebook instance is created with. For information about platform identifier type, see Amazon Linux 2 vs Amazon Linux notebook instances (p. 139).
   e. (Optional) Additional configuration lets advanced users create a shell script that can run when you create or start the instance. This script, called a lifecycle configuration script, can be used to set the environment for the notebook or to perform other functions. For information, see Customize a Notebook Instance Using a Lifecycle Configuration Script (p. 145).
   f. (Optional) Additional configuration also lets you specify the size, in GB, of the ML storage volume that is attached to the notebook instance. You can choose a size between 5 GB and 16,384 GB, in 1 GB increments. You can use the volume to clean up the training dataset or to temporarily store validation or other data.
   g. For IAM role, choose either an existing IAM role in your account that has the necessary permissions to access SageMaker resources or choose Create a new role. If you choose Create a new role, SageMaker creates an IAM role named AmazonSageMaker-ExecutionRole-YYYYMMDDTHHmmSS. The AWS managed policy AmazonSageMakerFullAccess is attached to the role. The role provides permissions that allow the notebook instance to call SageMaker and Amazon S3.
   h. For Root access, to enable root access for all notebook instance users, choose Enable. To disable root access for users, choose Disable. If you enable root access, all notebook instance users have administrator privileges and can access and edit all files on it.
   i. (Optional) Encryption key lets you encrypt data on the ML storage volume attached to the notebook instance using an AWS Key Management Service (AWS KMS) key. If you plan to store sensitive information on the ML storage volume, consider encrypting the information.
   j. (Optional) Network lets you put your notebook instance inside a Virtual Private Cloud (VPC). A VPC provides additional security and restricts access to resources in the VPC from sources outside the VPC. For more information on VPCs, see Amazon VPC User Guide.

To add your notebook instance to a VPC:
   i. Choose the VPC and a SubnetId.
   ii. For Security Group, choose your VPC’s default security group.
   iii. If you need your notebook instance to have internet access, enable direct internet access. For Direct internet access, choose Enable. Internet access can make your notebook instance less secure. For more information, see Connect a Notebook Instance to Resources in a VPC (p. 2595).
   k. (Optional) To associate Git repositories with the notebook instance, choose a default repository and up to three additional repositories. For more information, see Associate Git Repositories with SageMaker Notebook Instances (p. 154).
   l. Choose Create notebook instance.

In a few minutes, Amazon SageMaker launches an ML compute instance—in this case, a notebook instance—and attaches an ML storage volume to it. The notebook instance has a preconfigured Jupyter notebook server and a set of Anaconda libraries. For more information, see the
Access Notebook Instances

To access your Amazon SageMaker notebook instances, choose one of the following options:

- Use the console.

  Choose **Notebook instances**. The console displays a list of notebook instances in your account. To open a notebook instance with a standard Jupyter interface, choose **Open Jupyter** for that instance. To open a notebook instance with a JupyterLab interface, choose **Open JupyterLab** for that instance.

  ![Notebook instance list](image)

  The console uses your sign-in credentials to send a **CreatePresignedNotebookInstanceUrl** API request to SageMaker. SageMaker returns the URL for your notebook instance, and the console opens the URL in another browser tab and displays the Jupyter notebook dashboard.

  **Note**
  
  The URL that you get from a call to **CreatePresignedNotebookInstanceUrl** is valid only for 5 minutes. If you try to use the URL after the 5-minute limit expires, you are directed to the AWS Management Console sign-in page.

- Use the API.

  To get the URL for the notebook instance, call the **CreatePresignedNotebookInstanceUrl** API and use the URL that the API returns to open the notebook instance.

  Use the Jupyter notebook dashboard to create and manage notebooks and to write code. For more information about Jupyter notebooks, see [http://jupyter.org/documentation.html](http://jupyter.org/documentation.html).
Update a Notebook Instance

After you create a notebook instance, you can update it using the SageMaker console and the UpdateNotebookInstance API operation.

You can update the tags of a notebook instance that is InService. To update any other attribute of a notebook instance, its status must be Stopped.

To update a notebook instance in the SageMaker console:

2. Choose Notebook instances.
3. Choose the notebook instance that you want to update by selecting the notebook instance Name from the list.
4. If your notebook Status is not Stopped, select the Stop button to stop the notebook instance.
   
   When you do this, the notebook instance status changes to Stopping. Wait until the status changes to Stopped to complete the following steps.
5. Select the Edit button to open the Edit notebook instance page.
6. Update your notebook instance and select the Update notebook instance button at the bottom of the page when you are done to return to the notebook instances page. Your notebook instance status changes to Updating.
   
   When the notebook instance update is complete, the status changes to Stopped.

Customize a Notebook Instance Using a Lifecycle Configuration Script

To install packages or sample notebooks on your notebook instance, configure networking and security for it, or otherwise use a shell script to customize it, use a lifecycle configuration. A lifecycle configuration provides shell scripts that run only when you create the notebook instance or whenever you start one. When you create a notebook instance, you can create a new lifecycle configuration and the scripts it uses or apply one that you already have.

You can also use a lifecycle configuration script to access AWS services from your notebook. For example, you can create a script that lets you use your notebook to control other AWS resources, such as an Amazon EMR instance.

We maintain a public repository of notebook lifecycle configuration scripts that address common use cases for customizing notebook instances at https://github.com/aws-samples/amazon-sagemaker-notebook-instance-lifecycle-configuration-samples.

Note
Each script has a limit of 16384 characters.
The value of the $PATH environment variable that is available to both scripts is /usr/local/sbin:/usr/local/bin:/usr/bin:/usr/sbin:/sbin:/bin. The working directory, which is the value of the $PWD environment variable, is /.
View CloudWatch Logs for notebook instance lifecycle configurations in log group /aws/sagemaker/NotebookInstances in log stream [notebook-instance-name]/[LifecycleConfigHook].
Scripts cannot run for longer than 5 minutes. If a script runs for longer than 5 minutes, it fails and the notebook instance is not created or started. To help decrease the run time of scripts, try the following:
• Cut down on necessary steps. For example, limit which conda environments in which to install large packages.
• Run tasks in parallel processes.
• Use the `nohup` command in your script.

To create a lifecycle configuration
1. For Lifecycle configuration - Optional, choose Create a new lifecycle configuration.
2. For Name, type a name using alphanumeric characters and "-", but no spaces. The name can have a maximum of 63 characters.
3. (Optional) To create a script that runs when you create the notebook and every time you start it, choose Start notebook.
4. In the Start notebook editor, type the script.
5. (Optional) To create a script that runs only once, when you create the notebook, choose Create notebook.
6. In the Create notebook editor, type the script configure networking.
7. Choose Create configuration.

You can see a list of notebook instance lifecycle configurations you previously created by choosing Lifecycle configuration in the SageMaker console. From there, you can view, edit, delete existing lifecycle configurations. You can create a new notebook instance lifecycle configuration by choosing Create configuration. These notebook instance lifecycle configurations are available when you create a new notebook instance.

Lifecycle Configuration Best Practices

The following are best practices for using lifecycle configurations:

• Lifecycle configurations run as the root user. If your script makes any changes within the `/home/ec2-user/SageMaker` directory, (for example, installing a package with `pip`), use the command `sudo -u ec2-user` to run as the ec2-user user. This is the same user that Amazon SageMaker runs as.

• SageMaker notebook instances use conda environments to implement different kernels for Jupyter notebooks. If you want to install packages that are available to one or more notebook kernels, enclose the commands to install the packages with conda environment commands that activate the conda environment that contains the kernel where you want to install the packages.

For example, if you want to install a package only for the python3 environment, use the following code:

```
#!/bin/bash
sudo -u ec2-user -i <<'EOF'
# This will affect only the Jupyter kernel called "conda_python3".
sudo -u ec2-user -i <<'EOF'
source activate python3

# Replace `myPackage` with the name of the package you want to install.
pip install myPackage

# You can also perform "conda install" here as well.
source deactivate
EOF
EOF
```

146
If you want to install a package in all conda environments in the notebook instance, use the following code:

```bash
#!/bin/bash
sudo -u ec2-user -i <<'EOF'
# Note that "base" is special environment name, include it there as well.
for env in base /home/ec2-user/anaconda3/envs/*; do
  source /home/ec2-user/anaconda3/bin/activate $(basename "$env")
  # Installing packages in the Jupyter system environment can affect stability of your
  # Notebook Instance. You can remove this check if you'd like to install Jupyter
  # extensions, etc.
  if [ $env = 'JupyterSystemEnv' ]; then
    continue
  fi
  # Replace myPackage with the name of the package you want to install.
  pip install --upgrade --quiet myPackage
  # You can also perform "conda install" here as well.
  source /home/ec2-user/anaconda3/bin/deactivate
done
EOF
```

- You must store all conda environments in the default environments folder (/home/user/anaconda3/envs).

**Important**
When you create or change a script, we recommend that you use a text editor that provides Unix-style line breaks, such as the text editor available in the console when you create a notebook. Copying text from a non-Linux operating system might introduce incompatible line breaks and result in an unexpected error.

Install External Libraries and Kernels in Notebook Instances

Amazon SageMaker notebook instances come with multiple environments already installed. These environments contain Jupyter kernels and Python packages including: scikit, Pandas, NumPy, TensorFlow, and MXNet. These environments, along with all files in the sample-notebooks folder, are refreshed when you stop and start a notebook instance. You can also install your own environments that contain your choice of packages and kernels.

The different Jupyter kernels in Amazon SageMaker notebook instances are separate conda environments. For information about conda environments, see Managing environments in the Conda documentation.

Install custom environments and kernels on the notebook instance's Amazon EBS volume. This ensures that they persist when you stop and restart the notebook instance, and that any external libraries you install are not updated by SageMaker. To do that, use a lifecycle configuration that includes both a script that runs when you create the notebook instance (on-create) and a script that runs each time you restart the notebook instance (on-start). For more information about using notebook instance lifecycle configurations, see Customize a Notebook Instance Using a Lifecycle Configuration Script (p. 145). There is a GitHub repository that contains sample lifecycle configuration scripts at SageMaker Notebook Instance Lifecycle Config Samples.
The examples at https://github.com/aws-samples/amazon-sagemaker-notebook-instance-lifecycle-config-samples/blob/master/scripts/persistent-conda-ebs/on-create.sh and https://github.com/aws-samples/amazon-sagemaker-notebook-instance-lifecycle-config-samples/blob/master/scripts/persistent-conda-ebs/on-start.sh show the best practice for installing environments and kernels on a notebook instance. The on-create script installs the ipykernel library so that you can use create custom environments as Jupyter kernels, and then uses pip install and conda install to install libraries. You can adapt the script to create custom environments and install libraries that you want. SageMaker does not update these libraries when you stop and restart the notebook instance, so you can ensure that your custom environment has specific versions of libraries that you want. The on-start script installs any custom environments that you create as Jupyter kernels, so that they appear in the dropdown list in the Jupyter New menu.

Package installation tools

SageMaker notebooks support the following package installation tools:

- conda install
- pip install

You can install packages using the following methods:

- Lifecycle configuration scripts.

  For example scripts, see SageMaker Notebook Instance Lifecycle Config Samples. For more information on lifecycle configuration, see Customize a Notebook Instance Using a Lifecycle Configuration Script.

- Notebooks – The following commands are supported.
  - %conda install
  - %pip install
- The Jupyter terminal – You can install packages using pip and conda directly.

From within a notebook you can use the system command syntax (lines starting with !) to install packages, for example, !pip install and !conda install. More recently, new commands have been added to IPython: %pip and %conda. These commands are the recommended way to install packages from a notebook as they correctly take into account the activate environment or interpreter being used. For more information, see Add %pip and %conda magic functions.

Conda

Conda is an open source package management system and environment management system, which can install packages and their dependencies. SageMaker supports using Conda with either of the two main channels, the default channel, and the conda-forge channel. For more information, see Conda channels. The conda-forge channel is a community channel where contributors can upload packages.

**Note**

Due to how Conda resolves the dependency graph, installing packages from conda-forge can take significantly longer (in the worst cases, upwards of 10 minutes).

The Deep Learning AMI comes with many conda environments and many packages preinstalled. Due to the number of packages preinstalled, finding a set of packages that are guaranteed to be compatible is difficult. You may see a warning “The environment is inconsistent, please check the package plan carefully”. Despite this warning, SageMaker ensures that all the SageMaker provided environments are correct. SageMaker cannot guarantee that any user installed packages will function correctly.

Conda has two methods for activating environments: conda activate/deactivate, and source activate/deactivate. For more information, see Should I use ‘conda activate’ or ‘source activate’ in Linux.
SageMaker supports moving Conda environments onto the Amazon EBS volume, which is persisted when the instance is stopped. The environments aren't persisted when the environments are installed to the root volume, which is the default behavior. For an example lifecycle script, see persistent-conda-ebs.

**Supported conda operations (see note at the bottom of this topic)**

- conda install of a package in a single environment
- conda install of a package in all environments
- conda install of a R package in the R environment
- Installing a package from the main conda repository
- Installing a package from conda-forge
- Changing the Conda install location to use EBS
- Supporting both conda activate and source activate

**Pip**

Pip is the de facto tool for installing and managing Python packages. Pip searches for packages on the Python Package Index (PyPI) by default. Unlike Conda, pip doesn't have built in environment support, and is not as thorough as Conda when it comes to packages with native/system library dependencies. Pip can be used to install packages in Conda environments.

You can use alternative package repositories with pip instead of the PyPI. For an example lifecycle script, see on-start.sh.

**Supported pip operations (see note at the bottom of this topic)**

- Using pip to install a package without an active conda environment (install packages system wide)
- Using pip to install a package in a conda environment
- Using pip to install a package in all conda environments
- Changing the pip install location to use EBS
- Using an alternative repository to install packages with pip

**Unsupported**

SageMaker aims to support as many package installation operations as possible. However, if the packages were installed by SageMaker or DLAMI, and you use the following operations on these packages, it might make your notebook instance unstable:

- Uninstalling
- Downgrading
- Upgrading

We do not provide support for installing packages via yum install or installing R packages from CRAN.

Due to potential issues with network conditions or configurations, or the availability of Conda or PyPi, we cannot guarantee that packages will install in a fixed or deterministic amount of time.

**Note**

We cannot guarantee that a package installation will be successful. Attempting to install a package in an environment with incompatible dependencies can result in a failure. In such a case you should contact the library maintainer to see if it is possible to update the package dependencies. Alternatively you can attempt to modify the environment in such a way as to allow the installation. This modification however will likely mean removing or updating existing packages, which means we can no longer guarantee stability of this environment.
Notebook Instance Software Updates

Amazon SageMaker periodically tests and releases software that is installed on notebook instances. This includes:

- Kernel updates
- Security patches
- AWS SDK updates
- Amazon SageMaker Python SDK updates
- Open source software updates

SageMaker does not automatically update software on a notebook instance when it is in service. To ensure that you have the most recent software updates, stop and restart your notebook instance, either in the SageMaker console or by calling `StopNotebookInstance`.

You can also manually update software installed on your notebook instance while it is running by using update commands in a terminal or in a notebook.

**Note**

Updating kernels and some packages might depend on whether root access is enabled for the notebook instance. For more information, see Control root access to a SageMaker notebook instance (p. 2503).

Notebook instances do not notify you if you are running outdated software. You can check the Personal Health Dashboard or the security bulletin at Security Bulletins for updates.

Control an Amazon EMR Spark Instance Using a Notebook

You can use a notebook instance created with a custom lifecycle configuration script to access AWS services from your notebook. For example, you can create a script that lets you use your notebook with Sparkmagic to control other AWS resources, such as an Amazon EMR instance. You can then use the Amazon EMR instance to process your data instead of running the data analysis on your notebook. This allows you to create a smaller notebook instance because you won't use the instance to process data. This is helpful when you have large datasets that would require a large notebook instance to process the data.

The process requires three procedures using the Amazon SageMaker console:

- Create the Amazon EMR Spark instance
- Create the Jupyter Notebook
- Test the notebook-to-Amazon EMR connection

**To create an Amazon EMR Spark instance that can be controlled from a notebook using Sparkmagic**

1. Open the Amazon EMR console at https://console.aws.amazon.com/elasticmapreduce/.
2. In the navigation pane, choose **Create cluster**.
3. On the **Create Cluster - Quick Options** page, under **Software configuration**, choose **Spark: Spark 2.4.4 on Hadoop 2.8.5 YARN with Ganglia 3.7.2 and Zeppelin 0.8.2**.
4. Set additional parameters on the page and then choose **Create cluster**.
5. On the **Cluster** page, choose the cluster name that you created. Note the **Master Public DNS**, the **EMR master's security group**, and the VPC name and subnet ID where the EMR cluster was created. You will use these values when you create a notebook.

**To create a notebook that uses Sparkmagic to control an Amazon EMR Spark instance**

2. In the navigation pane, under **Notebook instances**, choose **Create notebook**.
3. Enter the notebook instance name and choose the instance type.
4. Choose **Additional configuration**, then, under **Lifecycle configuration**, choose **Create a new lifecycle configuration**.
5. Add the following code to the lifecycle configuration script:

```bash
# OVERVIEW
# This script connects an Amazon EMR cluster to an Amazon SageMaker notebook instance that uses Sparkmagic.
#
# Note that this script will fail if the Amazon EMR cluster's master node IP address is not reachable.
#   1. Ensure that the EMR master node IP is resolvable from the notebook instance.
#      One way to accomplish this is to have the notebook instance and the Amazon EMR cluster in the same subnet.
#   2. Ensure the EMR master node security group provides inbound access from the notebook instance security group.
#   3. Ensure the notebook instance has internet connectivity to fetch the SparkMagic example config.
#

# PARAMETERS
EMR_MASTER_IP=your.emr.master.ip

cd /home/ec2-user/.sparkmagic

echo "Fetching Sparkmagic example config from GitHub..."
wget https://raw.githubusercontent.com/jupyter-incubator/sparkmagic/master/sparkmagic/example_config.json

echo "Replacing EMR master node IP in Sparkmagic config..."
sed -i "s/localhost/$EMR_MASTER_IP/g" example_config.json
mv example_config.json config.json

echo "Sending a sample request to Livy..."
curl "$EMR_MASTER_IP:8998/sessions"
```

6. In the **PARAMETERS** section of the script, replace `your.emr.master.ip` with the Master Public DNS name for the Amazon EMR instance.

7. Choose **Create configuration**.

8. On the **Create notebook** page, choose **Network - optional**.

9. Choose the VPC and subnet where the Amazon EMR instance is located.

10. Choose the security group used by the Amazon EMR master node.

11. Choose **Create notebook instance**.
While the notebook instance is being created, the status is **Pending**. After the instance has been created and the lifecycle configuration script has successfully run, the status is **InService**.

**Note**

If the notebook instance can't connect to the Amazon EMR instance, SageMaker can't create the notebook instance. The connection can fail if the Amazon EMR instance and notebook are not in the same VPC and subnet, if the Amazon EMR master security group is not used by the notebook, or if the Master Public DNS name in the script is incorrect.

**To test the connection between the Amazon EMR instance and the notebook**

1. When the status of the notebook is **InService**, choose **Open Jupyter** to open the notebook.
2. Choose **New**, then choose **Sparkmagic (PySpark)**.
3. In the code cell, enter `%%info` and then run the cell.

   The output should be similar to the following

   ```
   Current session configs: {'driverMemory': '1000M', 'executorCores': 2, 'kind': 'pyspark'}
   No active sessions.
   ```

---

**Example Notebooks**

Your notebook instance contains example notebooks provided by Amazon SageMaker. The example notebooks contain code that shows how to apply machine learning solutions by using SageMaker. Notebook instances use the `nbexamples` Jupyter extension, which enables you to view a read-only version of an example notebook or create a copy of it so that you can modify and run it. For more information about the `nbexamples` extension, see [https://github.com/danielballan/nbexamples](https://github.com/danielballan/nbexamples).

For information about example notebooks for SageMaker Studio, see Use Amazon SageMaker Studio Notebooks (p. 66).

**Note**

Example notebooks typically download datasets from the internet. If you disable SageMaker-provided internet access when you create your notebook instance, example notebooks might not work. For more information, see Connect a Notebook Instance to Resources in a VPC (p. 2595).

---

**Use or View Example Notebooks in Jupyter Classic**

To view or use the example notebooks in the classic Jupyter view, choose the **SageMaker Examples** tab.

To view a read-only version of an example notebook in the Jupyter classic view, on the **SageMaker Examples** tab, choose **Preview** for that notebook. To create a copy of an example notebook in the home
directory of your notebook instance, choose **Use**. In the dialog box, you can change the notebook's name before saving it.

---

**Use or View Example Notebooks in Jupyterlab**

To view or use the example notebooks in the Jupyterlab view, choose the examples icon in the left navigation panel.
To view a read-only version of an example notebook, choose the name of the notebook. This opens the notebook as a tab in the main area. To create a copy of an example notebook in the home directory of your notebook instance, choose Create a Copy in the top banner. In the dialog box, type a name for the notebook and then choose CREATE COPY.

For more information about the example notebooks, see the SageMaker examples GitHub repository.

Set the Notebook Kernel

Amazon SageMaker provides several kernels for Jupyter that provide support for Python 2 and 3, Apache MXNet, TensorFlow, and PySpark. To set a kernel for a new notebook in the Jupyter notebook dashboard, choose New, and then choose the kernel from the list.

You can also create a custom kernel that you can use in your notebook instance. For information, see Install External Libraries and Kernels in Notebook Instances (p. 147).

Associate Git Repositories with SageMaker Notebook Instances

Associate Git repositories with your notebook instance to save your notebooks in a source control environment that persists even if you stop or delete your notebook instance. You can associate one default repository and up to three additional repositories with a notebook instance. The repositories can be hosted in AWS CodeCommit, GitHub, or on any other Git server. Associating Git repositories with your notebook instance can be useful for:

- Persistence - Notebooks in a notebook instance are stored on durable Amazon EBS volumes, but they do not persist beyond the life of your notebook instance. Storing notebooks in a Git repository enables you to store and use notebooks even if you stop or delete your notebook instance.
- Collaboration - Peers on a team often work on machine learning projects together. Storing your notebooks in Git repositories allows peers working in different notebook instances to share notebooks and collaborate on them in a source-control environment.
- Learning - Many Jupyter notebooks that demonstrate machine learning techniques are available in publicly hosted Git repositories, such as on GitHub. You can associate your notebook instance with a repository to easily load Jupyter notebooks contained in that repository.

There are two ways to associate a Git repository with a notebook instance:

- Add a Git repository as a resource in your Amazon SageMaker account. Then, to access the repository, you can specify an AWS Secrets Manager secret that contains credentials. That way, you can access repositories that require authentication.
- Associate a public Git repository that is not a resource in your account. If you do this, you cannot specify credentials to access the repository.
Add a Git Repository to Your Amazon SageMaker Account

To manage your GitHub repositories, easily associate them with your notebook instances, and associate credentials for repositories that require authentication, add the repositories as resources in your Amazon SageMaker account. You can view a list of repositories that are stored in your account and details about each repository in the SageMaker console and by using the API.

You can add Git repositories to your SageMaker account in the SageMaker console or by using the AWS CLI.

Note

You can use the SageMaker API `CreateCodeRepository` to add Git repositories to your SageMaker account, but step-by-step instructions are not provided here.

Add a Git Repository to Your SageMaker Account (Console)

To add a Git repository as a resource in your SageMaker account

2. Choose **Git repositories**, then choose **Add repository**.
3. To add an CodeCommit repository, choose **AWS CodeCommit**. To add a GitHub or other Git-based repository, choose **GitHub/Other Git-based repo**.

To add an existing CodeCommit repository

1. Choose **Use existing repository**.
2. For **Repository**, choose a repository from the list.
3. Enter a name to use for the repository in SageMaker. The name must be 1 to 63 characters. Valid characters are a-z, A-Z, 0-9, and - (hyphen).
4. Choose **Add repository**.

To create a new CodeCommit repository

1. Choose **Create new repository**.
2. Enter a name for the repository that you can use in both CodeCommit and SageMaker. The name must be 1 to 63 characters. Valid characters are a-z, A-Z, 0-9, and - (hyphen).
3. Choose **Create repository**.

To add a Git repository hosted somewhere other than CodeCommit

1. Choose **GitHub/Other Git-based repo**.
2. Enter a name of up to 63 characters. Valid characters include alpha-numeric characters, a hyphen (-), and 0-9.

3. Enter the URL for the repository. Do not provide a user name in the URL. Add the username and password in AWS Secrets Manager as described in the next step.

4. For **Git credentials**, choose the credentials to use to authenticate to the repository. This is necessary only if the Git repository is private.
   
   **Note**
   If you have two-factor authentication enabled for your Git repository, use a personal access token generated by your Git service provider instead of a password.
   
   a. To use an existing AWS Secrets Manager secret, choose **Use existing secret**, and then choose a secret from the list. For information about creating and storing a secret, see Creating a Basic Secret in the AWS Secrets Manager User Guide. The name of the secret you use must contain the string `sagemaker`.
      
      **Note**
      The secret must have a staging label of `AWSCURRENT` and must be in the following format:
      ```
      {
      "username": Username, "password": Password
      }
      ```
      For GitHub repositories, we recommend using a personal access token instead of your account password. For information, see https://help.github.com/articles/creating-a-personal-access-token-for-the-command-line/.
    
   b. To create a new AWS Secrets Manager secret, choose **Create secret**, enter a name for the secret, and then enter the username and password to use to authenticate to the repository. The name for the secret must contain the string `sagemaker`.
      
      **Note**
      The IAM role you use to create the secret must have the `secretsmanager:GetSecretValue` permission in its IAM policy.
      The secret must have a staging label of `AWSCURRENT` and must be in the following format:
      ```
      {
      "username": Username, "password": Password
      }
      ```
      For GitHub repositories, we recommend using a personal access token instead of your account password.
    
   c. To not use any credentials, choose **No secret**.

5. Choose **Create secret**.

---

**Add a Git Repository to Your Amazon SageMaker Account (CLI)**

Use the `create-code-repository` AWS CLI command. Specify a name for the repository as the value of the `code-repository-name` argument. The name must be 1 to 63 characters. Valid characters are a-z, A-Z, 0-9, and - (hyphen). Also specify the following:

- The default branch
- The URL of the Git repository

**Note**
Do not provide a user name in the URL. Add the username and password in AWS Secrets Manager as described in the next step.

- The Amazon Resource Name (ARN) of an AWS Secrets Manager secret that contains the credentials to use to authenticate the repository as the value of the `git-config` argument

For information about creating and storing a secret, see Creating a Basic Secret in the AWS Secrets Manager User Guide. The following command creates a new repository named `MyRespository` in
your Amazon SageMaker account that points to a Git repository hosted at https://github.com/myprofile/my-repo".

For Linux, OS X, or Unix:

```bash
aws sagemaker create-code-repository
   --code-repository-name "MyRepository"
   --git-config "{"Branch":"master", "RepositoryUrl":
   "https://github.com/myprofile/my-repo", "SecretArn":
   "arn:aws:secretsmanager:us-east-2:12345678901:secret:my-secret-ABC0DE"}
```

For Windows:

```bash
aws sagemaker create-code-repository
   --code-repository-name "MyRepository"
   --git-config "{"Branch":"master", "RepositoryUrl":
   "https://github.com/myprofile/my-repo", "SecretArn":
   "arn:aws:secretsmanager:us-east-2:12345678901:secret:my-secret-ABC0DE"}
```

**Note**

The secret must have a staging label of `AWSCURRENT` and must be in the following format:

```json
{"username": UserName, "password": Password}
```

For GitHub repositories, we recommend using a personal access token instead of your account password.

**Create a Notebook Instance with an Associated Git Repository**

You can associate Git repositories with a notebook instance when you create the notebook instance by using the AWS Management Console, or the AWS CLI. If you want to use a CodeCommit repository that is in a different AWS account than the notebook instance, set up cross-account access for the repository. For information, see Associate a CodeCommit Repository in a Different AWS Account with a Notebook Instance (p. 159).

**Topics**

- Create a Notebook Instance with an Associated Git Repository (Console) (p. 157)
- Create a Notebook Instance with an Associated Git Repository (CLI) (p. 158)

**Create a Notebook Instance with an Associated Git Repository (Console)**

To create a notebook instance and associate Git repositories in the Amazon SageMaker console

1. Follow the instructions at Step 1: Create an Amazon SageMaker Notebook Instance (p. 43).
2. For Git repositories, choose Git repositories to associate with the notebook instance.
   a. For Default repository, choose a repository that you want to use as your default repository. SageMaker clones this repository as a subdirectory in the Jupyter startup directory at /home/ec2-user/SageMaker. When you open your notebook instance, it opens in this repository. To choose a repository that is stored as a resource in your account, choose its name from the list. To add a new repository as a resource in your account, choose Add a repository to SageMaker (opens the Add repository flow in a new window) and then follow the instructions at Create
a Notebook Instance with an Associated Git Repository (Console) (p. 157). To clone a public repository that is not stored in your account, choose **Clone a public Git repository to this notebook instance only**, and then specify the URL for that repository.

b. For **Additional repository 1**, choose a repository that you want to add as an additional directory. SageMaker clones this repository as a subdirectory in the Jupyter startup directory at `/home/ec2-user/SageMaker`. To choose a repository that is stored as a resource in your account, choose **Add a repository to SageMaker (opens the Add repository flow in a new window)** and then follow the instructions at Create a Notebook Instance with an Associated Git Repository (Console) (p. 157). To clone a repository that is not stored in your account, choose **Clone a public Git repository to this notebook instance only**, and then specify the URL for that repository.

Repeat this step up to three times to add up to three additional repositories to your notebook instance.

Create a Notebook Instance with an Associated Git Repository (CLI)

To create a notebook instance and associate Git repositories by using the AWS CLI, use the `create-notebook-instance` command as follows:

- Specify the repository that you want to use as your default repository as the value of the `default-code-repository` argument. Amazon SageMaker clones this repository as a subdirectory in the Jupyter startup directory at `/home/ec2-user/SageMaker`. When you open your notebook instance, it opens in this repository. To use a repository that is stored as a resource in your SageMaker account, specify the name of the repository as the value of the `default-code-repository` argument. To use a repository that is not stored in your account, specify the URL of the repository as the value of the `default-code-repository` argument.

- Specify up to three additional repositories as the value of the `additional-code-repositories` argument. SageMaker clones this repository as a subdirectory in the Jupyter startup directory at `/home/ec2-user/SageMaker`, and the repository is excluded from the default repository by adding it to the `.git/info/exclude` directory of the default repository. To use repositories that are stored as resources in your SageMaker account, specify the names of the repositories as the value of the `additional-code-repositories` argument. To use repositories that are not stored in your account, specify the URLs of the repositories as the value of the `additional-code-repositories` argument.

For example, the following command creates a notebook instance that has a repository named `MyGitRepo`, that is stored as a resource in your SageMaker account, as a default repository, and an additional repository that is hosted on GitHub:

```bash
aws sagemaker create-notebook-instance \
    --notebook-instance-name "MyNotebookInstance" \
    --instance-type "ml.t2.medium" \
    --role-arn "arn:aws:iam::012345678901:role/service-role/AmazonSageMaker-ExecutionRole-20181129T1213390" \
    --default-code-repository "MyGitRepo" \
    --additional-code-repositories "https://github.com/myprofile/my-other-repo"
```

**Note**
If you use an AWS CodeCommit repository that does not contain "SageMaker" in its name, add the `codecommit:GitPull` and `codecommit:GitPush` permissions to the role that you pass as the `role-arn` argument to the `create-notebook-instance` command. For information
about how to add permissions to a role, see Adding and Removing IAM Policies in the Amazon Identity and Access Management User Guide.

## Associate a CodeCommit Repository in a Different AWS Account with a Notebook Instance

To associate a CodeCommit repository in a different AWS account with your notebook instance, set up cross-account access for the CodeCommit repository.

### To set up cross-account access for a CodeCommit repository and associate it with a notebook instance:

1. In the AWS account that contains the CodeCommit repository, create an IAM policy that allows access to the repository from users in the account that contains your notebook instance. For information, see Step 1: Create a Policy for Repository Access in AccountA in the CodeCommit User Guide.
2. In the AWS account that contains the CodeCommit repository, create an IAM role, and attach the policy that you created in the previous step to that role. For information, see Step 2: Create a Role for Repository Access in AccountA in the CodeCommit User Guide.
3. Create a profile in the notebook instance that uses the role that you created in the previous step:
   a. Open the notebook instance.
   b. Open a terminal in the notebook instance.
   c. Edit a new profile by typing the following in the terminal:
   ```bash
   vi /home/ec2-user/.aws/config
   ```
   d. Edit the file with the following profile information:
   ```
   [profile CrossAccountAccessProfile]
   region = us-west-2
   role_arn = arn:aws:iam::CodeCommitAccount:role/CrossAccountRepositoryContributorRole
   credential_source=Ec2InstanceMetadata
   output = json
   ```
   Where CodeCommitAccount is the account that contains the CodeCommit repository, CrossAccountAccessProfile is the name of the new profile, and CrossAccountRepositoryContributorRole is the name of the role you created in the previous step.
4. On the notebook instance, configure git to use the profile you created in the previous step:
   a. Open the notebook instance.
   b. Open a terminal in the notebook instance.
   c. Edit the Git configuration file typing the following in the terminal:
   ```bash
   vi /home/ec2-user/.gitconfig
   ```
   d. Edit the file with the following profile information:
   ```
   [credential]
   helper = !aws codecommit credential-helper --profile CrossAccountAccessProfile $@
   UseHttpPath = true
   ```
Where `CrossAccountAccessProfile` is the name of the profile that you created in the previous step.

**Use Git Repositories in a Notebook Instance**

When you open a notebook instance that has Git repositories associated with it, it opens in the default repository, which is installed in your notebook instance directly under `/home/ec2-user/SageMaker`. You can open and create notebooks, and you can manually run Git commands in a notebook cell. For example:

```bash
!git pull origin master
```

To open any of the additional repositories, navigate up one folder. The additional repositories are also installed as directories under `/home/ec2-user/SageMaker`.

If you open the notebook instance with a JupyterLab interface, the jupyter-git extension is installed and available to use. For information about the jupyter-git extension for JupyterLab, see [https://github.com/jupyterlab/jupyterlab-git](https://github.com/jupyterlab/jupyterlab-git).

When you open a notebook instance in JupyterLab, you see the git repositories associated with it on the left menu:
You can use the jupyter-git extension to manage git visually, instead of using the command line:
Notebook Instance Metadata

When you create a notebook instance, Amazon SageMaker creates a JSON file on the instance at the location `/opt/ml/metadata/resource-metadata.json` that contains the `ResourceName` and `ResourceArn` of the notebook instance. You can access this metadata from anywhere within the notebook instance, including in lifecycle configurations. For information about notebook instance lifecycle configurations, see Customize a Notebook Instance Using a Lifecycle Configuration Script (p. 145).

The `resource-metadata.json` file has the following structure:

```
{
   "ResourceArn": "NotebookInstanceArn",
   "ResourceName": "NotebookInstanceName"
}
```

You can use this metadata from within the notebook instance to get other information about the notebook instance. For example, the following commands get the tags associated with the notebook instance:

```
NOTEBOOK_ARN=$(jq '.ResourceArn' /opt/ml/metadata/resource-metadata.json --raw-output)
aws sagemaker list-tags --resource-arn $NOTEBOOK_ARN
```

The output looks like the following:

```
{
   "Tags": [
      {
         "Key": "test",
         "Value": "true"
      }
   ]
}
```

Monitor Jupyter Logs in Amazon CloudWatch Logs

Jupyter logs include important information such as events, metrics, and health information that provide actionable insights when running Amazon SageMaker notebooks. By importing Jupyter logs into CloudWatch Logs, customers can use CloudWatch Logs to detect anomalous behaviors, set alarms, and discover insights to keep the SageMaker notebooks running more smoothly. You can access the logs even when the Amazon EC2 instance that hosts the notebook is unresponsive, and use the logs to troubleshoot the unresponsive notebook. Sensitive information such as AWS account IDs, secret keys, and authentication tokens in presigned URLs are removed so that customers can share logs without leaking private information.

To view Jupyter logs for a notebook instance:

2. Choose Notebook instances.
3. In the list of notebook instances, choose the notebook instance for which you want to view Jupyter logs by selecting the Notebook instance Name.
This will bring you to the details page for that notebook instance.

4. Under **Monitor** on the notebook instance details page, choose **View logs**.

5. In the CloudWatch console, choose the log stream for your notebook instance. Its name is in the form `NotebookInstanceName/jupyter.log`.

For more information about monitoring CloudWatch logs for SageMaker, see [Log Amazon SageMaker Events with Amazon CloudWatch (p. 2635)](https://docs.aws.amazon.com/sagemaker/latest/dg/log-events-cloudwatch.html).
Automate model development with Amazon SageMaker Autopilot

Amazon SageMaker Autopilot is a feature-set that automates key tasks of an automatic machine learning (AutoML) process. It explores your data, selects the algorithms relevant to your problem type, and prepares the data to facilitate model training and tuning. Autopilot applies a cross-validation resampling procedure automatically to all candidate algorithms when appropriate to test their ability to predict data they have not been trained on. It also produces metrics to assess the predictive quality of its machine learning model candidates. It simplifies your machine learning experience by automating these key tasks that constitute an AutoML process. It ranks all of the optimized models tested by their performance. It finds the best performing model that you can deploy at a fraction of the time normally required.

Autopilot also helps explain how models make predictions using a feature attribution approach developed for Amazon SageMaker Clarify. Autopilot automatically generates a report that indicates the importance of each feature for the predictions made by the best candidate. This explainability functionality can make machine learning models more understandable to AWS customers. The model governance report generated can be used to inform risk and compliance teams and external regulators. You get full visibility into how the data was wrangled and how the models were selected, trained and tuned for each of the candidates tested. This is provided by notebooks that Autopilot generates for each trial that contain the code used to explore the data and find the best candidate. The notebooks also provide educational tools that enable you to learn about and conduct your own ML experiments. You can learn about the impact of various inputs and trade-offs made in experiments by examining the various data exploration and candidate definition notebooks exposed by Autopilot. You can also conduct further experiments on the higher performing candidates by making your own modifications to the notebooks and rerunning them.

The following graphic outlines the principal tasks of an AutoML process managed by Autopilot.

You can use Autopilot in different ways: on autopilot (hence the name) or with various degrees of human guidance, without code through Amazon SageMaker Studio, or with code using one of the AWS SDKs. Autopilot currently supports regression and binary and multiclass classification. It also only supports tabular data formatted in files with comma-separated values.

With Amazon SageMaker, you pay only for what you use. Building, training, and deploying ML models is billed by the second, with no minimum fees and no upfront commitments. For more information about the cost of using SageMaker, see Amazon SageMaker Pricing.

Topics
- Get started with Amazon SageMaker Autopilot (p. 165)
- Create an Amazon SageMaker Autopilot experiment (p. 167)
- Amazon SageMaker Autopilot problem types (p. 170)
- Model support, metrics, and validation (p. 171)
Get started with Amazon SageMaker Autopilot

Amazon SageMaker Autopilot provides samples, videos, and tutorials to get started with Amazon SageMaker Autopilot

Topics
- Samples: Explore modeling with Amazon SageMaker Autopilot (p. 165)
- Videos: Use Autopilot to automate and explore the machine learning process (p. 166)
- Tutorials: Get started with Amazon SageMaker Autopilot (p. 167)

Samples: Explore modeling with Amazon SageMaker Autopilot

Amazon SageMaker Autopilot provides the following sample notebooks.

- Direct marketing with Amazon SageMaker Autopilot: This notebook demonstrates how uses the Bank Marketing Data Set to predict whether a customer will enroll for a term deposit at a bank. You can use Autopilot on this dataset to get the most accurate ML pipeline by exploring options contained in various candidate pipelines. Autopilot generates each candidate in a two step procedure. The first step performs automated feature engineering on the dataset. The second step trains and tunes an algorithm to produce a model. The notebook contains instructions on how to train the model as well as how to deploy the model to perform batch inference using the best candidate.

- Customer Churn Prediction with Amazon SageMaker Autopilot: This notebook describes using machine learning for the automated identification of unhappy customers, also known as customer churn prediction. The sample shows how to analyze a publicly available dataset and perform feature engineering on it. Next it shows how to tune a model by selecting the best performing pipeline along with the optimal hyperparameters for the training algorithm. Finally it shows how to deploy the model to a hosted endpoint and evaluate its predictions against ground truth. ML models rarely give perfect predictions though, so this notebook is also about how to incorporate the relative costs of prediction mistakes when determining the financial outcome of using ML.

- Top Candidates Customer Churn Prediction with Amazon SageMaker Autopilot and Batch Transform (Python SDK): This notebook also describes using machine learning for the automated identification of unhappy customers, also known as customer churn prediction. This notebook demonstrate how to configure the model to obtain the inference probability, select the top N models, and make Batch Transform on a hold-out test set for evaluation.

  Note
  This notebook works with SageMaker Python SDK >= 1.65.1 released on 6/19/2020.

- Bringing your own data processing code to SageMaker Autopilot: This notebook demonstrates how to incorporate and deploy custom data processing code when using Amazon SageMaker Autopilot. It adds a custom feature selection step to remove irrelevant variables to a Autopilot job. It then shows how to deploy both the custom processing code and models generated by Autopilot on a real-time endpoint and, alternatively, for batch processing.
Videos: Use Autopilot to automate and explore the machine learning process

Here is a video series that provides a tour of Amazon SageMaker Autopilot capabilities using Studio. They show how to start an AutoML job, analyze and preprocess data, how to do feature engineering and hyperparameter optimization on candidate models, and how to visualize and compare the resulting model metrics.

Topics
• Start an AutoML job with Amazon SageMaker Autopilot (p. 166)
• Review data exploration and feature engineering automated in Autopilot. (p. 166)
• Tune models to optimize performance (p. 166)
• Choose and deploy the best model (p. 166)
• Amazon SageMaker Autopilot walkthrough (p. 166)

Start an AutoML job with Amazon SageMaker Autopilot

This video shows you how to start an AutoML job with Autopilot. (Length: 8:41)

Amazon SageMaker Studio - AutoML with Amazon SageMaker Autopilot (part 1)

Review data exploration and feature engineering automated in Autopilot.

This video shows you how to examine the data exploration and candidate definition notebooks generated by Amazon SageMaker Autopilot. (Length: 10:04)

Amazon SageMaker Studio - AutoML with Amazon SageMaker Autopilot (part 2)

Tune models to optimize performance

This video shows you how to optimize model performance during training using hyperparameter tuning. (Length: 4:59)

SageMaker Studio - AutoML with Amazon SageMaker Autopilot (part 3)

Choose and deploy the best model

This video shows you how to use job metrics to choose the best model and then how to deploy it. (Length: 5:20)

SageMaker Studio - AutoML with Amazon SageMaker Autopilot (part 4)

Amazon SageMaker Autopilot walkthrough

This video walks you through an end to end demo where we first build a binary classification model automatically with Amazon SageMaker Autopilot. We see how candidate models have been built and optimized using auto-generated notebooks. We also look at the top candidates with SageMaker Experiments. Finally, we deploy the top candidate (based on XGBoost), and configure data capture with SageMaker Model Monitor.

End to end demo with AutoML on SageMaker
Tutorials: Get started with Amazon SageMaker Autopilot

Autopilot get started tutorials demonstrate how to create a machine learning model automatically without having to write code. They show you how Autopilot simplifies the machine learning experience by helping you explore your data and try different algorithms. Autopilot builds the best machine learning model for the problem type using AutoML capabilities while allowing full control and visibility.

- Create a machine learning model automatically with Autopilot: You assume the role of a developer working at a bank in this tutorial. You have been asked to develop a machine learning model to predict whether or not a customer will enroll for a certificate of deposit (CD). This is a binary classification problem. The model is trained on the marketing dataset that contains information on customer demographics, responses to marketing events, and external factors.

Create an Amazon SageMaker Autopilot experiment

To create an Amazon SageMaker Autopilot experiment, you need to name it, provide locations for the input and output data, specify the target data to predict, and optionally the type of machine learning problem to solve. When you create an Amazon SageMaker Autopilot job as a pilot experiment, SageMaker analyzes your data and creates a notebook with candidate model definitions. If you choose to run the complete experiment option, SageMaker also trains and tunes these models on your behalf. You can view statistics while the experiment is running. Afterwards, you can compare trials and delve into the details.

1. Open Amazon SageMaker Studio and sign in.
2. Choose the Create Autopilot experiment option from the Build model automatically box.
3. Enter information about the experiment in the Job Settings form:
   - **Experiment Name** – Must be unique to your account in the current AWS Region and contain a maximum of 63 alphanumeric characters. Can include hyphens (-), but not spaces.
Create an Autopilot experiment

- **Input data location (S3 bucket)** – The S3 bucket that contains your input data.

- **Note**
  Must be an s3:// formatted URL where Amazon SageMaker has write permissions. The S3 bucket must be in the current AWS Region and must be in CSV format and contain at least 500 rows.

- **S3 bucket name** – The bucket name must be unique across all existing bucket names in S3.

- **S3 object key prefix** – The filename of the object in the bucket, including the path to the object within the bucket.

- **S3 bucket location** – The concatenation of the S3 bucket name and S3 object key prefix.

- **Is your S3 input a manifest file?** – A manifest file includes metadata with your input data. The metadata specifies the location of your data in Amazon S3 storage, how the data are formatted, and which attributes from the dataset to use when training your model. You can use a manifest file as an alternative to preprocessing when you have labeled data being streamed in Pipe mode.

- **Target attribute name** – The name of the data column you want the model to target for predictions.

- **Output data location (S3 bucket)** – The S3 bucket where you want to store the output data.
Note
Must be an s3:// formatted URL where Amazon SageMaker has write permissions. The S3 bucket must be in the current AWS Region.

- **S3 bucket name** – The bucket name must be unique across all existing bucket names in S3.
- **S3 object key prefix** – The filename of the object in the bucket, including the path to the object within the bucket.
- **S3 bucket location** – The concatenation of the S3 bucket name and S3 object key prefix.

Select the machine learning problem type:

- **Auto** – SageMaker infers the problem type from the values of the attribute you want to predict. In some cases, SageMaker is unable to infer accurately, in which case you must provide the value for the job to succeed.
- **Binary classification** – Binary classification is a type of supervised learning that assigns an individual to one of two predefined and mutually exclusive classes based on their attributes. For example, a medical diagnosis for whether an individual has a disease or not based on the results of diagnostic tests.
- **Regression** – Regression estimates the values of a dependent target variable based on one or more other variables or attributes that are correlated with it. For example, house prices based on features such as square footage and number of bathrooms.
- **Multiclass classification** – Multiclass classification is a type of supervised learning that assigns an individual to one of several classes based on their attributes. For example, the prediction of the topic most relevant to a text document, such as politics, finance, or philosophy.

Do you want to run a complete experiment?

If you choose Yes, SageMaker generates a model as well as statistics that you can view in real time while the experiment is running. After the experiment is complete, you can view the trials, sort by objective metric, and right-click to deploy the model for use in other environments.

If you choose No, instead of executing the entire workflow, SageMaker stops execution after generating a notebook with candidate definitions. A candidate is a combination of data preprocessors, algorithms, and algorithm parameter settings. You can use the notebook as a
starting point to guide your own process of model training/tuning. The notebook has highlighted sections that explain what kinds of changes are typical, such as changing instance type, cluster size, and so on.

4. To automatically deploy the best model from an Autopilot experiment to an endpoint, accept the default Auto deploy value On when creating the experiment.

Choose Create Experiment.

Note
Automatic deployment will fail if the default resource quota or your customer quota for endpoint instances in a region are too limited. Currently the requirement is that you need have at least two ml.m5.2xlarge instances. The eu-north-1 region (Stockholm) does not meet this requirement, for example. The supported instance types for this region are listed at SageMaker Instance Types in EU (Stockholm) eu-north-1. If you encounter this issue, you can request a service limit increase for SageMaker endpoints instances by following the procedure at Supported Regions and Quotas (p. 31). In the Case details panel, select SageMaker Endpoints for the Limit type. For Request1, select:

- Region: EU (Stockholm)
- Resource Type: SageMaker Hosting
- Limit: ml.m5.2xlarge (at least)
- New limit value: 2

Note
To avoid incurring unnecessary charges, delete the endpoints and resources that were created when deploying the model after they are no longer needed. Information on pricing of instances by region is available at Amazon SageMaker Pricing.

Amazon SageMaker Autopilot problem types

When setting a problem type, such as binary classification or regression, with the AutoML API, you have the option of specifying it or of letting Amazon SageMaker Autopilot detect it on your behalf. You set the type of problem with the CreateAutoPilot.ProblemType parameter. This limits the kind of preprocessing and algorithms that Autopilot tries. When the job is finished, if you had set the CreateAutoPilot.ProblemType, then the ResolvedAttribute.ProblemType will match the ProblemType you set. If you leave it blank (or null), the ProblemType will be whatever Autopilot decides on your behalf.

Note
In some cases, Autopilot is unable to infer the ProblemType with high enough confidence, in which case you must provide the value for the job to succeed.
Your problem type options are as follows:

**Topics**
- Regression (p. 171)
- Binary classification (p. 171)
- Multiclass classification (p. 171)

**Regression**

Regression estimates the values of a dependent target variable based on one or more other variables or attributes that are correlated with it. An example is the prediction of house prices using features like the number of bathrooms and bedrooms, square footage of the house and garden. Regression analysis can create a model that takes one or more of these features as an input and predicts the price of a house.

**Binary classification**

Binary classification is a type of supervised learning that assigns an individual to one of two predefined and mutually exclusive classes based on their attributes. It is supervised because the models are trained using examples where the attributes are provided with correctly labelled objects. A medical diagnosis for whether an individual has a disease or not based on the results of diagnostic tests is an example of binary classification.

**Multiclass classification**

Multiclass classification is a type of supervised learning that assigns an individual to one of several classes based on their attributes. It is supervised because the models are trained using examples where the attributes are provided with correctly labelled objects. An example is the prediction of the topic most relevant to a text document. A document may be classified as being about, say, religion or politics or finance, or about one of several other predefined topic classes.

**Model support, metrics, and validation**

Amazon SageMaker Autopilot supports three types of machine learning algorithms to address machine learning problems, reports on various quality and objective metrics, and uses cross-validation automatically when needed.

**Topics**
- Autopilot algorithm support (p. 171)
- Autopilot candidate metrics (p. 172)
- Autopilot cross-validation (p. 172)

**Autopilot algorithm support**

The three types of machine learning algorithms supported by Autopilot are:
- **Linear Learner Algorithm (p. 1486)**: a supervised learning algorithms used for solving either classification or regression problems.
- **XGBoost Algorithm (p. 1568)**: a supervised learning algorithm that attempts to accurately predict a target variable by combining an ensemble of estimates from a set of simpler and weaker models.
- **Deep Learning Algorithm**: a multilayer perceptron (MLP), a feedforward artificial neural network that can handle data that is not linearly separable.
Note
You do not need to specify an algorithm to use for your machine learning problem. Autopilot automatically selects the appropriate algorithm to train.

Autopilot candidate metrics

Amazon SageMaker Autopilot produces metrics used to measure the predictive quality of machine learning model candidates. The metrics calculated for candidates are specified using an array of MetricDatum types. The following list contains the names of the metrics currently available.

- **MSE**: The mean squared error (MSE) is the average of the squared differences between the predicted and actual values. It is used for regression. MSE values are always positive: the better a model is at predicting the actual values, the smaller the MSE value is.

- **Accuracy**: The ratio of the number of correctly classified items to the total number of (correctly and incorrectly) classified items. It is used for binary and multiclass classification. It measures how close the predicted class values are to the actual values. Accuracy values vary between zero and one: one indicates perfect accuracy and zero indicates perfect inaccuracy.

- **F1**: The F1 score is the harmonic mean of the precision and recall. It is used for binary classification into classes traditionally referred to as positive and negative. Predictions are said to be true when they match their actual (correct) class and false when they do not. Precision is the ratio of the true positive predictions to all positive predictions (including the false positives) in a dataset and measures the quality of the prediction when it predicts the positive class. Recall (or sensitivity) is the ratio of the true positive predictions to all actual positive instances and measures how completely a model predicts the actual class members in a dataset. The standard F1 score weighs precision and recall equally. But which metric is paramount typically depends on specific aspects of a problem. F1 scores vary between zero and one: one indicates the best possible performance and zero the worst.

- **AUC**: The area under the curve (AUC) metric is used to compare and evaluate binary classification by algorithms such as logistic regression that return probabilities. A threshold is needed to map the probabilities into classifications. The relevant curve is the receiver operating characteristic curve that plots the true positive rate (TPR) of predictions (or recall) against the false positive rate (FPR) as a function of the threshold value, above which a prediction is considered positive. Increasing the threshold results in fewer false positives but more false negatives. AUC is the area under this receiver operating characteristic curve and so provides an aggregated measure of the model performance across all possible classification thresholds. AUC scores vary between zero and one: a score of one indicates perfect accuracy and a score of one half indicates that the prediction is not better than a random classifier.

- **F1macro**: The F1macro score applies F1 scoring to multiclass classification. In this context, you have multiple classes to predict. You just calculate the precision and recall for each class as you did for the positive class in binary classification. Then, use these values to calculate the F1 score for each class and average them to obtain the F1macro score. F1macro scores vary between zero and one: one indicates the best possible performance and zero the worst.

The metrics automatically calculated for a candidate model are determined by the type of problem being addressed.

- **regression**: MSE
- **binary classification**: Accuracy, F1, AUC
- **multiclass classification**: Accuracy, F1macro

Autopilot cross-validation

Autopilot uses the k-fold cross-validation method automatically when needed. You can use this method to assess how well a model trained on a dataset can predict the values of an unseen validation dataset.
drawn from the same population. This method is especially important, for example, when training on datasets that have a limited number of training instances. It can protect against problems like overfitting and selection bias that can prevent a model from being more generally applicable to the population sampled.

For example, the Boston Housing dataset contains only 861 samples. If you try to build a model to predict house sale prices using this dataset without cross-validation, you risk training on a dataset that is not representative of the Boston housing stock. Typically, you would split the data only once into training and validation subsets. If the training fold happened to contain data mainly from suburbs that were not representative of the rest of the city, you would likely overfit on this biased selection. Cross-validation reduces the risk of these errors by making full and randomized use of the available data for training and validation.

K-fold cross-validation randomly splits a training dataset into $k$ equally sized subsamples or folds. Then models are trained on $k-1$ folds and tested against the remaining fold, which is retained as a validation dataset. The process is repeated $k$ times, using each fold once as the validation dataset. Autopilot applies the cross-validation method to datasets with 50,000 or fewer training instances. It uses a $k$ value of 5 on the candidate algorithms used to model the dataset. Multiple models are trained on different splits and the models are stored separately. When the training procedure is finished, the validation metrics for each of the models are averaged to produce a single estimation metric. When cross-validation is applied by Autopilot to smaller datasets, the training time increases 20% on average. If your dataset is complicated, the training time may increase more significantly. For predictions, Autopilot uses the ensemble of cross-validation models from the trial with the best validation metric.

You can see the training and validation metrics from each fold in your /aws/sagemaker/TrainingJobs CloudWatch Logs. For more information about CloudWatch Logs, see Log Amazon SageMaker Events with Amazon CloudWatch (p. 2635). The validation metric for the models trained by Autopilot is presented as the objective metric in model leader board. Autopilot uses the default validation metric for each problem type it handles unless you specify otherwise. For more information on the metrics Autopilot uses, see AutoMLJobObjective. You can deploy Autopilot models built using cross-validation just as you would any other Autopilot or SageMaker model.

**Amazon SageMaker Autopilot model deployment**

To deploy the model that produced the best validation metric in an Autopilot experiment, you have several options. When using Autopilot in SageMaker Studio, you can deploy the model automatically or manually. When working in another development, you can call Autopilot APIs directly to deploy a model.

- **Automatically**: To automatically deploy the best model from an Autopilot experiment to an endpoint, accept the default *Auto deploy* value *On* when creating the experiment in SageMaker Studio.
Note
Automatic deployment will fail if the default resource quota or your customer quota for endpoint instances in a region are too limited. Currently the requirement is that you need have at least two ml.m5.2xlarge instances. The eu-north-1 region (Stockholm) does not meet this requirement, for example. The supported instance types for this region are listed at SageMaker Instance Types in EU (Stockholm) eu-north-1. If you encounter this issue, you can request a service limit increase for SageMaker endpoints instances by following the procedure at Supported Regions and Quotas (p. 31). In the Case details panel, select SageMaker Endpoints for the Limit type. For Request1, select:

- Region: EU (Stockholm)
- Resource Type: SageMaker Hosting
- Limit: ml.m5.2xlarge (at least)
- New limit value: 2

- Manually: To manually deploy the best model from an Autopilot experiment to an endpoint, set the Auto deploy value to Off when creating the experiment in SageMaker Studio.
• **API calls:** Make the following series of API calls:

1. CreateAutoMLJob
2. DescribeAutoMLJob
3. ListCandidatesForAutoMLJob
4. CreateModel
5. CreateEndpointConfig
6. CreateEndpoint

The automatic deployment for the results of an experiment in SageMaker Studio calls the six APIs listed in this last option by default. For information on how to create an experiment, see *Create an Amazon SageMaker Autopilot experiment* (p. 167).

**Note**
To avoid incurring unnecessary charges, delete the endpoints and resources that were created when deploying the model after they are no longer needed. Information on pricing of instances by region is available at *Amazon SageMaker Pricing*.

---

**Amazon SageMaker Autopilot explainability**

Amazon SageMaker Autopilot uses tools provided by Amazon SageMaker Clarify to help explain how machine learning (ML) models make predictions. These tools can help ML modelers and developers and other internal stakeholders understand model characteristics as a whole prior to deployment and debug predictions provided by a model after it’s deployed. Transparency about how ML models arrive at their predictions is also critical to consumers and regulators, who need to trust the model predictions if they are going to accept the decisions based on them. The Autopilot explanatory functionality uses a model-agnostic feature attribution approach, which you can use to understand why a model made a prediction after training and to provide per-instance explanation during inference. The implementation includes a scalable and efficient implementation of SHAP, based on the concept of a Shapley value from the field of cooperative game theory that assigns each feature an importance value for a particular prediction.

You can use explanations for auditing and meeting regulatory requirements, building trust in the model and supporting human decision-making, and debugging and improving model performance.
Models generated by Amazon SageMaker Autopilot

This procedure describes how to view details about Amazon SageMaker Autopilot jobs that you have run. Details provided about the candidate models generated by Autopilot include:

- A plot of the aggregated SHAP values that indicate the importance of each feature to help explain your models predictions.
- The summary statistics for various training and validation metrics, including the objective metric.
- A list of the hyperparameters used to train and tune the model.

Note
This topic assumes that you have already created and run an Autopilot experiment. For information on how to create an Autopilot experiment, see Create an Amazon SageMaker Autopilot experiment (p. 167)

Note
To access the feature importance metrics in this procedure, you must first select File > Shut down, and then restart Studio from the Console.

1. To view model details after running an Amazon SageMaker Autopilot job, select the triangular icon from the menu on the left to open the Components and registries page.

2. Select Experiments and trials from the dropdown menu.
3. Locate the Autopilot job whose details you want to examine in the **Unassigned trial components** list.

4. Right-click the name of the Autopilot job and select **Describe AutoML Job** from the pop up menu.

To review the Objective: F1_binary, F1, AUC, and Accuracy metrics for an AutoML job, select that AutoML job from the **Experiments** panel.
5. To review the model details for the best tuning job, right-click the **Trial name** labeled as the **Best** at the top of the list of trials that has the highest objective metric score and select **Open Model Details**.

6. The plot of the aggregated SHAP values that indicate the importance of each feature is displayed in the **Explaining your model’s predictions** section.
7. For more information about how the SHAP values help explain predictions based on feature importance, scroll down to see the link to the Understanding the model explainability whitepaper. Additional information is also available in the Model Explainability (p. 1907) topic in the SageMaker Developer Guide.

8. To see the summary statistics for the objective metric, the f1 values for training and validation, the training and validation errors, and a list of the parameter values used to train and tune the model, scroll down to the bottom of the page.
Amazon SageMaker Autopilot notebooks generated to manage AutoML tasks

Amazon SageMaker Autopilot manages the key tasks in an automatic machine learning (AutoML) process. They are implemented by Autopilot with an AutoML job. The AutoML job creates two notebooks that describe the plan that Autopilot follows to generate candidate models. A candidate model consists of a (pipeline, algorithm) pair. First, there’s a data exploration notebook, that describes what Autopilot learned about the data that you provided. Second, there’s a candidate definition notebook, which uses the information about the data to generate candidates.

You can run both notebooks in Amazon SageMaker or locally if you have installed the Amazon SageMaker Python SDK. You can share the notebooks just like any other SageMaker Studio notebook. The notebooks are created for you to conduct experiment. For example, you could edit the following items in the notebooks:

- the preprocessors used on the data
- the number of hyperparameter optimization (HPO) runs and their parallelism
- the algorithms to try
- the instance types used for the HPO jobs
- the hyperparameter ranges

Modifications to the candidate definition notebook are encouraged to be used as a learning tool. This capability allows you to learn about how the decisions made during the machine learning process impact the your results.

**Note**
When you run the notebooks in your default instance you incur baseline costs, but when you execute HPO jobs from the candidate notebook, these jobs use additional compute resources that incur additional costs.

### Data exploration notebook

A notebook is produced during the analysis phase of the AutoML job that helps you identify problems in your dataset. It identifies specific areas for investigation in order to help you identify upstream problems with your data that may result in a suboptimal model.

### Candidate definition notebook

The candidate definition notebook contains each suggested preprocessing step, algorithm, and hyperparameter ranges. If you chose just to produce the notebook and not to run the AutoML job, you can then decide which candidates are to be trained and tuned. They optimize automatically and a final, best candidate is identified. If you ran the job directly without seeing the candidates first, then only best candidate is displayed when you open the notebook after the completion of the job.

### Configure inference output in Autopilot-generated containers

Amazon SageMaker Autopilot generates an ordered `ContainerDefinition` list that can be used to build a model to deploy in a machine learning pipeline. This model can be used for online hosting and inference. Customers can access the list of inference container definitions with the
Inference container definitions for regression and classification problem types

The inference containers generated depend on the problem type of the job.

- **Regression**: generates two containers:
  1. First is the feature engineering container that transforms the original features to features that the regression algorithms can train on.
  2. Second is the algorithm container that transforms features and generates the regression score for the dataset.

- **Classification**: generates three containers:
  1. First is the feature engineering container that transforms the original features to features that the classification algorithms can train on.
  2. Second is the algorithm container that generates the winning predicted_label and that can also produce the various probabilities associated with the classification outcomes in the inference response.
  3. Third is a feature engineering container that performs post-processing of the algorithm prediction, for example, an inverse transform of the predicted label to original label.

Select inference response for classification models

Classification inference containers allow you to select the content of the inference responses. There are four predefined keys:

- **predicted_label**: The winning label determined by Autopilot.
- **probability**: The probability of the True class for binary classification. The probability of winning class for multiclass classification.
- **probabilities**: The list of probabilities for all corresponding labels.
- **labels**: List of all labels

By default, inference containers are configured to generate predicted_label only.

Three environment variables are used to select the optional inference content:

- **SAGEMAKER_INFERENCE_SUPPORTED**: this is set to provide hints to the users about what content each container supports.
- **SAGEMAKER_INFERENCE_INPUT**: should be set to the keys that the container expects in its input payload.
- **SAGEMAKER_INFERENCE_OUTPUT**: should be populated with the set of keys the container outputs.

In order to choose the inference response content, we need to add the SAGEMAKER_INFERENCE_INPUT, SAGEMAKER_INFERENCE_OUTPUT appropriately in the second and the third containers in the list of containers for classification problem.
The keys supported by the third classification model container are `predicted_label`, `labels`, `probability` and `probabilities`. Hence the `SAGEMAKER_INFERENCE_SUPPORTED` environment includes the names of all these keys.

The keys supported by the second container (Algorithm) are `predicted_label`, `probability` and `probabilities`. Note that the `labels` is deliberately not added to the `SAGEMAKER_INFERENCE_SUPPORTED`.

Here is how to update the definition of the inference containers to receive `predicted_label` and `probability`:

```python
containers[1]['Environment'].update({'SAGEMAKER_INFERENCE_OUTPUT': 'predicted_label, probability'})
containers[2]['Environment'].update({'SAGEMAKER_INFERENCE_INPUT': 'predicted_label, probability'})
containers[2]['Environment'].update({'SAGEMAKER_INFERENCE_OUTPUT': 'predicted_label, probability'})
```

Here is how to update the definition of the inference containers to receive `predicted_label` and `probabilities` and `labels`. Note that you do not need to pass the `labels` to the second container, the algorithm container, as it's redundant and can be generated by the third container independently. This reduces the latency.

```python
containers[1]['Environment'].update({'SAGEMAKER_INFERENCE_OUTPUT': 'predicted_label,probabilities'})
containers[2]['Environment'].update({'SAGEMAKER_INFERENCE_INPUT': 'predicted_label,probabilities'})
containers[2]['Environment'].update({'SAGEMAKER_INFERENCE_OUTPUT': 'predicted_label,probabilities,labels'})
```

You can use the Amazon SageMaker Python SDK to accomplish this as follows:

```python
from sagemaker import AutoML

aml = AutoML.attach(auto_ml_job_name='AUTOML_JOB_NAME')
aml_best_model = aml.create_model(name='SELECT_MODEL_NAME',
                                   candidate=None,
                                   inference_response_keys=['probabilities', 'labels'])

aml_transformer = aml_best_model.transformer(accept='text/csv',
                                             assemble_with='Line',
                                             instance_type='ml.m5.xlarge',
                                             instance_count=1,)

aml_transformer.transform(test_data_s3_path,
                          content_type='text/csv',
                          split_type='Line',
                          job_name=<Add jobName>,
                          wait=True)
```

Amazon SageMaker Autopilot quotas

There are quotas that limit the resources available to you when using Amazon SageMaker Autopilot. Some of these limits are increasable and some are not.
Quotas that you can increase

There are default limits for the size of datasets for the number of concurrent jobs you can run with Amazon SageMaker Autopilot for each AWS account, per AWS Region. You can increase these limits by contacting AWS Support.

Resource limits

<table>
<thead>
<tr>
<th>Resource</th>
<th>Region</th>
<th>Default limits</th>
<th>Can be increased up to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size of input dataset</td>
<td>All</td>
<td>5 GB</td>
<td>Hundreds of GBs</td>
</tr>
<tr>
<td>Number of concurrent Autopilot jobs</td>
<td>us-east-1, us-east-2, us-west-2, ap-northeast-1, eu-west-1, eu-central-1</td>
<td>4</td>
<td>Hundreds</td>
</tr>
<tr>
<td></td>
<td>ap-northeast-2, ap-southeast-2, eu-west-2, ap-southeast-1</td>
<td>2</td>
<td>Hundreds</td>
</tr>
<tr>
<td></td>
<td>All other regions</td>
<td>1</td>
<td>Tens</td>
</tr>
</tbody>
</table>

To request a quota increase:

1. Open the AWS Support Center page, sign in if necessary, and then choose Create case.
2. On the Create case page, choose Service limit increase.
3. In the Case details panel, select SageMaker AutoML for the Limit Type.
4. On the Requests panel for Request 1, select the Region, the resource Limit to increase and the New Limit value you are requesting. Select Add another request if you have additional requests for quota increases.
Resource quotas

The following table contains the runtime resource limits for an Amazon SageMaker Autopilot job in an AWS region.

<table>
<thead>
<tr>
<th>Resource limits per Autopilot job</th>
</tr>
</thead>
<tbody>
<tr>
<td>Limit per Autopilot job</td>
</tr>
<tr>
<td>Maximum runtime for an Autopilot job</td>
</tr>
</tbody>
</table>

API reference guide for Amazon SageMaker Autopilot

Amazon SageMaker provides API reference documentation that describes all of the REST operations and data types used by Autopilot and a higher level Amazon SageMaker Python SDK that you can use to create and manage AutoML jobs. It also provides a command line interface (CLI), an AWS SDK for Python (Boto) for low-level clients of SageMaker services, and SDKs for .NET, C++, Go, Java, JavaScript, PHP V3, and Ruby V3. The following sections describe these Autopilot programming interfaces.
SageMaker API reference

This API provides HTTP service APIs for creating and managing Amazon SageMaker Autopilot resources.

**Actions**

- `CreateAutoMLJob`
- `DescribeAutoMLJob`
- `ListAutoMLJobs`
- `ListCandidatesForAutoMLJob`
- `StopAutoMLJob`

**Data Types**

- `AutoMLCandidate`
- `AutoMLCandidateStep`
- `AutoMLChannel`
- `AutoMLContainerDefinition`
- `AutoMLDataSource`
- `AutoMLJobArtifacts`
- `AutoMLJobCompletionCriteria`
- `AutoMLJobConfig`
- `AutoMLJobObjective`
- `AutoMLJobSummary`
- `AutoMLOutputDataConfig`
- `AutoMLPartialFailureReason`
- `AutoMLS3DataSource`
- `AutoMLSecurityConfig`
- `CandidateArtifactLocations`
- `CandidateProperties`
- `FinalAutoMLJobObjectiveMetric`
- `MetricDatum`
- `ModelDeployConfig`
- `ModelDeployResult`
• ResolvedAttributes
• TuningJobCompletionCriteria

For more information on the entire SageMaker REST API, see API and SDK Reference.

Amazon SageMaker Python SDK

This Python library provides several high-level abstractions for working with SageMaker. The following classes can be used to manage AutoML jobs.

• AutoML
• AutoMLInput
• AutoMLJob
• CandidateEstimator
• CandidateStep

For more information how this Python SDK simplifies model training and deployment, see Using the Amazon SageMaker Python SDK.

AWS Command Line Interface (CLI)

The AWS CLI provides APIs for creating and managing SageMaker resources. Here are the AWS CLI for Amazon SageMaker Autopilot commands.

• create-auto-ml-job
• describe-auto-ml-job
• list-auto-ml-jobs
• list-candidates-for-auto-ml-job
• stop-auto-ml-job

AWS SDK for Python (Boto)

Boto is the Amazon Web Services (AWS) SDK for Python. It enables Python developers to create, configure, and manage AWS services such as SageMaker. Boto provides a low-level Client API that maps to the underlying SageMaker service API. Here is a list of the methods used to manage AutoML jobs with the Client class.

• create_auto_ml_job()
• describe_auto_ml_job()
• list_auto_ml_jobs()
• list_candidates_for_auto_ml_job()
• stop_auto_ml_job()

AWS SDK for .NET

The .NET SDK enables developers to create, configure, and manage AWS services such as SageMaker. The API maps to the underlying SageMaker service API. Here is a list of the methods used to manage AutoML jobs with the Client class.
• `CreateAutoMLJob`
• `DescribeAutoMLJob`
• `ListAutoMLJobs`
• `ListCandidatesForAutoMLJob`
• `StopAutoMLJob`

### AWS SDK for C++

The C++ SDK enables developers to create, configure, and manage AWS services such as SageMaker. The API maps to the underlying SageMaker service API. For information on the methods used to manage AutoML jobs with the Client class, see `Aws::SageMaker::SageMakerClient Class Reference`.

### AWS SDK for Go

The Go SDK enables developers to create, configure, and manage AWS services such as SageMaker. The API maps to the underlying SageMaker service API. Here is a list of the methods used to manage AutoML jobs with the Client class.

• `CreateAutoMLJob`
• `DescribeAutoMLJob`
• `ListAutoMLJobs`
• `ListCandidatesForAutoMLJob`
• `StopAutoMLJob`

### AWS SDK for Java

The Java SDK enables developers to create, configure, and manage AWS services such as SageMaker. The API maps to the underlying SageMaker service API. Here is a list of the methods used to manage AutoML jobs with the Client class.

• `createAutoMLJob`
• `describeAutoMLJob`
• `listAutoMLJobs`
• `listCandidatesForAutoMLJob`
• `stopAutoMLJob`

### AWS SDK for JavaScript

The JavaScript SDK enables developers to create, configure, and manage AWS services such as SageMaker. The API maps to the underlying SageMaker service API. Here is a list of the methods used to manage AutoML jobs with the Client class.

• `createAutoMLJob`
• `describeAutoMLJob`
• `listAutoMLJobs`
• `listCandidatesForAutoMLJob`
• `stopAutoMLJob`
AWS SDK for PHP V3

The PHP V3 SDK enables developers to create, configure, and manage AWS services such as SageMaker. The API maps to the underlying SageMaker service API. Here is a list of the methods used to manage AutoML jobs with the Client class.

- `CreateAutoMLJob`
- `DescribeAutoMLJob`
- `ListAutoMLJobs`
- `ListCandidatesForAutoMLJob`
- `StopAutoMLJob`

AWS SDK for Ruby V3

The Ruby V3 SDK enables developers to create, configure, and manage AWS services such as SageMaker. The API maps to the underlying SageMaker service API. Here is a list of the methods used to manage AutoML jobs with the Client class.

- `create_auto_ml_job()`
- `describe_auto_ml_job()`
- `list_auto_ml_jobs()`
- `list_candidates_for_auto_ml_job()`
- `stop_auto_ml_job()`
Label Data

To train a machine learning model, you need a large, high-quality, labeled dataset. You can label your data using Amazon SageMaker Ground Truth. Choose from one of the Ground Truth built-in task types or create your own custom labeling workflow. To improve the accuracy of your data labels and reduce the total cost of labeling your data, use Ground Truth enhanced data labeling features like automated data labeling and annotation consolidation.

Topics
- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Create and Manage Workforces (p. 485)
- Crowd HTML Elements Reference (p. 510)

Use Amazon SageMaker Ground Truth to Label Data

To train a machine learning model, you need a large, high-quality, labeled dataset. Ground Truth helps you build high-quality training datasets for your machine learning models. With Ground Truth, you can use workers from either Amazon Mechanical Turk, a vendor company that you choose, or an internal, private workforce along with machine learning to enable you to create a labeled dataset. You can use the labeled dataset output from Ground Truth to train your own models. You can also use the output as a training dataset for an Amazon SageMaker model.

Depending on your ML application, you can choose from one of the Ground Truth built-in task types to have workers generate specific types of labels for your data. You can also build a custom labeling workflow to provide your own UI and tools to workers labeling your data. To learn more about the Ground Truth built in task types, see Built-in Task Types (p. 361). To learn how to create a custom labeling workflow, see Creating Custom Labeling Workflows (p. 328).

In order to automate labeling your training dataset, you can optionally use automated data labeling, a Ground Truth process that uses machine learning to decide which data needs to be labeled by humans. Automated data labeling may reduce the labeling time and manual effort required. For more information, see Automate Data Labeling (p. 459). To create a custom labeling workflow, see Creating Custom Labeling Workflows (p. 328).

Use either pre-built or custom tools to assign the labeling tasks for your training dataset. A labeling UI template is a webpage that Ground Truth uses to present tasks and instructions to your workers. The SageMaker console provides built-in templates for labeling data. You can use these templates to get started, or you can build your own tasks and instructions by using our HTML 2.0 components. For more information, see Creating Custom Labeling Workflows (p. 328).

Use the workforce of your choice to label your dataset. You can choose your workforce from:
- The Amazon Mechanical Turk workforce of over 500,000 independent contractors worldwide.
- A private workforce that you create from your employees or contractors for handling data within your organization.
- A vendor company that you can find in the AWS Marketplace that specializes in data labeling services.
For more information, see Create and Manage Workforces (p. 485).

You store your datasets in Amazon S3 buckets. The buckets contain three things: The data to be labeled, an input manifest file that Ground Truth uses to read the data files, and an output manifest file. The output file contains the results of the labeling job. For more information, see Use Input and Output Data (p. 391).

Events from your labeling jobs appear in Amazon CloudWatch under the /aws/sagemaker/LabelingJobs group. CloudWatch uses the labeling job name as the name for the log stream.

Are You a First-time User of Ground Truth?

If you are a first-time user of Ground Truth, we recommend that you do the following:

1. Read Getting started (p. 190)—This section walks you through setting up your first Ground Truth labeling job.
2. Explore other topics—Depending on your needs, do the following:
   - Explore built-in task types—Use built-in task types to streamline the process of creating a labeling job. See Built-in Task Types (p. 361) to learn more about Ground Truth built-in task types.
   - Manage your labeling workforce—Create new work teams and manage your existing workforce. For more information, see Create and Manage Workforces (p. 485).
   - Learn about streaming labeling jobs—Create a streaming labeling job and send new dataset objects to workers in real time using a perpetually running labeling job. Workers continuously receive new data objects to label as long as the labeling job is active and new objects are being sent to it. To learn more, see Ground Truth Streaming Labeling Jobs (p. 395).
3. See the Reference—This section describes operations to automate Ground Truth operations.

Getting started

This video shows you how to setup and use Amazon SageMaker Ground Truth. (Length: 9:37)

To get started using Amazon SageMaker Ground Truth, follow the instructions in the following sections. The sections here explain how to use the console to create a labeling job, assign a public or private workforce, and send the labeling job to your workforce. You can also learn how to monitor the progress of a labeling job.

If you want to create a custom labeling workflow, see Creating Custom Labeling Workflows (p. 328) for instructions.

Before you create a labeling job, you must upload your dataset to an Amazon S3 bucket. For more information, see Use Input and Output Data (p. 391).

Topics
- Step 1: Before You Begin (p. 190)
- Step 2: Create a Labeling Job (p. 191)
- Step 3: Select Workers (p. 192)
- Step 4: Configure the Bounding Box Tool (p. 194)
- Step 5: Monitoring Your Labeling Job (p. 195)

Step 1: Before You Begin

Before you begin using the SageMaker console to create a labeling job, you must set up the dataset for use. Do this:
1. Save two images at publicly available HTTP URLs. The images are used when creating instructions for completing a labeling task. The images should have an aspect ratio of around 2:1. For this exercise, the content of the images is not important.

2. Create an Amazon S3 bucket to hold the input and output files. The bucket must be in the same Region where you are running Ground Truth. Make a note of the bucket name because you use it during step 2.

Ground Truth requires all S3 buckets that contain labeling job input image data have a CORS policy attached. To learn more about this change, see CORS Permission Requirement (p. 468).

3. Assign the following permissions policy to the user that is creating the labeling job:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {

Next

Step 2: Create a Labeling Job (p. 191)

**Step 2: Create a Labeling Job**

In this step you use the console to create a labeling job. You tell Amazon SageMaker Ground Truth the Amazon S3 bucket where the manifest file is stored and configure the parameters for the job. For more information about storing data in an Amazon S3 bucket, see Use Input and Output Data (p. 391).

**To create a labeling job**

2. From the left navigation, choose **Labeling jobs**.
3. Choose **Create labeling job** to start the job creation process.
4. In the **Job overview** section, provide the following information:
   - **Job name** – Give the labeling job a name that describes the job. This name is shown in your job list. The name must be unique in your account in an AWS Region.
   - **Label attribute name** – Leave this unchecked as the default value is the best option for this introductory job.
   - **Input data setup** – Select Automated data setup. This option allows you to automatically connect to your input data in S3.
• **S3 location for input datasets** – Enter the S3 location where you added the images in step 1.
• **S3 location for output datasets** – The location where your output data is written in S3.
• **Data type** – Use the drop down menu to select Image. Ground Truth will use all images found in the S3 location for input datasets as input for your labeling job.
• **IAM role** – Create or choose an IAM role with the AmazonSageMakerFullAccess IAM policy attached.

5. In the **Task type** section, for the **Task category** field, choose **Image**.
6. In the **Task selection** choose **Bounding box**.
7. Choose **Next** to move on to configuring your labeling job.

**Next**

Step 3: Select Workers (p. 192)

**Step 3: Select Workers**

In this step you choose a workforce for labeling your dataset. It is recommended that you create a private workforce to test Amazon SageMaker Ground Truth. Use email addresses to invite the members of your workforce. If you create a private workforce in this step you won't be able to import your Amazon Cognito user pool later. If you want to create a private workforce using an Amazon Cognito user pool, see **Manage a Private Workforce (Amazon Cognito)** (p. 494) and use the Mechanical Turk workforce instead in this tutorial.

**Tip**
To learn about the other workforce options you can use with Ground Truth, see **Create and Manage Workforces** (p. 485).

**To create a private workforce:**

1. In the **Workers** section, choose **Private**.
2. If this is your first time using a private workforce, in the **Email addresses** field, enter up to 100 email addresses. The addresses must be separated by a comma. You should include your own email address so that you are part of the workforce and can see data object labeling tasks.
3. In the **Organization name** field, enter the name of your organization. This information is used to customize the email sent to invite a person to your private workforce.
4. In the **Contact email** field enter an email address that members of the workforce use to report problems with the task.

If you add yourself to the private workforce, you will receive an email that looks similar to the following. **Amazon, Inc.** is replaced by the organization you enter in step 3 of the preceding procedure. Select the link in the email to log in using the temporary password provided. If prompted, change your password. When you successfully log in, you see the worker portal where your labeling tasks appear.
Tip
You can find the link to your private workforce's worker portal in the Labeling workforces section of the Ground Truth area of the SageMaker console. To see the link, select the Private tab. The link is under the Labeling portal sign-in URL header in Private workforce summary.

If you choose to use the Amazon Mechanical Turk workforce to label the dataset, you are charged for labeling tasks completed on the dataset.

To use the Amazon Mechanical Turk workforce:

1. In the Workers section, choose Public.
2. Set a Price per task.
3. If applicable, choose The dataset does not contain adult content to acknowledge that the sample dataset has no adult content. This information enables Amazon SageMaker Ground Truth to warn external workers on Mechanical Turk that they might encounter potentially offensive content in your dataset.
4. Choose the check box next to the following statement to acknowledge that the sample dataset does not contain any personally identifiable information (PII). This is a requirement to use Mechanical Turk with Ground Truth. If your input data does contain PII, use the private workforce for this tutorial.

You understand and agree that the Amazon Mechanical Turk workforce consists of independent contractors located worldwide and that you should not share confidential information, personal information or protected health information with this workforce.

Next
Step 4: Configure the Bounding Box Tool (p. 194)
Step 4: Configure the Bounding Box Tool

Finally you configure the bounding box tool to give instructions to your workers. You can configure a task title that describes the task and provides high-level instructions for the workers. You can provide both quick instructions and full instructions. Quick instructions are displayed next to the image to be labeled. Full instructions contain detailed instructions for completing the task. In this example, you only provide quick instructions. You can see an example of full instructions by choosing Full instructions at the bottom of the section.

To configure the bounding box tool

1. In the Task description field type in brief instructions for the task. For example:

   **Draw a box around any objects in the image.**

   Replace *objects* with the name of an object that appears in your images.

2. In the Labels field, type a category name for the objects that the worker should draw a bounding box around. For example, if you are asking the worker to draw boxes around football players, you could use "Football Player" in this field.

3. The Short instructions section enables you to create instructions that are displayed on the page with the image that your workers are labeling. We suggest that you include an example of a correctly drawn bounding box and an example of an incorrectly drawn box. To create your own instructions, use these steps:

   a. Select the text between GOOD EXAMPLE and the image placeholder. Replace it with the following text:

      **Draw the box around the object with a small border.**

   b. Select the first image placeholder and delete it.

   c. Choose the image button and then enter the HTTPS URL of one of the images that you created in step 1. It is also possible to embed images directly in the short instructions section, however this section has a quota of 100 kilobytes (including text). If your images and text exceed 100 kilobytes, you receive an error.

   d. Select the text between BAD EXAMPLE and the image placeholder. Replace it with the following text:

      **Don't make the bounding box too large or cut into the object.**

   e. Select the second image placeholder and delete it.

   f. Choose the image button and then enter the HTTPS URL of the other image that you created in step 1.

4. Select Preview to preview the worker UI. The preview opens in a new tab, and so if your browser blocks pop ups you may need to manually enable the tab to open. When you add one or more annotations to the preview and then select Submit you can see a preview of the output data your annotation would created.

5. After you have configured and verified your instructions, select Create to create the labeling job.

If you used a private workforce, you can navigate to the worker portal that you logged into in Step 3: Select Workers (p. 192) of this tutorial to see your labeling tasks. The tasks may take a few minutes to appear.

Next

Step 5: Monitoring Your Labeling Job (p. 195)
Step 5: Monitoring Your Labeling Job

After you create your labeling job, you see a list of all the jobs that you have created. You can use this list to monitor that status of your labeling jobs. The list has the following fields:

- **Name** – The name that you assigned the job when you created it.
- **Status** – The completion status of the job. The status can be one of Complete, Failed, In progress, or Stopped.
- **Labeled objects/total** – Shows the total number of objects in the labeling job and how many of them have been labeled.
- **Creation time** – The date and time that you created the job.

You can also clone, chain, or stop a job. Select a job and then select one of the following from the Actions menu:

- **Clone** – Creates a new labeling job with the configuration copied from the selected job. You can clone a job when you want to change to the job and run it again. For example, you can clone a job that was sent to a private workforce so that you can send it to the Amazon Mechanical Turk workforce. Or you can clone a job to rerun it against a new dataset stored in the same location as the original job.
- **Chain** – Creates a new labeling job that can build upon the data and models (if any) of a stopped, failed, or completed job. For more information about the use cases and how to use it, see Chaining Labeling Jobs (p. 465).
- **Stop** – Stops a running job. You cannot restart a stopped job. You can clone a job to start over or chain the job to continue from where it left off. Labels for any already labeled objects are written to the output file location. For more information, see Output Data (p. 433).

Label Images

Use Ground Truth to label images. Select one of the following built-in task types to learn more about that task type. Each page includes instructions to help you create a labeling job using that task type.

**Tip**
To learn more about supported file types and input data quotas, see Input Data (p. 392).

Topics

- Bounding Box (p. 195)
- Image Semantic Segmentation (p. 201)
- Auto-Segmentation Tool (p. 204)
- Image Classification (Single Label) (p. 208)
- Image Classification (Multi-label) (p. 210)
- Image Label Verification (p. 214)

Bounding Box

The images used to train a machine learning model often contain more than one object. To classify and localize one or more objects within images, use the Amazon SageMaker Ground Truth bounding box labeling job task type. In this context, localization means the pixel-location of the bounding box.

You create a bounding box labeling job using the Ground Truth section of the Amazon SageMaker console or the CreateLabelingJob operation.
Important
For this task type, if you create your own manifest file, use "source-ref" to identify the location of each image file in Amazon S3 that you want labeled. For more information, see Input Data (p. 392).

Creating a Bounding Box Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) (p. 364) to learn how to create a bounding box labeling job in the SageMaker console. In Step 10, choose Image from the Task category drop down menu, and choose Bounding box as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and up to 50 labels that workers can choose from.
Good example

Fit each box tightly around the boundaries of the object.

Bad example

Boxes should not overlap with the boundaries of objects.
Create a Bounding Box Labeling Job (API)

To create a bounding box labeling job, use the SageMaker API operation CreateLabelingJob. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the See Also section of CreateLabelingJob.

Follow the instructions on Create a Labeling Job (API) (p. 367) and do the following while you configure your request:

• Pre-annotation Lambda functions for this task type end with PRE-BoundingBox. To find the pre-annotation Lambda ARN for your Region, see PreHumanTaskLambdaArn.
• Annotation-consolidation Lambda functions for this task type end with ACS-BoundingBox. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```python
response = client.create_labeling_job(
    LabelingJobName='example-bounding-box-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {'S3DataSource': {'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'}},
        'DataAttributes': {
            'ContentClassifiers': ['FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent'],
        },
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string',
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123,
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region:*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html',
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-BoundingBox',
        'TaskKeywords': ['Bounding Box'],
        'TaskTitle': 'Bounding Box task',
        'TaskDescription': 'Draw bounding boxes around objects in an image',
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'MaxConcurrentTaskCount': 123,
        'AnnotationConsolidationConfig': {
            'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:ACS-BoundingBox',
        },
    },
)
Provide a Template for Bounding Box Labeling Jobs

If you create a labeling job using the API, you must supply a worker task template in `UiTemplateS3Uri`. Copy and modify the following template. Only modify the short-instructions, full-instructions, and header. Upload this template to S3, and provide the S3 URI for this file in `UiTemplateS3Uri`.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-bounding-box
    name="boundingBox"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="please draw box"
    labels="{{ task.input.labels | to_json | escape }}"
  >
    <full-instructions header="Bounding box instructions">
      <ol>
        <li><strong>Inspect</strong> the image</li>
        <li><strong>Determine</strong> if the specified label is/are visible in the picture.</li>
        <li><strong>Outline</strong> each instance of the specified label in the image using the provided "Box" tool.</li>
      </ol>
      <ul>
        <li>Boxes should fit tight around each object</li>
        <li>Do not include parts of the object are overlapping or that cannot be seen, even though you think you can interpolate the whole shape.</li>
        <li>Avoid including shadows.</li>
        <li>If the target is off screen, draw the box up to the edge of the image.</li>
      </ul>
    </full-instructions>

    <short-instructions>
      <h3><span style="color: rgb(0, 138, 0);">Good example</span></h3>
      <p>Enter description of a correct bounding box label and add images</p>
      <h3><span style="color: rgb(230, 0, 0);">Bad example</span></h3>
      <p>Enter description of an incorrect bounding box label and add images</p>
    </short-instructions>
  </crowd-bounding-box>
</crowd-form>
```

Bounding Box Output Data

Once you have created a bounding box labeling job, your output data will be located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the Output dataset location field of the Job overview section of the console.

For example, the output manifest file of a successfully completed single-class bounding box task will contain the following:

```json
[
  {
    "boundingBox": {
      "boundingBoxes": [
      {
        "height": 2832,
```
The `boundingBoxes` parameter identifies the location of the bounding box drawn around an object identified as a “bird” relative to the top-left corner of the image which is taken to be the (0,0) pixel-coordinate. In the previous example, `left` and `top` identify the location of the pixel in the top-left corner of the bounding box relative to the top-left corner of the image. The dimensions of the bounding box are identified with `height` and `width`. The `inputImageProperties` parameter gives the pixel-dimensions of the original input image.

When you use the bounding box task type, you can create single- and multi-class bounding box labeling jobs. The output manifest file of a successfully completed multi-class bounding box will contain the following:
To learn more about the output manifest file that results from a bounding box labeling job, see Bounding Box Job Output (p. 439).

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see Output Data (p. 433).

Image Semantic Segmentation

To identify the contents of an image at the pixel level, use an Amazon SageMaker Ground Truth semantic segmentation labeling task. When assigned a semantic segmentation labeling job, workers classify pixels in the image into a set of predefined labels or classes. Ground Truth supports single and multi-class semantic segmentation labeling jobs.

Images that contain large numbers of objects that need to be segmented require more time. To help workers (from a private or vendor workforce) label these objects in less time and with greater accuracy, Ground Truth provides an AI-assisted auto-segmentation tool. For information, see Auto-Segmentation Tool (p. 204).

You create a semantic segmentation labeling job using the Ground Truth section of the Amazon SageMaker console or the CreateLabelingJob operation.

**Important**

For this task type, if you create your own manifest file, use "source-ref" to identify the location of each image file in Amazon S3 that you want labeled. For more information, see Input Data (p. 392).

Creating a Semantic Segmentation Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) (p. 364) to learn how to create a semantic segmentation labeling job in the SageMaker console. In Step 10, choose Image from the Task category drop down menu, and choose Semantic segmentation as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and labels that workers can choose from.
**Instructions**

- View full instructions
- View tool guide
- How to use the Auto-segment tool

**Good example**

All pixels in the image that are part of an animal have been colors with the appropriate label color.

**Bad example**

Some animals in the image have not been colored in completely.

The color for a given animal extends beyond the boundaries of the animal.
Create a Semantic Segmentation Labeling Job (API)

To create a semantic segmentation labeling job, use the SageMaker API operation CreateLabelingJob. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the See Also section of CreateLabelingJob.

Follow the instructions on Create a Labeling Job (API) (p. 367) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with PRE-SemanticSegmentation. To find the pre-annotation Lambda ARN for your Region, see PreHumanTaskLambdaArn.
- Annotation-consolidation Lambda functions for this task type end with ACS-SemanticSegmentation. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```python
response = client.create_labeling_job(
    LabelingJobName='example-semantic-segmentation-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent'
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region:*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html'
        },
        'TaskKeywords': ['Semantic Segmentation'],
        'TaskTitle': 'Semantic segmentation task',
        'TaskDescription': 'For each category provided, segment out each relevant object using the color associated with that category',
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'MaxConcurrentTaskCount': 123,
        'AnnotationConsolidationConfig': {
        }
    }
)
```
Provide a Template for Semantic Segmentation Labeling Jobs

If you create a labeling job using the API, you must supply a worker task template in UiTemplateS3Uri. Copy and modify the following template. Only modify the short-instructions, full-instructions, and header.

Upload this template to S3, and provide the S3 URI for this file in UiTemplateS3Uri.

Semantic Segmentation Output Data

Once you have created a semantic segmentation labeling job, your output data will be located in the Amazon S3 bucket specified in the S3OutputPath parameter when using the API or in the Output dataset location field of the Job overview section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see Output Data (p. 433).

To see an example of an output manifest file for a semantic segmentation labeling job, see 3D Point Cloud Semantic Segmentation Output (p. 449).

Auto-Segmentation Tool

Image segmentation is the process of dividing an image into multiple segments, or sets of labeled pixels. In Amazon SageMaker Ground Truth, the process of identifying all pixels that fall under a given label involves applying a colored filler, or "mask", over those pixels. Some labeling job tasks contain
images with a large numbers of objects that need to be segmented. To help workers label these objects in less time and with greater accuracy, Ground Truth provides an auto-segmentation tool for segmentation tasks assigned to private and vendor workforces. This tool uses a machine learning model to automatically segment individual objects in the image with minimal worker input. Workers can refine the mask generated by the auto-segmentation tool using other tools found in the worker console. This helps workers complete image segmentation tasks faster and more accurately, resulting in lower cost and higher label quality.

**Note**
The auto-segmentation tool is available for segmentation tasks that are sent to a private workforce or vendor workforce. It isn't available for tasks sent to the public workforce (Amazon Mechanical Turk).

**Tool Preview**

When workers are assigned a labeling job that provides the auto-segmentation tool, they are provided with detailed instructions on how to use the tool. For example, a worker might see the following in the worker console:
Use paint brush to paint a mask on each bird in the image.
Workers can use **View full instructions** to learn how to use the tool. Workers will need to place a point on four extreme-points (top-most, bottom-most, left-most, and right-most points) of the object of interest, and the tool will automatically generate a mask for the object. Workers can further-refine the mask using the other tools provided, or by using the auto-segment tool on smaller portions of the object that were missed.

**Tool Availability**

The auto-segmentation tool automatically appears in your workers' consoles if you create a semantic segmentation labeling job using the Amazon SageMaker console. While creating a semantic segmentation job in the SageMaker console, you will be able to preview the tool while creating worker instructions. To learn how to create a semantic segmentation labeling job in the SageMaker console, see [Getting started](#) (p. 190).

If you are creating a custom instance segmentation labeling job in the SageMaker console or creating an instance- or semantic-segmentation labeling job using the Ground Truth API, you need to create a custom task template to design your worker console and instructions. To include the auto-segmentation tool in your worker console, ensure that the following conditions are met in your custom task template:

- For semantic segmentation labeling jobs created using the API, the `<crowd-semantic-segmentation>` tag is present in the task template. For custom instance segmentation labeling jobs, the `<crowd-instance-segmentation>` tag is present in the task template.
- The task is assigned to a private workforce or vendor workforce.
- The images to be labeled are Amazon Simple Storage Service Amazon S3 objects that have been pre-signed for the Worker so that they can access it. This is true if the task template includes the `grant_read_access` filter. For information about the `grant_read_access` filter, see [Adding automation with Liquid](#) (p. 332).

The following is an example of a custom task template for a custom instance segmentation labeling job, which includes the `<crowd-instance-segmentation>` tag and the `grant_read_access` Liquid filter.

```html
<crowd-form>
  <crowd-instance-segmentation
    name="crowd-instance-segmentation"
    src="{{ task.input.taskObject | grant_read_access }}"
    labels="["Car","Road"]"
    full-instructions header="Segmentation instructions">
    Segment each instance of each class of objects in the image.
  </full-instructions>
  <short-instructions>
    <p>Segment each instance of each class of objects in the image.</p>
    <h3 style="color: green">GOOD EXAMPLES</h3>
    <img src="path/to/image.jpg" style="width: 100%">
    <p>Good because A, B, C.</p>
    <h3 style="color: red">BAD EXAMPLES</h3>
    <img src="path/to/image.jpg" style="width: 100%">
    <p>Bad because X, Y, Z.</p>
  </short-instructions>
</crowd-instance-segmentation>
</crowd-form>
```
Image Classification (Single Label)

Use an Amazon SageMaker Ground Truth image classification labeling task when you need workers to classify images using predefined labels that you specify. Workers are shown images and are asked to choose one label for each image.

You can create an image classification labeling job using the Ground Truth section of the Amazon SageMaker console or the `CreateLabelingJob` operation.

**Important**
For this task type, if you create your own manifest file, use "source-ref" to identify the location of each image file in Amazon S3 that you want labeled. For more information, see Input Data (p. 392).

Create an Image Classification Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) (p. 364) to learn how to create a image classification labeling job in the SageMaker console. In Step 10, choose Image from the Task category drop down menu, and choose Image Classification (Single Label) as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and labels that workers can choose from.

Create an Image Classification Labeling Job (API)

To create an image classification labeling job, use the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the See Also section of `CreateLabelingJob`.  

208
Follow the instructions on Create a Labeling Job (API) (p. 367) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with PRE-ImageMultiClass. To find the pre-annotation Lambda ARN for your Region, see PreHumanTaskLambdaArn.
- Annotation-consolidation Lambda functions for this task type end with ACS-ImageMultiClass. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```python
response = client.create_labeling_job(
    LabelingJobName='example-image-classification-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'}
        },
        'DataAttributes': {
            'ContentClassifiers': ['FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent'],
        }
    },

)
Amazon SageMaker Developer Guide
Label Images

)

]

Provide a Template for Image Classiﬁcation Labeling Jobs
If you create a labeling job using the API, you must supply a worker task template in UiTemplateS3Uri.
Copy and modify the following template. Only modify the short-instructions, fullinstructions, and header.
Upload this template to S3, and provide the S3 URI for this ﬁle in UiTemplateS3Uri.
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
<crowd-image-classifier
name="crowd-image-classifier"
src="{{ task.input.taskObject | grant_read_access }}"
header="please classify"
categories="{{ task.input.labels | to_json | escape }}"
>
<full-instructions header="Image classification instructions">
<ol><li><strong>Read</strong> the task carefully and inspect the image.</li>
<li><strong>Read</strong> the options and review the examples provided to understand
more about the labels.</li>
<li><strong>Choose</strong> the appropriate label that best suits the image.</li></
ol>
</full-instructions>
<short-instructions>
<h3><span style="color: rgb(0, 138, 0);">Good example</span></h3>
<p>Enter description to explain the correct label to the workers</p>
<h3><span style="color: rgb(230, 0, 0);">Bad example</span></h3><p>Enter description
of an incorrect label</p>
</short-instructions>
</crowd-image-classifier>
</crowd-form>

Image Classiﬁcation Output Data
Once you have created an image classiﬁcation labeling job, your output data will be located in the
Amazon S3 bucket speciﬁed in the S3OutputPath parameter when using the API or in the Output
dataset location ﬁeld of the Job overview section of the console.
To learn more about the output manifest ﬁle generated by Ground Truth and the ﬁle structure the
Ground Truth uses to store your output data, see Output Data (p. 433).
To see an example of an output manifest ﬁle from an image classiﬁcation labeling job, see Classiﬁcation
Job Output (p. 437).

Image Classiﬁcation (Multi-label)
Use an Amazon SageMaker Ground Truth multi-label image classiﬁcation labeling task when you need
workers to classify multiple objects in an image. For example, the following image features a dog and a
cat. You can use multi-label image classiﬁcation to associate the labels "dog" and "cat" with this image.

210


When working on a multi-label image classification task, workers should choose all applicable labels, but must choose at least one. When creating a job using this task type, you can provide up to 50 label-categories.

When creating a labeling job in the console, Ground Truth doesn't provide a "none" category for when none of the labels applies to an image. To provide this option to workers, include a label similar to "none" or "other" when you create a multi-label image classification job.

To restrict workers to choosing a single label for each image, use the Image Classification (Single Label) (p. 208) task type.

**Important**
For this task type, if you create your own manifest file, use "source-ref" to identify the location of each image file in Amazon S3 that you want labeled. For more information, see Input Data (p. 392).

**Create a Multi-Label Image Classification Labeling Job (Console)**

You can follow the instructions Create a Labeling Job (Console) (p. 364) to learn how to create a multi-label image classification labeling job in the SageMaker console. In Step 10, choose Image from the Task category drop down menu, and choose Image Classification (Multi-label) as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create a labeling job in the console, you specify instructions to help workers complete the job and labels that workers can choose from.
Create a Multi-Label Image Classification Labeling Job (API)

To create a multi-label image classification labeling job, use the SageMaker API operation CreateLabelingJob. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the See Also section of CreateLabelingJob.

Follow the instructions on Create a Labeling Job (API) (p. 367) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with PRE-ImageMultiClassMultiLabel. To find the pre-annotation Lambda ARN for your Region, see PreHumanTaskLambdaArn.
- Annotation-consolidation Lambda functions for this task type end with ACS-ImageMultiClassMultiLabel. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```python
response = client.create_labeling_job(
    LabelingJobName='example-multi-label-image-classification-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent',
            ]
        }
    },

```
OutputConfig={
    'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
    'KmsKeyId': 'string'
},
RoleArn='arn:aws:iam::*:role/*',
LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
StoppingConditions={
    'MaxHumanLabeledObjectCount': 123,
    'MaxPercentageOfInputDatasetLabeled': 123
},
HumanTaskConfig={
    'WorkteamArn': 'arn:aws:sagemaker:region::*:workteam/private-crowd/*',
    'UiConfig': {
        'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html'
    },
    'TaskKeywords': [
        'Image Classification',
    ],
    'TaskTitle': 'Multi-label image classification task',
    'TaskDescription': 'Select all labels that apply to the images shown',
    'NumberOfHumanWorkersPerDataObject': 123,
    'TaskTimeLimitInSeconds': 123,
    'TaskAvailabilityLifetimeInSeconds': 123,
    'MaxConcurrentTaskCount': 123,
    'AnnotationConsolidationConfig': {
        'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:ACS-ImageMultiClassMultiLabel'
    },
    Tags=[
        {'Key': 'string',
         'Value': 'string'}
    ]
}

Provide a Template for Multi-label Image Classification

If you create a labeling job using the API, you must supply a worker task template in UiTemplateS3Uri. Copy and modify the following template. Only modify the short-instructions, full-instructions, and header.

Upload this template to S3, and provide the S3 URI for this file in UiTemplateS3Uri.

<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-image-classifier-multi-select name="crowd-image-classifier-multi-select" src="{{ task.input.taskObject | grant_read_access }}"
    header="Please identify all classes in image"
    categories="{{ task.input.labels | to_json | escape }}"
  >
    <full-instructions header="Multi Label Image classification instructions">
      <ol>
        <li><strong>Read</strong> the task carefully and inspect the image.</li>
        <li><strong>Read</strong> the options and review the examples provided to understand more about the labels.</li>
        <li><strong>Choose</strong> the appropriate labels that best suit the image.</li>
      </ol>
    </full-instructions>
    <short-instructions>
      <h3><span style="color: rgb(0, 138, 0);">Good example</span></h3>
      <p>Enter description to explain the correct label to the workers</p>
  </crowd-image-classifier-multi-select>
</crowd-form>
<h3><span style="color: rgb(230, 0, 0);">Bad example</span></h3>
<p>Enter description of an incorrect label</p>
</short-instructions>
</crowd-image-classifier-multi-select>
</crowd-form>

Multi-label Image Classification Output Data

Once you have created a multi-label image classification labeling job, your output data will be located in the Amazon S3 bucket specified in the S3OutputPath parameter when using the API or in the Output dataset location field of the Job overview section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see Output Data (p. 433).

To see an example of output manifest files for multi-label image classification labeling job, see Multi-label Classification Job Output (p. 438).

Image Label Verification

Building a highly accurate training dataset for your machine learning (ML) algorithm is an iterative process. Typically, you review and continuously adjust your labels until you are satisfied that they accurately represent the ground truth, or what is directly observable in the real world.

You can use an Amazon SageMaker Ground Truth image label verification task to direct workers to review a dataset's labels and improve label accuracy. Workers can indicate if the existing labels are correct or rate label quality. They can also add comments to explain their reasoning. Amazon SageMaker Ground Truth supports label verification for Bounding Box (p. 195) and Image Semantic Segmentation (p. 201) labels.

You create an image label verification labeling job using the Ground Truth section of the Amazon SageMaker console or the CreateLabelingJob operation.

Ground Truth provides a worker console similar to the following for labeling tasks. When you create the labeling job with the console, you can modify the images and content that are shown. To learn how to create a labeling job using the Ground Truth console, see Create a Labeling Job (Console) (p. 364).
You can create a label verification labeling job using the SageMaker console or API. To learn how to create a labeling job using the Ground Truth API operation `CreateLabelingJob`, see Create a Labeling Job (API) (p. 367).

Use Ground Truth to Label Text

Use Ground Truth to text. Select one of the following built in task types to learn more about that task type. Each page includes instructions to help you create a labeling job using that task type.

Tip

To learn more about supported file types and input data quotas, see Input Data (p. 392).

Topics

- Named Entity Recognition (p. 215)
- Text Classification (Single Label) (p. 219)
- Text Classification (Multi-label) (p. 222)

Named Entity Recognition

To extract information from unstructured text and classify it into predefined categories, use an Amazon SageMaker Ground Truth named entity recognition (NER) labeling task. Traditionally, NER involves sifting through text data to locate noun phrases, called named entities, and categorizing each with a label, such as "person," "organization," or "brand." You can broaden this task to label longer spans of text and categorize those sequences with predefined labels that you specify.

When tasked with a named entity recognition labeling job, workers apply your labels to specific words or phrases within a larger text block. They choose a label, then apply it by using the cursor to highlight the part of the text to which the label applies. The Ground Truth named entity recognition tool supports
overlapping annotations, in-context label selection, and multi-label selection for a single highlight. Also, workers can use their keyboards to quickly select labels.

You can create a named entity recognition labeling job using the Ground Truth section of the Amazon SageMaker console or the CreateLabelingJob operation.

**Important**
If you manually create an input manifest file, use "source" to identify the text that you want labeled. For more information, see Input Data (p. 392).

### Create a Named Entity Recognition Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) (p. 364) to learn how to create a named entity recognition labeling job in the SageMaker console. In Step 10, choose **Text** from the **Task category** drop down menu, and choose **Named entity recognition** as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and labels that workers can choose from.

### Create a Named Entity Recognition Labeling Job (API)

To create a named entity recognition labeling job, using the SageMaker API operation CreateLabelingJob. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of CreateLabelingJob.

Follow the instructions on Create a Labeling Job (API) (p. 367) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with **PRE-NamedEntityRecognition**. To find the pre-annotation Lambda ARN for your Region, see **PreHumanTaskLambdaArn**.
• Annotation-consolidation Lambda functions for this task type end with ACS-NamedEntityRecognition. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.

• You must provide the following ARN for HumanTaskUiArn:

```
```

Replace `aws-region` with the AWS Region you use to create the labeling job. For example, use `us-west-1` if you create a labeling job in US West (N. California).

• Provide worker instructions in the label category configuration file using the instructions parameter. You can use a string, or HTML markup language in the shortInstruction and fullInstruction fields. For more details, see Provide Worker Instructions in a Label Category Configuration File (p. 218).

```
"instructions": {
"shortInstruction": "<h1>Add header</h1><p>Add Instructions</p>",
"fullInstruction": "<p>Add additional instructions.</p>"
}
```

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```
response = client.create_labeling_job(
    LabelingJobName='example-ner-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonllyIdentifiableInformation'|'FreeOfAdultContent'
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region::*:workteam/private-crowd/*',
        'UiConfig': {
        },
        'TaskKeywords': [
            'Named entity Recognition',
        ],
        'TaskTitle': 'Named entity Recognition task',
        'TaskDescription': 'Apply the labels provided to specific words or phrases within the larger text block.',
        'NumberOfHumanWorkersPerDataObject': 1,
    }
)
```
'TaskTimeLimitInSeconds': 28800,
'TaskAvailabilityLifetimeInSeconds': 864000,
'MaxConcurrentTaskCount': 1000,
'AnnotationConsolidationConfig': {
},
'Tags':[{
  'Key': 'string',
  'Value': 'string'
}]

Provide Worker Instructions in a Label Category Configuration File

You must provide worker instructions in the label category configuration file you identify with the LabelCategoryConfigS3Uri parameter in CreateLabelingJob. You can use these instructions to provide details about the task you want workers to perform and help them use the tool efficiently.

You provide short and long instructions using shortInstruction and fullInstruction in the instructions parameter, respectively. To learn more about these instruction types, see Creating Instruction Pages (p. 361).

The following is an example of a label category configuration file with instructions that can be used for a named entity recognition labeling job.

```json
{
  "document-version": "2018-11-28",
  "labels": [
    {
      "label": "label1",
      "shortDisplayName": "L1"
    },
    {
      "label": "label2",
      "shortDisplayName": "L2"
    },
    {
      "label": "label3",
      "shortDisplayName": "L3"
    },
    {
      "label": "label4",
      "shortDisplayName": "L4"
    },
    {
      "label": "label5",
      "shortDisplayName": "L5"
    }
  ],
  "instructions": {
    "shortInstruction": "Enter description of the labels that workers have to choose from. Add examples to help workers understand the label."
  },
  "fullInstruction": "Read the text carefully. Highlight words, phrases, or sections of the text. Choose the label that best matches what you have highlighted. To change a label, choose highlighted text and select a new label."
}
```
To <strong>remove</strong> a label from highlighted text, choose the X next to the abbreviated label name on the highlighted text.

You can select all of a previously highlighted text, but not a portion of it.

### Named Entity Recognition Output Data

Once you have created a named entity recognition labeling job, your output data will be located in the Amazon S3 bucket specified in the S3OutputPath parameter when using the API or in the Output dataset location field of the Job overview section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see Output Data (p. 433).

### Text Classification (Single Label)

To categorize articles and text into predefined categories, use text classification. For example, you can use text classification to identify the sentiment conveyed in a review or the emotion underlying a section of text. Use Amazon SageMaker Ground Truth text classification to have workers sort text into categories that you define.

You create a text classification labeling job using the Ground Truth section of the Amazon SageMaker console or the CreateLabelingJob operation.

**Important**

If you manually create an input manifest file, use "source" to identify the text that you want labeled. For more information, see Input Data (p. 392).

### Create a Text Classification Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) (p. 364) to learn how to create a text classification labeling job in the SageMaker console. In Step 10, choose Text from the Task category drop down menu, and choose Text Classification (Single Label) as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and labels that workers can choose from.
Create a Text Classification Labeling Job (API)

To create a text classification labeling job, use the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the See Also section of `CreateLabelingJob`.

Follow the instructions on Create a Labeling Job (API) (p. 367) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with `PRE-TextMultiClass`. To find the pre-annotation Lambda ARN for your Region, see PreHumanTaskLambdaArn.
- Annotation-consolidation Lambda functions for this task type end with `ACS-TextMultiClass`. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```python
response = client.create_labeling_job(
    LabelingJobName='example-text-classification-labeling-job,
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [ 'FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent' ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    }
)
```
RoleArn='arn:aws:iam::*:role/*',
LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
StoppingConditions={
    'MaxHumanLabeledObjectCount': 123,
    'MaxPercentageOfInputDatasetLabeled': 123
},
HumanTaskConfig={
    'WorkteamArn': 'arn:aws:sagemaker:region::*:workteam/private-crowd/*',
    'UiConfig': {
        'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html'
    },
    'TaskKeywords': ['Text classification'],
    'TaskTitle': 'Text classification task',
    'TaskDescription': 'Carefully read and classify this text using the categories provided.',
    'NumberOfHumanWorkersPerDataObject': 123,
    'TaskTimeLimitInSeconds': 123,
    'TaskAvailabilityLifetimeInSeconds': 123,
    'MaxConcurrentTaskCount': 123,
    'AnnotationConsolidationConfig': {
        'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:ACS-TextMultiClass'
    },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        }
    ]
}

Provide a Template for Text Classification Labeling Jobs

If you create a labeling job using the API, you must supply a worker task template in UiTemplateS3Uri. Copy and modify the following template. Only modify the short-instructions, full-instructions, and header.

Upload this template to S3, and provide the S3 URI for this file in UiTemplateS3Uri.

<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
    <crowd-classifier
        name="crowd-classifier"
        categories="{{ task.input.labels | to_json | escape }}"
        header="classify text"
    >
    <classification-target style="white-space: pre-wrap">
        {{ task.input.taskObject }}
    </classification-target>
    <full-instructions header="Classifier instructions">
        <ol>
            <li><strong>Read</strong> the text carefully.</li>
            <li><strong>Read</strong> the examples to understand more about the options.</li>
            <li><strong>Choose</strong> the appropriate labels that best suit the text.</li>
        </ol>
    </full-instructions>
    <short-instructions>
        <p>Enter description of the labels that workers have to choose from</p>
        <p>Add examples to help workers understand the label</p>
    </short-instructions>
</crowd-classifier>
Text Classification Output Data

Once you have created a text classification labeling job, your output data will be located in the Amazon S3 bucket specified in the S3OutputPath parameter when using the API or in the Output dataset location field of the Job overview section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see Output Data (p. 433).

To see an example of an output manifest file from a text classification labeling job, see Classification Job Output (p. 437).

Text Classification (Multi-label)

To categorize articles and text into multiple predefined categories, use the multi-label text classification task type. For example, you can use this task type to identify more than one emotion conveyed in text.

When working on a multi-label text classification task, workers should choose all applicable labels, but must choose at least one. When creating a job using this task type, you can provide up to 50 label categories.

Amazon SageMaker Ground Truth doesn't provide a "none" category for when none of the labels applies. To provide this option to workers, include a label similar to "none" or "other" when you create a multi-label text classification job.

To restrict workers to choosing a single label for each document or text selection, use the Text Classification (Single Label) (p. 219) task type.

Important
  If you manually create an input manifest file, use "source" to identify the text that you want labeled. For more information, see Input Data (p. 392).

Create a Multi-Label Text Classification Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) (p. 364) to learn how to create a multi-label text classification labeling job in the Amazon SageMaker console. In Step 10, choose Text from the Task category drop down menu, and choose Text Classification (Multi-label) as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and labels that workers can choose from.
Create a Multi-Label Text Classification Labeling Job (API)

To create a multi-label text classification labeling job, use the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the See Also section of `CreateLabelingJob`.

Follow the instructions on Create a Labeling Job (API) (p. 367) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with `PRE-TextMultiClassMultiLabel`. To find the pre-annotation Lambda ARN for your Region, see `PreHumanTaskLambdaArn`.
- Annotation-consolidation Lambda functions for this task type end with `ACS-TextMultiClassMultiLabel`. To find the annotation-consolidation Lambda ARN for your Region, see `AnnotationConsolidationLambdaArn`.

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```python
response = client.create_labeling_job(
    LabelingJobName='example-multi-label-text-classification-labeling-job,
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {

Create a Template for Multi-label Text Classification

If you create a labeling job using the API, you must supply a worker task template in UIMultiClassMultiLabel. Copy and modify the following template. Only modify the short-instructions, full-instructions, and header.

Upload this template to S3, and provide the S3 URI for this file in UIMultiClassMultiLabel.
To learn how to create a custom template, see Creating Custom Labeling Workflows (p. 328).

Multi-label Text Classification Output Data

Once you have created a multi-label text classification labeling job, your output data will be located in the Amazon S3 bucket specified in the S3OutputPath parameter when using the API or in the Output dataset location field of the Job overview section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see Output Data (p. 433).

To see an example of output manifest files for multi-label text classification labeling job, see Multi-label Classification Job Output (p. 438).

Label Videos and Video Frames

You can use Ground Truth to classify videos and annotate video frames (still images extracted from videos) using one of the three built-in video task types. These task types streamline the process of creating video and video frame labeling jobs using the Amazon SageMaker console, API, and language-specific SDKs.

- Video clip classification – Enable workers to classify videos into categories you specify. For example, you can use this task type to have workers categorize videos into topics like sports, comedy, music, and education. To learn more, see Video Classification (p. 225).

- Video frame labeling jobs – Enable workers to annotate video frames extracted from a video using bounding boxes, polylines, polygons or keypoint annotation tools. Ground Truth offers two built-in task types to label video frames:
  - Video frame object detection: Enable workers to identify and locate objects in video frames.
  - Video frame object tracking: Enable workers to track the movement of objects across video frames.
  - Video frame adjustment jobs: Have works adjust labels, label category attributes, and frame attributes from a previous video frame object detection or object tracking labeling job.
  - Video frame verification jobs: Have workers verify labels, label category attributes, and frame attributes from a previous video frame object detection or object tracking labeling job.

If you have video files, you can use the Ground Truth automatic frame extraction tool to extract video frames from your videos. To learn more, see Video Frame Input Data (p. 427).

Tip

To learn more about supported file types and input data quotas, see Input Data (p. 392).

Topics

- Video Classification (p. 225)
- Label Video Frames (p. 230)
- Worker Instructions (p. 242)

Video Classification

Use an Amazon SageMaker Ground Truth video classification labeling task when you need workers to classify videos using predefined labels that you specify. Workers are shown videos and are asked to choose one label for each video.

You create a video classification labeling job using the Ground Truth section of the Amazon SageMaker console or the CreateLabelingJob operation.
Your video files must be encoded in a format that is supported by the browser used by the work team that labels your data. It is recommended that you verify that all video file formats in your input manifest file display correctly using the worker UI preview. You can communicate supported browsers to your workers using worker instructions. To see supported file formats, see Supported Data Formats (p. 395).

**Important**
For this task type, if you create your own manifest file, use "source-ref" to identify the location of each video file in Amazon S3 that you want labeled. For more information, see Input Data (p. 392).

Create a Video Classification Labeling Job (Console)

You can follow the instructions in Create a Labeling Job (Console) (p. 364) to learn how to create a video classification labeling job in the SageMaker console. In step 10, choose Video from the Task category dropdown list, and choose Video Classification as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create a labeling job in the console, you specify instructions to help workers complete the job and labels from which workers can choose.
Instructions

View full instructions

View tool guide

Select a single label that best describes this video clip. Select none of the above if none of the other labels apply.

Select Submit when you are done.
Create a Video Classification Labeling Job (API)

This section covers details you need to know when you create a labeling job using the SageMaker API operation CreateLabelingJob. This API defines this operation for all AWS SDKs. To see a list of language-specific SDks supported for this operation, review the See Also section of CreateLabelingJob.

Follow the instructions on Create a Labeling Job (API) (p. 367) and do the following while you configure your request:

- Use a pre-annotation Lambda function that ends with PRE-VideoClassification. To find the pre-annotation Lambda ARN for your Region, see PreHumanTaskLambdaArn.
- Use an annotation-consolidation Lambda function that ends with ACS-VideoClassification. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region.

```python
response = client.create_labeling_job(
    LabelingJobName='example-video-classification-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': ['FreeOfPersonallyIdentifiableInformation','FreeOfAdultContent'],
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region:*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:43241866414:function:PRE-VideoClassification',
        'TaskKeywords': ['Video Classification'],
        'TaskTitle': 'Video classification task',
        'TaskDescription': 'Select a label to classify this video',
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'MaxConcurrentTaskCount': 123,
        'AnnotationConsolidationConfig': {
            ...
        }
    },
    PreHumanTaskConfig={
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:43241866414:function:PRE-VideoClassification',
        'TaskKeywords': ['Video Classification'],
        'TaskTitle': 'Video classification task',
        'TaskDescription': 'Select a label to classify this video',
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'MaxConcurrentTaskCount': 123,
        'AnnotationConsolidationConfig': {
            ...
        }
    }
)
```
'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-east-1:1432418664414:function:ACS-VideoClassification'
},
Tags=[
  {
    'Key': 'string',
    'Value': 'string'
  },
]
}

Provide a Template for Video Classification

If you create a labeling job using the API, you must supply a worker task template in UiTemplateS3Uri. Copy and modify the following template by modifying the short-instructions, full-instructions, and header. Upload this template to Amazon S3, and provide the Amazon S3 URI to this file in UiTemplateS3Uri.

<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-classifier
    name="crowd-classifier"
    categories="{{ task.input.labels | to_json | escape }}"
    header="Please classify video"
  >
    <classification-target>
      <video width="100\%" controls/>
      <source src="{{ task.input.taskObject | grant_read_access }}" type="video/mp4"/>
      <source src="{{ task.input.taskObject | grant_read_access }}" type="video/webm"/>
      <source src="{{ task.input.taskObject | grant_read_access }}" type="video/ogg"/>
      Your browser does not support the video tag.
    </video>
  </classification-target>
  <full-instructions header="Video classification instructions">
    <ol>
      <li><strong>Read</strong> the task carefully and inspect the video.</li>
      <li><strong>Read</strong> the options and review the examples provided to understand more about the labels.</li>
      <li><strong>Choose</strong> the appropriate label that best suits the video.</li>
    </ol>
  </full-instructions>
  <short-instructions>
    <h3><span style="color: rgb(0, 138, 0);">Good example</span></h3>
    Enter description to explain the correct label to the workers
    <p><img src="https://d7evko5405gb7.cloudfront.net/fe4fed9b-660c-4477-9294-2c66a15d6bbe/src/images/quick-instructions-example-placeholder.png" style="max-width:100%"></p>
    <h3><span style="color: rgb(230, 0, 0);">Bad example</span></h3>
    Enter description of an incorrect label
    <p><img src="https://d7evko5405gb7.cloudfront.net/fe4fed9b-660c-4477-9294-2c66a15d6bbe/src/images/quick-instructions-example-placeholder.png" style="max-width:100%"></p>
  </short-instructions>
</crowd-classifier>
</crowd-form>
**Video Classification Output Data**

Once you have created a video classification labeling job, your output data is located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see **Output Data** (p. 433).

To see an example of output manifest files for video classification labeling jobs, see **Classification Job Output** (p. 437).

**Label Video Frames**

You can use Ground Truth built-in video frame task types to have workers annotate video frames using bounding boxes, polylines, polygons or keypoints. A **video frame** is a sequence of images that have been extracted from a video.

If you do not have video frames, you can provide video files (MP4 files) and use the Ground Truth automated frame extraction tool to extract video frames. To learn more, see **Provide Video Files** (p. 429).

You can use the following built-in video task types to create video frame labeling jobs using the Amazon SageMaker console, API, and language-specific SDKs.

- **Video frame object detection** – Use this task type when you want workers to identify and locate objects in sequences of video frames. You provide a list of categories, and workers can select one category at a time and annotate objects which the category applies to in all frames. For example, you can use this task to ask workers to identify and localize various objects in a scene, such as cars, bikes, and pedestrians.

- **Video frame object tracking** – Use this task type when you want workers to track the movement of instances of objects across sequences of video frames. When a worker adds an annotation to a single frame, that annotation is associated with a unique instance ID. The worker adds annotations associated with the same ID in all other frames to identify the same object or person. For example, a worker can track the movement of a vehicle across a sequences of video frames by drawing bounding boxes associated with the same ID around the vehicle in each frame that it appears.

Use the following topics to learn more about these built-in task types and to how to create a labeling job using each task type. See **Task Types** (p. 239) to learn more about the annotations tools (bounding boxes, polylines, polygons and keypoints) available for these task types.

Before you create a labeling job, we recommend that you review **Video Frame Labeling Job Overview** (p. 238).

**Topics**

- **Video Frame Object Detection** (p. 230)
- **Video Frame Object Tracking** (p. 234)
- **Video Frame Labeling Job Overview** (p. 238)

**Video Frame Object Detection**

You can use the video frame object detection task type to have workers identify and locate objects in a sequence of video frames (images extracted from a video) using bounding boxes, polylines, polygons...
or keypoint annotation tools. The tool you choose defines the video frame task type you create. For example, you can use a bounding box video frame object detection task type workers to identify and localize various objects in a series of video frames, such as cars, bikes, and pedestrians.

You can create a video frame object detection labeling job using the Amazon SageMaker Ground Truth console, the SageMaker API, and language-specific AWS SDKs. To learn more, see Create a Video Frame Object Detection Labeling Job (p. 231) and select your preferred method. See Task Types (p. 239) to learn more about the annotations tools you can choose from when you create a labeling job.

Ground Truth provides a worker UI and tools to complete your labeling job tasks: Preview the Worker UI (p. 231).

You can create a job to adjust annotations created in a video object detection labeling job using the video object detection adjustment task type. To learn more, see Create Video Frame Object Detection Adjustment or Verification Labeling Job (p. 234).

Preview the Worker UI

Ground Truth provides workers with a web user interface (UI) to complete your video frame object detection annotation tasks. You can preview and interact with the worker UI when you create a labeling job in the console. If you are a new user, we recommend that you create a labeling job through the console using a small input dataset to preview the worker UI and ensure your video frames, labels, and label attributes appear as expected.

The UI provides workers with the following assistive labeling tools to complete your object detection tasks:

- For all tasks, workers can use the Copy to next and Copy to all features to copy an annotation to the next frame or to all subsequent frames respectively.
- For tasks that include the bounding box tools, workers can use a Predict next feature to draw a bounding box in a single frame, and then have Ground Truth predict the location of boxes with the same label in all other frames. Workers can then make adjustments to correct predicted box locations.

Create a Video Frame Object Detection Labeling Job

You can create a video frame object detection labeling job using the SageMaker console or the CreateLabelingJob API operation.

This section assumes that you have reviewed the Video Frame Labeling Job Overview (p. 238) and have chosen the type of input data and the input dataset connection you are using.

Create a Labeling Job (Console)

You can follow the instructions in Create a Labeling Job (Console) (p. 364) to learn how to create a video frame object tracking job in the SageMaker console. In step 10, choose Video - Object detection from the Task category dropdown list. Select the task type you want by selecting one of the cards in Task selection.
Task type

Info

Task category
Select the type of data being labeled to view available task templates for it or select 'Custom' if none are available.

Video - Object detection

Task selection
Select the task that a human worker will perform to label objects in your dataset.

Bounding box
Get workers to draw bounding boxes around specified objects in your video.

Polyline
Get workers to draw polyline around specified objects in your video.

Keypoint
Get workers to track keypoints in your video.
Create a Labeling Job (API)

You create an object detection labeling job using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the See Also section of `CreateLabelingJob`.

Create a Labeling Job (API) (p. 367) provides an overview of the `CreateLabelingJob` operation. Follow these instructions and do the following while you configure your request:

- You must enter an ARN for `HumanTaskUiArn`. Use
  `arn:aws:sagemaker:<region>:394669845002:human-task-ui/VideoObjectDetection`. Replace `<region>` with the AWS Region in which you are creating the labeling job.

  Do not include an entry for the `UiTemplateS3Uri` parameter.

- Your `LabelAttributeName` must end in `-ref`. For example, `video-od-labels-ref`.

- Your input manifest file must be a video frame sequence manifest file. You can create this manifest file using the SageMaker console, or create it manually and upload it to Amazon S3. For more information, see Input Data Setup (p. 429).

- You can only use private or vendor work teams to create video frame object detection labeling jobs.

- You specify your labels, label category and frame attributes, the task type, and worker instructions in a label category configuration file. Specify the task type (bounding boxes, polylines, polygons or keypoint) using `annotationType` in your label category configuration file. For more information, see Create a Labeling Category Configuration File with Label Category and Frame Attributes (p. 377) to learn how to create this file.

- You need to provide pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.

- To find the pre-annotation Lambda ARN, refer to `PreHumanTaskLambdaArn`. Use the Region in which you are creating your labeling job to find the correct ARN that ends with `PRE-VideoObjectDetection`.

- To find the post-annotation Lambda ARN, refer to `AnnotationConsolidationLambdaArn`. Use the Region in which you are creating your labeling job to find the correct ARN that ends with `ACS-VideoObjectDetection`.

- The number of workers specified in `NumberOfHumanWorkersPerDataObject` must be 1.

- Automated data labeling is not supported for video frame labeling jobs. Do not specify values for parameters in `LabelingJobAlgorithmsConfig`.

- Video frame object tracking labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in `TaskTimeLimitInSeconds` (up to 7 days, or 604,800 seconds).

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region.

```python
response = client.create_labeling_job(
    LabelingJobName='example-video-od-labeling-job',
    LabelAttributeName='label',
    InputConfig={'DataSource': {'S3DataSource': {'ManifestS3Uri': 's3://DOC-EXAMPLE-BUCKET/path/video-frame-sequence-input-manifest.json'}}},
    DataAttributes={'ContentClassifiers': ['FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent']},
```
Create Video Frame Object Detection Adjustment or Verification Labeling Job

You can create an adjustment and verification labeling job using the Ground Truth console or CreateLabelingJob API. To learn more about adjustment and verification labeling jobs, and to learn how create one, see Verify and Adjust Labels (p. 321).

Output Data Format

When you create a video frame object detection labeling job, tasks are sent to workers. When these workers complete their tasks, labels are written to the Amazon S3 output location you specified when you created the labeling job. To learn about the video frame object detection output data format, see Video Frame Object Detection Output (p. 445). If you are a new user of Ground Truth, see Output Data (p. 433) to learn more about the Ground Truth output data format.

Video Frame Object Tracking

You can use the video frame object tracking task type to have workers track the movement of objects in a sequence of video frames (images extracted from a video) using bounding boxes, polylines, polygons or keypoint annotation tools. The tool you choose defines the video frame task type you create. For
example, you can use a bounding box video frame object tracking task type to ask workers to track the movement of objects, such as cars, bikes, and pedestrians by drawing boxes around them.

You provide a list of categories, and each annotation that a worker adds to a video frame is identified as an instance of that category using an instance ID. For example, if you provide the label category car, the first car that a worker annotates will have the instance ID car:1. The second car the worker annotates will have the instance ID car:2. To track an object's movement, the worker adds annotations associated with the same instance ID around to object in all frames.

You can create a video frame object tracking labeling job using the Amazon SageMaker Ground Truth console, the SageMaker API, and language-specific AWS SDKs. To learn more, see Create a Video Frame Object Detection Labeling Job (p. 231) and select your preferred method. See Task Types (p. 239) to learn more about the annotations tools you can choose from when you create a labeling job.

Ground Truth provides a worker UI and tools to complete your labeling job tasks: Preview the Worker UI (p. 231).

You can create a job to adjust annotations created in a video object detection labeling job using the video object detection adjustment task type. To learn more, see Create Video Frame Object Detection Adjustment or Verification Labeling Job (p. 234).

Preview the Worker UI

Ground Truth provides workers with a web user interface (UI) to complete your video frame object tracking annotation tasks. You can preview and interact with the worker UI when you create a labeling job in the console. If you are a new user, we recommend that you create a labeling job through the console using a small input dataset to preview the worker UI and ensure your video frames, labels, and label attributes appear as expected.

The UI provides workers with the following assistive labeling tools to complete your object tracking tasks:

- For all tasks, workers can use the Copy to next and Copy to all features to copy an annotation with the same unique ID to the next frame or to all subsequent frames respectively.
- For tasks that include the bounding box tools, workers can use a Predict next feature to draw a bounding box in a single frame, and then have Ground Truth predict the location of boxes with the same unique ID in all other frames. Workers can then make adjustments to correct predicted box locations.

Create a Video Frame Object Tracking Labeling Job

You can create a video frame object tracking labeling job using the SageMaker console or the CreateLabelingJob API operation.

This section assumes that you have reviewed the Video Frame Labeling Job Overview (p. 238) and have chosen the type of input data and the input dataset connection you are using.

Create a Labeling Job (Console)

You can follow the instructions in Create a Labeling Job (Console) (p. 364) to learn how to create a video frame object tracking job in the SageMaker console. In step 10, choose Video - Object tracking from the Task category dropdown list. Select the task type you want by selecting one of the cards in Task selection.
Task type  Info

Task category
Select the type of data being labeled to view available task templates for it or select 'Custom' to create a custom task.

Video - Object tracking

Task selection
Select the task that a human worker will perform to label objects in your dataset.

- Bounding box
  Get workers to track specific instances of objects in your video across multiple frames in your bounding boxes.  Info

- Polyline
  Get workers to track specific instances of objects in your video across multiple frames in your polylines.  Info

- Keypoints
  Get workers to track specific points on objects in your video.  Info
Create a Labeling Job (API)

You create an object tracking labeling job using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the See Also section of `CreateLabelingJob`.

Create a Labeling Job (API) (p. 367) provides an overview of the `CreateLabelingJob` operation. Follow these instructions and do the following while you configure your request:

- You must enter an ARN for `HumanTaskUiArn`. Use
  arn:aws:sagemaker:<region>:394669845002:human-task-ui/VideoObjectTracking. Replace `<region>` with the AWS Region in which you are creating the labeling job.
  Do not include an entry for the `UiTemplateS3Uri` parameter.
- Your `LabelAttributeName` must end in `-ref`. For example, `ot-labels-ref`.
- Your input manifest file must be a video frame sequence manifest file. You can create this manifest file using the SageMaker console, or create it manually and upload it to Amazon S3. For more information, see Input Data Setup (p. 429). If you create a streaming labeling job, the input manifest file is optional.
- You can only use private or vendor work teams to create video frame object detection labeling jobs.
- You specify your labels, label category and frame attributes, the task type, and worker instructions in a label category configuration file. Specify the task type (bounding boxes, polylines, polygons or keypoint) using `annotationType` in your label category configuration file. For more information, see Create a Labeling Category Configuration File with Label Category and Frame Attributes (p. 377) to learn how to create this file.
- You need to provide pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.
  - To find the pre-annotation Lambda ARN, refer to `PreHumanTaskLambdaArn`. Use the Region in which you are creating your labeling job to find the correct ARN that ends with `PRE-VideoObjectTracking`.
  - To find the post-annotation Lambda ARN, refer to `AnnotationConsolidationLambdaArn`. Use the Region in which you are creating your labeling job to find the correct ARN that ends with `ACS-VideoObjectTracking`.
- The number of workers specified in `NumberOfHumanWorkersPerDataObject` must be 1.
- Automated data labeling is not supported for video frame labeling jobs. Do not specify values for parameters in `LabelingJobAlgorithmsConfig`.
- Video frame object tracking labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in `TaskTimeLimitInSeconds` (up to 7 days, or 604,800 seconds).

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region.

```python
response = client.create_labeling_job(
    LabelingJobName='example-video-ot-labeling-job,
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://DOC-EXAMPLE-BUCKET/path/video-frame-sequence-input-manifest.json'
            }
        }
    },
    DataAttributes: {
        'ContentClassifiers': [
            'FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent'
        ]
    },
    AlgorithmSpecification={
        'Name': 'VideoObjectTrackingLabeler',
        'ModelName': 'object-tracking'
    },
   UMANConfig={
        'UiTemplateS3Uri': 's3://DOC-EXAMPLE-BUCKET/path/video-frame-sequence-input-manifest.json'
    }
)```
Create a Video Frame Object Tracking Adjustment or Verification Labeling Job

You can create an adjustment and verification labeling job using the Ground Truth console or CreateLabelingJob API. To learn more about adjustment and verification labeling jobs, and to learn how create one, see Verify and Adjust Labels (p. 321).

Output Data Format

When you create a video frame object tracking labeling job, tasks are sent to workers. When these workers complete their tasks, labels are written to the Amazon S3 output location you specified when you created the labeling job. To learn about the video frame object tracking output data format, see Video Frame Object Tracking Output (p. 447). If you are a new user of Ground Truth, see Output Data (p. 433) to learn more about the Ground Truth output data format.

Video Frame Labeling Job Overview

Use this page to learn about the object detection and object tracking video frame labeling jobs. The information on this page applies to both of these built-in task types.

The video frame labeling job is unique because of the following:
You can either provide data objects that are ready to be annotated (video frames), or you can provide video files and have Ground Truth automatically extract video frames.

- Workers have the ability to save work as they go.
- You cannot use the Amazon Mechanical Turk workforce to complete your labeling tasks.
- Ground Truth provides a worker UI, as well as assistive and basic labeling tools, to help workers complete your tasks. You do not need to provide a worker task template.

Use the following topics to learn more.

**Topics**

- Input Data (p. 239)
- Job Completion Times (p. 239)
- Task Types (p. 239)
- Workforces (p. 240)
- Worker User Interface (UI) (p. 240)
- Video Frame Job Permission Requirements (p. 242)

**Input Data**

The video frame labeling job uses *sequences* of video frames. A single sequence is a series of images that have been extracted from a single video. You can either provide your own sequences of video frames, or have Ground Truth automatically extract video frame sequences from your video files. To learn more, see Provide Video Files (p. 429).

Ground Truth uses sequence files to identify all images in a single sequence. All of the sequences that you want to include in a single labeling job are identified in an input manifest file. Each sequence is used to create a single worker task. You can automatically create sequence files and an input manifest file using Ground Truth automatic data setup. To learn more, see Automated Video Frame Input Data Setup (p. 430).

To learn how to manually create sequence files and an input manifest file, see Create a Video Frame Input Manifest File (p. 432).

**Job Completion Times**

Video and video frame labeling jobs can take workers hours to complete. You can set the total amount of time that workers can work on each task when you create a labeling job. The maximum time you can set for workers to work on tasks is 7 days. The default value is 3 days.

We strongly recommend that you create tasks that workers can complete within 12 hours. Workers must keep the worker UI open while working on a task. They can save work as they go and Ground Truth saves their work every 15 minutes.

When using the SageMaker CreateLabelingJob API operation, set the total time a task is available to workers in the TaskTimeLimitInSeconds parameter of HumanTaskConfig.

When you create a labeling job in the console, you can specify this time limit when you select your workforce type and your work team.

**Task Types**

When you create a video object tracking or video object detection labeling job, you specify the type of annotation that you want workers to create while working on your labeling task. The annotation type determines the type of output data Ground Truth returns and defines the task type for your labeling job.
If you are creating a labeling job using the API operation `CreateLabelingJob`, you specify the task type using the label category configuration file parameter `annotationType`. To learn more, see Create a Labeling Category Configuration File with Label Category and Frame Attributes (p. 377).

The following task types are available for both video object tracking or video object detection labeling jobs:

- **Bounding box** – Workers are provided with tools to create bounding box annotations. A bounding box is a box that a worker draws around an objects to identify the pixel-location and label of that object in the frame.

- **Polyline** – Workers are provided with tools to create polyline annotations. A polyline is defined by the series of ordered x, y coordinates. Each point added to the polyline is connected to the previous point by a line. The polyline does not have to be closed (the start point and end point do not have to be the same) and there are no restrictions on the angles formed between lines.

- **Polygon** – Workers are provided with tools to create polygon annotations. A polygon is a closed shape defined by a series of ordered x, y coordinates. Each point added to the polygon is connected to the previous point by a line and there are no restrictions on the angles formed between lines. Two lines (sides) of the polygon cannot cross. The start and end point of a polygon must be the same.

- **Keypoint** – Workers are provided with tools to create keypoint annotations. A keypoint is a single point associated with an x, y coordinate in the video frame.

**Workforces**

When you create a video frame labeling job, you need to specify a work team to complete your annotation tasks. You can choose a work team from a private workforce of your own workers, or from a vendor workforce that you select in the AWS Marketplace. You cannot use the Amazon Mechanical Turk workforce for video frame labeling jobs.

To learn more about vendor workforces, see Managing Vendor Workforces (p. 489).

To learn how to create and manage a private workforce, see Use a Private Workforce (p. 490).

**Worker User Interface (UI)**

Ground Truth provides a worker user interface (UI), tools, and assistive labeling features to help workers complete your video labeling tasks. You can preview the worker UI when you create a labeling job in the console.

When you create a labeling job using the API operation `CreateLabelingJob`, you must provide an ARN provided by Ground Truth in the parameter `HumanTaskUiArn` to specify the worker UI for your task type. You can use `HumanTaskUiArn` with the SageMaker `RenderUiTemplate` API operation to preview the worker UI.

You provide worker instructions, labels, and optionally, attributes that workers can use to provide more information about labels and video frames. These attributes are referred to as label category attributes and frame attributes respectively. They are all displayed in the worker UI.

**Label Category and Frame Attributes**

When you create a video object tracking or video object detection labeling job, you can add one or more `label category attributes` and `frame attributes`:

- **Label category attribute** – A list of options (strings), a free form text box, or a numeric field associated with one or more labels. It is used by workers to provide metadata about a label.

- **Frame attribute** – A list of options (strings), a free form text box, or a numeric field that appears on each video frame a worker is sent to annotate. It is used by workers to provide metadata about video frames.
Additionally, you can use label and frame attributes to have workers verify labels in a video frame label verification job.

Use the following sections to learn more about these attributes. To learn how to add label category and frame attributes to a labeling job, use the Create Labeling Job sections on the task type page (p. 230) of your choice.

**Label Category Attributes**

Add label category attributes to labels to give workers the ability to provide more information about the annotations they create. A label category attribute is added to an individual label, or to all labels. When a label category attribute is applied to all labels it is referred to as a *global label category attribute*.

For example, if you add the label category *car*, you might also want to capture additional data about your labeled cars, such as if they are occluded or the size of the car. You can capture this metadata using label category attributes. In this example, if you added the attribute *occluded* to the car label category, you can assign *partial*, *completely*, or *no* to the *occluded* attribute and enable workers to select one of these options.

When you create a label verification job, you add labels category attributes to each label you want workers to verify.

**Frame Level Attributes**

Add frame attributes to give workers the ability to provide more information about individual video frames. Each frame attribute you add appears on all frames.

For example, you can add a number-frame attribute to have workers identify the number of objects they see in a particular frame.

In another example, you may want to provide a free-form text box to give workers the ability to provide an answer to a question.

When you create a label verification job, you can add one or more frame attributes to ask workers to provide feedback on all labels in a video frame.

**Worker Instructions**

You can provide worker instructions to help your workers complete your video frame labeling tasks. You might want to cover the following topics when writing your instructions:

- Best practices and things to avoid when annotating objects.
- The label category attributes provided (for object detection and object tracking tasks) and how to use them.
- How to save time while labeling by using keyboard shortcuts.

You can add your worker instructions using the SageMaker console while creating a labeling job. If you create a labeling job using the API operation CreateLabelingJob, you specify worker instructions in your label category configuration file.

In addition to your instructions, Ground Truth provides a link to help workers navigate and use the worker portal. View these instructions by selecting the task type on Worker Instructions (p. 242).

**Declining Tasks**

Workers are able to decline tasks.

Workers decline a task if the instructions are not clear, input data is not displaying correctly, or if they encounter some other issue with the task. If the number of workers per dataset object (NumberOfHumanWorkersPerDataObject) decline the task, the data object is marked as expired and will not be sent to additional workers.
Video Frame Job Permission Requirements

When you create a video frame labeling job, in addition to the permission requirements found in Assign IAM Permissions to Use Ground Truth (p. 469), you must add a CORS policy to your S3 bucket that contains your input manifest file.

Add a CORS Permission Policy to S3 Bucket

When you create a video frame labeling job, you specify buckets in S3 where your input data and manifest file are located and where your output data will be stored. These buckets may be the same. You must attach the following Cross-origin resource sharing (CORS) policy to your input and output buckets. If you use the Amazon S3 console to add the policy to your bucket, you must use the JSON format.

JSON

```json
[
    {
        "AllowedHeaders": ["*"]
      ,
        "AllowedMethods": [
            "GET",
            "HEAD",
            "PUT"
      ],
        "AllowedOrigins": ["*"]
      ,
        "ExposeHeaders": [
            "Access-Control-Allow-Origin"
      ],
        "MaxAgeSeconds": 3000
    }
]
```

XML

```xml
<?xml version="1.0" encoding="UTF-8"?>
<CORSConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <CORSRule>
    <AllowedOrigin>*</AllowedOrigin>
    <AllowedMethod>GET</AllowedMethod>
    <AllowedMethod>HEAD</AllowedMethod>
    <AllowedMethod>PUT</AllowedMethod>
    <MaxAgeSeconds>3000</MaxAgeSeconds>
    <ExposeHeader>Access-Control-Allow-Origin</ExposeHeader>
    <AllowedHeader>*</AllowedHeader>
  </CORSRule>
</CORSConfiguration>
```

To learn how to add a CORS policy to an S3 bucket, see How do I add cross-domain resource sharing with CORS? in the Amazon Simple Storage Service Console User Guide.

Worker Instructions

This topic provides an overview of the Ground Truth worker portal and the tools available to complete your video frame labeling task. First, select the type of task you are working on from Topics.

Important

It is recommended that you complete your task using a Google Chrome or Firefox web browser.
For adjustment jobs, select the original labeling job task type that produced the labels you are adjusting. Review and adjust the labels in your task as needed.

**Topics**
- Work on Video Frame Object Tracking Tasks (p. 243)
- Work on Video Frame Object Detection Tasks (p. 250)

**Work on Video Frame Object Tracking Tasks**

Video frame object tracking tasks require you to track the movement of objects across video frames. A video frame is a still image from a video scene.

You can use the worker UI to navigate between video frames and use the tools provided to identify unique objects and track their movement from one frame to the next. Use this page to learn how to navigate your worker UI, use the tools provided, and complete your task.

It is recommended that you complete your task using a Google Chrome or Firefox web browser.

**Important**
- If you see annotations have already been added to one or more video frames when you open your task, adjust those annotations and add additional annotations as needed.

**Topics**
- Your Task (p. 243)
- Navigate the UI (p. 245)
- Bulk Edit Label and Frame Attributes (p. 245)
- Tool Guide (p. 246)
- Icons Guide (p. 248)
- Shortcuts (p. 249)
- Release, Stop and Resume, and Decline Tasks (p. 250)
- Saving Your Work and Submitting (p. 250)

**Your Task**

When you work on a video frame object tracking task, you need to select a category from the Label category menu on the right side of your worker portal to start annotating. After you've chosen a category, use the tools provided to annotate the objects that the category applies to. This annotation will be associated with a unique label ID that should only be used for that object. Use this same label ID to create additional annotations for the same object in all of the video frames that it appears in. Refer to Tool Guide (p. 246) to learn more about the tools provided.

After you've added a label, you may see a downward pointing arrow next to the label in the Labels menu. Select this arrow and then select one option for each label attribute you see to provide more information about that label.

You may see frame attributes under the Labels menu. These attributes will appear on each frame in your task. Use these attribute prompts to enter additional information about each frame.
After you've added a label, you can quickly add and edit a label category attribute value by using the downward pointing arrow next to the label in the Labels menu. If you select the pencil icon next to the label in the Labels menu, the Edit instance menu will appear. You can edit the label ID, label category, and label category attributes using this menu.

To edit an annotation, select the label of the annotation that you want to edit in the Labels menu or select the annotation in the frame. When you edit or delete an annotation, the action will only modify the annotation in a single frame.

If you are working on a task that includes a bounding box tool, use the predict next icon to predict the location of all bounding boxes that you have drawn in a frame in the next frame. If you select a single box and then select the predict next icon, only that box will be predicted in the next frame. If you have not added any boxes to the current frame, you will receive an error. You must add at least one box to the frame before using this feature.
After you've used the predict next icon, review the location of each box in the next frame and make adjustments to the box location and size if necessary.

For all other tools, you can use the Copy to next and Copy to all tools to copy your annotations to the next or all frames respectively.

**Navigate the UI**

You can navigate between video frames using the navigation bar in the bottom-left corner of your UI.

Use the play button to automatically move through the entire sequence of frames.

Use the next frame and previous frame buttons to move forward or back one frame at a time. You can also input a frame number to navigate to that frame.

You can zoom in to and out of all video frames. Once you have zoomed into a video frame, you can move around in that frame using the move icon. When you set a new view in a single video frame by zooming and moving within that frame, all video frames are set to the same view. You can reset all video frames to their original view using the fit screen icon. For additional view options, see Icons Guide (p. 248).

When you are in the worker UI, you see the following menus:

- **Instructions** – Review these instructions before starting your task. Additionally, select More instructions and review these instructions.
- **Shortcuts** – Use this menu to view keyboard shortcuts that you can use to navigate video frames and use the tools provided.
- **Help** – Use this option to refer back to this documentation.

**Bulk Edit Label and Frame Attributes**

You can bulk edit label attributes and frame attributes (attributes).

When you bulk edit an attribute, you specify one or more ranges of frames that you want to apply the edit to. The attribute you select is edited in all frames in that range, including the start and end frames you specify. When you bulk edit label attributes, the range you specify must contain the label that the label attribute is attached to. If you specify frames that do not contain this label, you will receive an error.

To bulk edit an attribute you must specify the desired value for the attribute first. For example, if you want to change an attribute from Yes to No, you must select No, and then perform the bulk edit.

You can also specify a new value for an attribute that has not been filled in and then use the bulk edit feature to fill in that value in multiple frames. To do this, select the desired value for the attribute and complete the following procedure.

**To bulk edit a label or attribute:**

1. Use your mouse to right click the attribute you want to bulk edit.
2. Specify the range of frames you want to apply the bulk edit to using a dash (–) in the text box. For example, if you want to apply the edit to frames one through ten, enter 1–10. If you want to apply the edit to frames two to five, eight to ten and twenty enter 2–5, 8–10, 20.
3. Select Confirm.

If you get an error message, verify that you entered a valid range and that the label associated with the label attribute you are editing (if applicable) exists in all frames specified.

You can quickly add a label to all previous or subsequent frames using the Duplicate to previous frames and Duplicate to next frames options in the Label menu at the top of your screen.
Tool Guide

Your task will include one or more tools. The tool provided dictates the type of annotations you will create to identify and track objects. Use the following table to learn more about each tool provided.

<table>
<thead>
<tr>
<th>Tool</th>
<th>Icon</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bounding box</td>
<td><img src="bounding-box.png" alt="Icon" /></td>
<td>Add a bounding box annotation.</td>
<td>Choose this icon to add a bounding box. Each bounding box you add is associated with the category you choose from the Label category drop down menu. Select the bounding box or its associated label to adjust it.</td>
</tr>
<tr>
<td>Bounding box</td>
<td><img src="bounding-box-predict.png" alt="Icon" /></td>
<td>Predict bounding boxes in the next frame.</td>
<td>Select a bounding box, and then choose this icon to predict the location of that box in the next frame. You can select the icon multiple times in a row to automatically detect the location of box in multiple frames. For example, select this icon 5 times to predict the location of a bounding box in the next 5 frames.</td>
</tr>
<tr>
<td>Keypoint</td>
<td><img src="keypoint.png" alt="Icon" /></td>
<td>Add a keypoint annotation.</td>
<td>Choose this icon to add a keypoint. Click on an object the image to place the keypoint at that location. Each keypoint you add is associated with the category you choose from the Label category drop down menu. Select a keypoint or its associated label to adjust it.</td>
</tr>
<tr>
<td>Polyline</td>
<td><img src="polyline.png" alt="Icon" /></td>
<td>Add a polyline annotation.</td>
<td>Choose this icon to add a polyline. To add a polyline, continuously click around the object of interest to add new points. To stop drawing a polyline, select the last point that you placed a second time.</td>
</tr>
<tr>
<td>Tool</td>
<td>Icon</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>------</td>
<td>-----------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Polygon  | ![Polygon Icon] | Add a polygon annotation. | Choose this icon to add a polygon. To add a polygon, continuously click around the object of interest to add new points. To stop drawing the polygon, select the start point (this point will be green).  
A polygon is a closed shape defined by a series of points that you place. Each point added to the polygon is connected to the previous point by a line and there are no restrictions on the angles formed between lines. The start and end point must be the same.  
Each polyline you add is associated with the category you choose from the Label category drop down menu. Select the polyline or its associated label to adjust it. |

(this point will be green), or press Enter on your keyboard.

Each point added to the polyline is connected to the previous point by a line. The polyline does not have to be closed (the start point and end point do not have to be the same) and there are no restrictions on the angles formed between lines.

Each polyline you add is associated with the category you choose from the Label category drop down menu. Select the polyline or its associated label to adjust it.
## Label Videos and Video Frames

<td>If one or more annotations are selected in the current frame, those annotations are copied to all subsequent frames. If no annotations are selected, all annotations in the current frame will be copied to all subsequent frames.</td>
</tr>
</tbody>
</table>

## Icons Guide

Use this table to learn about the icons you see in your UI. You can automatically select some of these icons using the keyboard shortcuts found in the **Shortcuts** menu.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Brightness Icon]</td>
<td>brightness</td>
<td>Choose this icon to adjust the brightness of all video frames.</td>
</tr>
<tr>
<td>![Contrast Icon]</td>
<td>contrast</td>
<td>Choose this icon to adjust the contrast of all video frames.</td>
</tr>
<tr>
<td>![Zoom In Icon]</td>
<td>zoom in</td>
<td>Choose this icon to zoom into all of the video frames.</td>
</tr>
</tbody>
</table>
### Icon | Action | Description
---|---|---
[Image](#) | zoom out | Choose this icon to zoom out of all of the video frames.

[Image](#) | move screen | After you've zoomed into a video frame, choose this icon to move around in that video frame. You can move around the video frame using your mouse by clicking and dragging the frame in the direction you want it to move. This will change the view in all view frames.

[Image](#) | fit screen | Reset all video frames to their original position.

[Image](#) | undo | Undo an action. You can use this icon to remove a bounding box that you just added, or to undo an adjustment you made to a bounding box.

[Image](#) | redo | Redo an action that was undone using the undo icon.

[Image](#) | delete label | Delete a label. This will delete the bounding box associated with the label in a single frame.

[Image](#) | show or hide label | Select this icon to show a label that has been hidden. If this icon has a slash through it, select it to hide the label.

[Image](#) | edit label | Select this icon to open the **Edit instance** menu. Use this menu to edit a label category, ID, and to add or edit label attributes.

**Shortcuts**

The keyboard shortcuts listed in the **Shortcuts** menu can help you quickly select icons, undo and redo annotations, and use tools to add and edit annotations. For example, once you add a bounding box, you can use **P** to quickly predict the location of that box in subsequent frames.

Before you start your task, it is recommended that you review the **Shortcuts** menu and become acquainted with these commands.
Release, Stop and Resume, and Decline Tasks

When you open the labeling task, three buttons on the top right allow you to decline the task (Decline task), release it (Release task), and stop and resume it at a later time (Stop and resume later). The following list describes what happens when you select one of these options:

- **Decline task**: You should only decline a task if something is wrong with the task, such as unclear video frame images or an issue with the UI. If you decline a task, you will not be able to return to the task.

- **Release Task**: Use this option to release a task and allow others to work on it. When you release a task, you lose all work done on that task and other workers on your team can pick it up. If enough workers pick up the task, you may not be able to return to it. When you select this button and then select **Confirm**, you are returned to the worker portal. If the task is still available, its status will be **Available**. If other workers pick it up, it will disappear from your portal.

- **Stop and resume later**: You can use the **Stop and resume later** button to stop working and return to the task at a later time. You should use the **Save** button to save your work before you select **Stop and resume later**. When you select this button and then select **Confirm**, you are returned to the worker portal, and the task status is **Stopped**. You can select the same task to resume work on it.

Be aware that the person that creates your labeling tasks specifies a time limit in which all tasks must be completed by. If you do not return to and complete this task within that time limit, it will expire and your work will not be submitted. Contact your administrator for more information.

Saving Your Work and Submitting

You should periodically save your work using the **Save** button. Ground Truth will automatically save your work every 15 minutes.

When you open a task, you must complete your work on it before pressing **Submit**.

Work on Video Frame Object Detection Tasks

Video frame object detection tasks required you to classify and identify the location of objects in video frames using annotations. A video frame is a still image from a video scene.

You can use the worker UI to navigate between video frames and create annotations to identify objects of interest. Use the sections on this page to learn how to navigate your worker UI, use the tools provided, and complete your task.

It is recommended that you complete your task using a Google Chrome web browser.

**Important**
If you see annotations have already been added to one or more video frames when you open your task, adjust those annotations and add additional annotations as needed.

Topics

- Your Task (p. 251)
- Navigate the UI (p. 252)
- Bulk Edit Label and Frame Attributes (p. 252)
- Tool Guide (p. 253)
- UI Icon Guide (p. 256)
- Shortcuts (p. 257)
- Release, Stop and Resume, and Decline Tasks (p. 257)
- Saving Your Work and Submitting (p. 258)
Your Task

When you work on a video frame object detection task, you need to select a category from the **Label category** menu on the right side of your worker portal to start annotating. After you've chosen a category, draw annotations around objects that this category applies to. To learn more about the tools you see in your worker UI, refer to the Tool Guide (p. 253).

After you've added a label, you may see a downward pointing arrow next to the label in the **Labels** menu. Select this arrow and then select one option for each label attribute you see to provide more information about that label.

You may see frame attributes under the **Labels** menu. These attributes will appear on each frame in your task. Use these attribute prompts to enter additional information about each frame.
To edit an annotation, select the label of the annotation that you want to edit in the **Labels** menu or select the annotation in the frame. When you edit or delete an annotation, the action will only modify the annotation in a single frame.

If you are working on a task that includes a bounding box tool, use the predict next icon to predict the location of all bounding boxes that you have drawn in a frame in the next frame. If you select a single box and then select the predict next icon, only that box will be predicted in the next frame. If you have not added any boxes to the current frame, you will receive an error. You must add at least one box to the frame before using this feature.

**Note**
The predict next feature will not overwrite manually created annotations. It will only add annotations. If you use predict next and as a result have more than one bounding box around a single object, delete all but one box. Each object should only be identified with a single box.

After you've used the predict next icon, review the location of each box in the next frame and make adjustments to the box location and size if necessary.

For all other tools, you can use the **Copy to next** and **Copy to all** tools to copy your annotations to the next or all frames respectively.

**Navigate the UI**
You can navigate between video frames using the navigation bar in the bottom-left corner of your UI.

Use the play button to automatically play through multiple frames.

Use the next frame and previous frame buttons to move forward or back one frame at a time. You can also input a frame number to navigate to that frame.

You can zoom in to and out of all video frames. Once you have zoomed into a video frame, you can move around in that frame using the move icon. When you navigate to a new view in a single video frame by zooming and moving within that frame, all video frames are set to the same view. You can reset all video frames to their original view using the fit screen icon. To learn more, see UI Icon Guide (p. 256).

When you are in the worker UI, you see the following menus:

- **Instructions** – Review these instructions before starting your task. Additionally, select **More instructions** and review these instructions.
- **Shortcuts** – Use this menu to view keyboard shortcuts that you can use to navigate video frames and use the annotation tools provided.
- **Help** – Use this option to refer back to this documentation.

If you

**Bulk Edit Label and Frame Attributes**
You can bulk edit label attributes and frame attributes (attributes).

When you bulk edit an attribute, you specify one or more ranges of frames that you want to apply the edit to. The attribute you select is edited in all frames in that range, including the start and end frames you specify. When you bulk edit label attributes, the range you specify **must** contain the label that the label attribute is attached to. If you specify frames that do not contain this label, you will receive an error.

To bulk edit an attribute you **must** specify the desired value for the attribute first. For example, if you want to change an attribute from **Yes** to **No**, you must select **No**, and then perform the bulk edit.

You can also specify a new value for an attribute that has not been filled in and then use the bulk edit feature to fill in that value in multiple frames. To do this, select the desired value for the attribute and complete the following procedure.
To bulk edit a label or attribute:

1. Use your mouse to right click the attribute you want to bulk edit.
2. Specify the range of frames you want to apply the bulk edit to using a dash (–) in the text box. For example, if you want to apply the edit to frames one through ten, enter 1–10. If you want to apply the edit to frames two to five, eight to ten and twenty enter 2–5, 8–10, 20.
3. Select Confirm.

If you get an error message, verify that you entered a valid range and that the label associated with the label attribute you are editing (if applicable) exists in all frames specified.

You can quickly add a label to all previous or subsequent frames using the Duplicate to previous frames and Duplicate to next frames options in the Label menu at the top of your screen.

Tool Guide

Your task will include one or more tools. The tool provided dictates the type of annotations you will create to identify and label objects. Use the following table to learn more about the tool or tools you may see in your worker UI.

<table>
<thead>
<tr>

</tbody>
</table>

### Shortcuts

The keyboard shortcuts listed in the **Shortcuts** menu can help you quickly select icons, undo and redo annotations, and use tools to add and edit annotations. For example, once you add a bounding box, you can use **P** to quickly predict the location of that box in subsequent frames.

Before you start your task, it is recommended that you review the **Shortcuts** menu and become acquainted with these commands.

### Release, Stop and Resume, and Decline Tasks

When you open the labeling task, three buttons on the top right allow you to decline the task (Decline task), release it (Release task), and stop and resume it at a later time (Stop and resume later). The following list describes what happens when you select one of these options:

- **Decline task**: You should only decline a task if something is wrong with the task, such as unclear video frame images or an issue with the UI. If you decline a task, you will not be able to return to the task.
- **Release Task**: Use this option to release a task and allow others to work on it. When you release a task, you loose all work done on that task and other workers on your team can pick it up. If enough workers pick up the task, you may not be able to return to it. When you select this button and then select **Confirm**, you are returned to the worker portal. If the task is still available, its status will be **Available**. If other workers pick it up, it will disappear from your portal.
- **Stop and resume later**: You can use the **Stop and resume later** button to stop working and return to the task at a later time. You should use the **Save** button to save your work before you select **Stop and resume later**. When you select this button and then select **Confirm**, you are returned to the worker portal, and the task status is **Stopped**. You can select the same task to resume work on it.

Be aware that the person that creates your labeling tasks specifies a time limit in which all tasks must be completed by. If you do not return to and complete this task within that time limit, it will expire and your work will not be submitted. Contact your administrator for more information.
Saving Your Work and Submitting

You should periodically save your work. Ground Truth automatically saves your work every 15 minutes.

When you open a task, you must complete your work before pressing **Submit**.

Use Ground Truth to Label 3D Point Clouds

Create a 3D point cloud labeling job to have workers label objects in 3D point clouds generated from 3D sensors like Light Detection and Ranging (LiDAR) sensors and depth cameras, or generated from 3D reconstruction by stitching images captured by an agent like a drone.

3D Point Clouds

Point clouds are made up of three-dimensional (3D) visual data that consists of points. Each point is described using three coordinates, typically $x$, $y$, and $z$. To add color or variations in point intensity to the point cloud, points may be described with additional attributes, such as $i$ for intensity or values for the red ($r$), green ($g$), and blue ($b$) 8-bit color channels. When you create a Ground Truth 3D point cloud labeling job, you can provide point cloud and, optionally, sensor fusion data.

The following image shows a single, 3D point cloud scene rendered by Ground Truth and displayed in the semantic segmentation worker UI.
LiDAR

A Light Detection and Ranging (LiDAR) sensor is a common type of sensor used to collect measurements that are used to generate point cloud data. LiDAR is a remote sensing method that uses light in the form of a pulsed laser to measure the distances of objects from the sensor. You can provide 3D point cloud data generated from a LiDAR sensor for a Ground Truth 3D point cloud labeling job using the raw data formats described in Accepted Raw 3D Data Formats (p. 404).

Sensor Fusion

Ground Truth 3D point cloud labeling jobs include a sensor fusion feature that supports video camera sensor fusion for all task types. Some sensors come with multiple LiDAR devices and video cameras that capture images and associate them with a LiDAR frame. To help annotators visually complete your tasks with high confidence, you can use the Ground Truth sensor fusion feature to project annotations (labels) from a 3D point cloud to 2D camera images and vice versa using 3D scanner (such as LiDAR) extrinsic matrix and camera extrinsic and intrinsic matrices. To learn more, see Sensor Fusion (p. 420).

Label 3D Point Clouds

Ground Truth provides a user interface (UI) and tools that workers use to label or annotate 3D point clouds. When you use the object detection or semantic segmentation task types, workers can annotate a single point cloud frame. When you use object tracking, workers annotate a sequence of frames. You can use object tracking to track object movement across all frames in a sequence.

The following demonstrates how a worker would use the Ground Truth worker portal and tools to annotate a 3D point cloud for an object detection task. For similar visual examples of other task types, see 3D Point Cloud Task types (p. 262).
Double click on the point cloud to zoom in

Double click on the label ID to zoom in the object on point cloud.

**3D Cuboid Controls**

When you are in Edit Cuboid mode

- **C** Create
- **V** Edit
- **Cmd** + **Drag** Change dimension
- **Option** + **Drag** Move cuboid
- **Option** + **O** Fit label to points
- **Option** + **G** Set to ground
- **Shift** + **Drag** Rotate cuboid
- **[** Previous label
- **]** Next label
- **Cmd** + , Toggle show/hide label
Assistive Labeling Tools for Point Cloud Annotation

Ground Truth offers assistive labeling tools to help workers complete your point cloud annotation tasks faster and with more accuracy. For details about assistive labeling tools that are included in the worker UI for each task type, select a task type (p. 262) and refer to the View the Worker Task Interface section of that page.

Next Steps

You can create six types of tasks when you use Ground Truth 3D point cloud labeling jobs. Use the topics in 3D Point Cloud Task types (p. 262) to learn more about these task types and to learn how to create a labeling job using the task type of your choice.

The 3D point cloud labeling job is different from other Ground Truth labeling modalities. Before creating a labeling job, we recommend that you read 3D Point Cloud Labeling Jobs Overview (p. 287). Additionally, review input data quotas in 3D Point Cloud and Video Frame Labeling Job Quotas (p. 402).

For an end-to-end demo using the SageMaker API and AWS Python SDK (boto 3) to create a 3D point cloud labeling job, see create-3D-pointcloud-labeling-job.ipynb in the SageMaker Examples notebook tab.

Important
If you use a notebook instance created before June 5th, 2020 to run this notebook, you must stop and restart that notebook instance for the notebook to work.

Topics
• 3D Point Cloud Task types (p. 262)
• 3D Point Cloud Labeling Jobs Overview (p. 287)
• Worker Instructions (p. 290)

3D Point Cloud Task types

You can use Ground Truth 3D point cloud labeling modality for a variety of use cases. The following list briefly describes each 3D point cloud task type. For additional details and instructions on how to create a labeling job using a specific task type, select the task type name to see its task type page.

• **3D point cloud object detection** – Use this task type when you want workers to locate and classify objects in a 3D point cloud by adding and fitting 3D cuboids around objects.

• **3D point cloud object tracking** – Use this task type when you want workers to add and fit 3D cuboids around objects to track their movement across a sequence of 3D point cloud frames. For example, you can use this task type to ask workers to track the movement of vehicles across multiple point cloud frames.

• **3D point cloud semantic segmentation** – Use this task type when you want workers to create a point-level semantic segmentation mask by painting objects in a 3D point cloud using different colors where each color is assigned to one of the classes you specify.

• **3D point cloud adjustment task types** – Each of the task types above has an associated adjustment task type that you can use to audit and adjust annotations generated from a 3D point cloud labeling job. Refer to the task type page of the associated type to learn how to create an adjustment labeling job for that task.

3D Point Cloud Object Detection

Use this task type when you want workers to classify objects in a 3D point cloud by drawing 3D cuboids around objects. For example, you can use this task type to ask workers to identify different types of objects in a point cloud, such as cars, bikes, and pedestrians.
For this task type, the *data object* that workers label is a single point cloud frame. Ground Truth renders a 3D point cloud using point cloud data you provide. You can also provide camera data to give workers more visual information about scenes in the frame, and to help workers draw 3D cuboids around objects.

Ground Truth provides workers with tools to annotate objects with 9 degrees of freedom \((x,y,z,rx,ry,rz,l,w,h)\) in three dimensions in both 3D scene and projected side views (top, side, and back). If you provide sensor fusion information (like camera data), when a worker adds a cuboid to identify an object in the 3D point cloud, the cuboid shows up and can be modified in the 2D images. After a cuboid has been added, all edits made to that cuboid in the 2D or 3D scene are projected into the other view.

You can create a job to adjust annotations created in a 3D point cloud object detection labeling job using the 3D point cloud object detection adjustment task type.

If you are a new user of the Ground Truth 3D point cloud labeling modality, we recommend you review 3D Point Cloud Labeling Jobs Overview (p. 287). This labeling modality is different from other Ground Truth task types, and this page provides an overview of important details you should be aware of when creating a 3D point cloud labeling job.

**Topics**
- View the Worker Task Interface (p. 263)
- Create a 3D Point Cloud Object Detection Labeling Job (p. 267)
- Create a 3D Point Cloud Object Detection Adjustment or Verification Labeling Job (p. 268)
- Output Data Format (p. 269)

**View the Worker Task Interface**

Ground Truth provides workers with a web portal and tools to complete your 3D point cloud object detection annotation tasks. When you create the labeling job, you provide the Amazon Resource Name (ARN) for a pre-built Ground Truth worker UI in the `HumanTaskUiArn` parameter. When you create a labeling job using this task type in the console, this worker UI is automatically used. You can preview and interact with the worker UI when you create a labeling job in the console. If you are a new user, it is recommended that you create a labeling job using the console to ensure your label attributes, point cloud frames, and if applicable, images, appear as expected.

The following is a GIF of the 3D point cloud object detection worker task interface. If you provide camera data for sensor fusion in the world coordinate system, images are matched up with scenes in the point cloud frame. These images appear in the worker portal as shown in the following GIF.
Double click on the point cloud to zoom in

Double click on the label ID to zoom in the object on point cloud.

3D Cuboid Controls
When you are in Edit Cuboid mode

C  Create
V  Edit

Cmd + Drag  Change dimension
Option + Drag  Move cuboid
Option + O  Fit label to points
Option + G  Set to ground
Shift + Drag  Rotate cuboid

[  Previous label
]  Next label

Cmd + ,  Toggle show/hide label
Worker can navigate in the 3D scene using their keyboard and mouse. They can:

- Double click on specific objects in the point cloud to zoom into them.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

Once a worker places a cuboid in the 3D scene, a side-view will appear with the three projected side views: top, side, and back. These side-views show points in and around the placed cuboid and help workers refine cuboid boundaries in that area. Workers can zoom in and out of each of those side-views using their mouse.

The following video demonstrates movements around the 3D point cloud and in the side-view.
Additional view options and features are available in the View menu in the worker UI. See the worker instruction page for a comprehensive overview of the Worker UI.

Assistive Labeling Tools

Ground Truth helps workers annotate 3D point clouds faster and more accurately using machine learning and computer vision powered assistive labeling tools for 3D point cloud object tracking tasks. The following assistive labeling tools are available for this task type:

- **Snapping** – Workers can add a cuboid around an object and use a keyboard shortcut or menu option to have Ground Truth’s autofit tool snap the cuboid tightly around the object.
- **Set to ground** – After a worker adds a cuboid to the 3D scene, the worker can automatically snap the cuboid to the ground. For example, the worker can use this feature to snap a cuboid to the road or sidewalk in the scene.
- **Multi-view labeling** – After a worker adds a 3D cuboid to the 3D scene, a side panel displays front, side, and top perspectives to help the worker adjust the cuboid tightly around the object. In all of these views, the cuboid includes an arrow that indicates the orientation, or heading of the object. When the worker adjusts the cuboid, the adjustment will appear in real time on all of the views (that is, 3D, top, side, and front).
- **Sensor fusion** – If you provide data for sensor fusion, workers can adjust annotations in the 3D scenes and in 2D images, and the annotations will be projected into the other view in real time. Additionally, workers will have the option to view the direction the camera is facing and the camera frustum.
- **View options** – Enables workers to easily hide or view cuboids, label text, a ground mesh, and additional point attributes like color or intensity. Workers can also choose between perspective and orthogonal projections.

Create a 3D Point Cloud Object Detection Labeling Job

You can create a 3D point cloud labeling job using the SageMaker console or API operation, CreateLabelingJob. To create a labeling job for this task type you need the following:

- A single-frame input manifest file. To learn how to create this type of manifest file, see Create a Point Cloud Frame Input Manifest File (p. 405). If you are a new user of Ground Truth 3D point cloud labeling modalities, you may also want to review Accepted Raw 3D Data Formats (p. 404).
- A work team from a private or vendor workforce. You cannot use Amazon Mechanical Turk for video frame labeling jobs. To learn how to create workforces and work teams, see Create and Manage Workforces (p. 485).

Additionally, make sure that you have reviewed and satisfied the Assign IAM Permissions to Use Ground Truth (p. 469).

Use one of the following sections to learn how to create a labeling job using the console or an API.

Create a Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) (p. 364) in order to learn how to create a 3D point cloud object detection labeling job in the SageMaker console. While you are creating your labeling job, be aware of the following:

- Your input manifest file must be a single-frame manifest file. For more information, see Create a Point Cloud Frame Input Manifest File (p. 405).
- Optionally, you can provide label category and frame attributes. Workers can assign one or more of these attributes to annotations to provide more information about that object. For example, you might want to use the attribute occluded to have workers identify when an object is partially obstructed.
• Automated data labeling and annotation consolidation are not supported for 3D point cloud labeling tasks.

• 3D point cloud object detection labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs when you select your work team (up to 7 days, or 604800 seconds).

Create a Labeling Job (API)

This section covers details you need to know when you create a labeling job using the SageMaker API operation CreateLabelingJob. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the See Also section of CreateLabelingJob.

Create a Labeling Job (API) (p. 367), provides an overview of the CreateLabelingJob operation. Follow these instructions and do the following while you configure your request:

• You must enter an ARN for HumanTaskUiArn. Use
  arn:aws:sagemaker:<region>:394669845002:human-task-ui/PointCloudObjectDetection. Replace <region> with the AWS Region you are creating the labeling job in.

  There should not be an entry for the UiTemplateS3Uri parameter.

• Your input manifest file must be a single-frame manifest file. For more information, see Create a Point Cloud Frame Input Manifest File (p. 405).

• You specify your labels, label category and frame attributes, and worker instructions in a label category configuration file. To learn how to create this file, see Create a Labeling Category Configuration File with Label Category and Frame Attributes (p. 377).

• You need to provide pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.
  
  To find the pre-annotation Lambda ARN, refer to PreHumanTaskLambdaArn. Use the Region you are creating your labeling job in to find the correct ARN. For example, if you are creating your labeling job in us-east-1, the ARN will be arn:aws:lambda:us-east-1:432418664414:function:PRE-3DPointCloudObjectDetection.

  To find the post-annotation Lambda ARN, refer to AnnotationConsolidationLambdaArn. Use the Region you are creating your labeling job in to find the correct ARN. For example, if you are creating your labeling job in us-east-1, the ARN will be arn:aws:lambda:us-east-1:432418664414:function:ACS-3DPointCloudObjectDetection.

• The number of workers specified in NumberOfHumanWorkersPerDataObject must be 1.

• Automated data labeling is not supported for 3D point cloud labeling jobs. You should not specify values for parameters in LabelingJobAlgorithmsConfig.

• 3D point cloud object detection labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in TaskTimeLimitInSeconds (up to 7 days, or 604,800 seconds).

Create a 3D Point Cloud Object Detection Adjustment or Verification Labeling Job

You can create an adjustment or verification labeling job using the Ground Truth console or CreateLabelingJob API. To learn more about adjustment and verification labeling jobs, and to learn how create one, see Verify and Adjust Labels (p. 321).

When you create an adjustment labeling job, your input data to the labeling job can include labels, and yaw, pitch, and roll measurements from a previous labeling job or external source. In the adjustment job, pitch, and roll will be visualized in the worker UI, but cannot be modified. Yaw is adjustable.
Ground Truth uses Tait-Bryan angles with the following intrinsic rotations to visualize yaw, pitch and roll in the worker UI. First, rotation is applied to the vehicle according to the z-axis (yaw). Next, the rotated vehicle is rotated according to the intrinsic y’-axis (pitch). Finally, the vehicle is rotated according to the intrinsic x’’-axis (roll).

Output Data Format

When you create a 3D point cloud object detection labeling job, tasks are sent to workers. When these workers complete their tasks, labels are written to the Amazon S3 bucket you specified when you created the labeling job. The output data format determines what you see in your Amazon S3 bucket when your labeling job status (LabelingJobStatus) is Completed.

If you are a new user of Ground Truth, see Output Data (p. 433) to learn more about the Ground Truth output data format. To learn about the 3D point cloud object detection output data format, see 3D Point Cloud Object Detection Output (p. 451).

3D Point Cloud Object Tracking

Use this task type when you want workers to add and fit 3D cuboids around objects to track their movement across 3D point cloud frames. For example, you can use this task type to ask workers to track the movement of vehicles across multiple point cloud frames.

For this task type, the data object that workers label is a sequence of point cloud frames. A sequence is defined as a temporal series of point cloud frames. Ground Truth renders a series of 3D point cloud visualizations using a sequence you provide and workers can switch between these 3D point cloud frames in the worker task interface.

Ground Truth provides workers with tools to annotate objects with 9 degrees of freedom: $(x,y,z,r_x,r_y,r_z,l,w,h)$ in three dimensions in both 3D scene and projected side views (top, side, and back). When a worker draws a cuboid around an object, that cuboid is given a unique ID, for example Car:1 for one car in the sequence and Car:2 for another. Workers use that ID to label the same object in multiple frames.

You can also provide camera data to give workers more visual information about scenes in the frame, and to help workers draw 3D cuboids around objects. When a worker adds a 3D cuboid to identify an object in either the 2D image or the 3D point cloud, and the cuboid shows up in the other view.

You can adjust annotations created in a 3D point cloud object detection labeling job using the 3D point cloud object tracking adjustment task type.

If you are a new user of the Ground Truth 3D point cloud labeling modality, we recommend you review 3D Point Cloud Labeling Jobs Overview (p. 287). This labeling modality is different from other Ground Truth task types, and this page provides an overview of important details you should be aware of when creating a 3D point cloud labeling job.

Topics
- View the Worker Task Interface (p. 269)
- Create a 3D Point Cloud Object Tracking Labeling Job (p. 277)
- Create a 3D Point Cloud Object Tracking Adjustment or Verification Labeling Job (p. 278)
- Output Data Format (p. 278)

View the Worker Task Interface

Ground Truth provides workers with a web portal and tools to complete your 3D point cloud object tracking annotation tasks. When you create the labeling job, you provide the Amazon Resource Name
(ARN) for a pre-built Ground Truth UI in the `HumanTaskUiArn` parameter. When you create a labeling job using this task type in the console, this UI is automatically used. You can preview and interact with the worker UI when you create a labeling job in the console. If you are a new user, it is recommended that you create a labeling job using the console to ensure your label attributes, point cloud frames, and if applicable, images, appear as expected.

The following is a GIF of the 3D point cloud object tracking worker task interface and demonstrates how the worker can navigate the point cloud frames in the sequence.
Once workers add a single cuboid, that cuboid is replicated in all frames of the sequence with the same ID. Once workers adjust the cuboid in another frame, Ground Truth will interpolate the movement of that object and adjust all cuboids between the manually adjusted frames. The following GIF demonstrates this interpolation feature. In the navigation bar on the bottom-left, red-areas indicate manually adjusted frames.
If you provide camera data for sensor fusion, images are matched up with scenes in point cloud frames. These images appear in the worker portal as shown in the following GIF.

Worker can navigate in the 3D scene using their keyboard and mouse. They can:

- Double click on specific objects in the point cloud to zoom into them.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

Once a worker places a cuboids in the 3D scene, a side-view will appear with the three projected side views: top, side, and back. These side-views show points in and around the placed cuboid and help workers refine cuboid boundaries in that area. Workers can zoom in and out of each of those side-views using their mouse.

The following video demonstrates movements around the 3D point cloud and in the side-view.
Additional view options and features are available. See the worker instruction page for a comprehensive overview of the Worker UI.

Worker Tools

Workers can navigate through the 3D point cloud by zooming in and out, and moving in all directions around the cloud using the mouse and keyboard shortcuts. If workers click on a point in the point cloud, the UI will automatically zoom into that area. Workers can use various tools to draw 3D cuboid around objects. For more information, see Assistive Labeling Tools.

After workers have placed a 3D cuboid in the point cloud, they can adjust these cuboids to fit tightly around cars using a variety of views: directly in the 3D cuboid, in a side-view featuring three zoomed-in perspectives of the point cloud around the box, and if you include images for sensor fusion, directly in the 2D image.

View options that enable workers to easily hide or view label text, a ground mesh, and additional point attributes. Workers can also choose between perspective and orthogonal projections.

Assistive Labeling Tools

Ground Truth helps workers annotate 3D point clouds faster and more accurately using UX, machine learning and computer vision powered assistive labeling tools for 3D point cloud object tracking tasks. The following assistive labeling tools are available for this task type:

- **Label autofill** – When a worker adds a cuboid to a frame, a cuboid with the same dimensions and orientation is automatically added to all frames in the sequence.
- **Label interpolation** – After a worker has labeled a single object in two frames, Ground Truth uses those annotations to interpolate the movement of that object between those two frames.
- **Bulk label and attribute management** – Workers can add, delete, and rename annotations, label category attributes, and frame attributes in bulk.
  - Workers can manually delete annotations for a given object before or after a frame. For example, a worker can delete all labels for an object after frame 10 if that object is no longer located in the scene after that frame.
  - If a worker accidentally bulk deletes all annotations for an object, they can add them back. For example, if a worker deletes all annotations for an object before frame 100, they can bulk add them to those frames.
  - Workers can rename a label in one frame and all 3D cuboids assigned that label are updated with the new name across all frames.
  - Workers can use bulk editing to add or edit label category attributes and frame attributes in multiple frames.
- **Snapping** – Workers can add a cuboid around an object and use a keyboard shortcut or menu option to have Ground Truth's autofit tool snap the cuboid tightly around the object's boundaries.
- **Fit to ground** – After a worker adds a cuboid to the 3D scene, the worker can automatically snap the cuboid to the ground. For example, the worker can use this feature to snap a cuboid to the road or sidewalk in the scene.
- **Multi-view labeling** – After a worker adds a 3D cuboid to the 3D scene, a side-panel displays front and two side perspectives to help the worker adjust the cuboid tightly around the object. Workers can annotation the 3D point cloud, the side panel and the adjustments appear in the other views in real time.
- **Sensor fusion** – If you provide data for sensor fusion, workers can adjust annotations in the 3D scenes and in 2D images, and the annotations will be projected into the other view in real time.
- **Auto-merge cuboids** – Workers can automatically merge two cuboids across all frames if they determine that cuboids with different labels actually represent a single object.
- **View options** – Enables workers to easily hide or view label text, a ground mesh, and additional point attributes like color or intensity. Workers can also choose between perspective and orthogonal projections.
Create a 3D Point Cloud Object Tracking Labeling Job

You can create a 3D point cloud labeling job using the SageMaker console or API operation, CreateLabelingJob. To create a labeling job for this task type you need the following:

- A sequence input manifest file. To learn how to create this type of manifest file, see Create a Point Cloud Sequence Input Manifest (p. 412). If you are a new user of Ground Truth 3D point cloud labeling modalities, we recommend that you review Accepted Raw 3D Data Formats (p. 404).
- A work team from a private or vendor workforce. You cannot use Amazon Mechanical Turk for 3D point cloud labeling jobs. To learn how to create workforces and work teams, see Create and Manage Workforces (p. 485).

Additionally, make sure that you have reviewed and satisfied the Assign IAM Permissions to Use Ground Truth (p. 469).

To learn how to create a labeling job using the console or an API, see the following sections.

Create a Labeling Job (API)

This section covers details you need to know when you create a labeling job using the SageMaker API operation CreateLabelingJob. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the See Also section of CreateLabelingJob.

Create a Labeling Job (API) (p. 367) provides an overview of the CreateLabelingJob operation. Follow these instructions and do the following while you configure your request:

- You must enter an ARN for HumanTaskUiArn. Use arn:aws:sagemaker:<region>:394669845002:human-task-ui/PointCloudObjectTracking. Replace <region> with the AWS Region you are creating the labeling job in.
  - There should not be an entry for the UiTemplateS3Uri parameter.
- Your LabelAttributeName must end in -ref. For example, ot-labels-ref.
- Your input manifest file must be a point cloud frame sequence manifest file. For more information, see Create a Point Cloud Sequence Input Manifest (p. 412).
- You specify your labels, label category and frame attributes, and worker instructions in a label category configuration file. For more information, see Create a Labeling Category Configuration File with Label Category and Frame Attributes (p. 377) to learn how to create this file.
- You need to provide pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.
  - To find the pre-annotation Lambda ARN, refer to PreHumanTaskLambdaArn. Use the Region you are creating your labeling job in to find the correct ARN that ends with PRE-3DPointCloudObjectTracking.
  - To find the post-annotation Lambda ARN, refer to AnnotationConsolidationLambdaArn. Use the Region you are creating your labeling job in to find the correct ARN that ends with ACS-3DPointCloudObjectTracking.
- The number of workers specified in NumberOfHumanWorkersPerDataObject should be 1.
- Automated data labeling is not supported for 3D point cloud labeling jobs. You should not specify values for parameters in LabelingJobAlgorithmsConfig.
- 3D point cloud object tracking labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in TaskTimeLimitInSeconds (up to 7 days, or 604,800 seconds).
Create a Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) (p. 364) in order to learn how to create a 3D point cloud object tracking labeling job in the SageMaker console. While you are creating your labeling job, be aware of the following:

- Your input manifest file must be a sequence manifest file. For more information, see Create a Point Cloud Sequence Input Manifest (p. 412).
- Optionally, you can provide label category attributes. Workers can assign one or more of these attributes to annotations to provide more information about that object. For example, you might want to use the attribute occluded to have workers identify when an object is partially obstructed.
- Automated data labeling and annotation consolidation are not supported for 3D point cloud labeling tasks.
- 3D point cloud object tracking labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs when you select your work team (up to 7 days, or 604800 seconds).

Create a 3D Point Cloud Object Tracking Adjustment or Verification Labeling Job

You can create an adjustment and verification labeling job using the Ground Truth console or CreateLabelingJob API. To learn more about adjustment and verification labeling jobs, and to learn how create one, see Verify and Adjust Labels (p. 321).

When you create an adjustment labeling job, your input data to the labeling job can include labels, and yaw, pitch, and roll measurements from a previous labeling job or external source. In the adjustment job, pitch, and roll will be visualized in the worker UI, but cannot be modified. Yaw is adjustable.

Ground Truth uses Tait-Bryan angles with the following intrinsic rotations to visualize yaw, pitch and roll in the worker UI. First, rotation is applied to the vehicle according to the z-axis (yaw). Next, the rotated vehicle is rotated according to the intrinsic y'-axis (pitch). Finally, the vehicle is rotated according to the intrinsic x''-axis (roll).

Output Data Format

When you create a 3D point cloud object tracking labeling job, tasks are sent to workers. When these workers complete their tasks, their annotations are written to the Amazon S3 bucket you specified when you created the labeling job. The output data format determines what you see in your Amazon S3 bucket when your labeling job status (LabelingJobStatus) is Completed.

If you are a new user of Ground Truth, see Output Data (p. 433) to learn more about the Ground Truth output data format. To learn about the 3D point cloud object tracking output data format, see 3D Point Cloud Object Tracking Output (p. 453).

3D Point Cloud Semantic Segmentation

Semantic segmentation involves classifying individual points of a 3D point cloud into pre-specified categories. Use this task type when you want workers to create a point-level semantic segmentation mask for 3D point clouds. For example, if you specify the classes car, pedestrian, and bike, workers select one class at a time, and color all of the points that this class applies to the same color in the point cloud.

For this task type, the data object that workers label is a single point cloud frame. Ground Truth generates a 3D point cloud visualization using point cloud data you provide. You can also provide camera data to give workers more visual information about scenes in the frame, and to help workers paint objects. When a worker paints an object in either the 2D image or the 3D point cloud, the paint shows up in the other view.
You can adjust annotations created in a 3D point cloud object detection labeling job using the 3D point cloud semantic segmentation adjustment task type.

If you are a new user of the Ground Truth 3D point cloud labeling modality, we recommend you review 3D Point Cloud Labeling Jobs Overview (p. 287). This labeling modality is different from other Ground Truth task types, and this topic provides an overview of important details you should be aware of when creating a 3D point cloud labeling job.

Topics
- View the Worker Task Interface (p. 279)
- Create a 3D Point Cloud Semantic Segmentation Labeling Job (p. 285)
- Create a 3D Point Cloud Semantic Segmentation Adjustment or Verification Labeling Job (p. 286)
- Output Data Format (p. 286)

View the Worker Task Interface

Ground Truth provides workers with a web portal and tools to complete your 3D point cloud semantic segmentation annotation tasks. When you create the labeling job, you provide the Amazon Resource Name (ARN) for a pre-built Ground Truth UI in the HumanTaskUiArn parameter. When you create a labeling job using this task type in the console, this UI is automatically used. You can preview and interact with the worker UI when you create a labeling job in the console. If you are a new use, it is recommended that you create a labeling job using the console to ensure your label attributes, point cloud frames, and if applicable, images, appear as expected.

The following is a GIF of the 3D point cloud semantic segmentation worker task interface. If you provide camera data for sensor fusion, images are matched with scenes in the point cloud frame. Workers can paint objects in either the 3D point cloud or the 2D image, and the paint appears in the corresponding location in the other medium. These images appear in the worker portal as shown in the following GIF.
Worker can navigate in the 3D scene using their keyboard and mouse. They can:

- Double click on specific objects in the point cloud to zoom into them.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

The following video demonstrates movements around the 3D point cloud. Workers can hide and re-expand all side views and menus. In this GIF, the side-views and menus have been collapsed.
The following GIF demonstrates how a worker can label multiple objects quickly, refine painted objects using the Unpaint option and then view only points that have been painted.
Worker Tools

Workers can navigate through the 3D point cloud by zooming in and out, and moving in all directions around the cloud using the mouse and keyboard shortcuts. When you create a semantic segmentation job, workers have the following tools available to them:

- A paint brush to paint and unpaint objects. Workers paint objects by selecting a label category and then painting in the 3D point cloud. Workers unpaint objects by selecting the Unpaint option from the label category menu and using the paint brush to erase paint.
- A polygon tool that workers can use to select and paint an area in the point cloud.
- A background paint tool, which enables workers to paint behind objects they have already annotated without altering the original annotations. For example, workers might use this tool to paint the road after painting all of the cars on the road.
- View options that enable workers to easily hide or view label text, a ground mesh, and additional point attributes like color or intensity. Workers can also choose between perspective and orthogonal projections.

Create a 3D Point Cloud Semantic Segmentation Labeling Job

You can create a 3D point cloud labeling job using the SageMaker console or API operation, CreateLabelingJob. To create a labeling job for this task type you need the following:

- A single-frame input manifest file. To learn how to create this type of manifest file, see Create a Point Cloud Frame Input Manifest File (p. 405). If you are a new user of Ground Truth 3D point cloud labeling modalities, we recommend that you review Accepted Raw 3D Data Formats (p. 404).
- A work team from a private or vendor workforce. You cannot use Amazon Mechanical Turk workers for 3D point cloud labeling jobs. To learn how to create workforces and work teams, see Create and Manage Workforces (p. 485).
- A label category configuration file. For more information, see Create a Labeling Category Configuration File with Label Category and Frame Attributes (p. 377).

Additionally, make sure that you have reviewed and satisfied the Assign IAM Permissions to Use Ground Truth (p. 469).

Use one of the following sections to learn how to create a labeling job using the console or an API.

Create a Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) (p. 364) in order to learn how to create a 3D point cloud semantic segmentation labeling job in the SageMaker console. While you are creating your labeling job, be aware of the following:

- Your input manifest file must be a single-frame manifest file. For more information, see Create a Point Cloud Frame Input Manifest File (p. 405).
- Automated data labeling and annotation consolidation are not supported for 3D point cloud labeling tasks.
- 3D point cloud semantic segmentation labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs when you select your work team (up to 7 days, or 604800 seconds).
Create a Labeling Job (API)

This section covers details you need to know when you create a labeling job using the SageMaker API operation CreateLabelingJob. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the See Also section of CreateLabelingJob.

The page, Create a Labeling Job (API) (p. 367), provides an overview of the CreateLabelingJob operation. Follow these instructions and do the following while you configure your request:

- You must enter an ARN for HumanTaskUiArn. Use
  arn:aws:sagemaker:<region>:394669845002:human-task-ui/PointCloudSemanticSegmentation. Replace <region> with the AWS Region you are creating the labeling job in.
  There should not be an entry for the UiTemplateS3Uri parameter.
- Your LabelAttributeName must end in -ref. For example, *ss-labels*-ref.
- Your input manifest file must be a single-frame manifest file. For more information, see Create a Point Cloud Frame Input Manifest File (p. 405).
- You specify your labels and worker instructions in a label category configuration file. See Create a Labeling Category Configuration File with Label Category and Frame Attributes (p. 377) to learn how to create this file.
- You need to provide a pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.
  - To find the pre-annotation Lambda ARN, refer to PreHumanTaskLambdaArn. Use the Region you are creating your labeling job in to find the correct ARN. For example, if you are creating your labeling job in us-east-1, the ARN will be arn:aws:lambda:us-east-1:43241864414:function:PRE-3DPointCloudSemanticSegmentation.
  - To find the post-annotation Lambda ARN, refer to AnnotationConsolidationLambdaArn. Use the Region you are creating your labeling job in to find the correct ARN. For example, if you are creating your labeling job in us-east-1, the ARN will be arn:aws:lambda:us-east-1:43241864414:function:ACS-3DPointCloudSemanticSegmentation.
- The number of workers specified in NumberOfHumanWorkersPerDataObject should be 1.
- Automated data labeling is not supported for 3D point cloud labeling jobs. You should not specify values for parameters in LabelingJobAlgorithmsConfig.
- 3D point cloud semantic segmentation labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in TaskTimeLimitInSeconds (up to 7 days, or 604800 seconds).

Create a 3D Point Cloud Semantic Segmentation Adjustment or Verification Labeling Job

You can create an adjustment and verification labeling job using the Ground Truth console or CreateLabelingJob API. To learn more about adjustment and verification labeling jobs, and to learn how create one, see Verify and Adjust Labels (p. 321).

Output Data Format

When you create a 3D point cloud semantic segmentation labeling job, tasks are sent to workers. When these workers complete their tasks, their annotations are written to the Amazon S3 bucket you specified when you created the labeling job. The output data format determines what you see in your Amazon S3 bucket when your labeling job status (LabelingJobStatus) is Completed.

If you are a new user of Ground Truth, see Output Data (p. 433) to learn more about the Ground Truth output data format. To learn about the 3D point cloud object detection output data format, see 3D Point Cloud Semantic Segmentation Output (p. 449).
3D Point Cloud Labeling Jobs Overview

This topic provides an overview of the unique features of a Ground Truth 3D point cloud labeling job. You can use the 3D point cloud labeling jobs to have workers label objects in a 3D point cloud generated from a 3D sensors like LiDAR and depth cameras or generated from 3D reconstruction by stitching images captured by an agent like a drone.

Job Pre-processing Time

When you create a 3D point cloud labeling job, you need to provide an input manifest file (p. 403). The input manifest file can be:

- A frame input manifest file that has a single point cloud frame on each line.
- A sequence input manifest file that has a single sequence on each line. A sequence is defined as a temporal series of point cloud frames.

For both types of manifest files, job pre-processing time (that is, the time before Ground Truth starts sending tasks to your workers) depends on the total number and size of point cloud frames you provide in your input manifest file. For frame input manifest files, this is the number of lines in your manifest file. For sequence manifest files, this is the number of frames in each sequence multiplied by the total number of sequences, or lines, in your manifest file.

Additionally, the number of points per point cloud and the number of fused sensor data objects (like images) factor into job pre-processing times. On average, Ground Truth can pre-process 200 point cloud frames in approximately 5 minutes. If you create a 3D point cloud labeling job with a large number of point cloud frames, you might experience longer job pre-processing times. For example, if you create a sequence input manifest file with 4 point cloud sequences, and each sequence contains 200 point clouds, Ground Truth pre-processes 800 point clouds and so your job pre-processing time might be around 20 minutes. During this time, your labeling job status is InProgress.

While your 3D point cloud labeling job is pre-processing, you receive CloudWatch messages notifying you of the status of your job. To identify these messages, search for 3D_POINT_CLOUD_PROCESSING_STATUS in your labeling job logs.

For frame input manifest files, your CloudWatch logs will have a message similar to the following:

```json
{
  "labeling-job-name": "example-point-cloud-labeling-job",
  "event-name": "3D_POINT_CLOUD_PROCESSING_STATUS",
  "event-log-message": "datasetObjectId from: 0 to 10, status: IN_PROGRESS"
}
```

The event log message, datasetObjectId from: 0 to 10, status: IN_PROGRESS identifies the number of frames from your input manifest that have been processed. You receive a new message every time a frame has been processed. For example, after a single frame has processed, you receive another message that says datasetObjectId from: 1 to 10, status: IN_PROGRESS.

For sequence input manifest files, your CloudWatch logs will have a message similar to the following:

```json
{
  "labeling-job-name": "example-point-cloud-labeling-job",
  "event-name": "3D_POINT_CLOUD_PROCESSING_STATUS",
  "event-log-message": "datasetObjectId: 0, status: IN_PROGRESS"
}
```

The event log message, datasetObjectId from: 0, status: IN_PROGRESS identifies the number of sequences from your input manifest that have been processed. You receive a new message every
time a sequence has been processed. For example, after a single sequence has processed, you receive a message that says `datasetObjectId from: 1, status: IN_PROGRESS` as the next sequence begins processing.

### Job Completion Times

3D point cloud labeling jobs can take workers hours to complete. You can set the total amount of time that workers can work on each task when you create a labeling job. The maximum time you can set for workers to work on tasks is 7 days. The default value is 3 days.

It is strongly recommended that you create tasks that workers can complete within 12 hours. Workers must keep the worker UI open while working on a task. They can save work as they go and Ground Truth will save their work every 15 minutes.

When using the SageMaker `CreateLabelingJob` API operation, set the total time a task is available to workers in the `TaskTimeLimitInSeconds` parameter of `HumanTaskConfig`.

When you create a labeling job in the console, you can specify this time limit when you select your workforce type and your work team.

### Workforces

When you create a 3D point cloud labeling job, you need to specify a work team that will complete your point cloud annotation tasks. You can choose a work team from a private workforce of your own workers, or from a vendor workforce that you select in the AWS Marketplace. You cannot use the Amazon Mechanical Turk workforce for 3D point cloud labeling jobs.

To learn more about vendor workforce, see [Managing Vendor Workforces (p. 489)](#). To learn how to create and manage a private workforce, see [Use a Private Workforce (p. 490)](#).

### Worker User Interface (UI)

Ground Truth provides a worker user interface (UI), tools, and assistive labeling features to help workers complete your 3D point cloud labeling tasks.

You can preview the worker UI when you create a labeling job in the console.

When you create a labeling job using the API operation `CreateLabelingJob`, you must provide an ARN provided by Ground Truth in the parameter `HumanTaskUiArn` to specify the worker UI for your task type. You can use `HumanTaskUiArn` with the SageMaker `RenderUiTemplate` API operation to preview the worker UI.

You provide worker instructions, labels, and optionally, label category attributes that are displayed in the worker UI.

### Label Category Attributes

When you create a 3D point cloud object tracking or object detection labeling job, you can add one or more label category attributes. You can add frame attributes to all 3D point cloud task types:

- **Label category attribute** – A list of options (strings), a free form text box, or a numeric field associated with one or more labels. It is used by workers to provide metadata about a label.

- **Frame attribute** – A list of options (strings), a free form text box, or a numeric field that appears on each point cloud frame a worker is sent to annotate. It is used by workers to provide metadata about frames.

Additionally, you can use label and frame attributes to have workers verify labels in a 3D point cloud label verification job.
Use the following sections to learn more about these attributes. To learn how to add label category and frame attributes to a labeling job, use the Create Labeling Job section on the task type page of your choice.

**Label Category Attributes**

Add label category attributes to labels to give workers the ability to provide more information about the annotations they create. A label category attribute is added to an individual label, or to all labels. When a label category attribute is applied to all labels it is referred to as a global label category attribute.

For example, if you add the label category car, you might also want to capture additional data about your labeled cars, such as if they are occluded or the size of the car. You can capture this metadata using label category attributes. In this example, if you added the attribute occluded to the car label category, you can assign partial, completely, no to the occluded attribute and enable workers to select one of these options.

When you create a label verification job, you add labels category attributes to each label you want workers to verify.

**Frame Attributes**

Add frame attributes to give workers the ability to provide more information about individual point cloud frames. You can specify up to 10 frame attributes, and these attributes will appear on all frames.

For example, you can add a frame attribute that allows workers to enter a number. You may want to use this attribute to have workers identify the number of objects they see in a particular frame.

In another example, you may want to provide a free-form text box to give workers the ability to provide a free form answer to a question.

When you create a label verification job, you can add one or more frame attributes to ask workers to provide feedback on all labels in a point cloud frame.

**Worker Instructions**

You can provide worker instructions to help your workers complete your point cloud labeling tasks. You might want to use these instructions to do the following:

- Best practices and things to avoid when annotating objects.
- Explanation of the label category attributes provided (for object detection and object tracking tasks), and how to use them.
- Advice on how to save time while labeling by using keyboard shortcuts.

You can add your worker instructions using the SageMaker console while creating a labeling job. If you create a labeling job using the API operation CreateLabelingJob, you specify worker instructions in your label category configuration file.

In addition to your instructions, Ground Truth provides a link to help workers navigate and use the worker portal. View these instructions by selecting the task type on Worker Instructions (p. 290).

**Declining Tasks**

Workers are able to decline tasks.

Workers decline a task if the instructions are not clear, input data is not displaying correctly, or if they encounter some other issue with the task. If the number of workers per dataset object (NumberOfHumanWorkersPerDataObject) decline the task, the data object is marked as expired and will not be sent to additional workers.
3D Point Cloud Labeling Job Permission Requirements

When you create a 3D point cloud labeling job, in addition to the permission requirements found in Assign IAM Permissions to Use Ground Truth (p. 469), you must add a CORS policy to your S3 bucket that contains your input manifest file.

Add a CORS Permission Policy to S3 Bucket

When you create a 3D point cloud labeling job, you specify buckets in S3 where your input data and manifest file are located and where your output data will be stored. These buckets may be the same. You must attach the following Cross-origin resource sharing (CORS) policy to your input and output buckets. If you use the Amazon S3 console to add the policy to your bucket, you must use the JSON format.

**JSON**

```
[
  {
    "AllowedHeaders": [
      "*
    ],
    "AllowedMethods": [
      "GET",
      "HEAD",
      "PUT"
    ],
    "AllowedOrigins": [
      "*
    ],
    "ExposeHeaders": [
      "Access-Control-Allow-Origin"
    ],
    "MaxAgeSeconds": 3000
  }
]
```

**XML**

```xml
<?xml version="1.0" encoding="UTF-8"?>
<CORSConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/"
  <CORSRule>
    <AllowedOrigin>*</AllowedOrigin>
    <AllowedMethod>GET</AllowedMethod>
    <AllowedMethod>HEAD</AllowedMethod>
    <AllowedMethod>PUT</AllowedMethod>
    <MaxAgeSeconds>3000</MaxAgeSeconds>
    <ExposeHeader>Access-Control-Allow-Origin</ExposeHeader>
    <AllowedHeader>*</AllowedHeader>
  </CORSRule>
</CORSConfiguration>
```

To learn how to add a CORS policy to an S3 bucket, see How do I add cross-domain resource sharing with CORS? in the Amazon Simple Storage Service Console User Guide.

**Worker Instructions**

This topic provides an overview of the Ground Truth worker portal and the tools available to complete your 3D Point Cloud labeling task. First, select the type of task you are working on from **Topics**.

For adjustment jobs, select the original labeling job task type that produced the labels you are adjusting. Review and adjust the labels in your task as needed.
Important
It is recommended that you complete your task using a Google Chrome or Firefox web browser.

Topics
- 3D Point Cloud Semantic Segmentation (p. 291)
- 3D Point Cloud Object Detection (p. 300)
- 3D Point Cloud Object Tracking (p. 310)

3D Point Cloud Semantic Segmentation
Use this page to become familiarize with the user interface and tools available to complete your 3D point cloud semantic segmentation task.

Topics
- Your Task (p. 291)
- Navigate the UI (p. 296)
- Icon Guide (p. 298)
- Shortcuts (p. 299)
- Release, Stop and Resume, and Decline Tasks (p. 299)
- Saving Your Work and Submitting (p. 300)

Your Task
When you work on a 3D point cloud semantic segmentation task, you need to select a category from the Annotations menu on the right side of your worker portal using the drop down menu Label Categories. After you've selected a category, use the paint brush and polygon tools to paint each object in the 3D point cloud that this category applies to. For example, if you select the category Car, you would use these tools to paint all of the cars in the point cloud. The following video demonstrates how to use the paint brush tool to paint an object.

If you see one or more images in your worker portal, you can paint in the images or paint in the 3D point cloud and the paint will show up in the other medium.

You may see frame attributes under the Labels menu. Use these attribute prompts to enter additional information about the point cloud.
Important
If you see that objects have already been painted when you open the task, adjust those annotations.

The following video includes an image that can be annotated. You may not see an image in your task.
<table>
<thead>
<tr>
<th>Instructions</th>
<th>Shortcuts</th>
<th>View</th>
<th>3D Point Cloud</th>
<th>Paint</th>
<th>Help</th>
</tr>
</thead>
</table>

Point cloud View ✗
After you've painted one or more objects using a label category, you can select that category from the Label Category menu on the right to only view points painted for that category.
Navigate the UI

You can navigate in the 3D scene using their keyboard and mouse. You can:

- Double click on specific objects in the point cloud to zoom into them.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

The following video demonstrates movements around the 3D point cloud and in the side-view. You can hide and re-expand all side views using the full screen icon. In this GIF, the side-views and menus have been collapsed.
When you are in the worker UI, you see the following menus:

- **Instructions** – Review these instructions before starting your task.
- **Shortcuts** – Use this menu to view keyboard shortcuts that you can use to navigate the point cloud and use the annotation tools provided.
- **View** – Use this menu to toggle different view options on and off. For example, you can use this menu to add a ground mesh to the point cloud, and to choose the projection of the point cloud.
- **3D Point Cloud** – Use this menu to add additional attributes to the points in the point cloud, such as color, and pixel intensity. Note that some or all of these options may not be available.
- **Paint** – Use this menu to modify the functionality of the paint brush.

When you open a task, the move scene icon is on, and you can move around the point cloud using your mouse and the navigation buttons in the point cloud area of the screen. To return to the original view you see when you first opened the task, choose the reset scene icon.

After you select the paint icon, you can add paint to the point cloud and images (if included). You must select the move scene icon again to move to another area in the 3D point cloud or image.

To collapse all panels on the right and make the 3D point cloud full screen, select the full screen icon.

For the camera images and side-panels, you have the following view options:

- **C** – View the camera angle on point cloud view.
- **F** – View the frustum, or field of view, of the camera used to capture that image on point cloud view.
- **P** – View the point cloud overlaid on the image.

**Icon Guide**

Use this table to learn about the icons available in your worker task portal.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="brush" /></td>
<td>brush</td>
<td>Choose this icon to turn on the brush tool. To use with this tool, choose and move over the objects that you want to paint with your mouse. After you choose it, everything you paint be associated with the category you chose.</td>
</tr>
<tr>
<td><img src="image" alt="polygon" /></td>
<td>polygon</td>
<td>Choose this icon to use the polygon paint tool. Use this tool to draw polygons around objects that you want to paint. After you choose it, everything you draw a polygon around will be associated with the category you have chosen.</td>
</tr>
<tr>
<td><img src="image" alt="reset scene" /></td>
<td>reset scene</td>
<td>Choose this icon to reset the view of the point cloud, side panels, and if applicable, all images to their original position when the task was first opened.</td>
</tr>
<tr>
<td><img src="image" alt="move scene" /></td>
<td>move scene</td>
<td>Choose this icon to move the scene. By default, this icon will be selected when you first start a task.</td>
</tr>
</tbody>
</table>
Icon | Name | Description
--- | --- | ---
| ![full screen icon] | full screen | Choose this icon to make the 3D point cloud visualization full screen, and to collapse all side panels.

| ![ruler icon] | ruler | Use this icon to measure distances, in meters, in the point cloud. You may want to use this tool if your instructions ask you to annotate all objects in a given distance from the center of the cuboid or the object used to capture data.

When you select this icon, you can place the starting point (first marker) anywhere in the point cloud by selecting it with your mouse. The tool will automatically use interpolation to place a marker on the closest point within threshold distance to the location you select, otherwise the marker will be placed on ground. If you place a starting point by mistake, you can use the Escape key to revert marker placement.

After you place the first marker, you see a dotted line and a dynamic label that indicates the distance you have moved away from the first marker. Click somewhere else on the point cloud to place a second marker. When you place the second marker, the dotted line becomes solid, and the distance is set.

After you set a distance, you can edit it by selecting either marker. You can delete a ruler by selecting anywhere on the ruler and using the Delete key on your keyboard.

**Shortcuts**

The shortcuts listed in the **Shortcuts** menu can help you navigate the 3D point cloud and use the paint tool.

Before you start your task, it is recommended that you review the **Shortcuts** menu and become acquainted with these commands.

**Release, Stop and Resume, and Decline Tasks**

When you open the labeling task, three buttons on the top right allow you to decline the task (**Decline task**), release it (**Release task**), and stop and resume it at a later time (**Stop and resume later**). The following list describes what happens when you select one of these options:

- **Decline task**: You should only decline a task if something is wrong with the task, such as an issue with the 3D point cloud, images or the UI. If you decline a task, you will not be able to return to the task.

- **Release Task**: If you release a task, you loose all work done on that task. When the task is released, other workers on your team can pick it up. If enough workers pick up the task, you may not be able to return to it. When you select this button and then select **Confirm**, you are returned to the worker portal. If the task is still available, its status will be **Available**. If other workers pick it up, it will disappear from your portal.

- **Stop and resume later**: You can use the **Stop and resume later** button to stop working and return to the task at a later time. You should use the **Save** button to save your work before you select **Stop and
**resum​e later.** When you select this button and then select **Confirm**, you are returned to the worker portal, and the task status is **Stopped.** You can select the same task to resume work on it.

Be aware that the person that creates your labeling tasks specifies a time limit in which all tasks must be completed by. If you do not return to and complete this task within that time limit, it will expire and your work will not be submitted. Contact your administrator for more information.

**Saving Your Work and Submitting**

You should periodically save your work. Ground Truth will automatically save your work every 15 minutes. When you open a task, you must complete your work on it before pressing **Submit**.

**3D Point Cloud Object Detection**

Use this page to become familiar with the user interface and tools available to complete your 3D point cloud object detection task.

**Topics**

- Your Task (p. 300)
- Navigate the UI (p. 302)
- Icon Guide (p. 308)
- Shortcuts (p. 309)
- Release, Stop and Resume, and Decline Tasks (p. 309)
- Saving Your Work and Submitting (p. 310)

**Your Task**

When you work on a 3D point cloud object detection task, you need to select a category from the **Annotations** menu on the right side of your worker portal using the **Label Categories** menu. After you've chosen a category, use the add cuboid and fit cuboid tools to fit a cuboid around objects in the 3D point cloud that this category applies to. After you place a cuboid, you can modify its dimensions, location, and orientation directly in the point cloud, and the three panels shown on the right.

If you see one or more images in your worker portal, you can also modify cuboids in the images or in the 3D point cloud and the edits will show up in the other medium.

If you see cuboids have already been added to the 3D point cloud when you open your task, adjust those cuboids and add additional cuboids as needed.

To edit a cuboid, including moving, re-orienting, and changing cuboid dimensions, you must use shortcut keys. You can see a full list of shortcut keys in the **Shortcuts** menu in your UI. The following are important key-combinations that you should become familiar with before starting your labeling task.

<table>
<thead>
<tr>
<th>Mac Command</th>
<th>Windows Command</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cmd + Drag</td>

<td>Alt + G</td>
<td>Set the cuboid to the ground.</td>
</tr>
</tbody>
</table>

Individual labels may have one or more label attributes. If a label has a label attribute associated with it, it will appear when you select the downward pointing arrow next to the label from the Label Id menu. Fill in required values for all label attributes.

You may see frame attributes under the Labels menu. Use these attribute prompts to enter additional information about each frame.
Navigate the UI

You can navigate in the 3D scene using your keyboard and mouse. You can:

- Double click on specific objects in the point cloud to zoom into them.
- You can use the [ and ] keys on your keyboard to zoom into and move from one label to the next. If no label is selected, when you select [ or ], the UI will zoom into the first label in the Label ID list.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

Once you place a cuboids in the 3D scene, a side-view will appear with three projected views: top, side, and back. These side-views show points in and around the placed cuboid and help workers refine cuboid boundaries in that area. Workers can zoom in and out of each of those side-views using their mouse.

The following video demonstrates movements around the 3D point cloud and in the side-view.
When you are in the worker UI, you see the following menus:

- **Instructions** – Review these instructions before starting your task.
- **Shortcuts** – Use this menu to view keyboard shortcuts that you can use to navigate the point cloud and use the annotation tools provided.
- **Label** – Use this menu to modify a cuboid. First, select a cuboid, and then choose an option from this menu. This menu includes assistive labeling tools like setting a cuboid to the ground and automatically fitting the cuboid to the object’s boundaries.
- **View** – Use this menu to toggle different view options on and off. For example, you can use this menu to add a ground mesh to the point cloud, and to choose the projection of the point cloud.
- **3D Point Cloud** – Use this menu to add additional attributes to the points in the point cloud, such as color, and pixel intensity. Note that these options may not be available.

When you open a task, the move scene icon is on, and you can move around the point cloud using your mouse and the navigation buttons in the point cloud area of the screen. To return to the original view you see when you first opened the task, choose the reset scene icon. Resetting the view will not modify your annotations.

After you select the add cuboid icon, you can add cuboids to the 3D point cloud visualization. Once you've added a cuboid, you can adjust it in the three views (top, side, and front) and in the images (if included).
Double click on the point cloud to zoom in
Double click on the label ID to zoom in the object on point cloud.

3D Cuboid Controls
When you are in Edit Cuboid mode

- **C** Create
- **V** Edit
- **Cmd + Drag** Change dimension
- **Option + Drag** Move cuboid
- **Option + O** Fit label to points
- **Option + G** Set to ground
- **Shift + Drag** Rotate cuboid
- **[]** Previous label
- **]]** Next label
- **Cmd + ,** Toggle show/hide label
You must choose the move scene icon again to move to another area in the 3D point cloud or image.

To collapse all panels on the right and make the 3D point cloud full-screen, choose the full screen icon.

If camera images are included, you may have the following view options:

- **C** – View the camera angle on point cloud view.
- **F** – View the frustum, or field of view, of the camera used to capture that image on point cloud view.
- **P** – View the point cloud overlaid on the image.
- **B** – View cuboids in the image.

The following video demonstrates how to use these view options. The **F** option is used to view the field of view of the camera (the gray area), the **C** options shows the direction the camera is facing and angle of the camera (blue lines), and the **B** option is used to view the cuboid.
**Icon Guide**

Use this table to learn about the icons you see in your worker task portal.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Add Cuboid Icon" /></td>
<td><strong>add cuboid</strong> Choose this icon to add a cuboid. Each cuboid you add is associated with the category you chose.</td>
</tr>
<tr>
<td><img src="image" alt="Edit Cuboid Icon" /></td>
<td><strong>edit cuboid</strong> Choose this icon to edit a cuboid. After you have added a cuboid, you can edit its dimensions, location, and orientation. After a cuboid is added, it automatically switches to edit cuboid mode.</td>
</tr>
</tbody>
</table>
| ![Measuring Tool Icon](image) | **ruler** Use this icon to measure distances, in meters, in the point cloud. You may want to use this tool if your instructions ask you to annotate all objects in a given distance from the center of the cuboid or the object used to capture data.  
When you select this icon, you can place the starting point (first marker) anywhere in the point cloud by selecting it with your mouse. The tool will automatically use interpolation to place a marker on the closest point within threshold distance to the location you select, otherwise the marker will be placed on ground. If you place a starting point by mistake, you can use the Escape key to revert marker placement.  
After you place the first marker, you see a dotted line and a dynamic label that indicates the distance you have moved away from the first marker. Click somewhere else on the point cloud to place a second marker. When you place the second marker, the dotted line becomes solid, and the distance is set.  
After you set a distance, you can edit it by selecting either marker. You can delete a ruler by selecting anywhere on the ruler and using the Delete key on your keyboard. |
<p>| <img src="image" alt="Reset Scene Icon" /> | <strong>reset scene</strong> Choose this icon to reset the view of the point cloud, side panels, and if applicable, all images to their original position when the task was first opened.                                               |
| <img src="image" alt="Move Scene Icon" /> | <strong>move scene</strong> Choose this icon to move the scene. By default, this icon is chosen when you first start a task.                                                                                                   |</p>

**Shortcuts**

The shortcuts listed in the **Shortcuts** menu can help you navigate the 3D point cloud and use tools to add and edit cuboids.

Before you start your task, it is recommended that you review the **Shortcuts** menu and become acquainted with these commands. You need to use some of the 3D cuboid controls to edit your cuboid.

**Release, Stop and Resume, and Decline Tasks**

When you open the labeling task, three buttons on the top right allow you to decline the task (**Decline task**), release it (**Release task**), and stop and resume it at a later time (**Stop and resume later**). The following list describes what happens when you select one of these options:

- **Decline task**: You should only decline a task if something is wrong with the task, such as an issue with the 3D point cloud, images or the UI. If you decline a task, you will not be able to return to the task.

- **Release Task**: If you release a task, you loose all work done on that task. When the task is released, other workers on your team can pick it up. If enough workers pick up the task, you may not be able to return to it. When you select this button and then select **Confirm**, you are returned to the worker portal. If the task is still available, its status will be **Available**. If other workers pick it up, it will disappear from your portal.

- **Stop and resume later**: You can use the **Stop and resume later** button to stop working and return to the task at a later time. You should use the **Save** button to save your work before you select **Stop and resume later**. When you select this button and then select **Confirm**, you are returned to the worker portal, and the task status is **Stopped**. You can select the same task to resume work on it.

Be aware that the person that creates your labeling tasks specifies a time limit in which all tasks must be completed by. If you do not return to and complete this task within that time limit, it will expire and your work will not be submitted. Contact your administrator for more information.
Saving Your Work and Submitting

You should periodically save your work. Ground Truth will automatically save your work every 15 minutes.

When you open a task, you must complete your work on it before pressing Submit.

3D Point Cloud Object Tracking

Use this page to become familiar with the user interface and tools available to complete your 3D point cloud object detection task.

Topics

• Your Task (p. 310)
• Navigate the UI (p. 314)
• Bulk Edit Label Category and Frame Attributes (p. 318)
• Icon Guide (p. 319)
• Shortcuts (p. 320)
• Release, Stop and Resume, and Decline Tasks (p. 320)
• Saving Your Work and Submitting (p. 321)

Your Task

When you work on a 3D point cloud object tracking task, you need to select a category from the Annotations menu on the right side of your worker portal using the Label Categories menu. After you've selected a category, use the add cuboid and fit cuboid tools to fit a cuboid around objects in the 3D point cloud that this category applies to. After you place a cuboid, you can modify its location, dimensions, and orientation directly in the point cloud, and the three panels shown on the right. If you see one or more images in your worker portal, you can also modify cuboids in the images or in the 3D point cloud and the edits will show up in the other medium.

Important

If you see cuboids have already been added to the 3D point cloud frames when you open your task, adjust those cuboids and add additional cuboids as needed.

To edit a cuboid, including moving, re-orienting, and changing cuboid dimensions, you must use shortcut keys. You can see a full list of shortcut keys in the Shortcuts menu in your UI. The following are important key-combinations that you should become familiar with before starting your labeling task.

<table>
<thead>
<tr>
<th>Mac Command</th>
<th>Windows Command</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cmd + Drag</td>
<td>Ctrl + Drag</td>
<td>Modify the dimensions of the cuboid.</td>
</tr>
<tr>
<td>Option + Drag</td>
<td>Alt + Drag</td>
<td>Move the cuboid.</td>
</tr>
<tr>
<td>Shift + Drag</td>
<td>Shift + Drag</td>
<td>Rotate the cuboid.</td>
</tr>
<tr>
<td>Option + O</td>
<td>Alt + O</td>
<td>Fit the cuboid tightly around the points it has been drawn around. Before using the option, make sure the cuboid fully-surrounds the object of interest.</td>
</tr>
<tr>
<td>Option + G</td>
<td>Alt + G</td>
<td>Set the cuboid to the ground.</td>
</tr>
</tbody>
</table>
When you open your task, two frames will be loaded. If your task includes more than two frames, you need to use the navigation bar in the lower-left corner, or the load frames icon to load additional frames. You should annotate and adjust labels in all frames before submitting.

After you fit a cuboid tightly around the boundaries of an object, navigate to another frame using the navigation bar in the lower-left corner of the UI. If that same object has moved to a new location, add another cuboid and fit it tightly around the boundaries of the object. Each time you manually add a cuboid, you see the frame sequence bar in the lower-left corner of the screen turn red where that frame is located temporally in the sequence.

Your UI automatically infers the location of that object in all other frames after you've placed a cuboid. This is called interpolation. You can see the movement of that object, and the inferred and manually created cuboids using the arrows. Adjust inferred cuboids as needed. The following video demonstrates how to navigate between frames. The following video shows how, if you add a cuboid in one frame, and then adjust it in another, your UI will automatically infer the location of the cuboid in all of the frames in-between.
**Tip**

You can turn off the automatic cuboid interpolation across frames using the 3D Point Cloud menu item. Select **3D Point Cloud** from the top-menu, and then select **Interpolate Cuboids Across Frames**. This will uncheck this option and stop cuboid interpolation. You can reselect this item to turn cuboid interpolation back on.

Turning cuboid interpolation off will not impact cuboids that have already been interpolated across frames.

Individual labels may have one or more label attributes. If a label has a label attribute associated with it, it will appear when you select the downward pointing arrow next to the label from the **Label Id** menu. Fill in required values for all label attributes.

You may see frame attributes under the **Label Id** menu. These attributes will appear on each frame in your task. Use these attribute prompts to enter additional information about each frame.
Navigate the UI

You can navigate in the 3D scene using your keyboard and mouse. You can:

- Double click on specific objects in the point cloud to zoom into them.
- You can use the [ and ] keys on your keyboard to zoom into and move from one label to the next. If no label is selected, when you select [ or ], the UI will zoom into the first label in the Label Id list.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

Once you place a cuboids in the 3D scene, a side-view will appear with three projected views: top, side, and back. These side-views show points in and around the placed cuboid and help workers refine cuboid boundaries in that area. Workers can zoom in and out of each of those side-views using their mouse.

The following video demonstrates movements around the 3D point cloud and in the side-view.
When you are in the worker UI, you see the following menus:

- **Instructions** – Review these instructions before starting your task.
- **Shortcuts** – Use this menu to view keyboard shortcuts that you can use to navigate the point cloud and use the annotation tools provided.
- **Label** – Use this menu to modify a cuboid. First, select a cuboid, and then choose an option from this menu. This menu includes assistive labeling tools like setting a cuboid to the ground and automatically fitting the cuboid to the object’s boundaries.
- **View** – Use this menu to toggle different view options on and off. For example, you can use this menu to add a ground mesh to the point cloud, and to choose the projection of the point cloud.
- **3D Point Cloud** – Use this menu to add additional attributes to the points in the point cloud, such as color, and pixel intensity. Note that these options may not be available.

When you open a task, the move scene icon is on, and you can move around the point cloud using your mouse and the navigation buttons in the point cloud area of the screen. To return to the original view you see when you first opened the task, choose the reset scene icon.

After you select the add cuboid icon, you can add cuboids to the point cloud and images (if included). You must select the move scene icon again to move to another area in the 3D point cloud or image.

To collapse all panels on the right and make the 3D point cloud full-screen, choose the full screen icon.

If camera images are included, you may have the following view options:

- **C** – View the camera angle on point cloud view.
- **F** – View the frustum, or field of view, of the camera used to capture that image on point cloud view.
- **P** – View the point cloud overlaid on the image.
- **B** – View cuboids in the image.

The following video demonstrates how to use these view options. The F option is used to view the field of view of the camera (the gray area), the C options shows the direction the camera is facing and angle of the camera (blue lines), and the B option is used to view the cuboid.
Delete Cuboids

You can select a cuboid or label ID and:

• Delete an individual cuboid in the current frame you are viewing.
• Delete all cuboids with that label ID before or after the frame you are viewing.
• Delete all cuboids with that label ID in all frames.

A common use-case for cuboid deletion is if the object leaves the scene.

You can use one or more of these options to delete both manually placed and interpolated cuboids with the same label ID.

• To delete all cuboids before or after the frame you are currently on, select the cuboid, select the Label menu item at the top of the UI and then select one of Delete in previous frames or Delete in next frames. Use the Shortcuts menu to see the shortcut keys you can use for these options.
• To delete a label in all frames, select Delete in all frames from the Labels menu, or use the shortcut Shift + Delete on your keyboard.
• To delete an individual cuboid from a single frame, select the cuboid and either select the trashcan icon (Trash) next to that label ID in the Label ID sidebar on the right or use the Delete key on your keyboard to delete that cuboid.

If you have manually placed more than one cuboid with the same label in different frames, when you delete one of the manually placed cuboids, all interpolated cuboids adjust. This adjustment happens because the UI uses manually placed cuboids as anchor points when calculating the location of interpolated cuboid. When you remove one of these anchor points, the UI must recalculate the position of interpolated cuboids.

If you delete a cuboid from a frame, but later decide that you want to get it back, you can use the Duplicate to previous frames or Duplicate to next frames options in the Label menu to copy the cuboid into all the previous or all of the following frames, respectively.

Bulk Edit Label Category and Frame Attributes

You can bulk edit label attributes and frame attributes.

When you bulk edit an attribute, you specify one or more ranges of frames that you want to apply the edit to. The attribute you select is edited in all frames in that range, including the start and end frames you specify. When you bulk edit label attributes, the range you specify must contain the label that the label attribute is attached to. If you specify frames that do not contain this label, you will receive an error.

To bulk edit an attribute you must specify the desired value for the attribute first. For example, if you want to change an attribute from Yes to No, you must select No, and then perform the bulk edit.

You can also specify a new value for an attribute that has not been filled in and then use the bulk edit feature to fill in that value in multiple frames. To do this, select the desired value for the attribute and complete the following procedure.

To bulk edit a label or attribute:

1. Use your mouse to right click the attribute you want to bulk edit.
2. Specify the range of frames you want to apply the bulk edit to using a dash (-) in the text box. For example, if you want to apply the edit to frames one through ten, enter 1–10. If you want to apply the edit to frames two to five, eight to ten and twenty enter 2–5, 8–10, 20.
3. Select Confirm.
If you get an error message, verify that you entered a valid range and that the label associated with the label attribute you are editing (if applicable) exists in all frames specified.

You can quickly add a label to all previous or subsequent frames using the **Duplicate to previous frames** and **Duplicate to next frames** options in the **Label** menu at the top of your screen.

**Icon Guide**

Use this table to learn about the icons you see in your worker task portal.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="add cuboid" /></td>
<td>Choose this icon to add a cuboid. Each cuboid you add is associated with the category you chose.</td>

</tbody>
</table>

**Shortcuts**

The shortcuts listed in the **Shortcuts** menu can help you navigate the 3D point cloud and use tools to add and edit cuboids.

Before you start your task, it is recommended that you review the **Shortcuts** menu and become acquainted with these commands. You need to use some of the 3D cuboid controls to edit your cuboid.

**Release, Stop and Resume, and Decline Tasks**

When you open the labeling task, three buttons on the top right allow you to decline the task (**Decline task**), release it (**Release task**), and stop and resume it at a later time (**Stop and resume later**). The following list describes what happens when you select one of these options:

- **Decline task**: You should only decline a task if something is wrong with the task, such as an issue with the 3D point clouds, images or the UI. If you decline a task, you will not be able to return to the task.
- **Release Task**: Use this option to release a task and allow others to work on it. When you release a task, you lose all work done on that task and other workers on your team can pick it up. If enough workers pick up the task, you may not be able to return to it. When you select this button and then select **Confirm**, you are returned to the worker portal. If the task is still available, its status will be **Available**. If other workers pick it up, it will disappear from your portal.
- **Stop and resume later**: You can use the **Stop and resume later** button to stop working and return to the task at a later time. You should use the **Save** button to save your work before you select **Stop and resume later**. When you select this button and then select **Confirm**, you are returned to the worker portal, and the task status is **Stopped**. You can select the same task to resume work on it.
Be aware that the person that creates your labeling tasks specifies a time limit in which all tasks much be completed by. If you do not return to and complete this task within that time limit, it will expire and your work will not be submitted. Contact your administrator for more information.

Saving Your Work and Submitting

You should periodically save your work. Ground Truth will automatically save your work every 15 minutes. When you open a task, you must complete your work on it before pressing Submit.

Verify and Adjust Labels

When the labels on a dataset need to be validated, Amazon SageMaker Ground Truth provides functionality to have workers verify that labels are correct or to adjust previous labels.

These types of jobs fall into two distinct categories:

- **Label verification** — Workers indicate if the existing labels are correct, or rate their quality, and can add comments to explain their reasoning. Workers will not be able to modify or adjust labels.

  If you create a 3D point cloud or video frame label adjustment or verification job, you can choose to make label category attributes (not supported for 3D point cloud semantic segmentation) and frame attributes editable by workers.

- **Label adjustment** — Workers adjust prior annotations and, if applicable, label category and frame attributes to correct them.

The following Ground Truth built-in task types support adjustment and verification labeling jobs:

- Bounding box
- Semantic segmentation
- 3D point cloud object detection, 3D point cloud object tracking, and 3D point cloud semantic segmentation
- All video frame object detection and video frame object tracking task types — bounding box, polyline, polygon and keypoint

**Tip**

For 3D point cloud and video frame labeling verification jobs, it is recommended that you add new label category attributes or frame attributes to the labeling job. Workers can use these attribute to verify individual labels or the entire frame. To learn more about label category and frame attributes, see [Worker User Interface (UI) (p. 288)](https://docs.aws.amazon.com/sagemaker/latest/dg/worker-user-interface.html) for 3D point cloud and [Worker User Interface (UI) (p. 240)](https://docs.aws.amazon.com/sagemaker/latest/dg/worker-user-interface-video-frame.html) for video frame.

You can start a label verification and adjustment jobs using the SageMaker console or the API.

- Cautions and Considerations (p. 328)
Requirements to Create Verification and Adjustment Labeling Jobs

To create a label verification or adjustment job, the following criteria must be satisfied.

- For non streaming labeling jobs: The input manifest file you use must contain the label attribute name (LabelAttributeName) of the labels that you want adjusted. When you chain a successfully completed labeling job, the output manifest file is used as the input manifest file for the new, chained job. To learn more about the format of the output manifest file Ground Truth produces for each task type, see Output Data (p. 433).

For streaming labeling jobs: The Amazon SNS message you sent to the Amazon SNS input topic of the adjustment or verification labeling job must contain the label attribute name of the labels you want adjusted or verified. To see an example of how you can create an adjustment or verification labeling job with streaming labeling jobs, see this Jupyter Notebook example in GitHub.

- The task type of the verification or adjustment labeling job must be the same as the task type of the original job unless you are using the Image Label Verification (p. 214) task type to verify bounding box or semantic segmentation image labels. See the next bullet point for more details about the video frame task type requirements.

- For video frame annotation verification and adjustment jobs, you must use the same annotation task type used to create the annotations from the previous labeling job. For example, if you create a video frame object detection job to have workers draw bounding boxes around objects, and then you create a video object detection adjustment job, you must specify bounding boxes as the annotation task type. To learn more video frame annotation task types, see Task Types (p. 239).

- The task type you select for the adjustment or verification labeling job must support an audit workflow. The following Ground Truth built-in task types support adjustment and verification labeling jobs: bounding box, semantic segmentation, 3D point cloud object detection, 3D point cloud object tracking, and 3D point cloud semantic segmentation, and all video frame object detection and video frame object tracking task types — bounding box, polyline, polygon and keypoint.

Create a Label Verification Job (Console)

Bounding box and semantic segmentation labeling jobs are created by choosing the Label verification task type in the console. To create a verification job for 3D point cloud and video frame task types, you must choose the same task type as the original labeling job and choose to display existing labels. Use one of the following sections to create a label verification job for your task type.

Topics

- Create an Image Label Verification Job (Console) (p. 322)
- Create a Point Cloud or Video Frame Label Verification Job (Console) (p. 323)

Create an Image Label Verification Job (Console)

Use the following procedure to create a bounding box or semantic segmentation verification job using the console. This procedure assumes that you have already created a bounding box or semantic segmentation labeling job and its status is Complete. This the labeling job that produces the labels you want verified.

To create an image label verification job:

2. Start a new labeling job by chaining (p. 465) a prior job or start from scratch, specifying an input manifest that contains labeled data objects.
3. In the **Task type** pane, select **Label verification**.

4. Choose **Next**.

5. In the **Workers** section, choose the type of workforce you would like to use. For more details about your workforce options see [Create and Manage Workforces](#) (p. 485).

6. (Optional) After you've selected your workforce, specify the **Task timeout** and **Task expiration time**.

7. In the **Existing-labels display options** pane, the system shows the available label attribute names in your manifest. Choose the label attribute name that identifies the labels that you want workers to verify. Ground Truth tries to detect and populate these values by analyzing the manifest, but you might need to set the correct value.

8. Use the instructions areas of the tool designer to provide context about what the previous labelers were asked to do and what the current verifiers need to check.

   You can add new labels that workers choose from to verify labels. For example, you can ask workers to verify the image quality, and provide the labels **Clear** and **Blurry**. Workers will also have the option to add a comment to explain their selection.

9. Choose **See preview** to check that the tool is displaying the prior labels correctly and presents the label verification task clearly.

10. Select **Create**. This will create and start your labeling job.

---

### Create a Point Cloud or Video Frame Label Verification Job (Console)

Use the following procedure to create a 3D point cloud or video frame verification job using the console. This procedure assumes that you have already created a labeling job using the task type that produces the types of labels you want to be verified and its status is Complete.

**To create an image label verification job:**

2. Start a new labeling job by **chaining** (p. 465) a prior job or start from scratch, specifying an input manifest that contains labeled data objects.

3. In the **Task type** pane, select the same task type as the labeling job that you chained. For example, if the original labeling job was a video frame object detection keypoint labeling job, select that task type.

4. Choose **Next**.

5. In the **Workers** section, choose the type of workforce you would like to use. For more details about your workforce options see [Create and Manage Workforces](#) (p. 485).

6. (Optional) After you've selected your workforce, specify the **Task timeout** and **Task expiration time**.

7. Toggle on the switch next to **Display existing labels**.

8. Select **Verification**.

9. For **Label attribute name**, choose the name from your manifest that corresponds to the labels that you want to display for verification. You will only see label attribute names for labels that match the task type you selected on the previous screen. Ground Truth tries to detect and populate these values by analyzing the manifest, but you might need to set the correct value.

10. Use the instructions areas of the tool designer to provide context about what the previous labelers were asked to do and what the current verifiers need to check.

   You cannot modify or add new labels. You can remove, modify and add new label category attributes or frame attributes. It is recommended that you add new label category attributes or frame attributes to the labeling job. Workers can use these attribute to verify individual labels or the entire frame.
By default, preexisting label category attributes and frame attributes will not be editable by workers. If you want to make a label category or frame attribute editable, select the **Allow workers to edit this attribute** check box for that attribute.

To learn more about label category and frame attributes, see *Worker User Interface (UI)* (p. 288) for 3D point cloud and *Worker User Interface (UI)* (p. 240) for video frame.

11. Choose **See preview** to check that the tool is displaying the prior labels correctly and presents the label verification task clearly.

12. Select **Create**. This will create and start your labeling job.

### Create a Label Adjustment Job (Console)

Use one of the following sections to create a label verification job for your task type.

**Topics**
- Create an Image Label Adjustment Job (Console) (p. 324)
- Create a Point Cloud or Video Frame Label Adjustment Job (Console) (p. 325)

### Create an Image Label Adjustment Job (Console)

Use the following procedure to create a bounding box or semantic segmentation adjustment labeling job using the console. This procedure assumes that you have already created a bounding box or semantic segmentation labeling job and its status is Complete. This the labeling job that produces the labels you want adjusted.

**To create an image label adjustment job (console)**

2. Start a new labeling job by chaining (p. 465) a prior job or start from scratch, specifying an input manifest that contains labeled data objects.
3. Choose the same task type as the original labeling job.
4. Choose **Next**.
5. In the **Workers** section, choose the type of workforce you would like to use. For more details about your workforce options see *Create and Manage Workforces* (p. 485).
6. (Optional) After you've selected your workforce, specify the **Task timeout** and **Task expiration time**.
7. Expand **Existing-labels display options** by selecting the arrow next to the title.
8. Check the box next to **I want to display existing labels from the dataset for this job**.
9. For **Label attribute name**, choose the name from your manifest that corresponds to the labels that you want to display for adjustment. You will only see label attribute names for labels that match the task type you selected on the previous screen. Ground Truth tries to detect and populate these values by analyzing the manifest, but you might need to set the correct value.
10. Use the instructions areas of the tool designer to provide context about what the previous labelers were tasked with doing and what the current verifiers need to check and adjust.
11. Choose **See preview** to check that the tool shows the prior labels correctly and presents the task clearly.
12. Select **Create**. This will create and start your labeling job.
Create a Point Cloud or Video Frame Label Adjustment Job (Console)

Use the following procedure to create a 3D point cloud or video frame adjustment job using the console. This procedure assumes that you have already created a labeling job using the task type that produces the types of labels you want to be verified and its status is Complete.

To create a 3D point cloud or video frame label adjustment job (console)

2. Start a new labeling job by chaining (p. 465) a prior job or start from scratch, specifying an input manifest that contains labeled data objects.
3. Choose the same task type as the original labeling job.
4. Toggle on the switch next to Display existing labels.
5. Select Adjustment.
6. For Label attribute name, choose the name from your manifest that corresponds to the labels that you want to display for adjustment. You will only see label attribute names for labels that match the task type you selected on the previous screen. Ground Truth tries to detect and populate these values by analyzing the manifest, but you might need to set the correct value.
7. Use the instructions areas of the tool designer to provide context about what the previous labelers were asked to do and what the current adjusters need to check.

You cannot remove or modify existing labels but you can add new labels. You can remove, modify and add new label category attributes or frame attributes.

Be default, preexisting label category attributes and frame attributes will be editable by workers. If you want to make a label category or frame attribute uneditable, deselect the Allow workers to edit this attribute check box for that attribute.

To learn more about label category and frame attributes, see Worker User Interface (UI) (p. 288) for 3D point cloud and Worker User Interface (UI) (p. 240) for video frame.

8. Choose See preview to check that the tool shows the prior labels correctly and presents the task clearly.
9. Select Create. This will create and start your labeling job.

Start a Label Verification or Adjustment Job (API)

Start a label verification or adjustment job by chaining a successfully completed job or starting a new job from scratch using the CreateLabelingJob operation. The procedure is almost the same as setting up a new labeling job with CreateLabelingJob, with a few modifications. Use the following sections to learn what modifications are required to chain a labeling job to create an adjustment or verification labeling job.

When you create an adjustment or verification labeling job using the Ground Truth API, you must use a different LabelAttributeName than the original labeling job. The original labeling job is the job used to create the labels you want adjusted or verified.

Important
The label category configuration file you identify for an adjustment or verification job in LabelCategoryConfigS3Uri of CreateLabelingJob must contain the same labels used in the original labeling job. You can add new labels. For 3D point cloud and video frame jobs, you can add new label category and frame attributes to the label category configuration file.
Bounding Box and Semantic Segmentation

To create a bounding box or semantic segmentation label verification or adjustment job, use the following guidelines to specify API attributes for the CreateLabelingJob operation.

- Use the LabelAttributeName parameter to specify the output label name that you want to use for verified or adjusted labels. You must use a different LabelAttributeName than the one used for the original labeling job.
- If you are chaining the job, the labels from the previous labeling job to be adjusted or verified will be specified in the custom UI template. To learn how to create a custom template, see Create Custom Worker Task Templates (p. 2456).

Identify the location of the UI template in the UiTemplateS3Uri parameter. SageMaker provides widgets that you can use in your custom template to display old labels. Use the initial-value attribute in one of the following crowd elements to extract the labels that need verification or adjustment and include them in your task template:

- crowd-semantic-segmentation (p. 570)—Use this crowd element in your custom UI task template to specify semantic segmentation labels that need to be verified or adjusted.
- crowd-bounding-box (p. 516)—Use this crowd element in your custom UI task template to specify bounding box labels that need to be verified or adjusted.

- The LabelCategoryConfigS3Uri parameter must contain the same label categories as the previous labeling job.
- Use the bounding box or semantic segmentation adjustment or verification lambda ARNs for PreHumanTaskLambdaArn and AnnotationConsolidationLambdaArn:
  - For bounding box, the adjustment labeling job lambda function ARNs end with AdjustmentBoundingBox and the verification lambda function ARNs end with VerificationBoundingBox.
  - For semantic segmentation, the adjustment labeling job lambda function ARNs end with AdjustmentSemanticSegmentation and the verification lambda function ARNs end with VerificationSemanticSegmentation.

3D Point Cloud and Video Frame

- Use the LabelAttributeName parameter to specify the output label name that you want to use for verified or adjusted labels. You must use a different LabelAttributeName than the one used for the original labeling job.
- You must use the human task UI Amazon Resource Name (ARN) (HumanTaskUiArn) used for the original labeling job. To see supported ARNs, see HumanTaskUiArn.
- In the label category configuration file, you must specify the label attribute name (LabelAttributeName) of the previous labeling job that you use to create the adjustment or verification labeling job in the auditLabelAttributeName parameter.
- You specify whether your labeling job is a verification or adjustment labeling job using the editsAllowed parameter in your label category configuration file identified by the LabelCategoryConfigS3Uri parameter.
  - For verification labeling jobs, you must use the editsAllowed parameter to specify that all labels cannot be modified. editsAllowed must be set to "none" in each entry in labels. Optionally, you can specify whether or not label categories attributes and frame attributes can be adjusted by workers.
  - Optionally, for adjustment labeling jobs, you can use the editsAllowed parameter to specify labels, label category attributes, and frame attributes that can or cannot be modified by workers. If you do not use this parameter, all labels, label category attributes, and frame attributes will be adjustable.
To learn more about the `editsAllowed` parameter and configuring your label category configuration file, see Label Category Configuration File Schema (p. 377).

- Use the 3D point cloud or video frame adjustment lambda ARNs for `PreHumanTaskLambdaArn` and `AnnotationConsolidationLambdaArn` for both adjustment and verification labeling jobs:
  - For 3D point clouds, the adjustment and verification labeling job lambda function ARNs end with `Adjustment3DPointCloudSemanticSegmentation`, `Adjustment3DPointCloudObjectTracking`, and `Adjustment3DPointCloudObjectDetection` for 3D point cloud semantic segmentation, object detection, and object tracking respectively.
  - For video frames, the adjustment and verification labeling job lambda function ARNs end with `AdjustmentVideoObjectDetection` and `AdjustmentVideoObjectTracking` for video frame object detection and object tracking respectively.

Ground Truth stores the output data from a label verification or adjustment job in the S3 bucket that you specified in the `S3OutputPath` parameter of the `CreateLabelingJob` operation. For more information about the output data from a label verification or adjustment labeling job, see Label Verification and Adjustment Data in the Output Manifest (p. 327).

### Label Verification and Adjustment Data in the Output Manifest

Amazon SageMaker Ground Truth writes label verification data to the output manifest within the metadata for the label. It adds two properties to the metadata:

- A `type` property, with a value of "groundtruth/label-verification.
- A worker-feedback property, with an array of comment values. This property is added when the worker enters comments. If there are no comments, the field doesn’t appear.

The following example output manifest shows how label verification data appears:

```json
{
  "source-ref":"S3 bucket location",
  "verify-bounding-box":"1",
  "verify-bounding-box-metadata":
  {
    "class-name": "bad",
    "confidence": 0.93,
    "type": "groundtruth/label-verification",
    "job-name": "verify-bounding-boxes",
    "human-annotated": "yes",
    "creation-date": "2018-10-18T22:18:13.527256",
    "worker-feedback": [
      {"comment": "The bounding box on the bird is too wide on the right side."},
      {"comment": "The bird on the upper right is not labeled."}
    ]
  }
}
```

The worker output of adjustment tasks resembles the worker output of the original task, except that it contains the adjusted values and an `adjustment-status` property with the value of `adjusted` or `unadjusted` to indicate whether an adjustment was made.

For more examples of the output of different tasks, see Output Data (p. 433).
Cautions and Considerations

To get expected behavior when creating a label verification or adjustment job, carefully verify your input data.

- If you are using image data, verify that your manifest file contains hexadecimal RGB color information.
- To save money on processing costs, filter your data to ensure you are not including unwanted objects in your labeling job input manifest.
- Add required Amazon S3 permissions to ensure your input data is processed correctly.

When you create an adjustment or verification labeling job using the Ground Truth API, you must use a different LabelAttributeName than the original labeling job.

Color Information Requirements for Semantic Segmentation Jobs

To properly reproduce color information in verification or adjustment tasks, the tool requires hexadecimal RGB color information in the manifest (for example, #FFFFFF for white). When you set up a Semantic Segmentation verification or adjustment job, the tool examines the manifest to determine if this information is present. If it can't find it, Amazon SageMaker Ground Truth displays an error message and the ends job setup.

In prior iterations of the Semantic Segmentation tool, category color information wasn't output in hexadecimal RGB format to the output manifest. That feature was introduced to the output manifest at the same time the verification and adjustment workflows were introduced. Therefore, older output manifests aren't compatible with this new workflow.

Filter Your Data Before Starting the Job

Amazon SageMaker Ground Truth processes all objects in your input manifest. If you have a partially labeled data set, you might want to create a custom manifest using an Amazon S3 Select query on your input manifest. Unlabeled objects individually fail, but they don't cause the job to fail, and they might incur processing costs. Filtering out objects you don't want verified reduces your costs.

If you create a verification job using the console, you can use the filtering tools provided there. If you create jobs using the API, make filtering your data part of your workflow where needed.

Creating Custom Labeling Workflows

This document guides you through the process of setting up a workflow with a custom labeling template. For more information about starting a labeling job, see Getting started (p. 190). In that section, when you choose the Task type, select Custom labeling task, and then follow this section's instructions to configure it.

Topics

- Step 1: Setting up your workforce (p. 329)
- Step 2: Creating your custom worker task template (p. 329)
- Step 3: Processing with AWS Lambda (p. 335)
- Demo Template: Annotation of Images with crowd-bounding-box (p. 349)
- Demo Template: Labeling Intents with crowd-classifier (p. 354)
- Custom Workflows via the API (p. 360)
Step 1: Setting up your workforce

In this step you use the console to establish which worker type to use and make the necessary sub-
selections for the worker type. It assumes you have already completed the steps up to this point in the
Getting started (p. 190) section and have chosen the Custom labeling task as the Task type.

To configure your workforce.

1. First choose an option from the Worker types. There are three types currently available:
   - **Public** uses an on-demand workforce of independent contractors, powered by Amazon Mechanical
     Turk. They are paid on a per-task basis.
   - **Private** uses your employees or contractors for handling data that needs to stay within your
     organization.
   - **Vendor** uses third party vendors that specialize in providing data labeling services, available via
     the AWS Marketplace.

2. If you choose the Public option, you are asked to set the number of workers per dataset object.
   Having more than one worker perform the same task on the same object can help increase the
   accuracy of your results. The default is three. You can raise or lower that depending on the accuracy
   you need.

   You are also asked to set a price per task by using a drop-down menu. The menu recommends price
   points based on how long it will take to complete the task.

   The recommended method to determine this is to first run a short test of your task with a private
   workforce. The test provides a realistic estimate of how long the task takes to complete. You can
   then select the range your estimate falls within on the Price per task menu. If your average time is
   more than 5 minutes, consider breaking your task into smaller units.

Next

Step 2: Creating your custom worker task template (p. 329)

Step 2: Creating your custom worker task template

A worker task template is a file used by Ground Truth to customize the worker user interface (UI), or
human task UI. You can create a worker task template using HTML, CSS, JavaScript, Liquid template
language, and Crowd HTML Elements. Liquid is used to automate the template, and Crowd HTML
Elements can be used to include common annotation tools and provide the logic to submit to Ground
Truth.

- Starting with a base template (p. 330)
- Developing templates locally (p. 330)
- Using External Assets (p. 330)
- Track your variables (p. 330)
- A simple sample (p. 331)
- Adding automation with Liquid (p. 332)
- End-to-end demos (p. 335)
- Next (p. 335)

Use the following topics to learn how you can create a worker task template. You can see a repository of
example Ground Truth worker task templates on GitHub.
Starting with a base template

You can use a template editor in the Ground Truth console to start creating a template. This editor includes a number of pre-designed base templates and an HTML and Crowd HTML Element autofill feature.

To access the Ground Truth custom template editor:

1. Following the instructions in Create a Labeling Job (Console) (p. 364) and select Custom for the labeling job Task type.
2. When you select Next, you will be able to access the template editor and base templates in the Custom labeling task setup section.
3. (Optional) Select a base template from the drop-down menu under Templates. If you prefer to create a template from scratch, choose Custom from the drop down-menu for a minimal template skeleton.

Developing templates locally

While you need to be in the console to test how your template will process incoming data, you can test the look and feel of your template's HTML and custom elements in your browser by adding this code to the top of your HTML file.

Example

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
```

This loads the necessary code to render the custom HTML elements. Use this if you want to develop your template's look and feel in your preferred editor rather than in the console.

Remember, though, this will not parse your variables. You may want to replace them with sample content while developing locally.

Using External Assets

Amazon SageMaker Ground Truth custom templates allow external scripts and style sheets to be embedded. For example, the following code block demonstrates how you would add a style sheet located at https://www.example.com/my-enhancement-styles.css to your template.

Example

```html
<script src="https://www.example.com/my-enhancement-script.js"></script>
<link rel="stylesheet" type="text/css" href="https://www.example.com/my-enhancement-styles.css">
```

If you encounter errors, ensure that your originating server is sending the correct MIME type and encoding headers with the assets.

For example, the MIME and encoding types for remote scripts are: application/javascript;CHARSET=UTF-8.

The MIME and encoding type for remote stylesheets are: text/css;CHARSET=UTF-8.

Track your variables

In the process of building the sample below, there will be a step that adds variables to it to represent the pieces of data that may change from task to task, worker to worker. If you're starting with one of the
sample templates, you will need to make sure you're aware of the variables it already uses. When you create your pre-annotation AWS Lambda script, its output will need to contain values for any of those variables you choose to keep.

The values you use for the variables can come from your manifest file. All the key-value pairs in your data object are provided to your pre-annotation Lambda. If it's a simple pass-through script, matching keys for values in your data object to variable names in your template is the easiest way to pass those values through to the tasks forms your workers see.

A simple sample

All tasks begin and end with the `<crowd-form> </crowd-form>` elements. Like standard HTML `<form>` elements, all of your form code should go between them.

For a simple tweet-analysis task, use the `<crowd-classifier>` element. It requires the following attributes:

- `name` - the variable name to use for the result in the form output.
- `categories` - a JSON formatted array of the possible answers.
- `header` - a title for the annotation tool

As children of the `<crowd-classifier>` element, you must have three regions.

- `<classification-target>` - the text the worker will classify based on the options specified in the categories attribute above.
- `<full-instructions>` - instructions that are available from the "View full instructions" link in the tool. This can be left blank, but it is recommended that you give good instructions to get better results.
- `<short-instructions>` - a more brief description of the task that appears in the tool's sidebar. This can be left blank, but it is recommended that you give good instructions to get better results.

A simple version of this tool would look like this.

**Example of using crowd-classifier**

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-classifier
    name="tweetFeeling"
    categories="['positive','negative','neutral', 'unclear']"
    header="Which term best describes this tweet?"
  >
    <classification-target>
      My favorite football team won today!
      Bring on the division finals!
    </classification-target>
    <full-instructions header="Sentiment Analysis Instructions">
      Try to determine the sentiment the author of the tweet is trying to express.
      If none seem to match, choose "cannot determine."
    </full-instructions>
    <short-instructions>
      Pick the term best describing the sentiment of the tweet.
    </short-instructions>
  </crowd-classifier>
</crowd-form>
```
You can copy and paste the code into the editor in the Ground Truth labeling job creation workflow to preview the tool, or try out a demo of this code on CodePen.

Adding automation with Liquid

Our custom template system uses Liquid for automation. It is an open source inline markup language. In Liquid, the text between single curly braces and percent symbols is an instruction or tag that performs an operation like control flow or iteration. Text between double curly braces is a variable or object that outputs its value.

The most common use of Liquid will be to parse the data coming from your pre-annotation Lambda and pull out the relevant variables to create the task. The taskInput object returned by your Pre-annotation Lambda (p. 336) will be available as the task.input object in your templates.

The properties in your manifest's data objects are passed into your Pre-annotation Lambda (p. 336) as the event.dataObject. A simple pass-through script simply returns that object as the taskInput object. You would represent values from your manifest as variables as follows.

Example Manifest data object

```json
{
  "source": "This is a sample text for classification",
  "labels": ["angry", "sad", "happy", "inconclusive"],
  "header": "What emotion is the speaker feeling?"
}
```

Example Sample HTML using variables

```html
<crowd-classifier
```
name='tweetFeeling'
categories='{{ task.input.labels | to_json }}'
header='{{ task.input.header }}' >
<classification-target>
{{ task.input.source }}
</classification-target>

Note the addition of " | to_json" to the labels property above. That's a filter to turn the array into a JSON representation of the array. Variable filters are explained in the next section.

The following list includes two types of Liquid tags that you may find useful to automate template input data processing. If you select one of the following tag-types, you will be redirected to the Liquid documentation.

- **Control flow**: Includes programming logic operators like if/else, unless, and case/when.
- **Iteration**: Enables you to run blocks of code repeatedly using statements like for loops.

  For an example of an HTML template that uses Liquid elements to create a for loop, see translation-review-and-correction.liquid.html in GitHub.

For more information and documentation, visit the Liquid homepage.

**Variable filters**

In addition to the standard Liquid filters and actions, Ground Truth offers a few additional filters. Filters are applied by placing a pipe (|) character after the variable name, then specifying a filter name. Filters can be chained in the form of:

**Example**

```liquid
{{ <content> | <filter> | <filter> }}
```

**Autoescape and explicit escape**

By default, inputs will be HTML escaped to prevent confusion between your variable text and HTML. You can explicitly add the escape filter to make it more obvious to someone reading the source of your template that the escaping is being done.

**escape_once**

escape_once ensures that if you've already escaped your code, it doesn't get re-escaped on top of that. For example, so that & doesn't become &amp;.

**skip_autoescape**

skip_autoescape is useful when your content is meant to be used as HTML. For example, you might have a few paragraphs of text and some images in the full instructions for a bounding box.

**Use skip_autoescape sparingly**

The best practice in templates is to avoid passing in functional code or markup with skip_autoescape unless you are absolutely sure you have strict control over what's being passed. If you're passing user input, you could be opening your workers up to a Cross Site Scripting attack.

**to_json**

to_json will encode what you feed it to JSON (JavaScript Object Notation). If you feed it an object, it will serialize it.
grant_read_access

grant_read_access takes an S3 URI and encodes it into an HTTPS URL with a short-lived access token for that resource. This makes it possible to display to workers photo, audio, or video objects stored in S3 buckets that are not otherwise publicly accessible.

Example of the filters

Input

| auto-escape: | {{ "Have you read 'James & the Giant Peach'?'" |}} |
| explicit escape: | {{ "Have you read 'James & the Giant Peach'?'" | escape |}} |
| explicit escape_once: | {{ "Have you read 'James &; the Giant Peach'?'" | escape_once |}} |
| skip_autoescape: | {{ "Have you read 'James & the Giant Peach'?'" | skip_autoescape |}} |
| to_json: | {{ jsObject | to_json |}} |
| grant_read_access: | {{ "s3://mybucket/myphoto.png" | grant_read_access |}} |

Example

Output

| auto-escape: | Have you read 'James &; the Giant Peach'?' |
| explicit escape: | Have you read 'James &; the Giant Peach'?' |
| explicit escape_once: | Have you read 'James &; the Giant Peach'?' |
| skip_autoescape: | Have you read 'James & the Giant Peach'?' |
| to_json: | { "point_number": 8, "coords": [ 59, 76 ] } |
| grant_read_access: | https://s3.amazonaws.com/mybucket/myphoto.png?<access token and other params> |

Example of an automated classification template.

To automate the simple text classification sample, replace the tweet text with a variable.

The text classification template is below with automation added. The changes/additions are highlighted in bold.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-classifier
    name="tweetFeeling"
    categories="['positive', 'negative', 'neutral', 'cannot determine']"
    header="Which term best describes this tweet?"
  >
    <classification-target>
      {{ task.input.source }}
    </classification-target>

    <full-instructions header="Analyzing a sentiment">
      Try to determine the feeling the author of the tweet is trying to express.
      If none seem to match, choose "other."
    </full-instructions>

    <short-instructions>
      Pick the term best describing the sentiment of the tweet.
    </short-instructions>
  </crowd-classifier>
</crowd-form>
```
The tweet text that was in the prior sample is now replaced with an object. The entry.taskInput object uses source (or another name you specify in your pre-annotation Lambda) as the property name for the text and it is inserted directly in the HTML by virtue of being between double curly braces.

**End-to-end demos**

You can view the following end-to-end demos which include sample Lambda function:

- Demo Template: Annotation of Images with crowd-bounding-box (p. 349)
- Demo Template: Labeling Intents with crowd-classifier (p. 354)

**Next**

Step 3: Processing with AWS Lambda (p. 335)

**Step 3: Processing with AWS Lambda**

In this step, you learn how to create and specify the two types of AWS Lambda functions that are required to create a custom labeling workflow:

- **Pre-annotation Lambda**: This function initiates for and pre-processes each data object sent to your labeling job prior to sending it to workers.
- **Post-annotation Lambda**: This function processes the results once workers submit a task. If you specify multiple workers per data object, this function may include logic to consolidate annotations.

If you are a new user of Lambda and Ground Truth, we recommend that you use the pages in this section as follows:

1. First, review Pre-annotation and Post-annotation Lambda Function Requirements (p. 336).
2. Then, use the page Required Permissions To Use AWS Lambda With Ground Truth (p. 342) to learn about security and permission requirements to use your pre-annotation and post-annotation Lambda functions in a Ground Truth custom labeling job.
3. Next, you need to visit the Lambda console or use Lambda's APIs to create your functions. Use the section Create Lambda Functions for a Custom Labeling Workflow (p. 346) to learn how to create Lambda functions.
4. To learn how to test your Lambda functions, see Test Pre-Annotation and Post-Annotation Lambda Functions (p. 346).
5. After you create pre-processing and post-processing Lambda functions, select them from the Lambda functions section that comes after the code editor for your custom HTML in the Ground Truth console. To learn how to use these functions in a CreateLabelingJob API request, see Create a Labeling Job (API) (p. 367).

For a custom labeling workflow tutorial that includes example pre-annotation and post-annotation Lambda functions, in the "Demo Template: Annotation of Images with crowd-bounding-box (p. 349)" document.

**Topics**

- Pre-annotation and Post-annotation Lambda Function Requirements (p. 336)
- Required Permissions To Use AWS Lambda With Ground Truth (p. 342)
- Create Lambda Functions for a Custom Labeling Workflow (p. 346)
Pre-annotation and Post-annotation Lambda Function Requirements

Use this section to learn about the syntax of the requests sent to pre-annotation and post-annotation Lambda functions, and the response syntax that Ground Truth requires to run a custom labeling workflow.

Topics
- Pre-annotation Lambda (p. 336)
- Post-annotation Lambda (p. 338)

Pre-annotation Lambda

Before a labeling task is sent to the worker, your pre-annotation Lambda function is invoked.

Ground Truth sends your Lambda function a JSON-formatted request to provide details about the labeling job and the data object. The following table contains the pre-annotation request schemas. Each parameter is described below.

Data object identified with "source-ref"

```json
{
   "version": "2018-10-16",
   "labelingJobArn": <labelingJobArn>
   "dataObject" : {
       "source-ref": <s3Uri>
    }
}
```

Data object identified with "source"

```json
{
   "version": "2018-10-16",
   "labelingJobArn": <labelingJobArn>
   "dataObject" : {
       "source": <string>
    }
}
```

- version (string): This is a version number used internally by Ground Truth.
- labelingJobArn (string): This is the Amazon Resource Name, or ARN, of your labeling job. This ARN can be used to reference the labeling job when using Ground Truth API operations such as DescribeLabelingJob.
- The dataObject (JSON object): The key contains a single JSON line, either from your input manifest file or sent from Amazon SNS. The JSON line objects in your manifest can be up to 100 kilobytes in size and contain a variety of data. For a very basic image annotation job, the dataObject JSON may just contain a source-ref key, identifying the image to be annotated. If the data object (for example, a line of text) is included directly in the input manifest file, the data object is identified with source. If you create a verification or adjustment job, this line may contain label data and metadata from the previous labeling job.

The following table includes code block examples of a pre-annotation request. Each parameter in these example requests is explained below the tabbed table.
Data object identified with "source-ref"

```json
{
    "version": "2018-10-16",
    "labelingJobArn": "arn:aws:sagemaker:<aws_region>:<aws_account_number>:labeling-job/<labeling_job_name>"
    "dataObject" : {
        "source-ref": "s3://<input-data-bucket>/<data-object-file-name>"
    }
}
```

Data object identified with "source"

```json
{
    "version": "2018-10-16",
    "labelingJobArn": "arn:aws:sagemaker:<aws_region>:<aws_account_number>:labeling-job/<labeling_job_name>"
    "dataObject" : {
        "source": "Sue purchased 10 shares of the stock on April 10th, 2020"
    }
}
```

In return, Ground Truth requires a response formatted like the following:

**Example of expected return data**

```json
{
    "taskInput": <json object>,
    "isHumanAnnotationRequired": <boolean> # Optional
}
```

In the previous example, the `<json object>` needs to contain all the data your custom worker task template needs. If you're doing a bounding box task where the instructions stay the same all the time, it may just be the HTTP(S) or Amazon S3 resource for your image file. If it's a sentiment analysis task and different objects may have different choices, it is the object reference as a string and the choices as an array of strings.

**Implications of `isHumanAnnotationRequired`**

This value is optional because it defaults to `true`. The primary use case for explicitly setting it is when you want to exclude this data object from being labeled by human workers.

If you have a mix of objects in your manifest, with some requiring human annotation and some not needing it, you can include a `isHumanAnnotationRequired` value in each data object. You can add logic to your pre-annotation Lambda to dynamically determine if an object requires annotation, and set this boolean value accordingly.

**Examples of Pre-annotation Lambda Functions**

The following, basic pre-annotation Lambda function accesses the JSON object in `dataObject` from the initial request, and returns it in the `taskInput` parameter.

```python
import json

def lambda_handler(event, context):
    return {
        "taskInput": event['dataObject']
    }
```
Assuming the input manifest file uses "source-ref" to identify data objects, the worker task template used in the same labeling job as this pre-annotation Lambda must include a Liquid element like the following to ingest dataObject:

```
{{ task.input.source-ref | grant_read_access }}
```

If the input manifest file used source to identify the data object, the work task template can ingest dataObject with the following:

```
{{ task.input.source }}
```

The following pre-annotation Lambda example includes logic to identify the key used in dataObject, and to point to that data object using taskObject in the Lambda's return statement.

```python
import json
def lambda_handler(event, context):
    # Event received
    print("Received event: " + json.dumps(event, indent=2))

    # Get source if specified
    source = event['dataObject']['source'] if "source" in event['dataObject'] else None

    # Get source-ref if specified
    source_ref = event['dataObject']['source-ref'] if "source-ref" in event['dataObject'] else None

    # if source field present, take that otherwise take source-ref
    task_object = source if source is not None else source_ref

    # Build response object
    output = {
        "taskInput": {
            "taskObject": task_object
        },
        "humanAnnotationRequired": "true"
    }

    print(output)

    # If neither source nor source-ref specified, mark the annotation failed
    if task_object is None:
        print(" Failed to pre-process {} !".format(event["labelingJobArn"])))
        output["humanAnnotationRequired"] = "false"

    return output
```

### Post-annotation Lambda

When all workers have annotated the data object or when TaskAvailabilityLifetimeInSeconds has been reached, whichever comes first, Ground Truth sends those annotations to your post-annotation Lambda. This Lambda is generally used for Consolidate Annotations (p. 458).

**Tip**

To see an example of a post-consolidation Lambda function, see annotation_consolidation_lambda.py in the aws-sagemaker-ground-truth-recipe GitHub repository.

The following code block contains the post-annotation request schema. Each parameter is described in the following bulleted list.
Creating Custom Labeling Workflows

- **version** (string): A version number used internally by Ground Truth.
- **labelingJobArn** (string): The Amazon Resource Name, or ARN, of your labeling job. This ARN can be used to reference the labeling job when using Ground Truth API operations such as DescribeLabelingJob.
- **labelCategories** (list of strings): Includes the label categories and other attributes you either specified in the console, or that you include in the label category configuration file.
- **labelAttributeName** (string): Either the name of your labeling job, or the label attribute name you specify when you create the labeling job.
- **roleArn** (string): The Amazon Resource Name (ARN) of the IAM execution role you specify when you create the labeling job.
- **payload** (JSON object): A JSON that includes an `s3Uri` key, which identifies the location of the annotation data for that data object in Amazon S3. The second code block below shows an example of this annotation file.

The following code block contains an example of a post-annotation request. Each parameter in this example request is explained below the code block.

**Example of an post-annotation Lambda request**

```
{
    "version": "2018-10-16",
    "labelCategories": ["Ex Category1","Ex Category2", "Ex Category3"],
    "labelAttributeName": "labeling-job-attribute-name",
    "roleArn": "arn:aws:iam::111122223333:role/role-name",
    "payload": {
        "s3Uri": "s3://DOC-EXAMPLE-BUCKET/annotations.json"
    }
}
```

**Note**

If no worker works on the data object and `TaskAvailabilityLifetimeInSeconds` has been reached, the data object is marked as failed and not included as part of post-annotation Lambda invocation.

The following code block contains the payload schema. This is the file that is indicated by the `s3Uri` parameter in the post-annotation Lambda request `payload` JSON object. For example, if the previous code block is the post-annotation Lambda request, the following annotation file is located at `s3://DOC-EXAMPLE-BUCKET/annotations.json`.

Each parameter is described in the following bulleted list.

**Example of an annotation file**

```
[
```
• `datasetObjectId` (string): Identifies a unique ID that Ground Truth assigns to each data object you send to the labeling job.

• `dataObject` (JSON object): The data object that was labeled. If the data object is included in the input manifest file and identified using the `source` key (for example, a string), `dataObject` includes a `content` key, which identifies the data object. Otherwise, the location of the data object (for example, a link or S3 URI) is identified with `s3Uri`.

• `annotations` (list of JSON objects): This list contains a single JSON object for each annotation submitted by workers for that `dataObject`. A single JSON object contains a unique `workerId` that can be used to identify the worker that submitted that annotation. The `annotationData` key contains one of the following:
  • `content` (string): Contains the annotation data.
  • `s3Uri` (string): Contains an S3 URI that identifies the location of the annotation data.

The following table contains examples of the content that you may find in payload for different types of annotation.

### Named Entity Recognition Payload

```
[  
    {  
        "datasetObjectId": "1",  
        "dataObject": {  
            "content": "Sift 3 cups of flour into the bowl."  
        },  
        "annotations": [  
            {  
                "workerId": "private.us-west-2.ef7294f850a3d9d1",  
                "annotationData": {  
                    "content": "{"crowd-entity-annotation":{"entities":[{"endOffset":4,"label":"verb","startOffset":0},{"endOffset":6,"label":"number","startOffset":5},{"endOffset":20,"label":"object","startOffset":15}, {"endOffset":34,"label":"object","startOffset":30}]}}  
                }  
            }  
        ]  
    }  
]
```

### Semantic Segmentation Payload

```
[  
    {  
        "datasetObjectId": "2",  
        "dataObject": {  
            "content": "Sift 3 cups of flour into the bowl."  
        },  
        "annotations": [  
            {  
                "workerId": "private.us-west-2.ef7294f850a3d9d1",  
                "annotationData": {  
                    "content": "{"crowd-entity-annotation":{"entities":[{"endOffset":4,"label":"verb","startOffset":0},{"endOffset":6,"label":"number","startOffset":5},{"endOffset":20,"label":"object","startOffset":15}, {"endOffset":34,"label":"object","startOffset":30}]}}  
                }  
            }  
        ]  
    }  
]```
"dataObject": {  
   "s3Uri": "s3://DOC-EXAMPLE-BUCKET(gt-input-data/images/bird3.jpg"
},
"annotations": [  
   {  
      "workerId": "private.us-west-2.ab1234c5678a919d0",
      "annotationData": {  
         "content": "{"crowd-semantic-segmentation":{"inputImageProperties":{"height":2000,"width":3020},"labelMappings":{"Bird":{"color":"#2ca02c"}},"labeledImage":{"pngImageData":"iVBOR..."}}"
      }
   }
]
]

Bounding Box Payload

[  
   {  
      "datasetObjectId": "0",
      "dataObject": {  
         "s3Uri": "s3://DOC-EXAMPLE-BUCKET(gt-input-data/images/bird1.jpg"
      },
      "annotations": [  
         {  
            "workerId": "private.us-west-2.ab1234c5678a919d0",
            "annotationData": {  
               "content": "{"boundingBox":{"boundingBoxes":[{"height":2052,"label ":"Bird"},"left":583,"top":302,"width":1375}],"inputImageProperties":
   }"
         }
      ]
   }
]

Your post-annotation Lambda function may contain logic similar to the following to loop through and access all annotations contained in the request. For a full example, see annotation_consolidation_lambda.py in the aws-sagemaker-ground-truth-recipe GitHub repository. In this GitHub example, you must add your own annotation consolidation logic.

```python
for i in range(len(annotations)):  
    worker_id = annotations[i]["workerId"]  
    annotation_content = annotations[i]["annotationData"].get('content')  
    annotation_s3_uri = annotations[i]["annotationData"].get('s3Uri')  
    annotation = annotation_content if annotation_s3_uri is None else  
    s3_client.get_object_from_s3(  
        annotation_s3_uri)  
    annotation_from_single_worker = json.loads(annotation)  
    print("{} Received Annotations from worker [{} is [{]"
         .format(log_prefix, worker_id, annotation_from_single_worker))
```

Tip

When you run consolidation algorithms on the data, you can use an AWS database service to store results, or you can pass the processed results back to Ground Truth. The data you return to Ground Truth is stored in consolidated annotation manifests in the S3 bucket specified for output during the configuration of the labeling job.

In return, Ground Truth requires a response formatted like the following:
Example of expected return data

```
[
  {
    "datasetObjectId": <string>,
    "consolidatedAnnotation": {
      "content": {
        "<labelAttributeName>": {
          # ... label content
        }
      }
    },
  },
  {
    "datasetObjectId": <string>,
    "consolidatedAnnotation": {
      "content": {
        "<labelAttributeName>": {
          # ... label content
        }
      }
    },
  },
  ...
]
```

At this point, all the data you're sending to your S3 bucket, other than the `datasetObjectId`, is in the `content` object.

When you return annotations in `content`, this results in an entry in your job's output manifest like the following:

**Example of label format in output manifest**

```
{
  "source-ref": "<s3uri or content>",
  "<labelAttributeName>": {
    # ... label content from you
  },
  "<labelAttributeName>-metadata": {
    # This will be added by Ground Truth
    "job_name": "<labelingJobName>",
    "type": "groundTruth/custom",
    "human-annotated": "yes",
    "creation_date": <date> # Timestamp of when received from Post-labeling Lambda
  }
}
```

Because of the potentially complex nature of a custom template and the data it collects, Ground Truth does not offer further processing of the data.

**Required Permissions To Use AWS Lambda With Ground Truth**

You may need to configure some or all the following to create and use AWS Lambda with Ground Truth.

- You need to grant an IAM role or user (collectively, an IAM entity) permission to create the pre-annotation and post-annotation Lambda functions using AWS Lambda, and to choose them when creating the labeling job.
- The IAM execution role specified when the labeling job is configured needs permission to invoke the pre-annotation and post-annotation Lambda functions.
- The post-annotation Lambda functions may need permission to access Amazon S3.
Use the following sections to learn how to create the IAM entities and grant permissions described above.

**Topics**
- Grant Permission to Create and Select an AWS Lambda Function (p. 343)
- Grant IAM Execution Role Permission to Invoke AWS Lambda Functions (p. 344)
- Grant Post-Annotation Lambda Permissions to Access Annotation (p. 344)

**Grant Permission to Create and Select an AWS Lambda Function**

If you do not require granular permissions to develop pre-annotation and post-annotation Lambda functions, you can attach the AWS managed policy `AWSLambda_FullAccess` to an IAM user or role. This policy grants broad permissions to use all Lambda features, as well as permission to perform actions in other AWS services with which Lambda interacts.

To create a more granular policy for security-sensitive use cases, refer to the documentation Identity-based IAM policies for Lambda in the AWS Lambda Developer Guide to learn how to create an IAM policy that fits your use case.

**Policies to Use the Lambda Console**

If you want to grant an IAM entity permission to use the Lambda console, see Using the Lambda console in the AWS Lambda Developer Guide.

Additionally, if you want the user to be able to access and deploy the Ground Truth starter pre-annotation and post-annotation functions using the AWS Serverless Application Repository in the Lambda console, you must specify the `<aws-region>` where you want to deploy the functions (this should be the same AWS Region used to create the labeling job), and add the following policy to the IAM role.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "VisualEditor0",
            "Effect": "Allow",
            "Action": ["serverlessrepo:ListApplicationVersions", "serverlessrepo:GetApplication", "serverlessrepo:CreateCloudFormationTemplate"],
        },
        {
            "Sid": "VisualEditor1",
            "Effect": "Allow",
            "Action": "serverlessrepo:SearchApplications",
            "Resource": "*"
        }
    ]
}
```

**Policies to See Lambda Functions in the Ground Truth Console**

To grant an IAM entity permission to view Lambda functions in the Ground Truth console when the user is creating a custom labeling job, the entity must have the permissions described in Grant IAM Permission to Use the Amazon SageMaker Ground Truth Console (p. 470), including the permissions described in the section Custom Labeling Workflow Permissions (p. 473).
Grant IAM Execution Role Permission to Invoke AWS Lambda Functions

If you add the IAM managed policy AmazonSageMakerGroundTruthExecution to the IAM execution role used to create the labeling job, this role has permission to list and invoke Lambda functions with one of the following strings in the function name: GtRecipe, SageMaker, Sagemaker, sagemaker, or LabelingFunction.

If the pre-annotation or post-annotation Lambda function names do not include one of the terms in the preceding paragraph, or if you require more granular permission than those in the AmazonSageMakerGroundTruthExecution managed policy, you can add a policy similar to the following to give the execution role permission to invoke pre-annotation and post-annotation functions.

```
{
   "Version": "2012-10-17",
   "Statement": [
       {
           "Effect": "Allow",
           "Action": "lambda:InvokeFunction",
           "Resource": [
           ]
       }
   ]
}
```

Grant Post-Annotation Lambda Permissions to Access Annotation

As described in Post-annotation Lambda (p. 338), the post-annotation Lambda request includes the location of the annotation data in Amazon S3. This location is identified by the s3Uri string in the payload object. To process the annotations as they come in, even for a simple pass through function, you need to assign the necessary permissions to the post-annotation Lambda execution role to read files from the Amazon S3.

There are many ways that you can configure your Lambda to access annotation data in Amazon S3. Two common ways are:

- Allow the Lambda execution role to assume the SageMaker execution role identified in roleArn in the post-annotation Lambda request. This SageMaker execution role is the one used to create the labeling job, and has access to the Amazon S3 output bucket where the annotation data is stored.
- Grant the Lambda execution role permission to access the Amazon S3 output bucket directly.

Use the following sections to learn how to configure these options.

Grant Lambda Permission to Assume SageMaker Execution Role

To allow a Lambda function to assume a SageMaker execution role, you must attach a policy to the Lambda function's execution role, and modify the trust relationship of the SageMaker execution role to allow Lambda to assume it.

1. Attach the following IAM policy to your Lambda function's execution role to assume the SageMaker execution role identified in Resource. Replace 222222222222 with an AWS account ID. Replace sm-execution-role with the name of the assumed role.

```
{
   "Version": "2012-10-17",
   "Statement": [
       {
           "Effect": "Allow",
           "Action": "sts:AssumeRole",
           "Resource": "arn:aws:iam::222222222222:role/sm-execution-role"
       }
   ]
}
```
2. Modify the trust policy of the SageMaker execution role to include the following Statement. Replace `222222222222` with an AWS account ID. Replace `my-lambda-execution-role` with the name of the assumed role.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::222222222222:role/my-lambda-execution-role"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

Grant Lambda Execution Role Permission to Access S3

You can add a policy similar to the following to the post-annotation Lambda function execution role to give it S3 read permissions. Replace `DOC-EXAMPLE-BUCKET` with the name of the output bucket you specify when you create a labeling job.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": ["s3:GetObject"],
      "Resource": "arn:aws:s3:::DOC-EXAMPLE-BUCKET/*"
    }
  ]
}
```

To add S3 read permissions to a Lambda execution role in the Lambda console, use the following procedure.

**Add S3 read permissions to post-annotation Lambda:**

1. Open the Functions page in the Lambda console.
2. Choose the name of the post-annotation function.
3. Choose Configuration and then choose Permissions.
4. Select the Role name and the summary page for that role opens in the IAM console in a new tab.
5. Select Attach policies.
6. Do one of the following:
   - Search for and select AmazonS3ReadOnlyAccess to give the function permission to read all buckets and objects in the account.
• If you require more granular permissions, select Create policy and use the policy example in the preceding section to create a policy. Note that you must navigate back to the execution role summary page after you create the policy.

7. If you used the AmazonS3ReadOnlyAccess managed policy, select Attach policy.

If you created a new policy, navigate back to the Lambda execution role summary page and attach the policy you just created.

Create Lambda Functions for a Custom Labeling Workflow

You can create a Lambda function using the Lambda console, the AWS CLI, or an AWS SDK in a supported programming language of your choice. Use the AWS Lambda Developer Guide to learn more about each of these options:

• To learn how to create a Lambda function using the console, see Create a Lambda function with the console.
• To learn how to create a Lambda function using the AWS CLI, see Using AWS Lambda with the AWS Command Line Interface.
• Select the relevant section in the table of contents to learn more about working with Lambda in the language of your choice. For example, select Working with Python to learn more about using Lambda with the AWS SDK for Python (Boto3).

Ground Truth provides pre-annotation and post-annotation templates through an AWS Serverless Application Repository (SAR) recipe. Use the following procedure to select the Ground Truth recipe in the Lambda console.

Use the Ground Truth SAR recipe to create pre-annotation and post-annotation Lambda functions:

1. Open the Functions page on the Lambda console.
2. Select Create function.
3. Select Browse serverless app repository.
4. In the search text box, enter aws-sagemaker-ground-truth-recipe and select that app.
5. Select Deploy. The app may take a couple of minutes to deploy.

Once the app deploys, two functions appear in the Functions section of the Lambda console: serverlessrepo-aws-sagemake-GtRecipePreHumanTaskFunc-<id> and serverlessrepo-aws-sagemake-GtRecipeAnnotationConsol-<id>.

6. Select one of these functions and add your custom logic in the Code section.
7. When you are finished making changes, select Deploy to deploy them.

Test Pre-Annotation and Post-Annotation Lambda Functions

You can test your pre-annotation and post annotation Lambda functions in the Lambda console. If you are a new user of Lambda, you can learn how to test, or invoke, your Lambda functions in the console using the Create a Lambda function tutorial with the console in the AWS Lambda Developer Guide.

You can use the sections on this page to learn how to test the Ground Truth pre-annotation and post-annotation templates provided through an AWS Serverless Application Repository (SAR).

Topics
• Prerequisites (p. 347)
Creating Custom Labeling Workflows

- Test the Pre-annotation Lambda Function (p. 347)
- Test the Post-Annotation Lambda Function (p. 348)

Prerequisites

You must do the following to use the tests described on this page.

- You need access to the Lambda console, and you need permission to create and invoke Lambda functions. To learn how to set up these permissions, see Grant Permission to Create and Select an AWS Lambda Function (p. 343).
- If you have not deployed the Ground Truth SAR recipe, use the procedure in Create Lambda Functions for a Custom Labeling Workflow (p. 346) to do so.
- To test the post-annotation Lambda function, you must have a data file in Amazon S3 with sample annotation data. For a simple test, you can copy and paste the following code into a file and save it as sample-annotations.json and upload this file to Amazon S3. Note the S3 URI of this file—you need this information to configure the post-annotation Lambda test.

```json
[{
  "datasetObjectId": "0",
  "dataObject": {
    "content": "To train a machine learning model, you need a large, high-quality, labeled dataset. Ground Truth helps you build high-quality training datasets for your machine learning models.

  "annotationData": {
    "content": "The narrative was interesting, however the character development was weak.

  "entities": [
    {"endOffset": 73,"label": "adjective", "startOffset": 69}]
  }
},
{
  "datasetObjectId": "1",
  "dataObject": {
    "content": "Sift 3 cups of flour into the bowl.

  "annotationData": {
    "content": "Jen purchased 10 shares of the stock on January 1st, 2020.

  "entities": [
    {"endOffset": 16,"label": "name", "startOffset": 13}]
  }
},
{
  "datasetObjectId": "2",
  "dataObject": {
    "content": "The narrative was interesting, however the character development was weak.

  "annotationData": {
    "content": "Jen purchased 10 shares of the stock on January 1st, 2020.

  "entities": [
    {"endOffset": 16,"label": "name", "startOffset": 13}]
  }
},
{
  "datasetObjectId": "3",
  "dataObject": {
    "content": "The narrative was interesting, however the character development was weak.

  "annotationData": {
    "content": "Jen purchased 10 shares of the stock on January 1st, 2020.

  "entities": [
    {"endOffset": 16,"label": "name", "startOffset": 13}]
  }
}
```

- You must use the directions in Grant Post-Annotation Lambda Permissions to Access Annotation (p. 344) to give your post-annotation Lambda function's execution role permission to assume the SageMaker execution role you use to create the labeling job. The post-annotation Lambda function uses the SageMaker execution role to access the annotation data file, sample-annotations.json, in S3.

Test the Pre-annotation Lambda Function

Use the following procedure to test the pre-annotation Lambda function created when you deployed the Ground Truth AWS Serverless Application Repository (SAR) recipe.
Test the Ground Truth SAR recipe pre-annotation Lambda function

1. Open the Functions page in the Lambda console.
2. Select the pre-annotation function that was deployed from the Ground Truth SAR recipe. The name of this function is similar to serverlessrepo-aws-sagemaker-GtRecipePreHumanTaskFunc-<id>.
3. In the Code source section, select the arrow next to Test.
4. Select Configure test event.
5. Keep the Create new test event option selected.
7. Give your test an Event name.
8. Select Create.
9. Select the arrow next to Test again and you should see that the test you created is selected, which is indicated with a dot by the event name. If it is not selected, select it.
10. Select Test to run the test.

After you run the test, you can see the Execution results. In the Function logs, you should see a response similar to the following:

```
START RequestId: cd117d38-8365-4e1a-bff8-0dc631a878f Version: $LATEST
Received event: {
    "version": "2018-10-16",
    "dataObject": {
        "source-ref": "s3://sagemakerexample/object_to_annotate.jpg"
    }
}
{"taskInput": {'taskObject': 's3://sagemakerexample/object_to_annotate.jpg'},
 'isHumanAnnotationRequired': 'true'}
END RequestId: cd117d38-8365-4e1a-bff8-0dc631a878f
REPORT RequestId: cd117d38-8365-4e1a-bff8-0dc631a878f Duration: 0.42 ms Billed Duration: 1 ms Memory Size: 128 MB Max Memory Used: 43 MB
```

In this response, we can see the Lambda function's output matches the required pre-annotation response syntax:

```
{"taskInput": {'taskObject': 's3://sagemakerexample/object_to_annotate.jpg'},
 'isHumanAnnotationRequired': 'true'}
```

Test the Post-Annotation Lambda Function

Use the following procedure to test the post-annotation Lambda function created when you deployed the Ground Truth AWS Serverless Application Repository (SAR) recipe.

Test the Ground Truth SAR recipe post-annotation Lambda

1. Open the Functions page in the Lambda console.
2. Select the post-annotation function that was deployed from the Ground Truth SAR recipe. The name of this function is similar to serverlessrepo-aws-sagemaker-GtRecipeAnnotationConsole-<id>.
3. In the Code source section, select the arrow next to Test.
4. Select Configure test event.
5. Keep the **Create new test event** option selected.
6. Under **Event template**, select **SageMaker Ground Truth AnnotationConsolidation**.
7. Give your test an **Event name**.
8. Modify the template code provided as follows:
   - Replace the Amazon Resource Name (ARN) in `roleArn` with the ARN of the SageMaker execution role you used to create the labeling job.
   - Replace the S3 URI in `s3Uri` with the URI of the `sample-annotations.json` file you added to Amazon S3.

After you make these modifications, your test should look similar to the following:

```json
{
  "version": "2018-10-16",
  "labelAttributeName": "example-attribute",
  "roleArn": "arn:aws:iam::222222222222:role/sm-exeuction-role",
  "payload": {
    "s3Uri": "s3://your-bucket/sample-annotations.json"
  }
}
```

9. Select **Create**.
10. Select the arrow next to **Test** again and you should see that the test you created is selected, which is indicated with a dot by the event name. If it is not selected, select it.
11. Select the **Test** to run the test.

After you run the test, you should see a **-- Consolidated Output --** section in the **Function Logs**, which contains a list of all annotations included in `sample-annotations.json`.

**Demo Template: Annotation of Images with crowd-bounding-box**

When you chose to use a custom template as your task type in the Amazon SageMaker Ground Truth console, you reach the **Custom labeling task panel**. There you can choose from multiple base templates. The templates represent some of the most common tasks and provide a sample to work from as you create your customized labeling task’s template. If you are not using the console, or as an additional recourse, see Amazon SageMaker Ground Truth Sample Task UIs for a repository of demo templates for a variety of labeling job task types.

This demonstration works with the **BoundingBox** template. The demonstration also works with the AWS Lambda functions needed for processing your data before and after the task. In the Github repository above, to find templates that work with AWS Lambda functions, look for `{{ task.input.<property name> }}` in the template.

**Topics**
- Starter Bounding Box custom template (p. 350)
- Your own Bounding Box custom template (p. 350)
- Your manifest file (p. 351)
- Your pre-annotation Lambda function (p. 352)
- Your post-annotation Lambda function (p. 352)
The output of your labeling job (p. 353)

Starter Bounding Box custom template

This is the starter bounding box template that is provided.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-bounding-box
    name="boundingBox"
    src="{ task.input.taskObject | grant_read_access }"
    header="{ task.input.header }"
    labels="{ task.input.labels | to_json | escape }"
  >
    <!-- The <full-instructions> tag is where you will define the full instructions of your task. -->
    <full-instructions header="Bounding Box Instructions" >
      <p>Use the bounding box tool to draw boxes around the requested target of interest:
      </p>
      <ol>
        <li>Draw a rectangle using your mouse over each instance of the target.</li>
        <li>Make sure the box does not cut into the target, leave a 2 - 3 pixel margin</li>
        <li>When targets are overlapping, draw a box around each object, include all contiguous parts of the target in the box. Do not include parts that are completely overlapped by another object.</li>
        <li>Do not include parts of the target that cannot be seen, even though you think you can interpolate the whole shape of the target.</li>
        <li>Avoid shadows, they're not considered as a part of the target.</li>
        <li>If the target goes off the screen, label up to the edge of the image.</li>
      </ol>
    </full-instructions>
  </crowd-bounding-box>
</crowd-form>
```

The custom templates use the Liquid template language, and each of the items between double curly braces is a variable. The pre-annotation AWS Lambda function should provide an object named `taskInput` and that object's properties can be accessed as `{ task.input.<property name> }` in your template.

Your own Bounding Box custom template

As an example, assume you have a large collection of animal photos in which you know the kind of animal in an image from a prior image-classification job. Now you want to have a bounding box drawn around it.

In the starter sample, there are three variables: `taskObject`, `header`, and `labels`.

Each of these would be represented in different parts of the bounding box.
• **taskObject** is an HTTP(S) URL or S3 URI for the photo to be annotated. The added |
  grant_read_access is a filter that will convert an S3 URI to an HTTPS URL with short-lived access to |
  that resource. If you're using an HTTP(S) URL, it's not needed.
• **header** is the text above the photo to be labeled, something like "Draw a box around the bird in the |
  photo."
• **labels** is an array, represented as ['item1', 'item2', ...]. These are labels that can be |
  assigned by the worker to the different boxes they draw. You can have one or many.

Each of the variable names come from the JSON object in the response from your pre-annotation |
Lambda, The names above are merely suggested, Use whatever variable names make sense to you and |
will promote code readability among your team.

**Only use variables when necessary**
If a field will not change, you can remove that variable from the template and replace it with |
that text, otherwise you have to repeat that text as a value in each object in your manifest or |
code it into your pre-annotation Lambda function.

**Example : Final Customized Bounding Box Template**

To keep things simple, this template will have one variable, one label, and very basic instructions. |
Assuming your manifest has an "animal" property in each data object, that value can be re-used in two |
parts of the template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-bounding-box
    name="boundingBox"
    labels="['{{ task.input.animal }}']"
    src="{{ task.input.source-ref | grant_read_access }}"
    header="Draw a box around the {{ task.input.animal }}.""
  >
    <full-instructions header="Bounding Box Instructions">
      <p>Draw a bounding box around the {{ task.input.animal }} in the image. If there is more than one {{ task.input.animal }} per image, draw a bounding box around the largest one.</p>
      <p>The box should be tight around the {{ task.input.animal }} with no more than a couple of pixels of buffer around the edges.</p>
      <p>If the image does not contain a {{ task.input.animal }}, check the <strong>Nothing to label</strong> box.</p>
    </full-instructions>
    <short-instructions>
      <p>Draw a bounding box around the {{ task.input.animal }} in each image. If there is more than one {{ task.input.animal }} per image, draw a bounding box around the largest one.</p>
    </short-instructions>
  </crowd-bounding-box>
</crowd-form>
```

Note the re-use of {{ task.input.animal }} throughout the template. If your manifest had all |
of the animal names beginning with a capital letter, you could use {{ task.input.animal | |
downcase }}, incorporating one of Liquid's built-in filters in sentences where it needed to be presented |
lowercase.

**Your manifest file**

Your manifest file should provide the variable values you're using in your template. You can do some |
transformation of your manifest data in your pre-annotation Lambda, but if you don't need to, you |
maintain a lower risk of errors and your Lambda will run faster. Here's a sample manifest file for the |
template.
Your pre-annotation Lambda function

As part of the job set-up, provide the ARN of an AWS Lambda function that can be called to process your manifest entries and pass them to the template engine.

Naming your Lambda function

The best practice in naming your function is to use one of the following four strings as part of the function name: SageMaker, Sagemaker, sagemaker, or LabelingFunction. This applies to both your pre-annotation and post-annotation functions.

When you're using the console, if you have AWS Lambda functions that are owned by your account, a drop-down list of functions meeting the naming requirements will be provided to choose one.

In this very basic example, you're just passing through the information from the manifest without doing any additional processing on it. This sample pre-annotation function is written for Python 3.7.

```python
import json
def lambda_handler(event, context):
    return {
        "taskInput": event['dataObject']
    }
```

The JSON object from your manifest will be provided as a child of the `event` object. The properties inside the `taskInput` object will be available as variables to your template, so simply setting the value of `taskInput` to `event['dataObject']` will pass all the values from your manifest object to your template without having to copy them individually. If you wish to send more values to the template, you can add them to the `taskInput` object.

Your post-annotation Lambda function

As part of the job set-up, provide the ARN of an AWS Lambda function that can be called to process the form data when a worker completes a task. This can be as simple or complex as you want. If you want to do answer consolidation and scoring as it comes in, you can apply the scoring and/or consolidation algorithms of your choice. If you want to store the raw data for offline processing, that is an option.

Provide permissions to your post-annotation Lambda

The annotation data will be in a file designated by the `s3Uri` string in the `payload` object. To process the annotations as they come in, even for a simple pass through function, you need to assign S3ReadOnly access to your Lambda so it can read the annotation files.

In the Console page for creating your Lambda, scroll to the Execution role panel. Select Create a new role from one or more templates. Give the role a name. From the Policy templates drop-down, choose Amazon S3 object read-only permissions. Save the Lambda and the role will be saved and selected.

The following sample is in Python 2.7.

```python
import json
import boto3
from urlparse import urlparse

def lambda_handler(event, context):
    consolidated_labels = []
```
parsed_url = urlparse(event['payload']['s3Uri']);
s3 = boto3.client('s3')
textFile = s3.get_object(Bucket = parsed_url.netloc, Key = parsed_url.path[1:])
filecont = textFile['Body'].read()
annotations = json.loads(filecont);

for dataset in annotations:
    for annotation in dataset['annotations']:
        new_annotation = json.loads(annotation['annotationData']['content'])
        label = {
            'datasetObjectId': dataset['datasetObjectId'],
            'consolidatedAnnotation': {
                'content': {
                    event['labelAttributeName']: {
                        'workerId': annotation['workerId'],
                        'boxesInfo': new_annotation,
                        'imageSource': dataset['dataObject']
                    }
                }
            }
        }
        consolidated_labels.append(label)

return consolidated_labels

The post-annotation Lambda will often receive batches of task results in the event object. That batch will be the payload object the Lambda should iterate through. What you send back will be an object meeting the API contract (p. 335).

The output of your labeling job

You'll find the output of the job in a folder named after your labeling job in the target S3 bucket you specified. It will be in a subfolder named manifests.

For a bounding box task, the output you find in the output manifest will look a bit like the demo below. The example has been cleaned up for printing. The actual output will be a single line per record.

Example: JSON in your output manifest

```
{
    "source-ref" : "<URL>",
    "<label attribute name>": {
        "workerId" : "<URL>",
        "imageSource" : "<image URL>",
        "boxesInfo" : "{"boundingBox":{{"height":878, \"label\":\"bird \", \left\":208, \"top\":6, \"width\":809}}, \"inputImageProperties\":{{\"height\":924, \"width\":1280}}}},
    "<label attribute name>-metadata": {
        "type" : "groundTruth/custom",
        "job_name" : "<Labeling job name>",
        "human-annotated" : "yes"
    },
    "animal" : "bird"
}
```

Note how the additional animal attribute from your original manifest is passed to the output manifest on the same level as the source-ref and labeling data. Any properties from your input manifest, whether they were used in your template or not, will be passed to the output manifest.
Demo Template: Labeling Intents with crowd-classifier

If you choose a custom template, you'll reach the Custom labeling task panel. There you can select from multiple starter templates that represent some of the more common tasks. The templates provide a starting point to work from in building your customized labeling task's template.

In this demonstration, you work with the Intent Detection template, which uses the crowd-classifier (p. 524) element, and the AWS Lambda functions needed for processing your data before and after the task.

Topics

- Starter Intent Detection custom template (p. 354)
- Your Intent Detection custom template (p. 354)
- Your pre-annotation Lambda function (p. 358)
- Your post-annotation Lambda function (p. 358)
- Your labeling job output (p. 359)

Starter Intent Detection custom template

This is the intent detection template that is provided as a starting point.

The custom templates use the Liquid template language, and each of the items between double curly braces is a variable. The pre-annotation AWS Lambda function should provide an object named taskInput and that object's properties can be accessed as {{ task.input.<property name> }} in your template.

Your Intent Detection custom template

In the starter template, there are two variables: the task.input.labels property in the crowd-classifier element opening tag and the task.input.utterance in the classification-target region's content.
Unless you need to offer different sets of labels with different utterances, avoiding a variable and just using text will save processing time and creates less possibility of error. The template used in this demonstration will remove that variable, but variables and filters like to_json are explained in more detail in the crowd-bounding-box demonstration article.

**Styling Your Elements**

Two parts of these custom elements that sometimes get overlooked are the <full-instructions> and <short-instructions> regions. Good instructions generate good results.

In the elements that include these regions, the <short-instructions> appear automatically in the "Instructions" pane on the left of the worker’s screen. The <full-instructions> are linked from the "View full instructions" link near the top of that pane. Clicking the link opens a modal pane with more detailed instructions.

You can not only use HTML, CSS, and JavaScript in these sections, you are encouraged to if you believe you can provide a strong set of instructions and examples that will help workers complete your tasks with better speed and accuracy.

**Example Try out a sample with JSFiddle**

Try out an example <crowd-classifier> task. The example is rendered by JSFiddle, therefore all the template variables are replaced with hard-coded values. Click the "View full instructions" link to see a set of examples with extended CSS styling. You can fork the project to experiment with your own changes to the CSS, adding sample images, or adding extended JavaScript functionality.

**Example : Final Customized Intent Detection Template**

This uses the example <crowd-classifier> task, but with a variable for the <classification-target>. If you are trying to keep a consistent CSS design among a series of different labeling jobs, you can include an external stylesheet using a <link rel...> element the same way you'd do in any other HTML document.

<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
<crowd-classifier
  name="intent"
  categories="["buy", 'eat', 'watch', 'browse', 'leave']"
  header="Pick the most relevant intent expressed by the text below"
>
  <classification-target>
    {{ task.input.source }}
  </classification-target>
</crowd-classifier>
</crowd-form>

<full-instructions header="Emotion Classification Instructions">
  <p>In the statements and questions provided in this exercise, what category of action
is the speaker interested in doing?</p>
  <table>
    <tr>
      <th>Example Utterance</th>
      <th>Good Choice</th>
    </tr>
    <tr>
      <td>When is the Seahawks game on?</td>
      <td>
        eat<br>
        <greenbg>watch</greenbg>
        <botchoice>browse</botchoice>
      </td>
    </tr>
    <tr>
      <td>When is the Seahawks game on?</td>
      <td>
        buy<br>
        <greenbg>eat</greenbg>
        <botchoice>watch</botchoice>
      </td>
    </tr>
    <tr>
      <th>Example Utterance</th>
      <th>Bad Choice</th>
    </tr>
    <tr>
      <td>When is the Seahawks game on?</td>
      <td>
        <greenbg>eat</greenbg>
        <botchoice>watch</botchoice>
      </td>
    </tr>
  </table>
</full-instructions>

<short-instructions>
  What is the speaker expressing they would like to do next?
</short-instructions>
</crowd-classifier>
</crowd-form>

<style>
.greenbg {
  background: #feee23;
  display: block;
}

.table {
  *border-collapse: collapse; /* IE7 and lower */
  border-spacing: 0;
}

.th, .tfoot, .fakehead {
  background-color: #8888ee;
  color: #f3f3f3;
  font-weight: 700;
}

.th, .td, .tfoot {
  border: 1px solid blue;
}
Example: Your manifest file

If you are preparing your manifest file manually for a text-classification task like this, have your data formatted in the following manner.

```json
{"source": "Roses are red"}
{"source": "Violets are Blue"}
{"source": "Ground Truth is the best"}
```
This differs from the manifest file used for the "Demo Template: Annotation of Images with crowd-bounding-box (p. 349)" demonstration in that source-ref was used as the property name instead of source. The use of source-ref designates S3 URIs for images or other files that must be converted to HTTP. Otherwise, source should be used like it is with the text strings above.

Your pre-annotation Lambda function

As part of the job set-up, provide the ARN of an AWS Lambda that can be called to process your manifest entries and pass them to the template engine.

This Lambda function is required to have one of the following four strings as part of the function name: SageMaker, Sagemaker, sagemaker, or LabelingFunction.

This applies to both your pre-annotation and post-annotation Lambdas.

When you're using the console, if you have Lambdas that are owned by your account, a drop-down list of functions meeting the naming requirements will be provided to choose one.

In this very basic sample, where you have only one variable, it's primarily a pass-through function. Here's a sample pre-labeling Lambda using Python 3.7.

```python
import json
def lambda_handler(event, context):
    return {
        "taskInput": event['dataObject']
    }
```

The dataObject property of the event contains the properties from a data object in your manifest.

In this demonstration, which is a simple pass through, you just pass that straight through as the taskInput value. If you add properties with those values to the event['dataObject'] object, they will be available to your HTML template as Liquid variables with the format `{{ task.input.<property name> }}`.

Your post-annotation Lambda function

As part of the job set up, provide the ARN of an Lambda function that can be called to process the form data when a worker completes a task. This can be as simple or complex as you want. If you want to do answer-consolidation and scoring as data comes in, you can apply the scoring or consolidation algorithms of your choice. If you want to store the raw data for offline processing, that is an option.

**Set permissions for your post-annotation Lambda function**

The annotation data will be in a file designated by the s3Uri string in the payload object. To process the annotations as they come in, even for a simple pass through function, you need to assign S3ReadOnly access to your Lambda so it can read the annotation files.

In the Console page for creating your Lambda, scroll to the Execution role panel. Select Create a new role from one or more templates. Give the role a name. From the Policy templates drop-down, choose Amazon S3 object read-only permissions. Save the Lambda and the role will be saved and selected.

The following sample is for Python 3.7.

```python
import json
import boto3
from urllib.parse import urlparse
def lambda_handler(event, context):
    return {
        "taskInput": event['dataObject']
    }
```
consolidated_labels = []
parsed_url = urlparse(event['payload']['s3Uri']);
s3 = boto3.client('s3')
textFile = s3.get_object(Bucket = parsed_url.netloc, Key = parsed_url.path[1:])
filecont = textFile['Body'].read()
annotations = json.loads(filecont);
for dataset in annotations:
    for annotation in dataset['annotations']:
        new_annotation = json.loads(annotation['annotationData']['content'])
        label = {
            'datasetObjectId': dataset['datasetObjectId'],
            'consolidatedAnnotation': {
                'content': {
                    event['labelAttributeName']: {
                        'workerId': annotation['workerId'],
                        'result': new_annotation,
                        'labeledContent': dataset['dataObject']
                    }
                }
            }
        }
    consolidated_labels.append(label)
return consolidated_labels

Your labeling job output

The post-annotation Lambda will often receive batches of task results in the event object. That batch will be the payload object the Lambda should iterate through.

You'll find the output of the job in a folder named after your labeling job in the target S3 bucket you specified. It will be in a subfolder named manifests.

For an intent detection task, the output in the output manifest will look a bit like the demo below. The example has been cleaned up and spaced out to be easier for humans to read. The actual output will be more compressed for machine reading.

Example : JSON in your output manifest

```json
[
  {
    "datasetObjectId": "<Number representing item's place in the manifest>",
    "consolidatedAnnotation": {
      "content": {
        "<name of labeling job>": {
          "workerId": "private.us-east-1.XXXXXXXXXXXXXXXXXXXXXX",
          "result": {
            "intent": {
              "label": "<label chosen by worker>"
            },
            "labeledContent": {
              "content": "<text content that was labeled>"
            }
          }
        }
      }
    }
  }
]```
This should help you create and use your own custom template.

**Custom Workflows via the API**

When you have created your custom UI template (Step 2) and processing Lambda functions (Step 3), you should place the template in an Amazon S3 bucket with a file name format of: `<FileName>.liquid.html`.

Use the `CreateLabelingJob` action to configure your task. You'll use the location of a custom template (Step 2: Creating your custom worker task template (p. 329)) stored in a `<filename>.liquid.html` file on S3 as the value for the `UiTemplateS3Uri` field in the `UiConfig` object within the `HumanTaskConfig` object.

For the AWS Lambda tasks described in Step 3: Processing with AWS Lambda (p. 335), the post-annotation task’s ARN will be used as the value for the `AnnotationConsolidationLambdaArn` field, and the pre-annotation task will be used as the value for the `PreHumanTaskLambdaArn` field.

**Create a Labeling Job**

You can create a labeling job in the Amazon SageMaker console and by using an AWS SDK in your preferred language to run `CreateLabelingJob`. After a labeling job has been created, you can track worker metrics (for private workforces) and your labeling job status using CloudWatch.

Before you create a labeling job it is recommended that you review the following pages, as applicable:

- You can specify our input data using an automatic data setup in the console, or an input manifest file in either the console or when using `CreateLabelingJob` API. For automated data setup, see Automated Data Setup (p. 393). To learn how to create an input manifest file, see Use an Input Manifest File (p. 392).
- Review labeling job input data quotas: Input Data Quotas (p. 400).
After you have chosen your task type, use the topics on this page to learn how to create a labeling job.

If you are a new Ground Truth user, we recommend that you start by walking through the demo in Getting started (p. 190).

**Important**
Ground Truth requires all S3 buckets that contain labeling job input image data to have a CORS policy attached. To learn more, see CORS Permission Requirement (p. 468).

**Topics**
- Built-in Task Types (p. 361)
- Creating Instruction Pages (p. 361)
- Create a Labeling Job (Console) (p. 364)
- Create a Labeling Job (API) (p. 367)
- Create a Streaming Labeling Job (p. 371)
- Create a Labeling Category Configuration File with Label Category and Frame Attributes (p. 377)

**Built-in Task Types**
Amazon SageMaker Ground Truth has several built-in task types. Ground Truth provides a worker task template for built-in task types. Additionally, some built in task types support Automate Data Labeling (p. 459). The following topics describe each built-in task type and demo the worker task templates that are provided by Ground Truth in the console. To learn how to create a labeling job in the console using one of these task types, select the task type page.

<table>
<thead>
<tr>
<th>Label Images</th>
<th>Label Text</th>
<th>Label Videos and Video Frames</th>
<th>Label 3D Point Clouds</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Bounding Box (p. 195)</td>
<td>• Named Entity Recognition (p. 215)</td>
<td>• Video Classification (p. 225)</td>
<td>• 3D Point Cloud Object Detection (p. 262)</td>
</tr>
<tr>
<td>• Image Classification (Single Label) (p. 208)</td>
<td>• Text Classification (Single Label) (p. 219)</td>
<td>• Video Frame Object Detection (p. 230)</td>
<td>• 3D Point Cloud Object Tracking (p. 269)</td>
</tr>
<tr>
<td>• Image Classification (Multi-label) (p. 210)</td>
<td>• Text Classification (Multi-label) (p. 222)</td>
<td>• Video Frame Object Tracking (p. 234)</td>
<td>• 3D Point Cloud Semantic Segmentation (p. 278)</td>
</tr>
<tr>
<td>• Image Semantic Segmentation (p. 201)</td>
<td>• Verify and Adjust Labels (p. 321)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note**
Each of the video frame and 3D point cloud task types has an adjustment task type that you use to verify and adjust labels from a previous labeling job. Select a video frame or 3D point cloud task type page above to learn how to adjust labels created using that task type.

**Creating Instruction Pages**
Create custom instructions for labeling jobs to improve your worker's accuracy in completing their task. You can modify the default instructions that are provided in the console or you can create your own. The instructions are shown to the worker on the page where they complete their labeling task.
There are two kinds of instructions:

- **Short instructions**—instructions that are shown on the same webpage where the worker completes their task. These instructions should provide an easy reference to show the worker the correct way to label an object.
- **Full instructions**—instructions that are shown on a dialog box that overlays the page where the worker completes their task. We recommend that you provide detailed instructions for completing the task with multiple examples showing edge cases and other difficult situations for labeling objects.

Create instructions in the console when you are creating your labeling job. Start with the existing instructions for the task and use the editor to modify them to suit your labeling job.

**Note**

Once you create your labeling job, it will automatically start and you will not be able to modify your worker instructions. If you need to change your worker instructions, stop the labeling job that you created, clone it, and modify your worker instructions before creating a new job. You can clone a labeling job in the console by selecting the labeling job and then selecting **Clone** in the **Actions** menu.

To clone a labeling job using the Amazon SageMaker API or your preferred Amazon SageMaker SDK, make a new request to the `CreateLabelingJob` operation with the same specifications as your original job after modifying your worker instructions.

**Short Instructions**

Short instructions appear on the same web page that workers use to label your data object. For example, the following is the editing page for a bounding box task. The short instructions panel is on the left.
Keep in mind that a worker will only spend seconds looking at the short instructions. Workers must be able to scan and understand your information quickly. In all cases it should take less time to understand the instructions than it takes to complete the task. Keep these points in mind:

- Your instructions should be clear and simple.
- Pictures are better than words. Create a simple illustration of your task that your workers can immediately understand.
- If you must use words, use short, concise examples.
- Your short instructions are more important than your full instructions.

The Amazon SageMaker Ground Truth console provides an editor so that you can create your short instructions. Replace the placeholder text and images with instructions for your task. Preview the worker's task page by choosing Preview. The preview will open in a new window, be sure to turn off pop-up blocking so that the window will show.

**Full Instructions**

You can provide additional instructions for your workers in a dialog box that overlays the page where workers label your data objects. Use full instructions to explain more complex tasks and to show workers the proper way to label edge cases or other difficult objects.
You can create full instructions using an editor in the Ground Truth console. As with quick instructions, keep the following in mind:

- Workers will want detailed instruction the first few times that they complete your task. Any information that they must have should be in the quick instructions.
- Pictures are more important than words.
- Text should be concise.
- Full instructions should supplement the short instructions. Don't repeat information that appears in the short instructions.

The Ground Truth console provides an editor so that you can create your full instructions. Replace the placeholder text and images with instructions for your task. Preview the full instruction page by choosing Preview. The preview will open in a new window, be sure to turn off pop-up blocking so that the window will show.

Add example images to your instructions

Images provide useful examples for your workers. To add a publicly accessible image to your instructions:

- Place the cursor where the image should go in the instructions editor.
- Click the image icon in the editor toolbar.
- Enter the URL of your image.

If your instruction image in Amazon S3 is not publicly accessible:

- As the image URL, enter: {{ 'https://s3.amazonaws.com/your-bucket-name/image-file-name' | grant_read_access }}.
- This renders the image URL with a short-lived, one-time access code appended so the worker's browser can display it. A broken image icon is displayed in the instructions editor, but previewing the tool displays the image in the rendered preview.

Create a Labeling Job (Console)

You can use the Amazon SageMaker console to create a labeling job for all of the Ground Truth built-in task types and custom labeling workflows. For built-in task types, we recommend that you use this page alongside the page for your task type. Each task type page includes specific details on creating a labeling job using that task type.

You need to provide the following to create a labeling job in the SageMaker console:

- An input manifest file in Amazon S3. You can place your input dataset in Amazon S3 and automatically generate a manifest file using the Ground Truth console (not supported for 3D point cloud labeling jobs).
- Alternatively, you can manually create an input manifest file. To learn how, see Input Data (p. 392).
- An Amazon S3 bucket to store your output data.
- An IAM role with permission to access your resources in Amazon S3 and with a SageMaker execution policy attached. For a general solution, you can attach the managed policy, AmazonSageMakerFullAccess, to an IAM role and include sagemaker in your bucket name.

For more granular policies, see the section called "IAM Permissions" (p. 469).

3D point cloud task types have additional security considerations. Learn more.
A work team. You create a work team from a workforce made up of Amazon Mechanical Turk workers, vendors, or your own private workers. To learn more, see Create and Manage Workforces (p. 485).

You cannot use the Mechanical Turk workforce for 3D point cloud or video frame labeling jobs.

If you are using a custom labeling workflow, you must save a worker task template in Amazon S3 and provide an Amazon S3 URI for that template. For more information, see Step 2: Creating your custom worker task template (p. 329).

(Optional) An AWS KMS key ARN if you want SageMaker to encrypt the output of your labeling job using your own AWS KMS encryption key instead of the default Amazon S3 service key.

(Optional) Existing labels for the dataset you use for your labeling job. Use this option if you want workers to adjust, or approve and reject labels.

If you want to create an adjustment or verification labeling job, you must have an output manifest file in Amazon S3 that contains the labels you want adjusted or verified. This option is only supported for bounding box and semantic segmentation image labeling jobs and 3D point cloud and video frame labeling jobs. It is recommended that you use the instructions on Verify and Adjust Labels (p. 321) to create a verification or adjustment labeling job.

Important
Your work team, input manifest file, output bucket, and other resources in Amazon S3 must be in the same AWS Region you use to create your labeling job.

When you create a labeling job using the SageMaker console, you add worker instructions and labels to the worker UI that Ground Truth provides. You can preview and interact with the worker UI while creating your labeling job in the console. You can also see a preview of the worker UI on your built-in task type page.

To create a labeling job (console)

2. In the left navigation pane, choose Labeling jobs.
4. For Job name, enter a name for your labeling job.
5. (Optional) If you want to identify your labels with a key, select I want to specify a label attribute name different from the labeling job name. If you do not select this option, the labeling job name you specified in the previous step will be used to identify your labels in your output manifest file.
6. Choose a data setup to setup to set up a connection between your input dataset and Ground Truth.
   - For Automated data setup:
     • Follow the instructions in Automated Data Setup (p. 393) for image, text, and video clip labeling jobs.
     • Follow the instructions in Automated Video Frame Input Data Setup (p. 430) for video frame labeling jobs.
   - For Manual data setup:
     • For Input dataset location, provide the location in Amazon S3 in which your input manifest file is located. For example, if your input manifest file, manifest.json, is located in example-bucket, enter s3://example-bucket/manifest.json.
     • For Output dataset location, provide the location in Amazon S3 where you want Ground Truth to store the output data from your labeling job.
7. For IAM Role, choose an existing IAM role or create an IAM role with permission to access your resources in Amazon S3, to write to the output Amazon S3 bucket specified above, and with a SageMaker execution policy attached.
8. (Optional) For Additional configuration, you can specify how much of your dataset you want workers to label, and if you want SageMaker to encrypt the output data for your labeling job using
an AWS KMS encryption key. To encrypt your output data, you must have the required AWS KMS permissions attached to the IAM role you provided in the previous step. For more details, see the section called “IAM Permissions” (p. 469).

9. In the Task type section, under Task category, use the dropdown list to select your task category.

10. In Task selection, choose your task type.

11. (Optional) Provide tags for your labeling job to make it easier to find in the console later.

12. Choose Next.

13. In the Workers section, choose the type of workforce you would like to use. For more details about your workforce options see Create and Manage Workforces (p. 485).

14. (Optional) After you’ve selected your workforce, specify the Task timeout. This is the maximum amount of time a worker has to work on a task.

15. (Optional) For bounding box, semantic segmentation, video frame, and 3D point cloud task types, you can select Display existing labels if you want to display labels for your input data set for workers to verify or adjust.

For bounding box and semantic segmentation labeling jobs, this will create an adjustment labeling job.

For 3D point cloud and video frame labeling jobs:

- Select Adjustment to create an adjustment labeling job. When you select this option, you can add new labels but you cannot remove or edit existing labels from the previous job. Optionally, you can choose label category attributes and frame attributes that you want workers to edit. To make an attribute editable, select the check box Allow workers to edit this attribute for that attribute.

- Select Verification to create an adjustment labeling job. When you select this option, you cannot add, modify, or remove existing labels from the previous job. Optionally, you can choose label category attributes and frame attributes that you want workers to edit. To make an attribute editable, select the check box Allow workers to edit this attribute for that attribute.

16. Configure your workers’ UI:

- If you are using a built-in task type, specify workers instructions and labels.

- For image classification and text classification (single and multi-label) you must specify at least two label categories. For all other built-in task types, you must specify at least one label category.

- (Optional) If you are creating a 3D point cloud or video frame labeling job, you can specify label category attributes (not supported for 3D point cloud semantic segmentation) and frame attributes. Label category attributes can be assigned to one or more labels. Frame attributes will appear on each point cloud or video frame workers label. To learn more, see Worker User Interface (UI) (p. 288) for 3D point cloud and Worker User Interface (UI) (p. 240) for video frame.

- (Optional) Add Additional instructions to help your worker complete your task.

- If you are creating a custom labeling workflow you must:
• Enter a custom template in the code box. Custom templates can be created using a combination of HTML, the Liquid templating language and our pre-built web components. Optionally, you can choose a base-template from the drop-down menu to get started.

• Specify pre-annotation and post-annotation lambda functions. To learn how to create these functions, see Step 3: Processing with AWS Lambda (p. 335).

17. (Optional) You can select See preview to preview your worker instructions, labels, and interact with the worker UI. Make sure the pop-up blocker of the browser is disabled before generating the preview.

18. Choose Create.

After you've successfully created your labeling job, you are redirected to the Labeling jobs page. The status of the labeling job you just created is In progress. This status progressively updates as workers complete your tasks. When all tasks are successfully completed, the status changes to Completed.

If an issue occurs while creating the labeling job, its status changes to Failed.

To view more details about the job, choose the labeling job name.

Next Steps

After your labeling job status changes to Completed, you can view your output data in the Amazon S3 bucket that you specified while creating that labeling job. For details about the format of your output data, see Output Data (p. 433).

Create a Labeling Job (API)

To create a labeling job using the Amazon SageMaker API, you use the CreateLabelingJob operation. For specific instructions on creating a labeling job for a built-in task type, see that task type page. To learn how to create a streaming labeling job, which is a labeling job that runs perpetually, see Create a Streaming Labeling Job (p. 371).

To use the CreateLabelingJob operation, you need the following:

• A worker task template (UiTemplateS3Uri) or human task UI ARN (HumanTaskUiArn) in Amazon S3.

• For 3D point cloud jobs, video object detection and tracking jobs, and NER jobs, use the ARN listed in HumanTaskUiArn for your task type.

• If you are using a built-in task type other than 3D point cloud tasks, you can add your worker instructions to one of the pre-built templates and save the template (using a .html or .liquid extension) in your S3 bucket. Find the pre-build templates on your task type page.

• If you are using a custom labeling workflow, you can create a custom template and save the template in your S3 bucket. To learn how to built a custom worker template, see Step 2: Creating your custom worker task template (p. 329). For custom HTML elements that you can use to customize your template, see Crowd HTML Elements Reference (p. 510). For a repository of demo templates for a variety of labeling tasks, see Amazon SageMaker Ground Truth Sample Task UIs.

• An input manifest file that specifies your input data in Amazon S3. Specify the location of your input manifest file in ManifestS3Uri. For information about creating an input manifest, see Input Data (p. 392). If you create a streaming labeling job, this is optional. To learn how to create a streaming labeling job, see Create a Streaming Labeling Job (p. 371).

• An Amazon S3 bucket to store your output data. You specify this bucket, and optionally, a prefix in S3OutputPath.

• A label category configuration file. Each label category name must be unique. Specify the location of this file in Amazon S3 using the LabelCategoryConfigS3Uri parameter. The format and label categories for this file depend on the task type you use:
For image classification and text classification (single and multi-label) you must specify at least two label categories. For all other task types, the minimum number of label categories required is one.

For named entity recognition tasks, you must provide worker instructions in this file. See Provide Worker Instructions in a Label Category Configuration File (p. 218) for details and an example.

For 3D point cloud and video frame task type, use the format in Create a Labeling Category Configuration File with Label Category and Frame Attributes (p. 377).

For all other built-in task types and custom tasks, your label category configuration file must be a JSON file in the following format. Identify the labels you want to use by replacing label_1, label_2, ..., label_n with your label categories.

```json
{
  "document-version": "2018-11-28",
  "labels": [
    {"label": "label_1"},
    {"label": "label_2"},
    ...
    {"label": "label_n"}
  ]
}
```

An AWS Identity and Access Management (IAM) role with the AmazonSageMakerGroundTruthExecution managed IAM policy attached and with permissions to access your S3 buckets. Specify this role in RoleArn. To learn more about this policy, see Use IAM Managed Policies with Ground Truth (p. 469). If you require more granular permissions, see the section called "IAM Permissions" (p. 469).

If your input or output bucket name does not contain sagemaker, you can attach a policy similar to the following to the role that is passed to the CreateLabelingJob operation.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:GetObject"
      ],
      "Resource": [
        "arn:aws:s3:::my_input_bucket/*"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "s3:PutObject"
      ],
      "Resource": [
        "arn:aws:s3:::my_output_bucket/*"
      ]
    }
  ]
}
```

A pre-annotation and post-annotation (or annotation-consolidation) AWS Lambda function Amazon Resource Name (ARN) to process your input and output data.

Lambda functions are predefined in each AWS Region for built-in task types. To find the pre-annotation Lambda ARN for your Region, see PreHumanTaskLambdaArn. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.
• For custom labeling workflows, you must provide a custom pre- and post-annotation Lambda ARN. To learn how to create these Lambda functions, see Step 3: Processing with AWS Lambda (p. 335).

• A work team ARN that you specify in WorkteamArn. You receive a work team ARN when you subscribe to a vendor workforce or create a private workteam. If you are creating a labeling job for a video frame or point cloud task type, you cannot use the Amazon Mechanical Turk workforce. For all other task types, to use the Mechanical Turk workforce, use the following ARN. Replace region with the AWS Region you are using to create the labeling job.

    arn:aws:sagemaker:region:394669845002:workteam/public-crowd/default

If you use the Amazon Mechanical Turk workforce, use the ContentClassifiers parameter in DataAttributes of InputConfig to declare that your content is free of personally identifiable information and adult content.

Ground Truth requires that your input data is free of personally identifiable information (PII) if you use the Mechanical Turk workforce. If you use Mechanical Turk and do not specify that your input data is free of PII using the FreeOfPersonallyIdentifiableInformation flag, your labeling job will fail. Use the FreeOfAdultContent flag to declare that your input data is free of adult content. SageMaker may restrict the Amazon Mechanical Turk workers that can view your task if it contains adult content.

To learn more about work teams and workforces, see Create and Manage Workforces (p. 485).

• If you use the Mechanical Turk workforce, you must specify the price you'll pay workers for performing a single task in PublicWorkforceTaskPrice.

• To configure the task, you must provide a task description and title using TaskDescription and TaskTitle respectively. Optionally, you can provide time limits that control how long the workers have to work on an individual task (TaskTimeLimitInSeconds) and how long tasks remain in the worker portal, available to workers (TaskAvailabilityLifetimeInSeconds).

• (Optional) For some task types, you can have multiple workers label a single data object by inputting a number greater than one for the NumberOfHumanWorkersPerDataObject parameter. For more information about annotation consolidation, see Consolidate Annotations (p. 458).

• (Optional) To create an automated data labeling job, specify one of the ARNs listed in LabelingJobAlgorithmSpecificationArn in LabelingJobAlgorithmsConfig. This ARN identifies the algorithm used in the automated data labeling job. The task type associated with this ARN must match the task type of the PreHumanTaskLambdaArn and AnnotationConsolidationLambdaArn you specified. Automated data labeling is supported for the following task types: image classification, bounding box, semantic segmentation, and text classification. The minimum number of objects allowed for automated data labeling is 1,250, and we strongly suggest providing a minimum of 5,000 objects. To learn more about automated data labeling jobs, see Automate Data Labeling (p. 459).

• (Optional) You can provide StoppingConditions that cause the labeling job to stop if one the conditions is met. You can use stopping conditions to control the cost of the labeling job.

Examples

The following code examples demonstrate how to create a labeling job using CreateLabelingJob. For additional examples, we recommend you use one of the Ground Truth Labeling Jobs Jupyter notebooks in the SageMaker Examples section of a SageMaker notebook instance. To learn how to use a notebook example from the SageMaker Examples, see Example Notebooks (p. 152). You can also see these example notebooks on GitHub in the SageMaker Examples repository.

AWS SDK for Python (Boto3)

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job for a built-in task type in the US East (N. Virginia) Region using a private workforce. Replace all red-italicized text with your labeling job resources and specifications.
Create a Labeling Job

```
response = client.create_labeling_job(
    LabelingJobName="example-labeling-job",
    LabelAttributeName="label",
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': "s3://bucket/path/manifest-with-input-data.json"
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                "FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent",
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': "s3://bucket/path/file-to-store-output-data",
        'KmsKeyId': "string"
    },
    RoleArn="arn:aws:iam::*:role/*",
    LabelCategoryConfigS3Uri="s3://bucket/path/label-categories.json",
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': "arn:aws:sagemaker:region:*:workteam/private-crowd/*",
        'UiConfig': {
            'UiTemplateS3Uri': "s3://bucket/path/custom-worker-task-template.html"
        },
        'TaskKeywords': [
            "Images",
            "Classification",
            "Multi-label"
        ],
        'TaskTitle': "Multi-label image classification task",
        'TaskDescription': "Select all labels that apply to the images shown",
        'NumberOfHumanWorkersPerDataObject': 1,
        'TaskTimeLimitInSeconds': 3600,
        'TaskAvailabilityLifetimeInSeconds': 21600,
        'MaxConcurrentTaskCount': 1000,
        'AnnotationConsolidationConfig': {
            'AnnotationConsolidationLambdaArn': "arn:aws:lambda:us-east-1:432418664414:function:ACS-
        },
    },
    Tags=[
        {
            'Key': "string",
            'Value': "string"
        }
    ]
)
```

AWS CLI

The following is an example of an AWS CLI request to create a labeling job for a built-in task type in the US East (N. Virginia) Region using the Amazon Mechanical Turk workforce. For more information, see `start-human-loop` in the AWS CLI Command Reference. Replace all red-italicized text with your labeling job resources and specifications.

```
$ aws --region us-east-1 sagemaker create-labeling-job \
    --labeling-job-name "example-labeling-job" \
```
For more information about this operation, see CreateLabelingJob. For information about how to use other language-specific SDKs, see See Also in the CreateLabelingJobs topic.

Create a Streaming Labeling Job

Streaming labeling jobs enable you to send individual data objects in real time to a perpetually running, streaming labeling job. To create a streaming labeling job, you must create an Amazon SNS input topic and specify this topic in CreateLabelingJob parameters InputConfig of SnsDataSource. Optionally, you can also create an Amazon SNS output topic and specify it in OutputConfig if you want to receive label data in real time.
Create a Labeling Job

Important
If you are a new user of Ground Truth streaming labeling jobs, it is recommended that you review Ground Truth Streaming Labeling Jobs (p. 395) before creating a streaming labeling job.

Use the following sections to create the resources that you need and can use to create a streaming labeling job:

- Learn how to create SNS topics with the permissions required for Ground Truth streaming labeling jobs by following the steps in Create Amazon SNS Input and Output Topics (p. 372). Your SNS topics must be created in the same AWS Region as your labeling job.

- See Subscribe an Endpoint to Your Amazon SNS Output Topic (p. 374) to learn how to set up an endpoint to receive labeling task output data at a specified endpoint each time a labeling task is completed.

- To learn how to configure your Amazon S3 bucket to send notifications to your Amazon SNS input topic, see Set up Amazon S3 Bucket Event Notifications (p. 374).

- Optionally, add data objects that you want to have labeled as soon as the labeling job starts to your input manifest. For more information, see Create a Manifest File (Optional) (p. 375).

- There are other resources required to create a labeling job, such as an IAM role, Amazon S3 bucket, a worker task template and label categories. These are described in the Ground Truth documentation on creating a labeling job. For more information, see Create a Labeling Job (p. 360).

Important
When you create a labeling job you must provide an IAM execution role. Attach the AWS managed policy AmazonSageMakerGroundTruthExecution to this role to ensure it has required permissions to execute your labeling job.

When you submit a request to create a streaming labeling job, the state of your labeling job is Initializing. Once the labeling job is active, the state changes to InProgress. Do not send new data objects to your labeling job or attempt to stop your labeling job while it is in the Initializing state. Once the state changes to InProgress, you can start sending new data objects using Amazon SNS and the Amazon S3 configuration.

Topics
- Create Amazon SNS Input and Output Topics (p. 372)
- Set up Amazon S3 Bucket Event Notifications (p. 374)
- Create a Manifest File (Optional) (p. 375)
- Example: Use SageMaker API To Create Streaming Labeling Job (p. 375)
- Stop a Streaming Labeling Job (p. 376)

Create Amazon SNS Input and Output Topics

You need to create an Amazon SNS input to create a streaming labeling job. Optionally, you may provide an Amazon SNS output topic.

When you create an Amazon SNS topic to use in your streaming labeling job, note down the topic Amazon Resource Name (ARN). The ARN will be the input values for the parameter SnsTopicArn in InputConfig and OutputConfig when you create a labeling job.

Create an Input Topic

Your input topic is used to send new data objects to Ground Truth. To create an input topic, follow the instructions in Creating an Amazon SNS topic in the Amazon Simple Notification Service Developer Guide.
Note down your input topic ARN and use it as input for the `CreateLabelingJob` parameter `SnsTopicArn` in `InputConfig`.

**Create an Output Topic**

If you provide an output topic, it is used to send notifications when a data object is labeled. When you create a topic, you have the option to add an encryption key. Use this option to add a AWS Key Management Service customer managed key to your topic to encrypt the output data of your labeling job before it is published to your output topic.

To create an output topic, follow the instructions in Creating an Amazon SNS topic in the Amazon Simple Notification Service Developer Guide.

If you add encryption, you must attach additional permission to the topic. See Add Encryption to Your Output Topic (Optional) (p. 373) for more information.

**Important**

To add a customer managed key to your output topic while creating a topic in the console, do not use the (Default) alias/aws/sns option. Select a customer managed key that you created.

Note down your input topic ARN and use it in your `CreateLabelingJob` request in the parameter `SnsTopicArn` in `OutputConfig`.

**Add Encryption to Your Output Topic (Optional)**

To encrypt messages published to your output topic, you need to provide an AWS KMS customer managed key to your topic. Modify the following policy and add it to your customer managed key to give Ground Truth permission to encrypt output data before publishing it to your output topic.

Replace `<account_id>` with the ID of the account that you are using to create your topic. To learn how to find your AWS account ID, see Finding Your AWS Account ID.

```json
{
    "Id": "key-console-policy",
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Enable IAM User Permissions",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::<account_id>:root"
            },
            "Action": "kms:*",
            "Resource": "*"
        },
        {
            "Sid": "Allow access for Key Administrators",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::<account_id>:role/Admin"
            },
            "Action": [
                "kms:Create*",
                "kms:Describe*",
                "kms:Enable*",
                "kms:List*",
                "kms:Put*",
                "kms:Update*",
                "kms:Revoke",
                "kms:Disable*",
                "kms:Get*"
            ]
        }
    ]
}
```
Additionally, you must modify and add the following policy to the execution role that you use to create your labeling job (the input value for RoleArn).

Replace `<account_id>` with the ID of the account that you are using to create your topic. Replace `<region>` with the AWS Region you are using to create your labeling job. Replace `<key_id>` with your customer managed key ID.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "sid1",
      "Effect": "Allow",
      "Action": [
        "kms:Decrypt",
        "kms:GenerateDataKey"
      ],
      "Resource": "arn:aws:kms:<region>:<account_id>:key/<key_id>"
    }
  ]
}
```

For more information on creating and securing keys, see Creating Keys and Using Key Policies in the AWS Key Management Service Developer Guide.

**Subscribe an Endpoint to Your Amazon SNS Output Topic**

When a worker completes a labeling job task from a Ground Truth streaming labeling job, Ground Truth uses your output topic to publish output data to one or more endpoints that you specify. To receive notifications when a worker finishes a labeling task, you must subscribe an endpoint to your Amazon SNS output topic.

To learn how to add endpoints to your output topic, see Subscribe to an Amazon SNS topic in the Amazon Simple Notification Service Developer Guide.

To learn more about the output data format that is published to these endpoints, see Output Data (p. 433).

**Important**

If you do not subscribe an endpoint to your Amazon SNS output topic, you will not receive notifications when new data objects are labeled.

**Set up Amazon S3 Bucket Event Notifications**

You can add an event notification to your Amazon S3 bucket using the Amazon S3 console, API, and language specific AWS SDKs, or the AWS Command Line Interface. Set up this event to send notifications to the same Amazon SNS input topic that you specify using SnsTopicArn in InputConfig when you create a labeling job. Do not set up event notifications using the same Amazon S3 location that you
specified for S3OutputPath in OutputConfig – doing so may result in unwanted data objects being processed by Ground Truth for labeling.

You decide the types of events that you want to send to your Amazon SNS topic. Ground Truth creates a labeling job when you send object creation events.

The event structure sent to your Amazon SNS input topic must be a JSON message formatted using the same structure found in Event message structure.

To see examples of how you can set up an event notification for your Amazon S3 bucket using the Amazon S3 console, AWS SDK for .NET, and AWS SDK for Java, follow this walkthrough, Walkthrough: Configure a bucket for notifications (SNS topic or SQS queue) in the Amazon Simple Storage Service Developer Guide.

Create a Manifest File (Optional)

When you create a streaming labeling job, you have the one time option to add objects (such as images or text) to an input manifest file that you specify in ManifestS3Uri of CreateLabelingJob. When the streaming labeling job starts, these objects are sent to workers or added to the Amazon SQS queue if the total number of objects exceed MaxConcurrentTaskCount. The results are added to the Amazon S3 path that you specify when creating the labeling job periodically as workers complete labeling tasks. Output data is sent to any endpoint that you subscribe to your output topic.

If you want to provide initial objects to be labeled, create a manifest file that identifies these objects and place it in Amazon S3. Specify the S3 URI of this manifest file in ManifestS3Uri within InputConfig.

To learn how to format your manifest file, see Input Data (p. 392). To use the SageMaker console to automatically generate a manifest file (not supported for 3D point cloud task types), see Automated Data Setup (p. 393).

Example: Use SageMaker API To Create Streaming Labeling Job

The following is an example of an AWS Python SDK (Boto3) request that you can use to start a streaming labeling job for a built-in task type in the US East (N. Virginia) Region. For more details about each parameter below see CreateLabelingJob. To learn how you can create a labeling job using this API and associated language specific SDKs, see Create a Labeling Job (API).

In this example, note the following parameters:

- SnsDataSource – This parameter appears in InputConfig and OutputConfig and is used to identify your input and output Amazon SNS topics respectively. To create a streaming labeling job, you are required to provide an Amazon SNS input topic. Optionally, you can also provide an Amazon SNS output topic.
- S3DataSource – This parameter is optional. Use this parameter if you want to include an input manifest file of data objects that you want labeled as soon as the labeling job starts.
- StoppingConditions – This parameter is ignored when you create a streaming labeling job. To learn more about stopping a streaming labeling job, see Stop a Streaming Labeling Job (p. 376).
- Streaming labeling jobs do not support automated data labeling. Do not include the LabelingJobAlgorithmsConfig parameter.

response = client.create_labeling_job(
    LabelingJobName= 'example-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        }
    })
Stop a Streaming Labeling Job

You can manually stop your streaming labeling job using the operation StopLabelingJob.

If your labeling job remains idle for over 10 days, it is automatically stopped by Ground Truth. In this context, a labeling job is considered idle if no objects are sent to the Amazon SNS input topic and no objects remain in your Amazon SQS queue, waiting to be labeled. For example, if no data objects are fed to the Amazon SNS input topic and all the objects fed to the labeling job are already labeled, Ground Truth starts a timer. After the timer starts, if no items are received within a 10 day period, the labeling job is stopped.

If this 10 day limit poses a problem for your business use case, please contact AWS Support.

When a labeling job is stopped, its status is STOPPING while Ground Truth cleans up labeling job resources and unsubscribes your Amazon SNS topic from your Amazon SQS queue. The Amazon SQS is not deleted by Ground Truth because this queue may contain unprocessed data objects. You should manually delete the queue if you want to avoid incurring additional charges from Amazon SQS. To learn more, see Amazon SQS pricing.
Create a Labeling Category Configuration File with Label Category and Frame Attributes

When you create a 3D point cloud or video frame labeling job using the Amazon SageMaker API operation CreateLabelingJob, you use a label category configuration file to specify your labels and worker instructions. Optionally, you can also provide the following in your label category attribute file:

- You can provide **label category attributes** for video frame and 3D point cloud object tracking and object detection task types. Workers can use one or more attributes to give more information about an object. For example, you may want to use the attribute *occluded* to have workers identify when an object is partially obstructed. You can either specify a label category attribute for a single label using the categoryAttributes parameter, or for all labels using the categoryGlobalAttributes parameter.

- You can provide **frame attributes** for video frame and 3D point cloud object tracking and object detection task types using frameAttributes. When you create a frame attribute, it appears on each frame or point cloud in the worker task. In video frame labeling jobs, these are attributes that workers assign to an entire video frame. For 3D point cloud labeling jobs, these attributes are applied to a single point cloud. Use frame attributes to have workers provide more information about the scene in a specific frame or point cloud.

- For video frame labeling jobs, you use the label category configuration file to specify the task type (bounding box, polyline, polygon, or keypoint) sent to workers.

For workers, specifying values for label category attributes and frame attributes will be optional.

**Important**
You should only provide a label attribute name in auditLabelAttributeName if you are running an audit job to verify or adjust labels. Use this parameter to input the LabelAttributeName used in the labeling job that generated the annotations you want your worker to adjust. When you create a labeling job in the console, if you did not specify a label attribute name, the **Name** of your job is used as the LabelAttributeName.

**Topics**
- Label Category Configuration File Schema (p. 377)
- Example: Label Category Configuration Files for 3D Point Cloud Labeling Jobs (p. 383)
- Example: Label Category Configuration Files for Video Frame Labeling Jobs (p. 387)
- Creating Worker Instructions (p. 391)

**Label Category Configuration File Schema**

The following table lists elements you can and must include in your label category configuration file.

**Note**
The parameter annotationType is only supported for video frame labeling jobs.

<table>

<td>Enter the LabelAttributeName used in the labeling job you want to adjust annotations of. Only use this parameter if you are creating an adjustment job for video frame and 3D point cloud object detection, object tracking, or 3D point cloud semantic segmentation.</td>
</tr>
</tbody>
</table>

The following table describes the parameters that you can and must use to create a list of Labels. Each parameter should be included in a JSON object.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Accepted Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>Yes</td>
<td>String</td>
<td>The name of the label category that is displayed to workers. Each label category name must be unique.</td>
</tr>
<tr>
<td>categoryAttributes</td>
<td>No</td>
<td>A list of JSON objects. Required Parameters in each JSON Object: name, type minimum and maximum required if type is &quot;number&quot;</td>
<td>Use this parameter to add label category attributes to specific labels you specify in labels. To add one or more label category attributes to a label, include the categoryAttributes JSON object in the same labels JSON object as that label. See the following table for more information.</td>
</tr>
<tr>
<td>editsAllowed</td>
<td>No</td>
<td>String</td>
<td>Specifies whether or not a label can be edited by workers. For video frame or 3D point cloud adjustment labeling jobs, add this parameter to one or more JSON objects in the labels list to specify whether or not a worker can edit a label. For 3D point cloud and video frame verification labeling jobs, add this parameter with the value &quot;none&quot; to each JSON object in the labels list. This will make all labels uneditable.</td>
</tr>
</tbody>
</table>

The following table describes the parameters that you can and must use to create a frame attributes using frameAttributes and label category attribute using the categoryGlobalAttributes and categoryAttributes parameters.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Accepted Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Yes</td>
<td>String</td>
<td>Use this parameter to assign a name to your label category or frame attribute. This is the attribute name that workers see. Each label category attribute name in your label category configuration file must be unique. Global label category attributes and label specific label category attributes cannot have the same name.</td>
</tr>
<tr>
<td>type</td>
<td>Yes</td>
<td>String</td>
<td>Use this parameter to define the label category or frame attribute type. Required Values: &quot;string&quot; or &quot;number&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If you specify &quot;string&quot; for type and provide an enum value for this attribute, workers will be able to choose from one of the choices you provide. If you specify &quot;string&quot; for type and do not provide an enum value, workers can enter free form text. If you specify number for type, workers can enter a number between the minimum and maximum numbers you specify.</td>
</tr>
<tr>
<td>enum</td>
<td>Yes</td>
<td>List of strings</td>
<td>Use this parameter to define options that workers can choose from for this label category or frame attribute. Workers can choose one value specified in enum. For example, if you specify [&quot;foo&quot;, &quot;buzz&quot;, &quot;bar&quot;] for enum,</td>
</tr>
</tbody>
</table>
### Create a Labeling Job

<table>
<thead>

<td></td>
<td>or</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;any&quot; (Default): all modifications are allowed.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Label and label category attribute quotas**

You can specify up to 10 label category attributes per class. This 10-attribute quotas includes global label category attributes. For example, if you create four global label category attributes, and then assign three label category attributes to label X, that label will have $4 + 3 = 7$ label category attributes in total. For all label category and label category attribute limits, refer to the following table.
### Create a Labeling Job

<table>
<thead>
<tr>
<th>Type</th>
<th>Min</th>
<th>Max</th>
</tr>
</thead>
<tbody>
<tr>
<td>Labels (Labels)</td>
<td>1</td>
<td>30</td>
</tr>
<tr>
<td>Label name character quota</td>
<td>1</td>
<td>16</td>
</tr>
<tr>
<td>Label category attributes per label (sum of categoryAttributes and categoryGlobalAttributes)</td>
<td>0</td>
<td>10</td>
</tr>
<tr>
<td>Free form text entry label category attributes per label (sum of categoryAttributes and categoryGlobalAttributes)</td>
<td>0</td>
<td>5</td>
</tr>
<tr>
<td>Frame attributes</td>
<td>0</td>
<td>10</td>
</tr>
<tr>
<td>Free form text entry attributes in frameAttributes</td>

</tr>
<tr>
<td>Character quota for a value in enum list</td>
<td>1</td>
<td>16</td>
</tr>
<tr>
<td>Maximum characters in free form text response for free form text frameAttributes</td>
<td>0</td>
<td>1000</td>
</tr>
<tr>
<td>Maximum characters in free form text response for free form text categoryAttributes and categoryGlobalAttributes</td>
<td>0</td>
<td>80</td>
</tr>
</tbody>
</table>

### Example: Label Category Configuration Files for 3D Point Cloud Labeling Jobs

Select a tab in the following tables to see examples of 3D point cloud label category configuration files for object detection, object tracking, semantic segmentation, adjustment, and verification labeling jobs.

#### 3D Point Cloud Object Tracking and Object Detection

The following is an example of a label category configuration file that includes label category attributes for a 3D point cloud object detection or object tracking labeling job. This example includes a two frame attributes, which will be added to all point clouds submitted to the labeling job. The Car label will include four label category attributes—X, Y, Z, and the global attribute, θ.

```json
{
    // Example label category configuration file
}
```
Create a Labeling Job

3D Point Cloud Semantic Segmentation

The following is an example of a label category configuration file for a 3D point cloud semantic segmentation labeling job.

Label category attributes are not supported for 3D point cloud semantic segmentation task types. Frame attributes are supported. If you provide label category attributes for a semantic segmentation labeling job, they will be ignored.

```json
{
  "documentVersion": "2020-03-01",
  "frameAttributes": [
    {
      "name": "count players",
      "description": "How many players do you see in the scene?",
      "type": "number"
    },
    {
      "name": "select one",
      "description": "describe the scene",
      "type": "string",
      "enum": ["clear", "blurry"]
    }
  ],
  "categoryGlobalAttributes": [
    {
      "name": "W",
      "description": "label-attributes-for-all-labels",
      "type": "string",
      "enum": ["foo", "buzz", "biz"]
    }
  ],
  "labels": [
    {
      "label": "Car",
      "categoryAttributes": [
        {
          "name": "X",
          "description": "enter a number",
          "type": "number"
        },
        {
          "name": "Y",
          "description": "select an option",
          "type": "string",
          "enum": ["y1", "y2"]
        },
        {
          "name": "Z",
          "description": "submit a free-form response",
          "type": "string"
        }
      ]
    },
    {
      "label": "Pedestrian",
      "categoryAttributes": [...]}
  ],
  "instructions": {"shortInstruction": "Draw a tight Cuboid", "fullInstruction": "<html markup>"}
}
```
"frameAttributes": [
  {
    "name": "count players",
    "description": "How many players to you see in the scene?",
    "type": "number"
  },
  {
    "name": "select one",
    "description": "describe the scene",
    "type": "string",
    "enum": ["clear", "blurry"]
  }
],
"labels": [
  {
    "label": "Car",
  },
  {
    "label": "Pedestrian",
  },
  {
    "label": "Cyclist",
  }
],
"instructions": {"shortInstruction": "Select the appropriate label and paint all objects in the point cloud that it applies to the same color",
"fullInstruction": "<html markup>"}
}

Select a tab in the following table to see an example of a label category configuration file for 3D point cloud verification or adjustment labeling jobs.

### 3D Point Cloud Adjustment

The following is an example of a label category configuration file for a 3D point cloud object detection or object tracking adjustment labeling job. For 3D point cloud semantic segmentation adjustment labeling jobs, categoryGlobalAttributes and categoryAttributes are not supported.

You must include auditLabelAttributeName to specify the label attribute name of the previous labeling job that you use to create the adjustment labeling job. Optionally, you can use the editsAllowed parameter to specify whether or not a label or frame attribute can be edited.

```json
{  "documentVersion": "2020-03-01",
  "frameAttributes": [
    {
      "name": "count players",
      "description": "How many players to you see in the scene?",
      "type": "number"
    },
    {
      "name": "select one",
      "editsAllowed": "none",
      "description": "describe the scene",
      "type": "string",
      "enum": ["clear", "blurry"]
    }
  ],
  "categoryGlobalAttributes": [
    {
      "name": "W",
      "editsAllowed": "any",
    }
  ]
}
3D Point Cloud Verification

The following is an example of a label category configuration file you may use for a 3D point cloud object detection or object tracking verification labeling job. For a 3D point cloud semantic segmentation verification labeling job, categoryGlobalAttributes and categoryAttributes are not supported.

You must include auditLabelAttributeName to specify the label attribute name of the previous labeling job that you use to create the verification labeling job. Additionally, you must use the editsAllowed parameter to specify that no labels can be edited.

```json
{
    "documentVersion": "2020-03-01",
    "frameAttributes": [
        {
            "name": "count players",
            "editsAllowed": "any",
            "description": "How many players to you see in the scene?",
            "type": "number"
        },
        {
            "name": "select one",
            "editsAllowed": "any",
```
Example: Label Category Configuration Files for Video Frame Labeling Jobs

The annotation tools available to your worker and task type used depends on the value you specify for annotationType. For example, if you want workers to use key points to track changes in the pose of specific objects across multiple frames, you would specify Keypoint for the annotationType. If you do not specify an annotation type, BoundingBox will be used by default.

The following is an example of a video frame keypoint label category configuration file with label category attributes. This example includes two frame attributes, which will be added to all frames submitted to the labeling job. The Car label will include four label category attributes—X, Y, Z, and the global attribute, W.
Select a tab from the following table to see examples of label category configuration files for video frame adjustment and verification labeling jobs.

Video Frame Adjustment

The following is an example of a label category configuration file you may use for a video frame adjustment labeling job.
You must include `auditLabelAttributeName` to specify the label attribute name of the previous labeling job that you use to create the verification labeling job. Optionally, you can use the `editsAllowed` parameter to specify whether or not labels, label category attributes, or frame attributes can be edited.

```
{
    "documentVersion": "2020-03-01",
    "frameAttributes": [
    {
        "name": "count players",
        "editsAllowed": "none",
        "description": "How many players do you see in the scene?",
        "type": "number"
    },
    {
        "name": "select one",
        "description": "describe the scene",
        "type": "string",
        "enum": ["clear", "blurry"]
    }],
    "categoryGlobalAttributes": [
    {
        "name": "W",
        "editsAllowed": "any",
        "description": "label-attributes-for-all-labels",
        "type": "string",
        "enum": ["foo", "buz", "buz2"]
    }],
    "labels": [
    {
        "label": "Car",
        "editsAllowed": "any",
        "categoryAttributes": [
        {
            "name": "X",
            "description": "enter a number",
            "type": "number",
            "editsAllowed": "any"
        },
        {
            "name": "Y",
            "description": "select an option",
            "type": "string",
            "enum": ["y1", "y2"],
            "editsAllowed": "any"
        },
        {
            "name": "Z",
            "description": "submit a free-form response",
            "type": "string",
            "editsAllowed": "none"
        }
    }],
    {
        "label": "Pedestrian",
        "editsAllowed": "none",
        "categoryAttributes": [...]}
],
    "annotationType": "Keypoint",
    "instructions": {"shortInstruction": "add example short instructions here",
    "fullInstruction": "<html markup>"},
```

Video Frame Verification

The following is an example of a label category configuration file for a video frame labeling job.

You must include `auditLabelAttributeName` to specify the label attribute name of the previous labeling job that you use to create the verification labeling job. Additionally, you must use the `editsAllowed` parameter to specify that no labels can be edited.

```json
{
    "documentVersion": "2020-03-01",
    "frameAttributes": [
        {
            "name": "count players",
            "editsAllowed": "none",
            "description": "How many players do you see in the scene?",
            "type": "number"
        },
        {
            "name": "select one",
            "editsAllowed": "any",
            "description": "describe the scene",
            "type": "string",
            "enum": ["clear", "blurry"]
        }
    ],
    "categoryGlobalAttributes": [
        {
            "name": "W",
            "editsAllowed": "none",
            "description": "label-attributes-for-all-labels",
            "type": "string",
            "enum": ["foo", "buz", "buz2"]
        }
    ],
    "labels": [
        {
            "label": "Car",
            "editsAllowed": "none",
            "categoryAttributes": [
                {
                    "name": "X",
                    "description": "enter a number",
                    "type": "number",
                    "editsAllowed": "any"
                },
                {
                    "name": "Y",
                    "description": "select an option",
                    "type": "string",
                    "enum": ["y1", "y2"],
                    "editsAllowed": "any"
                },
                {
                    "name": "Z",
                    "description": "submit a free-form response",
                    "type": "string",
                    "editsAllowed": "none"
                }
            ]
        }
    ]
}
```
Creating Worker Instructions

Create custom instructions for labeling jobs to improve your worker's accuracy in completing their task. Your instructions are accessible when workers select the Instructions menu option in the worker UI. Short instructions must be under 255 characters and long instruction must be under 2,048 characters.

There are two kinds of instructions:

- **Short instructions** – These instructions are shown to workers when they select Instructions in the worker UI menu. They should provide an easy reference to show the worker the correct way to label an object.

- **Full instructions** – These instructions are shown when workers select More Instructions in instructions the pop-up window. We recommend that you provide detailed instructions for completing the task with multiple examples showing edge cases and other difficult situations for labeling objects.

For 3D point cloud and video frame labeling jobs, you can add worker instructions to your label category configuration file. You can use a single string to create instructions or you can add HTML mark up to customize the appearance of your instructions and add images. Make sure that any images you include in your instructions are publicly available, or if your instructions are in Amazon S3, that your workers have read-access so that they can view them.

Use Input and Output Data

The input data that you provide to Amazon SageMaker Ground Truth is sent to your workers for labeling. You choose the data to send to your workers by creating a single manifest file that defines all of the data that requires labeling or by sending input data objects to an ongoing, streaming labeling job to be labeled in real time.

The output data is the result of your labeling job. The output data file, or augmented manifest file, contains label data for each object you send to the labeling job and metadata about the label assigned to data objects.

When you use image classification (single and multi-label), text classification (single and multi-label), object detection, and semantic segmentation built in task types to create a labeling job, you can use the resulting augmented manifest file to launch a SageMaker training job. For a demonstration of how to use an augmented manifest to train an object detection machine learning model with Amazon SageMaker, see object_detection_augmented_manifest_training.ipynb. For more information, see Provide Dataset Metadata to Training Jobs with an Augmented Manifest File (p. 1919).

Topics

- Input Data (p. 392)
- 3D Point Cloud Input Data (p. 403)
Input Data

The input data are the data objects that you send to your workforce to be labeled. There are two ways to send data objects to Ground Truth for labeling:

This directory contains one numbered
- Send a list of data objects that require labeling using an input manifest file.
- Send individual data objects in real time to a perpetually running, streaming labeling job.

If you have a dataset that needs to be labeled one time, and you do not require an ongoing labeling job, create a standard labeling job using an input manifest file.

If you want to regularly send new data objects to your labeling job after it has started, create a streaming labeling job. When you create a streaming labeling job, you can optionally use an input manifest file to specify a group of data that you want labeled immediately when the job starts. You can continuously send new data objects to a streaming labeling job as long as it is active.

**Note**
Streaming labeling jobs are only supported through the SageMaker API. You cannot create a streaming labeling job using the SageMaker console.

The following task types have special input data requirements and options:
- For 3D point cloud labeling job input data requirements, see 3D Point Cloud Input Data (p. 403).
- For video frame labeling job input data requirements, see Video Frame Input Data (p. 427).

**Topics**
- Use an Input Manifest File (p. 392)
- Automated Data Setup (p. 393)
- Supported Data Formats (p. 395)
- Ground Truth Streaming Labeling Jobs (p. 395)
- Input Data Quotas (p. 400)
- Filter and Select Data for Labeling (p. 402)

**Use an Input Manifest File**

Each line in an input manifest file is an entry containing an object, or a reference to an object, to label. An entry can also contain labels from previous jobs and for some task types, additional information.

Input data and the manifest file must be stored in Amazon Simple Storage Service (Amazon S3). Each has specific storage and access requirements, as follows:

- The Amazon S3 bucket that contains the input data must be in the same AWS Region in which you are running Amazon SageMaker Ground Truth. You must give Amazon SageMaker access to the data stored in the Amazon S3 bucket so that it can read it. For more information about Amazon S3 buckets, see Working with Amazon S3 buckets.
- The manifest file must be in the same AWS Region as the data files, but it doesn't need to be in the same location as the data files. It can be stored in any Amazon S3 bucket that is accessible to the AWS
Identity and Access Management (IAM) role that you assigned to Ground Truth when you created the labeling job.

**Note**
3D point cloud and video frame task types have different input manifest requirements and attributes.
For 3D point cloud task types, refer to Create an Input Manifest File for a 3D Point Cloud Labeling Job (p. 405).
For video frame task types, refer to Create a Video Frame Input Manifest File (p. 432).

The manifest is a UTF-8 encoded file in which each line is a complete and valid JSON object. Each line is delimited by a standard line break, \n or \r\n. Because each line must be a valid JSON object, you can't have unescaped line break characters. For more information about data format, see JSON Lines.

Each JSON object in the manifest file can be no larger than 100,000 characters. No single attribute within an object can be larger than 20,000 characters. Attribute names can't begin with $ (dollar sign).

Each JSON object in the manifest file must contain one of the following keys: source-ref or source. The value of the keys are interpreted as follows:

- **source-ref** – The source of the object is the Amazon S3 object specified in the value. Use this value when the object is a binary object, such as an image.
- **source** – The source of the object is the value. Use this value when the object is a text value.

The following is an example of a manifest file for files stored in an Amazon S3 bucket:

```
{"source-ref": "S3 bucket location 1"}
{"source-ref": "S3 bucket location 2"}
...  
{"source-ref": "S3 bucket location n"}
```

Use the source-ref key for image files for bounding box, image classification (single and multi-label), semantic segmentation, and video clips for video classification labeling jobs. 3D point cloud and video frame labeling jobs also use the source-ref key but these labeling jobs require additional information in the input manifest file. For more information see 3D Point Cloud Input Data (p. 403) and Video Frame Input Data (p. 427).

The following is an example of a manifest file with the input data stored in the manifest:

```
{"source": "Lorem ipsum dolor sit amet"}
{"source": "consectetur adipiscing elit"}
...  
{"source": "mollit anim id est laborum"}
```

Use the source key for single and multi-label text classification and named entity recognition labeling jobs.

You can include other key-value pairs in the manifest file. These pairs are passed to the output file unchanged. This is useful when you want to pass information between your applications. For more information, see Output Data (p. 433).

**Automated Data Setup**

You can use the automated data setup to create manifest files for your labeling jobs in the Ground Truth console using images, videos, video frames, text (.txt) files, and comma-separated value (.csv) files stored...
in Amazon S3. When you use automated data setup, you specify an Amazon S3 location where your input data is stored and the input data type, and Ground Truth looks for the files that match that type in the location you specify.

**Note**
Ground Truth does not use an AWS KMS key to access your input data or write the input manifest file in the Amazon S3 location that you specify. The IAM user or role that creates the labeling job must have permissions to access your input data objects in Amazon S3.

Before using the following procedure, ensure that your input images or files are correctly formatted:

- **Image files** – Image files must comply with the size and resolution limits listed in the tables found in Input File Size Quota (p. 400).
- **Text files** – Text data can be stored in one or more .txt files. Each item that you want labeled must be separated by a standard line break.
- **CSV files** – Text data can be stored in one or more .csv files. Each item that you want labeled must be in a separate row.
- **Videos** – Video files can be any of the following formats: .mp4, .ogg, and .webm. If you want to extract video frames from your video files for object detection or object tracking, see Provide Video Files (p. 429).
- **Video frames** – Video frames are images extracted from a video. All images extracted from a single video are referred to as a sequence of video frames. Each sequence of video frames must have unique prefix keys in Amazon S3. See Provide Video Frames (p. 428). For this data type, see Automated Video Frame Input Data Setup (p. 430)

**Important**
For video frame object detection and video frame object tracking labeling jobs, see Automated Video Frame Input Data Setup (p. 430) to learn how to use the automated data setup.

Use these instructions to automatically set up your input dataset connection with Ground Truth.

**Automatically connect your data in Amazon S3 with Ground Truth**

1. Navigate to the Create labeling job page in the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
   This link puts you in the North Virginia (us-east-1) AWS Region. If your input data is in an Amazon S3 bucket in another Region, switch to that Region. To change your AWS Region, on the navigation bar, choose the name of the currently displayed Region.
2. Select Create labeling job.
3. Enter a Job name.
4. In the section Input data setup, select Automated data setup.
5. Enter an Amazon S3 URI for S3 location for input datasets.
6. Specify your S3 location for output datasets. This is where your output data is stored.
7. Choose your Data type using the dropdown list.
8. Use the drop down menu under IAM Role to select an execution role. If you select Create a new role, specify the Amazon S3 buckets that you want grant this role permission to access. This role must have permission to access the S3 buckets you specified in Steps 5 and 6.
9. Select Complete data setup.

The following GIF demonstrates how to use the automated data setup for image data. This example will create a file, `dataset-YYMDDTHHMMSS.manifest` in the Amazon S3 bucket `example-groundtruth-images` where `YYMDDTHHMMSS` indicates the year (YY), month (MM), day (DD) and time in hours (HH), minutes (mm) and seconds (ss), that the input manifest file was created.
Supported Data Formats

When you create an input manifest file for a built-in task type manually, your input data must be in one of the following support file formats for the respective input data type. To learn about automated data setup, see Automated Data Setup (p. 393).

**Tip**
When you use the automated data setup, additional data formats can be used to generate an input manifest file for video frame and text based task types.

Ground Truth Streaming Labeling Jobs

If you want to perpetually send new data objects to Amazon SageMaker Ground Truth to be labeled, use a streaming labeling job. Streaming labeling jobs allow you to:

- Send new dataset objects to workers in real time using a perpetually running labeling job. Workers continuously receive new data objects to label as long as the labeling job is active and new objects are being sent to it.
- Gain visibility into the number of objects that have been queued and are waiting to be labeled. Use this information to control the flow of data objects sent to your labeling job.
- Receive label data for individual data objects in real time as workers finish labeling them.
Ground Truth streaming labeling jobs remain active until they are manually stopped or have been idle for more than 10 days. You can intermittently send new data objects to workers while the labeling job is active.

If you are a new user of Ground Truth streaming labeling jobs, it is recommended that you review How It Works (p. 396).

Use Create a Streaming Labeling Job (p. 371) to learn how to create a streaming labeling job.

**Note**

Ground Truth streaming labeling jobs are only supported through the SageMaker API.

**Topics**

- How It Works (p. 396)
- Send Data to a Streaming Labeling Job (p. 396)
- Manage Labeling Requests with an Amazon SQS Queue (p. 398)
- Receive Output Data from a Streaming Labeling Job (p. 398)
- Duplicate Message Handling (p. 398)

**How It Works**

When you create a Ground Truth streaming labeling job, the job remains active until it is manually stopped, remains idle for more than 10 days, or is unable to access input data sources. You can intermittently send new data objects to workers while it is active. A worker can continue to receive new data objects in real time as long as the total number of tasks currently available to the worker is less than the value in `MaxConcurrentTaskCount`. Otherwise, the data object is sent to a queue that Ground Truth creates on your behalf in Amazon Simple Queue Service (Amazon SQS) for later processing. These tasks are sent to workers as soon as the total number of tasks currently available to a worker falls below `MaxConcurrentTaskCount`. If a data object is not sent to a worker after 14 days, it expires. You can view the number of tasks pending in the queue and adjust the number of objects you send to the labeling job. For example, you may decrease the speed at which you send objects to the labeling job if the backlog of pending objects moves above a threshold.

**Send Data to a Streaming Labeling Job**

You can optionally submit input data to a streaming labeling job one time when you create the labeling job using an input manifest file. Once the labeling job has started and the state is `InProgress`, you can submit new data objects to your labeling job in real time using your Amazon SNS input topic and Amazon S3 event notifications.

**Submit Data Objects When you Start the Labeling Job (One Time):**

- **Use an Input Manifest File** – You can optionally specify an input manifest file Amazon S3 URI in `ManifestS3Uri` when you create the streaming labeling job. Ground Truth sends each data object in the manifest file to workers for labeling as soon as the labeling job starts. To learn more, see Create a Manifest File (Optional) (p. 375).

  After you submit a request to create the streaming labeling job, its status will be `Initializing`. Once the labeling job is active, the state changes to `InProgress` and you can start using the real-time options to submit additional data objects for labeling.

**Submit Data Objects in Real Time:**

- **Send data objects using Amazon SNS messages** – You can send Ground Truth new data objects to label by sending an Amazon SNS message. You will send this message to an Amazon SNS input topic that you create and specify when you create your streaming labeling job. For more information, see Send Data Objects Using Amazon SNS (p. 397).
• **Send data objects by placing them in an Amazon S3 bucket** – Each time you add a new data object to an Amazon S3 bucket, you can prompt Ground Truth to process that object for labeling. To do this, you add an event notification to the bucket so that it notifies your Amazon SNS input topic each time a new object is added to (or created in) that bucket. For more information, see *Send Data Objects using Amazon S3* (p. 397). This option is not available for text-based labeling jobs such as text classification and named entity recognition.

   **Important**
   If you use the Amazon S3 configuration, do not use the same Amazon S3 location for your input data configuration and your output data. You specify the S3 prefix for your output data when you create a labeling job.

**Send Data Objects Using Amazon SNS**

You can send data objects to your streaming labeling job using Amazon Simple Notification Service (Amazon SNS). Amazon SNS is a web service that coordinates and manages the delivery of messages to and from endpoints (for example, an email address or AWS Lambda function). An Amazon SNS topic acts as a communication channel between two or more endpoints. You use Amazon SNS to send, or publish, new data objects to the topic specified in the `CreateLabelingJob` parameter `SnsTopicArn` in `InputConfig`. The format of these messages is the same as a single line from an input manifest file.

For example, you may send a piece of text to an active text classification labeling job by publishing it to your input topic. The message that you publish may look similar to the following:

```json
{"source": "Lorem ipsum dolor sit amet"}
```

To send a new image object to an image classification labeling job, your message may look similar to the following:

```json
{"source-ref": "s3://awsexamplebucket/example-image.jpg"}
```

   **Note**
   You can also include custom deduplication IDs and deduplication keys in your Amazon SNS messages. To learn more, see *Duplicate Message Handling* (p. 398).

When Ground Truth creates your streaming labeling job, it subscribes to your Amazon SNS input topic.

**Send Data Objects using Amazon S3**

You can send one or more new data objects to a streaming labeling job by placing them in an Amazon S3 bucket that is configured with an Amazon SNS event notification. You can set up an event to notify your Amazon SNS input topic anytime a new object is created in your bucket. You must specify this same Amazon SNS input topic in the `CreateLabelingJob` parameter `SnsTopicArn` in `InputConfig`.

Anytime you configure an Amazon S3 bucket to send notifications to Amazon SNS, Ground Truth will publish a test event, "s3:TestEvent", to ensure that the topic exists and that the owner of the Amazon S3 bucket specified has permission to publish to the specified topic. It is recommended that you set up your Amazon S3 connection with Amazon SNS before starting a streaming labeling job. If you do not, this test event may register as a data object and be sent to Ground Truth for labeling.

   **Important**
   If you use the Amazon S3 configuration, do not use the same Amazon S3 location for your input data configuration and your output data. You specify the S3 prefix for your output data when you create a labeling job.

   For image-based labeling jobs, Ground Truth requires all S3 buckets to have a CORS policy attached. To learn more, see *CORS Permission Requirement* (p. 468).
Once you have configured your Amazon S3 bucket and created your labeling job, you can add objects to your bucket and Ground Truth either sends that object to workers or places it on your Amazon SQS queue.

To learn more, see Set up Amazon S3 Bucket Event Notifications (p. 374).

**Important**
This option is not available for text-based labeling jobs such as text classification and named entity recognition.

**Manage Labeling Requests with an Amazon SQS Queue**

When Ground Truth creates your streaming labeling job, it creates an Amazon SQS queue in the AWS account used to create the labeling job. The queue name is `GroundTruth-labeling_job_name` where `labeling_job_name` is the name of your labeling job, in lowercase letters. When you send data objects to your labeling job, Ground Truth either sends the data objects directly to workers or places the task in your queue to be processed at a later time. If a data object is not sent to a worker after 14 days, it expires and is removed from the queue. You can setup an alarm in Amazon SQS to detect when objects expire and use this mechanism to control the volume of objects you send to your labeling job.

**Important**
Modifying, deleting, or sending objects directly to the Amazon SQS queue associated with your streaming labeling job may lead to job failures.

**Receive Output Data from a Streaming Labeling Job**

Your Amazon S3 output bucket is periodically updated with new output data from your streaming labeling job.

Optionally, you can specify an Amazon SNS output topic. Each time a worker submits a labeled object, a notification with the output data is sent to that topic. You can subscribe an endpoint to your SNS output topic to receive notifications or trigger events when you receive output data from a labeling task. Use an Amazon SNS output topic if you want to do real time chaining to another streaming job and receive an Amazon SNS notifications each time a data object is submitted by a worker.

To learn more, see Subscribe an Endpoint to Your Amazon SNS Output Topic (p. 374).

**Duplicate Message Handling**

For data objects sent in real time, Ground Truth guarantees idempotency by ensuring each unique object is only sent for labeling once, even if the input message referring to that object is received multiple times (duplicate messages). To do this, each data object sent to a streaming labeling job is assigned a deduplication ID, which is identified with a deduplication key.

If you send your requests to label data objects directly through your Amazon SNS input topic using Amazon SNS messages, you can optionally choose a custom deduplication key and deduplication IDs for your objects. For more information, see Specify A Deduplication Key and ID in an Amazon SNS Message (p. 398).

If you do not provide your own deduplication key, or if you use the Amazon S3 configuration to send data objects to your labeling job, Ground Truth uses one of the following for the deduplication ID:

- For messages sent directly to your Amazon SNS input topic, Ground Truth uses the SNS message ID.
- For messages that come from an Amazon S3 configuration, Ground Truth creates a deduplication ID by combining the Amazon S3 URI of the object with the sequencer token in the message.

**Specify A Deduplication Key and ID in an Amazon SNS Message**

When you send a data object to your streaming labeling job using an Amazon SNS message, you have the option to specify your deduplication key and deduplication ID in one of the following ways. In all of these scenarios, identify your deduplication key with `dataset-objectid-attribute-name`. 
Bring Your Own Deduplication Key and ID

Create your own deduplication key and deduplication ID by configuring your Amazon SNS message as follows. Replace byo-key with your key and UniqueId with the deduplication ID for that data object.

```json
{
    "source-ref": "s3://bucket/prefix/object1",
    "dataset-objectid-attribute-name": "byo-key",
    "byo-key": "UniqueId"
}
```

Your deduplication key can be up to 140 characters. Supported patterns include: "^[a-zA-Z0-9-]*[a-zA-Z0-9-$]*/".

Your deduplication ID can be up to 1,024 characters. Supported patterns include: ^(https|s3)://([^/]+)\/*(.*)$.

Use an Existing Key for your Deduplication Key

You can use an existing key in your message as the deduplication key. When you do this, the value associated with that key is used for the deduplication ID.

For example, you can specify use the source-ref key as your deduplication key by formatting your message as follows:

```json
{
    "source-ref": "s3://bucket/prefix/object1",
    "dataset-objectid-attribute-name": "source-ref"
}
```

In this example, Ground Truth uses "s3://bucket/prefix/object1" for the deduplication id.

Find Deduplication Key and ID in Your Output Data

You can see the deduplication key and ID in your output data. The deduplication key is identified by dataset-objectid-attribute-name.

When you use your own custom deduplication key, your output contains something similar to the following:

```json
"dataset-objectid-attribute-name": "byo-key",
"byo-key": "UniqueId",
```

When you do not specify a key, you can find the deduplication ID that Ground Truth assigned to your data object as follows. The $label-attribute-name-object-id parameter identifies your deduplication ID.

```json
{
    "source-ref": "s3://bucket/prefix/object1",
    "dataset-objectid-attribute-name": "$label-attribute-name-object-id",
    "label-attribute-name": 0,
    "label-attribute-name-metadata": { ... },
    "$label-attribute-name-object-id": "<service-generated-key>"
}
```

For <service-generated-key>, if the data object came through an Amazon S3 configuration, Ground Truth adds a unique value used by the service and emits a new field keyed by $sequencer which shows the Amazon S3 sequencer used. If object was fed to SNS directly, Ground Truth use the SNS message ID.
**Note**
Do not use the $ character in your label attribute name.

**Input Data Quotas**

Input datasets used in semantic segmentation labeling jobs have a quota of 20,000 items. For all other labeling job types, the dataset size quota is 100,000 items. To request an increase to the quota for labeling jobs other than semantic segmentation jobs, review the procedures in AWS Service Quotas to request a quota increase.

Input image data for active and non-active learning labeling jobs must not exceed size and resolution quotas. **Active learning** refers to labeling jobs that use automated data labeling. **Non-active learning** refers to labeling jobs that don't use automated data labeling.

Additional quotas apply for label categories for all task types, and for input data and labeling category attributes for 3D point cloud and video frame task types.

**Input File Size Quota**

Input files can't exceed the following size- quotas for both active and non-active learning labeling jobs. There is no input file size quota for videos used in video classification labeling jobs.

<table>
<thead>
<tr>
<th>Labeling Job Task Type</th>
<th>Input File Size Quota</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image classification</td>
<td>40 MB</td>
</tr>
<tr>
<td>Bounding box (Object detection)</td>
<td>40 MB</td>
</tr>
<tr>
<td>Semantic segmentation</td>
<td>40 MB</td>
</tr>
<tr>
<td>Bounding box (Object detection) label adjustment</td>
<td>40 MB</td>
</tr>
<tr>
<td>Semantic segmentation label adjustment</td>
<td>40 MB</td>
</tr>
<tr>
<td>Bounding box (Object detection) label verification</td>
<td>40 MB</td>
</tr>
<tr>
<td>Semantic segmentation label verification</td>
<td>40 MB</td>
</tr>
</tbody>
</table>

**Input Image Resolution Quotas**

Image file resolution refers to the number of pixels in an image, and determines the amount of detail an image holds. Image resolution quotas differ depending on the labeling job type and the SageMaker built-in algorithm used. The following table lists the resolution quotas for images used in active and non-active learning labeling jobs.

<table>
<thead>
<tr>
<th>Labeling Job Task Type</th>
<th>Resolution Quota - Non Active Learning</th>
<th>Resolution Quota - Active Learning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image classification</td>
<td>100 million pixels</td>
<td>3840 x 2160 pixels (4 K)</td>
</tr>
<tr>
<td>Bounding box (Object detection)</td>
<td>100 million pixels</td>
<td>3840 x 2160 pixels (4 K)</td>
</tr>
<tr>
<td>Semantic segmentation</td>
<td>100 million pixels</td>
<td>1920 x 1080 pixels (1080 p)</td>
</tr>
<tr>
<td>Object detection label adjustment</td>
<td>100 million pixels</td>
<td>3840 x 2160 pixels (4 K)</td>
</tr>
</tbody>
</table>
Labeling Job Task Type | Resolution Quota - Non Active Learning | Resolution Quota - Active Learning
--- | --- | ---
Semantic segmentation label adjustment | 100 million pixels | 1920 x 1080 pixels (1080 p)
Object detection label verification | 100 million pixels | Not available
Semantic segmentation label verification | 100 million pixels | Not available

**Label Category Quotas**

Each labeling job task type has a quota for the number of label categories you can specify. Workers select label categories to create annotations. For example, you may specify label categories *car*, *pedestrian*, and *biker* when creating a bounding box labeling job and workers will select the *car* category before drawing bounding boxes around cars.

**Important**

- Label category names cannot exceed 256 characters.
- All label categories must be unique. You cannot specify duplicate label categories.

The following label category limits apply to labeling jobs. Quotas for label categories depend on whether you use the SageMaker API operation `CreateLabelingJob` or the console to create a labeling job.

<table>
<thead>
<tr>
<th>Labeling Job Task Type</th>
<th>Label Category Quota - API</th>
<th>Label Category Quota - Console</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image classification (Multi-label)</td>
<td>50</td>
<td>50</td>
</tr>
<tr>
<td>Image classification (Single label)</td>
<td>Unlimited</td>
<td>30</td>
</tr>
<tr>
<td>Bounding box (Object detection)</td>
<td>50</td>
<td>50</td>
</tr>
<tr>
<td>Label verification</td>
<td>Unlimited</td>
<td>30</td>
</tr>
<tr>
<td>Semantic segmentation (with active learning)</td>
<td>20</td>
<td>10</td>
</tr>
<tr>
<td>Semantic segmentation (without active learning)</td>
<td>Unlimited</td>
<td>10</td>
</tr>
<tr>
<td>Named entity recognition</td>
<td>Unlimited</td>
<td>30</td>
</tr>
<tr>
<td>Text classification (Multi-label)</td>
<td>50</td>
<td>50</td>
</tr>
<tr>
<td>Text classification (Single label)</td>
<td>Unlimited</td>
<td>30</td>
</tr>
<tr>

<td>30</td>
<td>30</td>
</tr>
<tr>
<td>Video frame object tracking</td>
<td>30</td>
<td>30</td>
</tr>
<tr>
<td>3D point cloud object detection</td>
<td>30</td>
<td>30</td>
</tr>
<tr>
<td>3D point cloud object tracking</td>
<td>30</td>
<td>30</td>
</tr>
</tbody>
</table>
3D Point Cloud and Video Frame Labeling Job Quotas

The following quotas apply for 3D point cloud and video frame labeling job input data.

<table>
<thead>
<tr>
<th>Labeling Job Task Type</th>
<th>Input Data Quota</th>
</tr>
</thead>
<tbody>
<tr>
<td>Video frame object detection</td>
<td>2,000 video frames (images) per sequence</td>
</tr>
<tr>
<td>Video frame object detection</td>
<td>10 video frame sequences per manifest file</td>
</tr>
<tr>
<td>Video frame object tracking</td>
<td>2,000 video frames (images) per sequence</td>
</tr>
<tr>
<td>Video frame object tracking</td>
<td>10 video frame sequences per manifest file</td>
</tr>
<tr>
<td>3D point cloud object detection</td>
<td>100,000 point cloud frames per labeling job</td>
</tr>
<tr>
<td>3D point cloud object tracking</td>
<td>100,000 point cloud frame sequences per labeling job</td>
</tr>
<tr>
<td>3D point cloud object tracking</td>
<td>500 point cloud frames in each sequence file</td>
</tr>
</tbody>
</table>

When you create a video frame or 3D point cloud labeling job, you can add one or more label category attributes to each label category that you specify to have workers provide more information about an annotation.

Each label category attribute has a single label category attribute name, and a list of one or more options (values) to choose from. To learn more, see Worker User Interface (UI) (p. 288) for 3D point cloud labeling jobs and Worker User Interface (UI) (p. 240) for video frame labeling jobs.

The following quotas apply to the number of label category attributes names and values you can specify for labeling jobs.

<table>
<thead>
<tr>
<th>Labeling Job Task Type</th>
<th>Label Category Attribute (name) Quota</th>
<th>Label Category Attribute Values Quota</th>
</tr>
</thead>
<tbody>
<tr>
<td>Video frame object detection</td>
<td>10</td>
<td>10</td>
</tr>
<tr>
<td>Video frame object tracking</td>
<td>10</td>
<td>10</td>
</tr>
<tr>
<td>3D point cloud object detection</td>
<td>10</td>
<td>10</td>
</tr>
<tr>
<td>3D point cloud object tracking</td>
<td>10</td>
<td>10</td>
</tr>
<tr>
<td>3D point cloud semantic segmentation</td>
<td>10</td>
<td>10</td>
</tr>
</tbody>
</table>

Filter and Select Data for Labeling

You can use the Amazon SageMaker console to select a portion of your dataset for labeling. The data must be stored in an Amazon S3 bucket. You have three options:
• Use the full dataset.
• Choose a randomly selected sample of the dataset.
• Specify a subset of the dataset using a query.

The following options are available in the Labeling jobs section of the SageMaker console after selecting Create labeling job. To learn how to create a labeling job in the console, see Getting started (p. 190). To configure the dataset that you use for labeling, in the Job overview section, choose Additional configuration.

Use the Full Dataset

When you choose to use the Full dataset, you must provide a manifest file for your data objects. You can provide the path of the Amazon S3 bucket that contains the manifest file or use the SageMaker console to create the file. To learn how to create a manifest file using the console, see Automated Data Setup (p. 393).

Choose a Random Sample

When you want to label a random subset of your data, select Random sample. The dataset is stored in the Amazon S3 bucket specified in the input dataset location field.

After you have specified the percentage of data objects that you want to include in the sample, choose Create subset. SageMaker randomly picks the data objects for your labeling job. After the objects are selected, choose Use this subset.

SageMaker creates a manifest file for the selected data objects. It also modifies the value in the Input dataset location field to point to the new manifest file.

Specify a Subset

You can specify a subset of your data objects using an Amazon S3 SELECT query on the object file names.

The SELECT statement of the SQL query is defined for you. You provide the WHERE clause to specify which data objects should be returned.

For more information about the Amazon S3 SELECT statement, see Selecting Content from Objects.

Choose Create subset to start the selection, and then choose Use this subset to use the selected data.

SageMaker creates a manifest file for the selected data objects. It also updates the value in the Input dataset location field to point to the new manifest file.

3D Point Cloud Input Data

To create a 3D point cloud labeling job, you must create an input manifest file. Use this topic to learn the formatting requirements of the input manifest file for each task type. To learn about the raw input data formats Ground Truth accepts for 3D point cloud labeling jobs, see the section Accepted Raw 3D Data Formats (p. 404).

Use your labeling job task type to choose a topics on Create an Input Manifest File for a 3D Point Cloud Labeling Job (p. 405) to learn about the formatting requirements for each line of your input manifest file.

Topics
• Accepted Raw 3D Data Formats (p. 404)
• Create an Input Manifest File for a 3D Point Cloud Labeling Job (p. 405)
• Understand Coordinate Systems and Sensor Fusion (p. 418)
## Accepted Raw 3D Data Formats

Ground Truth uses your 3D point cloud data to render a 3D scenes that workers annotate. This section describes the raw data formats that are accepted for point cloud data and sensor fusion data for a point cloud frame. To learn how to create an input manifest file to connect your raw input data files with Ground Truth, see [Create an Input Manifest File for a 3D Point Cloud Labeling Job](p. 405).

For each frame, Ground Truth supports Compact Binary Pack Format (.bin) and ASCII (.txt) files. These files contain information about the location (x, y, and z coordinates) of all points that make up that frame, and, optionally, information about the pixel color of each point for colored point clouds. When you create a 3D point cloud labeling job input manifest file, you can specify the format of your raw data in the `format` parameter.

The following table lists elements that Ground Truth supports in point cloud frame files to describe individual points.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>The x coordinate of the point.</td>
</tr>
<tr>
<td>y</td>
<td>The y coordinate of the point.</td>
</tr>
<tr>
<td>z</td>
<td>The z coordinate of the point.</td>
</tr>
<tr>
<td>i</td>
<td>The intensity of the point.</td>
</tr>
<tr>
<td>r</td>
<td>The red color channel component. An 8-bit value (0-255).</td>
</tr>
<tr>
<td>g</td>
<td>The green color channel component. An 8-bit value (0-255)</td>
</tr>
<tr>
<td>b</td>
<td>The blue color channel component. An 8-bit value (0-255)</td>
</tr>
</tbody>
</table>

Ground Truth assumes the following about your input data:

- All of the positional coordinates (x, y, z) are in meters.
- All the pose headings (qx, qy, qz, qw) are measured in [Spatial Quaternions](#).

### Compact Binary Pack Format

The Compact Binary Pack Format represents a point cloud as an ordered set of a stream of points. Each point in the stream is an ordered binary pack of 4-byte float values in some variant of the form `xyzirgb`. The x, y, and z elements are required and additional information about that pixel can be included in a variety of ways using i, r, g, and b.

To use a binary file to input point cloud frame data to a Ground Truth 3D point cloud labeling job, enter `binary/` in the `format` parameter for your input manifest file and replace with the order of elements in each binary pack. For example, you may enter one of the following for the `format` parameter.

- `binary/xyzi` – When you use this format, your point element stream would be in the following order: `x1y1z1i1x2y2z2i2...`
- `binary/xyzrgb` – When you use this format, your point element stream would be in the following order: `x1y1z1r1g1b1x2y2z2r2g2b2...`
- `binary/xyzirgb` – When you use this format, your point element stream would be in the following order: `x1y1z1i1r1g1b1x2y2z2i2r2g2b2...`
When you use a binary file for your point cloud frame data, if you do not enter a value for `format`, the default pack format `binary/xyzi` is used.

**ASCII Format**

The ASCII format uses a text file to represent a point cloud, where each line in the ASCII point cloud file represents a single point. Each point is a line in the text file and contains whitespace-separated values, each of which is a 4-byte float ASCII values. The \( x \), \( y \), and \( z \) elements are required for each point and additional information about that point can be included in a variety of ways using \( i \), \( r \), \( g \), and \( b \).

To use a text file to input point cloud frame data to a Ground Truth 3D point cloud labeling job, enter `text/` in the `format` parameter for your input manifest file and replace  with the order of point elements on each line.

For example, if you enter `text/xyzi` for `format`, your text file for each point cloud frame should look similar to the following:

```
x1 y1 z1 i1
x2 y2 z2 i2
...
```

If you enter `text/xyzrgb`, your text file should look similar to the following:

```
x1 y1 z1 r1 g1 b1
x2 y2 z2 r2 g2 b1
...
```

When you use a text file for your point cloud frame data, if you do not enter a value for `format`, the default format `text/xyzi` will be used.

**Point Cloud Resolution Limits**

Ground Truth does not have a resolution limit for 3D point cloud frames. However, we recommend that you limit each point cloud frame to 500K points for optimal performance. When Ground Truth renders the 3D point cloud visualization, it must be viewable on your workers' computers, which depends on workers' computer hardware. Point cloud frames that are larger than 1 million points may not render on standard machines, or may take too long to load.

**Create an Input Manifest File for a 3D Point Cloud Labeling Job**

When you create a labeling job, you provide an input manifest file where each line of the manifest describes a unit of task to be completed by annotators. The format of your input manifest file depends on your task type.

- If you are creating a 3D point cloud **object detection** or **semantic segmentation** labeling job, each line in your input manifest file contains information about a single 3D point cloud frame. This is called a point cloud frame input manifest. To learn more, see Create a Point Cloud Frame Input Manifest File (p. 405).

- If you are creating a 3D point cloud **object tracking** labeling job, each line of your input manifest file contains a sequence of 3D point cloud frames and associated data. This is called a point cloud sequence input manifest. To learn more, see Create a Point Cloud Sequence Input Manifest (p. 412).

**Create a Point Cloud Frame Input Manifest File**

The manifest is a UTF-8 encoded file in which each line is a complete and valid JSON object. Each line is delimited by a standard line break, \n or \n. Because each line must be a valid JSON object, you can't
have unescaped line break characters. In the single-frame input manifest file, each line in the manifest contains data for a single point cloud frame. The point cloud frame data can either be stored in binary or ASCII format (see Accepted Raw 3D Data Formats (p. 404)). This is the manifest file formatting required for 3D point cloud object detection and semantic segmentation. Optionally, you can also provide camera sensor fusion data for each point cloud frame.

Ground Truth supports point cloud and video camera sensor fusion in the world coordinate system (p. 418) for all modalities. If you can obtain your 3D sensor extrinsic (like a LiDAR extrinsic), we recommend that you transform 3D point cloud frames into the world coordinate system using the extrinsic. For more information, see Sensor Fusion (p. 420).

However, if you cannot obtain a point cloud in world coordinate system, you can provide coordinates in the original coordinate system that the data was captured in. If you are providing camera data for sensor fusion, it is recommended that you provide LiDAR sensor and camera pose in the world coordinate system.

To create a single-frame input manifest file, you will identify the location of each point cloud frame that you want workers to label using the `source-ref` key. Additionally, you must use the `source-ref-metadata` key to identify the format of your dataset, a timestamp for that frame, and, optionally, sensor fusion data and video camera images.

The following example demonstrates the syntax used for an input manifest file for a single-frame point cloud labeling job. The example includes two point cloud frames. For details about each parameter, see the table following this example.

**Important**

Each line in your input manifest file must be in JSON Lines format. The following code block shows an input manifest file with two JSON objects. Each JSON object is used to point to and provide details about a single point cloud frame. The JSON objects have been expanded for readability, but you must minimize each JSON object to fit on a single line when creating an input manifest file. An example is provided under this code block.

  }
]
When you create an input manifest file, you must collapse your JSON objects to fit on a single line. For example, the code block above would appear as follows in an input manifest file:

```
{"source-ref":"s3://awsexamplebucket/examplefolder/frame1.bin","source-ref-metadata":
{"format":"binary/xyzi","unix-timestamp":1566861644.759115,"ego-vehicle-pose":{"position":{"x":-2.7161461413869947,"y":116.25822288149078,"z":1.8348751887989483},"heading":
{"qx":-0.02111296123795955,"qy":-0.006495469416730261,"qz":-0.008024565904865688,"qw":0.999781192298088},
"prefix":"s3://awsexamplebucket/lidar_singleframe_dataset/someprefix/","images":
{"qx":0.7594754093069037,"qy":0.02181790885672969,"qz":-0.024617253103356,"qw":-0.6496916273040025},"camera-model":"pinhole"}}}
{"source-ref":"s3://awsexamplebucket/examplefolder/frame2.bin","source-ref-metadata":
{"format":"binary/xyzi","unix-timestamp":1566861644.759115,"ego-vehicle-pose":{"position":{"x":-2.7161461413869947,"y":116.25822288149078,"z":1.8348751887989483},"heading":
{"qx":-0.02111296123795955,"qy":-0.006495469416730261,"qz":-0.008024565904865688,"qw":0.999781192298088},
"prefix":"s3://awsexamplebucket/lidar_singleframe_dataset/someprefix/","images":
{"qx":0.7594754093069037,"qy":0.02181790885672969,"qz":-0.024617253103356,"qw":-0.6496916273040025},"camera-model":"pinhole"}}]
```

The following table shows the parameters you can include in your input manifest file:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Accepted Values</th>
<th>Description</th>

Include Vehicle Pose Information in Your Input Manifest

Use the ego-vehicle location to provide information about the location of the vehicle used to capture point cloud data. Ground Truth uses this information to compute LiDAR extrinsic matrix.

Ground Truth uses extrinsic matrices to project labels to and from the 3D scene and 2D images. For more information, see Sensor Fusion (p. 420).

The following table provides more information about the position and orientation (heading) parameters that are required when you provide ego-vehicle information.

<table>

Include Camera Data in Your Input Manifest

If you want to include video camera data with a frame, use the following parameters to provide information about each image. The Required column below applies when the images parameter is included in the input manifest file under source-ref-metadata. You are not required to include images in your input manifest file.

If you include camera images, you must include information about the camera position and heading used the capture the images in the world coordinate system.

If your images are distorted, Ground Truth can automatically undistort them using information you provide about the image in your input manifest file, including distortion coefficients (k1, k2, k3, k4, p1, p1), the camera model and the camera intrinsic matrix. The intrinsic matrix is made up of focal length (fx, fy), and the principal point (cx, cy). See Intrinsic Matrix (p. 422) to learn how Ground Truth uses the camera intrinsic. If distortion coefficients are not included, Ground Truth will not undistort an image.

Point Cloud Frame Limits

You can include up to 100,000 point cloud frames in your input manifest file. 3D point cloud labeling job have longer pre-processing times than other Ground Truth task types. For more information, see Job Pre-processing Time (p. 287).

Create a Point Cloud Sequence Input Manifest

The manifest is a UTF-8 encoded file in which each line is a complete and valid JSON object. Each line is delimited by a standard line break, \n or \r\n. Because each line must be a valid JSON object, you can't have unescaped line break characters. In the point cloud sequence input manifest file, each line in the manifest contains a sequence of point cloud frames. The point cloud data for each frame in the sequence can either be stored in binary or ASCII format. For more information, see Accepted Raw 3D Data Formats (p. 404). This is the manifest file formatting required for 3D point cloud object tracking. Optionally, you can also provide point attribute and camera sensor fusion data for each point cloud frame. When you create a sequence input manifest file, you must provide LiDAR and video camera sensor fusion data in a world coordinate system (p. 418).

The following example demonstrates the syntax used for an input manifest file when each line in the manifest is a sequence file. Each line in your input manifest file must be in JSON Lines format.

```json
{"source-ref": "s3://awsexamplebucket/example-folder/seq1.json"}
{"source-ref": "s3://awsexamplebucket/example-folder/seq2.json"}
```

The data for each sequence of point cloud frames needs to be stored in a JSON data object. The following is an example of the format you use for a sequence file. Information about each frame is included as a JSON object and is listed in the `frames` list. This is an example of a sequence file with two point cloud frame files, `frame300.bin` and `frame303.bin`. The `...` is used to indicated where you should include information for additional frames. Add a JSON object for each frame in the sequence.

The following code block includes a JSON object for a single sequence file. The JSON object has been expanded for readability.

```json
{  "seq-no": 1,
   "prefix": "s3://awsexamplebucket/example_lidar_sequence_dataset/seq1/",
   "number-of-frames": 100,
   "frames": [
      {
        "frame-no": 300,
        "unix-timestamp": 1566861644.759115,
        "frame": "example_lidar_frames/frame300.bin",
        "format": "binary/xyz",
        "ego-vehicle-pose": {
          "position": {
            "x": -2.7161461413869947,
            "y": 116.25822288149078,
            "z": 1.8348751887989483
          },
          "heading": {
            "qx": -0.02111296123795955,
            "qy": -0.006495469416730261,
            "qz": -0.008024565904865688,
            "qw": 0.9997181192298087
          }
        },
        "images": [
          {
            "image-path": "example_images/frame300.bin_camera0.jpg",
            "unix-timestamp": 1566861644.759115,
            "fx": 847.7962624528487,
            "fy": 412
```
The following table provides details about the top-level parameters of a sequence file. For detailed information about the parameters required for individual frames in the sequence file, see Parameters for Individual Point Cloud Frames (p. 414).

| prefix             | No       | String         | The location in Amazon S3 where your metadata, such as camera images, is stored for this frame. The prefix must end with a forward slash: /.

**Example of format**

```
<folder-name>/<sequence-file.json>
```

**Accepted string values**

- "binary/xyz"
- "binary/xyzri"
- "binary/xyzrgb"
- "binary/xyzirgb"
- "text/xyz"
- "text/xyzi"
- "text/xyzrgb"
- "text/xyzirgb"

**Default Values:**

- When the file identified in source-ref has a .bin extension, binary/xyzi
- When the file identified in source-ref has a .txt extension, text/xyzi
Use Input and Output Data

Parameter | Required | Accepted Values | Description
--- | --- | --- | ---
images | No | List | A list parameters describing color camera images used for sensor fusion. You can include up to 8 images in this list. For more information about the parameters required for each image, see Include Camera Data in Your Input Manifest (p. 416).

Include Vehicle Pose Information in Your Input Manifest

Use the ego-vehicle location to provide information about the pose of the vehicle used to capture point cloud data. Ground Truth use this information to compute LiDAR extrinsic matrices.

Ground Truth uses extrinsic matrices to project labels to and from the 3D scene and 2D images. For more information, see Sensor Fusion (p. 420).

The following table provides more information about the position and orientation (heading) parameters that are required when you provide ego-vehicle information.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Accepted Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>position</td>
<td>Yes</td>
<td>JSON object</td>
<td>The translation vector of the ego vehicle in the world coordinate system. <strong>Required Parameters:</strong> x, y, and z. Enter numbers for these parameters.</td>
</tr>
<tr>
<td>heading</td>
<td>Yes</td>
<td>JSON Object</td>
<td>The orientation of the frame of reference of the device or sensor mounted on the vehicle sensing the surrounding, measured in quaternions, (qx, qy, qz, qw) in the a coordinate system. <strong>Required Parameters:</strong> qx, qy, qz, and qw. Enter numbers for these parameters.</td>
</tr>
</tbody>
</table>

Include Camera Data in Your Input Manifest

If you want to include color camera data with a frame, use the following parameters to provide information about each image. The **Required** column in the following table applies when the images parameter is included in the input manifest file. You are not required to include images in your input manifest file.

If you include camera images, you must include information about the position and orientation (heading) of the camera used to capture the images.
If your images are distorted, Ground Truth can automatically undistort them using information you provide about the image in your input manifest file, including distortion coefficients (k1, k2, k3, k4, p1, p1), camera model and focal length (fx, fy), and the principal point (cx, cy). To learn more about these coefficients and undistorting images, see Camera calibration With OpenCV. If distortion coefficients are not included, Ground Truth will not undistort an image.

</table>

**Sequence File and Point Cloud Frame Limits**

You can include up to 100,000 point cloud frame sequences in your input manifest file. You can include up to 500 point cloud frames in each sequence file.

Keep in mind that 3D point cloud labeling job have longer pre-processing times than other Ground Truth task types. For more information, see [Job Pre-processing Time](p. 287).

**Understand Coordinate Systems and Sensor Fusion**

Point cloud data is always located in a coordinate system. This coordinate system may be local to the vehicle or the device sensing the surroundings, or it may be a world coordinate system. When you use Ground Truth 3D point cloud labeling jobs, all the annotations are generated using the coordinate system of your input data. For some labeling job task types and features, you must provide data in a world coordinate system.

In this topic, you’ll learn the following:

- When you are required to provide input data in a world coordinate system or global frame of reference.
- What a world coordinate is and how you can convert point cloud data to a world coordinate system.
- How you can use your sensor and camera extrinsic matrices to provide pose data when using sensor fusion.

**Coordinate System Requirements for Labeling Jobs**

If your point cloud data was collected in a local coordinate system, you can use an extrinsic matrix of the sensor used to collect the data to convert it to a world coordinate system or a global frame of reference. If you cannot obtain an extrinsic for your point cloud data and, as a result, cannot obtain point clouds in a world coordinate system, you can provide point cloud data in a local coordinate system for 3D point cloud object detection and semantic segmentation task types.

For object tracking, you must provide point cloud data in a world coordinate system. This is because when you are tracking objects across multiple frames, the ego vehicle itself is moving in the world and so all of the frames need a point of reference.

If you include camera data for sensor fusion, it is recommended that you provide camera poses in the same world coordinate system as the 3D sensor (such as a LiDAR sensor).

**Using Point Cloud Data in a World Coordinate System**

This section explains what a world coordinate system (WCS), also referred to as a global frame of reference, is and explains how you can provide point cloud data in a world coordinate system.

**What is a World Coordinate System?**

A WCS or global frame of reference is a fixed universal coordinate system in which vehicle and sensor coordinate systems are placed. For example, if multiple point cloud frames are located in different
coordinate systems because they were collected from two sensors, a WCS can be used to translate all of the coordinates in these point cloud frames into a single coordinate system, where all frames have the same origin, (0,0,0). This transformation is done by translating the origin of each frame to the origin of the WCS using a translation vector, and rotating the three axes (typically x, y, and z) to the right orientation using a rotation matrix. This rigid body transformation is called a homogeneous transformation.

A world coordinate system is important in global path planning, localization, mapping, and driving scenario simulations. Ground Truth uses the right-handed Cartesian world coordinate system such as the one defined in ISO 8855, where the x axis is forward toward the car's movement, y axis is left, and the z axis points up from the ground.

The global frame of reference depends on the data. Some datasets use the LiDAR position in the first frame as the origin. In this scenario, all the frames use the first frame as a reference and device heading and position will be near the origin in the first frame. For example, KITTI datasets have the first frame as a reference for world coordinates. Other datasets use a device position that is different from the origin.

Note that this is not the GPS/IMU coordinate system, which is typically rotated by 90 degrees along the z-axis. If your point cloud data is in a GPS/IMU coordinate system (such as OxTS in the open source AV KITTI dataset), then you need to transform the origin to a world coordinate system (typically the vehicle's reference coordinate system). You apply this transformation by multiplying your data with transformation metrics (the rotation matrix and translation vector). This will transform the data from its original coordinate system to a global reference coordinate system. Learn more about this transformation in the next section.

Convert 3D Point Cloud Data to a WCS

Ground Truth assumes that your point cloud data has already been transformed into a reference coordinate system of your choice. For example, you can choose the reference coordinate system of the sensor (such as LiDAR) as your global reference coordinate system. You can also take point clouds from various sensors and transform them from the sensor's view to the vehicle's reference coordinate system view. You use the sensor's extrinsic matrix, made up of a rotation matrix and translation vector, to convert your point cloud data to a WCS or global frame of reference.

Collectively, the translation vector and rotation matrix can be used to make up an extrinsic matrix, which can be used to convert data from a local coordinate system to a WCS. For example, your LiDAR extrinsic matrix may be composed as follows, where \( R \) is the rotation matrix and \( T \) is the translation vector:

\[
\text{LiDAR}_{\text{extrinsic}} = \begin{bmatrix} R & T; & 0 & 0 & 0 & 1 \end{bmatrix}
\]

For example, the autonomous driving KITTI dataset includes a rotation matrix and translation vector for the LiDAR extrinsic transformation matrix for each frame. The pykitti python module can be used for loading the KITTI data, and in the dataset \( \text{dataset.oxts} [i].T_{w \text{imu}} \) gives the LiDAR extrinsic transform for the \( i \)th frame with can be multiplied with points in that frame to convert them to a world frame - np.matmul(liDAR_transform_matrix, points). Multiplying a point in LiDAR frame with a LiDAR extrinsic matrix transforms it into world coordinates. Multiplying a point in the world frame with the camera extrinsic matrix gives the point coordinates in the camera's frame of reference.

The following code example demonstrates how you can convert point cloud frames from the KITTI dataset into a WCS.

```python
import pykitti
import numpy as np

basedir = '/Users/nameofuser/kitti-data'
date = '2011_09_26'
drive = '0079'
```
# The 'frames' argument is optional - default: None, which loads the whole dataset.
# Calibration, timestamps, and IMU data are read automatically.
# Camera and velodyne data are available via properties that create generators
# when accessed, or through getter methods that provide random access.
data = pykitti.raw(basedir, date, drive, frames=range(0, 50, 5))

# i is frame number
i = 0

# lidar extrinsic for the ith frame
lidar_extrinsic_matrix = data.oxts[i].T_w_imu

# velodyne raw point cloud in lidar scanners own coordinate system
points = data.get_velo(i)

# transform points from lidar to global frame using lidar_extrinsic_matrix
def generate_transformed_pcd_from_point_cloud(points, lidar_extrinsic_matrix):
    tps = []
    for point in points:
        transformed_points = np.matmul(lidar_extrinsic_matrix, np.array([point[0],
            point[1], point[2], 1], dtype=np.float32).reshape(4,1)).tolist()
        if len(point) > 3 and point[3] is not None:
            tps.append([transformed_points[0][0], transformed_points[1][0],
                transformed_points[2][0], point[3]])
    return tps

# customer transforms points from lidar to global frame using lidar_extrinsic_matrix
transformed_pcl = generate_transformed_pcd_from_point_cloud(points, lidar_extrinsic_matrix)

Sensor Fusion

Ground Truth supports sensor fusion of point cloud data with up to 8 video camera inputs. This feature
allows human labellers to view the 3D point cloud frame side-by-side with the synchronized video
frame. In addition to providing more visual context for labeling, sensor fusion allows workers to adjust
annotations in the 3D scene and in 2D images and the adjustment are projected into the other view. The
following video demonstrates a 3D point cloud labeling job with LiDAR and camera sensor fusion.
For best results, when using sensor fusion, your point cloud should be in a WCS. Ground Truth uses your sensor (such as LiDAR), camera, and ego vehicle pose information to compute extrinsic and intrinsic matrices for sensor fusion.

**Extrinsic Matrix**

Ground Truth uses sensor (such as LiDAR) extrinsic and camera extrinsic and intrinsic matrices to project objects to and from the point cloud data's frame of reference to the camera's frame of reference.

For example, in order to project a label from the 3D point cloud to camera image plane, Ground Truth transforms 3D points from LiDAR's own coordinate system to the camera's coordinate system. This is typically done by first transforming 3D points from LiDAR's own coordinate system to a world coordinate system (or a global reference frame) using the LiDAR extrinsic matrix. Ground Truth then uses the camera inverse extrinsic (which converts points from a global frame of reference to the camera's frame of reference) to transform the 3D points from world coordinate system obtained in previous step into the camera image plane. The LiDAR extrinsic matrix can also be used to transform 3D data into a world coordinate system. If your 3D data is already transformed into world coordinate system then the first transformation doesn't have any impact on label translation, and label translation only depends on the camera inverse extrinsic. A view matrix is used to visualize projected labels. To learn more about these transformations and the view matrix, see Ground Truth Sensor Fusion Transformations (p. 426).

Ground Truth computes these extrinsic matrices by using LiDAR and camera pose data that you provide: heading (in quaternions: qx, qy, qz, and qw) and position (x, y, z). For the vehicle, typically the heading and position are described in vehicle's reference frame in a world coordinate system and are called a *ego vehicle pose*. For each camera extrinsic, you can add pose information for that camera. For more information, see Pose (p. 423).

**Intrinsic Matrix**

Ground Truth use the camera extrinsic and intrinsic matrices to compute view metrics to transform labels to and from the 3D scene to camera images. Ground Truth computes the camera intrinsic matrix using camera focal length (fx, fy) and optical center coordinates (cx, cy) that you provide. For more information, see Intrinsic and Distortion (p. 426).

**Image Distortion**

Image distortion can occur for a variety of reasons. For example, images may be distorted due to barrel or fish-eye effects. Ground Truth uses intrinsic parameters along with distortion co-efficient to undistort images you provide when creating 3D point cloud labeling jobs. If a camera image is already been undistorted, all distortion coefficients should be set to 0.

For more information about the transformations Ground Truth performs to undistort images, see Camera Calibrations: Extrinsic, Intrinsic and Distortion (p. 426).

**Ego Vehicle**

To collect data for autonomous driving applications, the measurements used to generate point cloud data and are taken from sensors mounted on a vehicle, or the *ego vehicle*. To project label adjustments to and from the 3D scene and 2D images, Ground Truth needs your ego vehicle pose in a world coordinate system. The ego vehicle pose is comprised of position coordinates and orientation quaternion.

Ground Truth uses your ego vehicle pose to compute rotation and transformations matrices. Rotations in 3 dimensions can be represented by a sequence of 3 rotations around a sequence of axes. In theory, any three axes spanning the 3D Euclidean space are enough. In practice, the axes of rotation are chosen to be the basis vectors. The three rotations are expected to be in a global frame of reference (extrinsic). Ground Truth does not a support body centered frame of reference (intrinsic) which is attached to, and moves with, the object under rotation. To track objects, Ground Truth needs to measure from a global reference where all vehicles are moving. When using Ground Truth 3D point cloud labeling jobs, z specifies the axis of rotation (extrinsic rotation) and yaw Euler angles are in radians (rotation angle).
Pose

Ground Truth uses pose information for 3D visualizations and sensor fusion. Pose information you input through your manifest file is used to compute extrinsic matrices. If you already have an extrinsic matrix, you can use it to extract sensor and camera pose data.

For example in the autonomous driving KITTI dataset, the pykitti python module can be used for loading the KITTI data. In the dataset dataset.oxts[i].T_w_imu gives the LiDAR extrinsic transform for the i\textsuperscript{th} frame and it can be multiplied with the points to get them in a world frame - matmul(lidar_transform_matrix, points). This transform can be converted into position (translation vector) and heading (in quaternion) of LiDAR for the input manifest file JSON format. Camera extrinsic transform for cam0 in i\textsuperscript{th} frame can be calculated by inv(matmul(dataset.calib.T_cam0_velo, inv(dataset.oxts[i].T_w_imu))) and this can be converted into heading and position for cam0.

```python
import numpy

rotation = [
    [9.96714314e-01, -8.09967396e-02, 1.16333982e-03],
    [8.09967396e-02, 9.9661051e-01, -1.03090934e-02],
    [-3.24531964e-04, 1.03694477e-02, 9.99946183e-01]
]

origin = [1.71104606e+00,
          5.80000039e-01,
          9.43144935e-01]

from scipy.spatial.transform import Rotation as R

# position is the origin
position = origin
r = R.from_matrix(np.asarray(rotation))

# heading in WCS using scipy
heading = r.as_quat()
print(f"pose: {position}\nheading: {heading}\")
```

Position

In the input manifest file, position refers to the position of the sensor with respect to a world frame. If you are unable to put the device position in a world coordinate system, you can use LiDAR data with local coordinates. Similarly, for mounted video cameras you can specify the position and heading in a world coordinate system. For camera, if you do not have position information, please use (0, 0, 0).

The following are the fields in the position object:

1. x (float) – x coordinate of ego vehicle, sensor, or camera position in meters.
2. y (float) – y coordinate of ego vehicle, sensor, or camera position in meters.
3. z (float) – z coordinate of ego vehicle, sensor, or camera position in meters.

The following is an example of a position JSON object:

```json
{
    "position": {
        "y": -152.77584902657554,
        "x": 311.21505956090624,
        "z": -10.854137529636024
    }
}
```
**Heading**

In the input manifest file, `heading` is an object that represents the orientation of a device with respect to world frame. Heading values should be in quaternion. A quaternion is a representation of the orientation consistent with geodesic spherical properties. If you are unable to put the sensor heading in world coordinates, please use the identity quaternion \((qx = 0, qy = 0, qz = 0, qw = 1)\). Similarly, for cameras, specify the heading in quaternions. If you are unable to obtain extrinsic camera calibration parameters, please also use the identity quaternion.

Fields in `heading` object are as follows:

1. `qx` (float) - x component of ego vehicle, sensor, or camera orientation.
2. `qy` (float) - y component of ego vehicle, sensor, or camera orientation.
3. `qz` (float) - z component of ego vehicle, sensor, or camera orientation.
4. `qw` (float) - w component of ego vehicle, sensor, or camera orientation.

The following is an example of a `heading` JSON object:

```json
{
    "heading": {
        "qy": -0.7046155108831117,
        "qx": 0.034278837280808494,
        "qz": 0.7070617895701465,
        "qw": -0.04904659893885366
    }
}
```

To learn more, see Compute Orientation Quaternions and Position (p. 424).

**Compute Orientation Quaternions and Position**

Ground Truth requires that all orientation, or heading, data be given in quaternions. A quaternions is a representation of the orientation consistent with geodesic spherical properties that can be used to approximate of rotation. Compared to Euler angles they are simpler to compose and avoid the problem of gimbal lock. Compared to rotation matrices they are more compact, more numerically stable, and more efficient.

You can compute quaternions from a rotation matrix or a transformation matrix.

If you have a rotation matrix (made up of the axis rotations) and translation vector (or origin) in world coordinate system instead of a single 4x4 rigid transformation matrix, then you can directly use the rotation matrix and translation vector to compute quaternions. Libraries like `scipy` and `pyquaternion` can help. The following code-block shows an example using these libraries to compute quaternion from a rotation matrix.

```python
import numpy
rotation = [[ 9.96714314e-01, -8.09989350e-02,  1.16333982e-03],
            [ 8.09967396e-02,  9.96661051e-01, -1.03090934e-02],
            [-3.24531964e-04,  1.03694477e-02,  9.99946183e-01]]
origin = [1.71104606e+00, 5.80000039e-01, 9.43144935e-01]

from scipy.spatial.transform import Rotation as R
# position is the origin
position = origin
```
Amazon SageMaker Developer Guide
Use Input and Output Data

```python
r = R.from_matrix(np.asarray(rotation))
# heading in WCS using scipy
heading = r.as_quat()
print(f"position: {position}\nheading: {heading}"

A UI tool like 3D Rotation Converter can also be useful.

If you have a 4x4 extrinsic transformation matrix, note that the transformation matrix is in the form 
$[ R \ T; 0 \ 0 \ 0 \ 1]$ where $R$ is the rotation matrix and $T$ is the origin translation vector. That means you can
extract rotation matrix and translation vector from the transformation matrix as follows.

```python
import numpy as np
transformation = 
[[ 9.96714314e-01, -8.0990350e-02, 1.16333982e-03, 1.71104606e+00],
 [ 8.09967396e-02, 9.96661051e-01, -1.03090934e-02, 5.80000039e-01],
 [-3.24531964e-04, 1.03694477e-02, 9.99946183e-01, 9.43144935e-01],
 [0, 0, 0, 1]]
transformation = np.array(transformation)
rotation = transformation[0:3][0:3]
translation = transformation[0:3][3]
from scipy.spatial.transform import Rotation as R
# position is the origin translation
position = translation
r = R.from_matrix(np.asarray(rotation))
# heading in WCS using scipy
heading = r.as_quat()
print(f"position: {position}\nheading: {heading}"

With your own setup, you can compute an extrinsic transformation matrix using the GPS/IMU
position and orientation (latitude, longitude, altitude and roll, pitch, yaw) with respect to the LiDAR
sensor on the ego vehicle. For example, you can compute pose from KITTI raw data using
pose = convertOxtsToPose(oxts) to transform the oxts data into a local euclidean poses, specified by
4x4 rigid transformation matrices. You can then transform this pose transformation matrix to a global
reference frame using the reference frames transformation matrix in the world coordinate system.

```c
struct Quaternion
{
  double w, x, y, z;
};
Quaternion ToQuaternion(double yaw, double pitch, double roll) // yaw (Z), pitch (Y), roll (X)
{
  // Abbreviations for the various angular functions
  double cy = cos(yaw * 0.5);
  double sy = sin(yaw * 0.5);
  double cp = cos(pitch * 0.5);
  double sp = sin(pitch * 0.5);
  double cr = cos(roll * 0.5);
  double sr = sin(roll * 0.5);
  Quaternion q;
  q.w = cr * cp + cy * sr - sp * sy;
  q.x = sr * cp - cy * cr + sp * sy;
  q.y = cr * sp + cy * sr - cp * sy;
  q.z = cr * cp - sy * sr + sp * cy;
  return q;
}
Ground Truth Sensor Fusion Transformations

The following sections go into greater detail about the Ground Truth sensor fusion transformations that are performed using the pose data you provide.

LiDAR Extrinsic

In order to project to and from a 3D LiDAR scene to a 2D camera image, Ground Truth computes the rigid transformation projection metrics using the ego vehicle pose and heading. Ground Truth computes rotation and translation of a world coordinates into the 3D plane by doing a simple sequence of rotations and translation.

Ground Truth computes rotation metrics using the heading quaternions as follows:

\[
M = \begin{pmatrix}
1 - 2y^2 - 2z^2 & 2xy + 2zw & 2xz - 2yw \\
2xy - 2zw & 1 - 2x^2 - 2z^2 & 2yz + 2xw \\
2xz + 2yw & 2yz - 2xw & 1 - 2x^2 - 2y^2
\end{pmatrix}
\]

Here, \([x, y, z, w] \) corresponds to parameters in the heading JSON object, \([qx, qy, qz, qw] \). Ground Truth computes the translation column vector as \(T = [\text{poseX}, \text{poseY}, \text{poseZ}] \). Then the extrinsic metrics is simply as follows:

\[
\text{LiDAR_extrinsic} = [R \ T; 0 \ 0 \ 0 \ 1]
\]

Camera Calibrations: Extrinsic, Intrinsic and Distortion

Geometric camera calibration, also referred to as camera resectioning, estimates the parameters of a lens and image sensor of an image or video camera. You can use these parameters to correct for lens distortion, measure the size of an object in world units, or determine the location of the camera in the scene. Camera parameters include intrinsics and distortion coefficients.

Camera Extrinsic

If the camera pose is given, then Ground Truth computes the camera extrinsic based on a rigid transformation from the 3D plane into the camera plane. The calculation is the same as the one used for the LiDAR Extrinsic (p. 426), except that Ground Truth uses camera pose (position and heading) and computes the inverse extrinsic.

\[
\text{camera_inverse_extrinsic} = \text{inv}([Rc \ Tc; 0 \ 0 \ 0 \ 1]) \text{ # where Rc and Tc are camera pose components}
\]

Intrinsic and Distortion

Some cameras, such as pinhole or fisheye cameras, may introduce significant distortion in photos. This distortion can be corrected using distortion coefficients and the camera focal length. To learn more, see Camera calibration With OpenCV in the OpenCV documentation.

There are two types of distortion Ground Truth can correct for: radial distortion and tangential distortion.

Radial distortion occurs when light rays bend more near the edges of a lens than they do at its optical center. The smaller the lens, the greater the distortion. The presence of the radial distortion manifests in form of the barrel or fish-eye effect and Ground Truth uses Formula 1 to undistort it.

Formula 1:

\[
x_{\text{corrected}} = x(1 + k_1r^2 + k_2r^4 + k_3r^6) \\
y_{\text{corrected}} = y(1 + k_1r^2 + k_2r^4 + k_3r^6)
\]
Tangential distortion occurs because the lenses used to take the images are not perfectly parallel to the imaging plane. This can be corrected with Formula 2.

**Formula 2:**

\[
\begin{align*}
    x_{\text{corrected}} &= x + [2p_1xy + p_2(r^2 + 2x^2)] \\
    y_{\text{corrected}} &= y + [p_1(r^2 + 2y^2) + 2p_2xy]
\end{align*}
\]

In the input manifest file, you can provide distortion coefficients and Ground Truth will undistort your images. All distortion coefficients are floats.

- k1, k2, k3, k4 – Radial distortion coefficients. Supported for both fisheye and pinhole camera models.
- p1, p2 – Tangential distortion coefficients. Supported for pinhole camera models.

If images are already undistorted, all distortion coefficients should be 0 in your input manifest.

In order to correctly reconstruct the corrected image, Ground Truth does a unit conversion of the images based on focal lengths. If a common focal length is used with a given aspect ratio for both axes, such as 1, in the upper formula we will have a single focal length. The matrix containing these four parameters is referred to as the *in camera intrinsic calibration matrix*.

\[
\begin{pmatrix}
    x \\
    y \\
    w
\end{pmatrix} = \begin{pmatrix}
    f_x & 0 & c_x \\
    0 & f_y & c_y \\
    0 & 0 & 1
\end{pmatrix} \begin{pmatrix}
    X \\
    Y \\
    Z
\end{pmatrix}
\]

While the distortion coefficients are the same regardless of the camera resolutions used, these should be scaled with the current resolution from the calibrated resolution.

The following are float values.

- fx - focal length in x direction.
- fy - focal length in y direction.
- cx - x coordinate of principal point.
- cy - y coordinate of principal point.

Ground Truth uses the camera extrinsic and camera intrinsic to compute view metrics as shown in the following code block to transform labels between the 3D scene and 2D images.

```python
def generate_view_matrix(intrinsic_matrix, extrinsic_matrix):
    intrinsic_matrix = np.c_[intrinsic_matrix, np.zeros(3)]
    view_matrix = np.matmul(intrinsic_matrix, extrinsic_matrix)
    view_matrix = np.insert(view_matrix, 2, np.array((0, 0, 0, 1)), 0)
    return view_matrix
```

**Video Frame Input Data**

When you create a video frame object detection or object tracking labeling job, you can choose video files (MP4 files) or video frames for input data. All worker tasks are created using video frames, so if you choose video files, use the Ground Truth frame extraction tool to extract video frames (images) from your video files.
For both of these options, you can use the **Automated data setup** option in the Ground Truth section of the Amazon SageMaker console to set up a connection between Ground Truth and your input data in Amazon S3 so that Ground Truth knows where to look for your input data when creating your labeling tasks. This creates and stores an input manifest file in your Amazon S3 input dataset location. To learn more, see Automated Video Frame Input Data Setup (p. 430).

Alternatively, you can manually create sequence files for each sequence of video frames that you want labeled and provide the Amazon S3 location of an input manifest file that references each of these sequences files using the `source-ref` key. To learn more, see Create a Video Frame Input Manifest File (p. 432).

**Topics**
- Choose Video Files or Video Frames for Input Data (p. 428)
- Input Data Setup (p. 429)

### Choose Video Files or Video Frames for Input Data

When you create a video frame object detection or object tracking labeling job, you can provide a sequence of video frames (images) or you can use the Amazon SageMaker console to have Ground Truth automatically extract video frames from your video files. Use the following sections to learn more about these options.

#### Provide Video Frames

Video frames are sequences of images extracted from a video file. You can create a Ground Truth labeling job to have workers label multiple sequences of video frames. Each sequence is made up of images extracted from a single video.

To create a labeling job using video frame sequences, you must store each sequence using a unique key name prefix in Amazon S3. In the Amazon S3 console, key name prefixes are folders. So in the Amazon S3 console, each sequence of video frames must be located in its own folder in Amazon S3.

For example, if you have two sequences of video frames, you might use the key name prefixes `sequence1/` and `sequence2/` to identify your sequences. In this example, your sequences may be located in `s3://DOC-EXAMPLE-BUCKET/video-frames/sequence1/` and `s3://DOC-EXAMPLE-BUCKET/video-frames/sequence2/`.

If you are using the Ground Truth console to create an input manifest file, all of the sequence key name prefixes should be in the same location in Amazon S3. For example, in the Amazon S3 console, each sequence could be in a folder in `s3://DOC-EXAMPLE-BUCKET/video-frames/`. In this example, your first sequence of video frames (images) may be located in `s3://DOC-EXAMPLE-BUCKET/video-frames/sequence1/` and your second sequence may be located in `s3://DOC-EXAMPLE-BUCKET/video-frames/sequence2/`.

**Important**

Even if you only have a single sequence of video frames that you want workers to label, that sequence must have a key name prefix in Amazon S3. If you are using the Amazon S3 console, this means that your sequence is located in a folder. It cannot be located in the root of your S3 bucket.

When creating worker tasks using sequences of video frames, Ground Truth uses one sequence per task. In each task, Ground Truth orders your video frames using UTF-8 binary order.

For example, video frames might be in the following order in Amazon S3:

```
[0001.jpg, 0002.jpg, 0003.jpg, ..., 0011.jpg]
```
They are arranged in the same order in the worker's task: 0001.jpg, 0002.jpg, 0003.jpg, ..., 0011.jpg.

Frames might also be ordered using a naming convention like the following:

| frame1.jpg, frame2.jpg, ..., frame11.jpg |

In this case, frame10.jpg and frame11.jpg come before frame2.jpg in the worker task. Your worker sees your video frames in the following order: frame1.jpg, frame10.jpg, frame11.jpg, frame2.jpg, ..., frame9.jpg.

Provide Video Files

You can use the Ground Truth frame splitting feature when creating a new labeling job in the console to extract video frames from video files (MP4 files). A series of video frames extracted from a single video file is referred to as a sequence of video frames.

You can either have Ground Truth automatically extract all frames, up to 2,000, from the video, or you can specify a frequency for frame extraction. For example, you can have Ground Truth extract every 10th frame from your videos.

You can provide up to 50 videos when you use automated data setup to extract frames, however your input manifest file cannot reference more than 10 video frame sequence files when you create a video frame object tracking and video frame object detection labeling job. If you use the automated data setup console tool to extract video frames from more than 10 video files, you will need to modify the manifest file the tool generates or create a new one to include 10 video frame sequence files or less. To learn more about these quotas, see 3D Point Cloud and Video Frame Labeling Job Quotas (p. 402).

To use the video frame extraction tool, see Automated Video Frame Input Data Setup (p. 430).

When all of your video frames have been successfully extracted from your videos, you will see the following in your S3 input dataset location:

- A key name prefix (a folder in the Amazon S3 console) named after each video. Each of these prefixes leads to:
  - A sequence of video frames extracted from the video used to name that prefix.
  - A sequence file used to identify all of the images that make up that sequence.
  - An input manifest file with a .manifest extension. This identifies all of the sequence files that will be used to create your labeling job.

All of the frames extracted from a single video file are used for a labeling task. If you extract video frames from multiple video files, multiple tasks are created for your labeling job, one for each sequence of video frames.

Ground Truth stores each sequence of video frames that it extracts in your Amazon S3 location for input datasets using a unique key name prefix. In the Amazon S3 console, key name prefixes are folders.

Input Data Setup

When you create a video frame labeling job, you need to let Ground Truth know where to look for your input data. You can do this in one of two ways:

- You can store your input data in Amazon S3 and have Ground Truth automatically detect the input dataset used for your labeling job. See Automated Video Frame Input Data Setup (p. 430) to learn more about this option.
You can create an input manifest file and sequence files and upload them to Amazon S3. See Manual Input Data Setup (p. 432) to learn more about this option.

Topics

- Automated Video Frame Input Data Setup (p. 430)
- Manual Input Data Setup (p. 432)

Automated Video Frame Input Data Setup

You can use the Ground Truth automated data setup to automatically detect video files in your Amazon S3 bucket and extract video frames from those files. To learn how, see Provide Video Files (p. 429).

If you already have video frames in Amazon S3, you can use the automated data setup to use these video frames in your labeling job. For this option, all video frames from a single video must be stored using a unique prefix. To learn about the requirements to use this option, see Provide Video Frames (p. 428).

Select one of the following sections to learn how to set up your automatic input dataset connection with Ground Truth.

Provide Video Files and Extract Frames

Use the following procedure to connect your video files with Ground Truth and automatically extract video frames from those files for video frame object detection and object tracking labeling jobs.

Note

If you use the automated data setup console tool to extract video frames from more than 10 video files, you will need to modify the manifest file the tool generates or create a new one to include 10 video frame sequence files or less. To learn more, see Provide Video Files (p. 429).

Make sure your video files are stored in an Amazon S3 bucket in the same AWS Region that you perform the automated data setup in.

Automatically connect your video files in Amazon S3 with Ground Truth and extract video frames:

Your input and output S3 buckets must be located in the same AWS Region that you create your labeling job in. This link puts you in the North Virginia (us-east-1) AWS Region. If your input data is in an Amazon S3 bucket in another Region, switch to that Region. To change your AWS Region, on the navigation bar, choose the name of the currently displayed Region.

2. Select Create labeling job.

3. Enter a Job name.

4. In the section Input data setup, select Automated data setup.

5. Enter an Amazon S3 URI for S3 location for input datasets. An S3 URI looks like the following: `s3://DOC-EXAMPLE-BUCKET/path-to-files/`. This URI should point to the Amazon S3 location where your video files are stored.

6. Specify your S3 location for output datasets. This is where your output data is stored. You can choose to store your output data in the Same location as input dataset or Specify a new location and entering the S3 URI of the location that you want to store your output data.

7. Choose Video Files for your Data type using the dropdown list.

8. Choose Yes, extract frames for object tracking and detection tasks.
9. Choose a method of **Frame extraction**.

   - When you choose **Use all frames extracted from the video to create a labeling task**, Ground Truth extracts all frames from each video in your **S3 location for input datasets**, up to 2,000 frames. If a video in your input dataset contains more than 2,000 frames, the first 2,000 are extracted and used for that labeling task.
   - When you choose **Use every x frame from a video to create a labeling task**, Ground Truth extracts every \( x \) frame from each video in your **S3 location for input datasets**.

   For example, if your video is 2 seconds long, and has a frame rate of 30 frames per second, there are 60 frames in your video. If you specify 10 here, Ground Truth extracts every 10\(^{th}\) frame from your video. This means the 1\(^{st}\), 10\(^{th}\), 20\(^{th}\), 30\(^{th}\), 40\(^{th}\), 50\(^{th}\), and 60\(^{th}\) frames are extracted.

10. Choose or create an IAM execution role. Make sure that this role has permission to access your Amazon S3 locations for input and output data specified in steps 5 and 6.

11. Select **Complete data setup**.

### Provide Video Frames

Use the following procedure to connect your sequences of video frames with Ground Truth for video frame object detection and object tracking labeling jobs.

Make sure your video frames are stored in an Amazon S3 bucket in the same AWS Region that you perform the automated data setup in. Each sequence of video frames should have a unique prefix. For example, if you have two sequences stored in `s3://DOC-EXAMPLE-BUCKET/video-frames/sequences/`, each should have a unique prefix like `sequence1` and `sequence2` and should both be located directly under the `/sequences/` prefix. In the example above, the locations of these two sequences is: `s3://DOC-EXAMPLE-BUCKET/video-frames/sequences/sequence1/` and `s3://DOC-EXAMPLE-BUCKET/video-frames/sequences/sequence2/`.

### Automatically connect your video frame in Amazon S3 with Ground Truth:

1. Navigate to the **Create labeling job** page in the Amazon SageMaker console: [https://console.aws.amazon.com/sagemaker/groundtruth](https://console.aws.amazon.com/sagemaker/groundtruth).

   Your input and output S3 buckets must be located in the same AWS Region that you create your labeling job in. This link puts you in the North Virginia (us-east-1) AWS Region. If your input data is in an Amazon S3 bucket in another Region, switch to that Region. To change your AWS Region, on the navigation bar, choose the name of the currently displayed Region.

2. Select **Create labeling job**.
3. Enter a **Job name**.
4. In the section **Input data setup**, select **Automated data setup**.
5. Enter an Amazon S3 URI for **S3 location for input datasets**.

   This should be the Amazon S3 location where your sequences are stored. For example, if you have two sequences stored in `s3://DOC-EXAMPLE-BUCKET/video-frames/sequences/sequence1/`, `s3://DOC-EXAMPLE-BUCKET/video-frames/sequences/sequence2/`, enter `s3://DOC-EXAMPLE-BUCKET/video-frames/sequences/` here.

6. Specify your **S3 location for output datasets**. This is where your output data is stored. You can choose to store your output data in the **Same location as input dataset** or **Specify a new location** and entering the S3 URI of the location that you want to store your output data.

7. Choose **Video frames** for your **Data type** using the dropdown list.
8. Choose or create an IAM execution role. Make sure that this role has permission to access your Amazon S3 locations for input and output data specified in steps 5 and 6.
9. Select **Complete data setup**.
These procedures will create an input manifest in the Amazon S3 location for input datasets that you specified in step 5. If you are creating a labeling job using the SageMaker API or AWS CLI, or an AWS SDK, use the Amazon S3 URI for this input manifest file as input to the parameter ManifestS3Uri.

**Manual Input Data Setup**

Choose the manual data setup option if you have created sequence files for each of your video frame sequences, and a manifest file listing references to those sequences files.

**Create a Video Frame Input Manifest File**

Ground Truth uses the input manifest file to identify the location of your input dataset when creating labeling tasks. For video frame object detection and object tracking labeling jobs, each line in the input manifest file identifies the location of a video frame sequence file. Each sequence file identifies the images included in a single sequence of video frames.

Use this page to learn how to create a video frame sequence file and an input manifest file for video frame object tracking and object detection labeling jobs.

If you want Ground Truth to automatically generate your sequence files and input manifest file, see Automated Video Frame Input Data Setup (p. 430).

**Create a Video Frame Sequence Input Manifest**

In the video frame sequence input manifest file, each line in the manifest is a JSON object, with a "source-ref" key that references a sequence file. Each sequence file identifies the location of a sequence of video frames. This is the manifest file formatting required for all video frame labeling jobs.

The following example demonstrates the syntax used for an input manifest file:

```json
{"source-ref": "s3://DOC-EXAMPLE-BUCKET/example-folder/seq1.json"}
{"source-ref": "s3://DOC-EXAMPLE-BUCKET/example-folder/seq2.json"}
```

**Create a Video Frame Sequence File**

The data for each sequence of video frames needs to be stored in a JSON data object. The following is an example of the format you use for a sequence file. Information about each frame is included as a JSON object and is listed in the frames list. The following JSON has been expanded for readability.

```json
{
  "seq-no": 1,
  "prefix": "s3://mybucket/prefix/video1/",
  "number-of-frames": 3,
  "frames": [
    {"frame-no": 1, "unix-timestamp": 1566861644, "frame": "frame0001.jpg" },
    {"frame-no": 2, "unix-timestamp": 1566861644, "frame": "frame0002.jpg" },
    {"frame-no": 3, "unix-timestamp": 1566861644, "frame": "frame0003.jpg" }
  ]
}
```

The following table provides details about the parameters shown in the this code example.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Accepted Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seq-no</td>
<td>Yes</td>
<td>Integer</td>
<td>The ordered number of the sequence.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Required</td>
<td>Accepted Values</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>----------</td>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| prefix        | Yes      | String          | The Amazon S3 location where the sequence files are located. The prefix must end with a forward slash: /.
| number-of-frames | Yes    | Integer         | The total number of frames included in the sequence file. This number must match the total number of frames listed in the frames parameter in the next row.
| frames        | Yes      | List of JSON objects | A list of frame data. The length of the list must equal number-of-frames. In the worker UI, frames in a sequence are ordered in UTF-8 binary order. To learn more about this ordering, see Provide Video Frames (p. 428).
| frame-no      | Yes      | Integer         | The frame order number. This will determine the order of a frame in the sequence. |
| unix-timestamp | No       | Integer         | The unix timestamp of a frame. The number of seconds since January 1st, 1970 until the UTC time when the frame was captured. |
| frame         | Yes      | String          | The name of a video frame image file. |

### Output Data

The output from a labeling job is placed in the Amazon S3 location that you specified in the console or in the call to the CreateLabelingJob operation. Output data appears in this location when the workers have submitted one or more tasks, or when tasks expire. Note that it may take a few minutes for output data to appear in Amazon S3 after the worker submits the task or the task expires.

Each line in the output data file is identical to the manifest file with the addition of an attribute and value for the label assigned to the input object. The attribute name for the value is defined in the console or in the call to the CreateLabelingJob operation. You can’t use -metadata in the label attribute name. If you are running an image semantic segmentation, 3D point cloud semantic...
segmentation, or 3D point cloud object tracking job, the label attribute must end with -ref. For any other type of job, the attribute name can't end with -ref.

The output of the labeling job is the value of the key-value pair with the label. The label and the value overwrites any existing JSON data in the input file with the new value.

For example, the following is the output from an image classification labeling job where the input data files were stored in an Amazon S3 bucket and the label attribute name was defined as sport. In this example the JSON object is formatted for readability, in the actual output file the JSON object is on a single line. For more information about the data format, see JSON Lines.

```
{
    "source-ref": "s3://AWSDOC-EXAMPLE-BUCKET/image_example.png",
    "sport": 0,
    "sport-metadata": {
        "class-name": "football",
        "confidence": 0.00,
        "type": "groundtruth/image-classification",
        "job-name": "identify-sport",
        "human-annotated": "yes",
        "creation-date": "2018-10-18T22:13:52Z"
    }
}
```

The value of the label can be any valid JSON. In this case the label's value is the index of the class in the classification list. Other job types, such as bounding box, have more complex values.

Any key-value pair in the input manifest file other than the label attribute is unchanged in the output file. You can use this to pass data to your application.

The output from a labeling job can be used as the input to another labeling job. You can use this when you are chaining together labeling jobs. For example, you can send one labeling job to determine the sport that is being played. Then you send another using the same data to determine if the sport is being played indoors or outdoors. By using the output data from the first job as the manifest for the second job, you can consolidate the results of the two jobs into one output file for easier processing by your applications.

The output data file is written to the output location periodically while the job is in progress. These intermediate files contain one line for each line in the manifest file. If an object is labeled, the label is included. If the object hasn't been labeled, it is written to the intermediate output file identically to the manifest file.

**Output Directories**

Ground Truth creates several directories in your Amazon S3 output path. These directories contain the results of your labeling job and other artifacts of the job. The top-level directory for a labeling job is given the same name as your labeling job; the output directories are placed beneath it. For example, if you named your labeling job find-people, your output would be in the following directories:

```
s3://AWSDOC-EXAMPLE-BUCKET/find-people/activelearning
s3://AWSDOC-EXAMPLE-BUCKET/find-people/annotations
s3://AWSDOC-EXAMPLE-BUCKET/find-people/inference
s3://AWSDOC-EXAMPLE-BUCKET/find-people/manifests
s3://AWSDOC-EXAMPLE-BUCKET/find-people/training
```

Each directory contains the following output:
Active Learning Directory

The activelearning directory is only present when you are using automated data labeling. It contains the input and output validation set for automated data labeling, and the input and output folder for automatically labeled data.

Annotations Directory

The annotations directory contains all of the annotations made by the workforce. These are the responses from individual workers that have not been consolidated into a single label for the data object.

There are three subdirectories in the annotations directory.

- The first, worker-response, contains the responses from individual workers. This contains a subdirectory for each iteration, which in turn contains a subdirectory for each data object in that iteration. The worker response data for each data object is stored in a timestamped JSON file that contains the answers submitted by each worker for that data object, and if you use a private workforce, metadata about those workers. To learn more about this metadata, see Worker Metadata (p. 436).
- The second, consolidated-annotation, contains information required to consolidate the annotations in the current batch into labels for your data objects.
- The third, intermediate, contains the output manifest for the current batch with any completed labels. This file is updated as the label for each data object is completed.

Inference Directory

The inference directory is only present when you are using automated data labeling. This directory contains the input and output files for the SageMaker batch transform used while labeling data objects.

Manifest Directory

The manifest directory contains the output manifest from your labeling job. There is one subdirectory in the manifest directory, output. The output directory contains the output manifest file for your labeling job. The file is named output.manifest.

Training Directory

The training directory is only present when you are using automated data labeling. This directory contains the input and output files used to train the automated data labeling model.

Confidence Score

When you have more than one worker annotate a single task, your label results from annotation consolidation. Ground Truth calculates a confidence score for each label. A confidence score is a number between 0 and 1 that indicates how confident Ground Truth is in the label. You can use the confidence score to compare labeled data objects to each other, and to identify the least or most confident labels.

You should not interpret the value of a confidence score as an absolute value, or compare confidence scores across labeling jobs. For example, if all of the confidence scores are between 0.98 and 0.998, you should only compare the data objects with each other and not rely on the high confidence scores.

You should not compare the confidence scores of human-labeled data objects and auto-labeled data objects. The confidence scores for humans are calculated using the annotation consolidation function for the task, while the confidence scores for automated labeling are calculated using a model that incorporates object features. The two models generally have different scales and average confidence.

For a bounding box labeling job, Ground Truth calculates a confidence score per box. You can compare confidence scores within one image or across images for the same labeling type (human or auto). You can't compare confidence scores across labeling jobs.
If a single worker annotates a task (NumberOfHumanWorkersPerDataObject is set to 1 or in the console, you enter 1 for **Number of workers per dataset object**), the confidence score is set to 0.00.

**Worker Metadata**

Ground Truth provides information that you can use to track individual workers in task output data. The following data is located in the directories under the `worker-response` located in the Annotations Directory (p. 435):

- **The acceptanceTime** is the time that the worker accepted the task. The format of this date and time stamp is `YYYY-MM-DDTHH:MM:SS.mmmZ` for the year (YYYY), month (MM), day (DD), hour (HH), minute (MM), second (SS) and millisecond (mmm). The date and time are separated by a T.

- **The submissionTime** is the time that the worker submitted their annotations using the **Submit** button. The format of this date and time stamp is `YYYY-MM-DDTHH:MM:SS.mmmZ` for the year (YYYY), month (MM), day (DD), hour (HH), minute (MM), second (SS) and millisecond (mmm). The date and time are separated by a T.

- **timeSpentInSeconds** reports the total time, in seconds, that a worker actively worked on that task. This metric does not include time when a worker paused or took a break.

- **The workerId** is unique to each worker.

- If you use a **private workforce**, in **workerMetadata**, you see the following.
  - The **identityProviderType** is the service used to manage the private workforce.
  - The **issuer** is the Cognito user pool or OIDC Identity Provider (IdP) issuer associated with the work team assigned to this human review task.
  - A unique **sub** identifier refers to the worker. If you create a workforce using Amazon Cognito, you can retrieve details about this worker (such as the name or user name) using this ID using Amazon Cognito. To learn how, see **Managing and Searching for User Accounts in Amazon Cognito Developer Guide**.

The following is an example of the output you may see if you use Amazon Cognito to create a private workforce. This is identified in the `identityProviderType`.

```json
"submissionTime": "2020-12-28T18:59:58.321Z",
"acceptanceTime": "2020-12-28T18:59:15.191Z",
"timeSpentInSeconds": 40.543,
"workerId": "a12b3cdefg4h5i67",
"workerMetadata": {
  "identityData": {
    "identityProviderType": "Cognito",
    "sub": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeee"}
}
```

The following is an example of the **workerMetadata** you may see if you use your own OIDC IdP to create a private workforce:

```json
"workerMetadata": {
  "identityData": {
    "identityProviderType": "Oidc",
    "issuer": "https://example-oidc-ipd.com/adfs",
    "sub": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeee"
  }
}
```

To learn more about using private workforces, see **Use a Private Workforce (p. 490)**.
Output Metadata

The output from each job contains metadata about the label assigned to data objects. These elements are the same for all jobs with minor variations. The following example shows the metadata elements:

```
"confidence": 0.00,
"type": "groundtruth/image-classification",
"job-name": "identify-animal-species",
"human-annotated": "yes",
"creation-date": "2020-10-18T22:18:13.527256"
```

The elements have the following meaning:

- **confidenc**e – The confidence that Ground Truth has that the label is correct. For more information, see Confidence Score (p. 435).
- **type** – The type of classification job. For job types, see Built-in Task Types (p. 361).
- **job-name** – The name assigned to the job when it was created.
- **human-annotated** – Whether the data object was labeled by a human or by automated data labeling. For more information, see Automate Data Labeling (p. 459).
- **creation-date** – The date and time that the label was created.

Classification Job Output

The following are sample outputs (output manifest files) from an image classification job and a text classification job. They include the label that Ground Truth assigned to the data object, the value for the label, and metadata that describes the label.

In addition to the standard metadata elements, the metadata for a classification job includes the text value of the label’s class. For more information, see Image Classification Algorithm (p. 1443).

The red, italicized text in the examples below depends on labeling job specifications and output data.

```
{
  "source-ref": "s3://AWSDOC-EXAMPLE-BUCKET/example_image.jpg",
  "species": "0",
  "species-metadata":
    {
      "class-name": "dog",
      "confidence": 0.00,
      "type": "groundtruth/image-classification",
      "job-name": "identify-animal-species",
      "human-annotated": "yes",
      "creation-date": "2018-10-18T22:18:13.527256"
    }
}
```

```
{
  "source": "The food was delicious",
  "mood": "1",
  "mood-metadata":
    {
      "class-name": "positive",
      "confidence": 0.8,
      "type": "groundtruth/text-classification",
      "job-name": "label-sentiment",
      "human-annotated": "yes",
      "creation-date": "2020-10-18T22:18:13.527256"
    }
}
```
Multi-label Classification Job Output

The following are example output manifest files from a multi-label image classification job and a multi-label text classification job. They include the labels that Ground Truth assigned to the data object (for example, the image or piece of text) and metadata that describes the labels the worker saw when completing the labeling task.

The label attribute name parameter (for example, image-label-attribute-name) contains an array of all of the labels selected by at least one of the workers who completed this task. This array contains integer keys (for example, [1, 0, 8]) that correspond to the labels found in class-map. In the multi-label image classification example, bicycle, person, and clothing were selected by at least one of the workers who completed the labeling task for the image, exampleimage.jpg.

The confidence-map shows the confidence score that Ground Truth assigned to each label selected by a worker. To learn more about Ground Truth confidence scores, see Confidence Score (p. 435).

The red, italicized text in the examples below depends on labeling job specifications and output data.

The following is an example of a multi-label image classification output manifest file.

```json
{
  "source-ref": "s3://AWSDOC-EXAMPLE-BUCKET/example_image.jpg",
  "image-label-attribute-name": [1, 0, 8],
  "image-label-attribute-name-metadata": {
    "job-name": "labeling-job/image-label-attribute-name",
    "class-map": {
      "1": "bicycle", "0": "person", "8": "clothing"
    },
    "human-annotated": "yes",
    "creation-date": "2020-02-27T21:36:25.000201",
    "confidence-map": {
      "1": 0.95, "0": 0.77, "8": 0.2
    }
  },
  "type": "groundtruth/image-classification-multilabel"
}
```

The following is an example of a multi-label text classification output manifest file. In this example, approving, sad and critical were selected by at least one of the workers who completed the labeling task for the object exampltext.txt found in AWSDOC-EXAMPLE-BUCKET.

```json
{
  "source-ref": "AWSDOC-EXAMPLE-BUCKET/text_file.txt",
  "text-label-attribute-name": [1, 0, 4],
  "text-label-attribute-name-metadata": {
    "job-name": "labeling-job/text-label-attribute-name",
    "class-map": {
      "1": "approving", "0": "sad", "4": "critical"
    },
    "human-annotated": "yes",
    "creation-date": "2020-02-20T21:36:25.000201",
    "confidence-map": {
      "1": 0.95, "0": 0.77, "4": 0.2
    }
  }
}
```
Bounding Box Job Output

The following is sample output (output manifest file) from a bounding box job. For this task, three bounding boxes are returned. The label value contains information about the size of the image, and the location of the bounding boxes.

The `class_id` element is the index of the box's class in the list of available classes for the task. The `class-map` metadata element contains the text of the class.

The metadata has a separate confidence score for each bounding box. The metadata also includes the `class-map` element that maps the `class_id` to the text value of the class. For more information, see Object Detection Algorithm (p. 1523).

The red, italicized text in the examples below depends on labeling job specifications and output data.

```json
{
  "source-ref": "s3://AWSDOC-EXAMPLE-BUCKET/example_image.png",
  "bounding-box-attribute-name":
  {
    "image_size": [{ "width": 500, "height": 400, "depth": 3 }],
    "annotations":
    [
      { "class_id": 0, "left": 111, "top": 134, "width": 61, "height": 128 },
      { "class_id": 5, "left": 161, "top": 250, "width": 30, "height": 30 },
      { "class_id": 5, "left": 20, "top": 20, "width": 30, "height": 30 }
    ],
    "bounding-box-attribute-name-metadata":
    {
      "objects":
      [{ "confidence": 0.8 },
       { "confidence": 0.9 },
       { "confidence": 0.9 }],
      "class-map":
      {
        "0": "dog",
        "5": "bone"
      },
      "type": "groundtruth/object-detection",
      "human-annotated": "yes",
      "creation-date": "2018-10-18T22:18:13.527256",
      "job-name": "identify-dogs-and-toys"
    }
  }
}
```

The output of a bounding box adjustment job looks like the following JSON. Note that the original JSON is kept intact and two new jobs are listed, each with "adjust-" prepended to the original attribute's name.

```json
{
  "source-ref": "S3 bucket location",
  "bounding-box-attribute-name":
  {
    "image_size": [{ "width": 500, "height": 400, "depth": 3 }
```
In this output, the job's type doesn't change, but an adjustment-status field is added. This field has the value of adjusted or unadjusted. If multiple workers have reviewed the object and at least one adjusted the label, the status is adjusted.
Named Entity Recognition

The following is an example output manifest file from a named entity recognition (NER) labeling task. For this task, seven entities are returned.

In the output manifest, the JSON object, annotations, includes a list of the labels (label categories) that you provided.

Worker responses are in a list named entities. Each entity in this list is a JSON object that contains a label value that matches one in the labels list, an integer startOffset value for labeled span's starting Unicode offset, and an integer endOffset value for the ending Unicode offset.

The metadata has a separate confidence score for each entity. If a single worker labeled each data object, the confidence value for each entity will be zero.

The red, italicized text in the examples below depends on labeling job inputs and worker responses.

```
{
    "source": "Amazon SageMaker is a cloud machine-learning platform that was launched in November 2017. SageMaker enables developers to create, train, and deploy machine-learning (ML) models in the cloud. SageMaker also enables developers to deploy ML models on embedded systems and edge-devices",
    "ner-labeling-job-attribute-name": {
        "annotations": {
            "labels": [
                {
                    "label": "Date",
                    "shortDisplayName": "dt"
                },
                {
                    "label": "Verb",
                    "shortDisplayName": "vb"
                },
                {
                    "label": "Thing",
                    "shortDisplayName": "tng"
                },
                {
                    "label": "People",
                    "shortDisplayName": "ppl"
                }
            ],
            "entities": [
                {
                    "label": "Thing",
                    "startOffset": 22,
                    "endOffset": 53
                },
                {
                    "label": "Thing",
                    "startOffset": 269,
                    "endOffset": 281
                },
                {
                    "label": "Verb",
                    "startOffset": 63,
                    "endOffset": 71
                },
                {
                    "label": "Verb",
                    "startOffset": 228,
                    "endOffset": 234
                }
            ]
        }
    }
}
```
Label Verification Job Output

The output (output manifest file) of a bounding box verification job looks different than the output of a bounding box annotation job. That's because the workers have a different type of task. They're not labeling objects, but evaluating the accuracy of prior labeling, making a judgment, and then providing that judgment and perhaps some comments.

If human workers are verifying or adjusting prior bounding box labels, the output of a verification job would look like the following JSON. The red, italicized text in the examples below depends on labeling job specifications and output data.

```
{
  "source-ref":"s3://AWSDOC-EXAMPLE-BUCKET/image_example.png",
  "bounding-box-attribute-name":{
    "image_size": [{ "width": 500, "height": 400, "depth": 3}],
  }
}
```
Although the type on the original bounding box output was `groundtruth/object-detection`, the new type is `groundtruth/label-verification`. Also note that the `worker-feedback` array provides worker comments. If the worker doesn't provide comments, the empty fields are excluded during consolidation.

**Semantic Segmentation Job Output**

The following is the output manifest file from a semantic segmentation labeling job. The value of the label for this job is a reference to a PNG file in an Amazon S3 bucket.

In addition to the standard elements, the metadata for the label includes a color map that defines which color is used to label the image, the class name associated with the color, and the confidence score for each color. For more information, see [Semantic Segmentation Algorithm](#).

The red, italicized text in the examples below depends on labeling job specifications and output data.
Confidence is scored on a per-image basis. Confidence scores are the same across all classes within an image.

The output of a semantic segmentation adjustment job looks similar to the following JSON.

```json
{
    "source-ref": "s3://AWSDOC-EXAMPLE-BUCKET/example_city_image.png",
    "city-streets-ref": "S3 bucket location",
    "city-streets-ref-metadata": {
        "internal-color-map": {
            "0": {
                "class-name": "BACKGROUND",
                "confidence": 0.9,
                "hex-color": "#ffffff"
            },
            "1": {
                "class-name": "buildings",

Video Frame Object Detection Output

The following is the output manifest file from a video frame object detection labeling job. The red, italicized text in the examples below depends on labeling job specifications and output data.

In addition to the standard elements, the metadata includes a class map that lists each class that has at least one label in the sequence. The metadata also includes job-name which is the name you assigned to the labeling job. For adjustment tasks, if one or more bounding boxes were modified, there is an adjustment-status parameter in the metadata for audit workflows that is set to adjusted.

```
{"source-ref": "s3://DOC-EXAMPLE-BUCKET/example-path/input-manifest.json",
"CarObjectDetection-ref": "s3://AWSDOC-EXAMPLE-BUCKET/output/labeling-job-name/annotations/consolidated-annotation/output/0/SeqLabel.json",
"CarObjectDetection-ref-metadata": {
"class-map": {
"0": "car",
"1": "bus"
},
"job-name": "labeling-job/labeling-job-name",
"human-annotated": "yes",
"creation-date": "2020-05-15T08:01:16+0000",
"type": "groundtruth/video-object-detection"
}
```

Ground Truth creates one output sequence file for each sequence of video frames that was labeled. Each output sequence file contains the following:
• All annotations for all frames in a sequence in the detection-annotations list of JSON objects.
• For each frame that was annotated by a worker, the frame file name (frame), number (frame-no), a list of JSON objects containing annotations (annotations), and if applicable, frame-attributes. The name of this list is defined by the task type you use: polylines, polygons, keypoints, and for bounding boxes, annotations.

Each JSON object contains information about a single annotation and associated label. The following table outlines the parameters you’ll see for each video frame task type.

<table>
<thead>
<tr>
<th>Task Type</th>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bounding Box</td>
<td>Box dimensions: height and width</td>
</tr>
<tr>
<td></td>
<td>Box top, left corner pixel location: top and left</td>
</tr>
<tr>
<td>Keypoint</td>
<td>Keypoint vertices: { &quot;x&quot;: int, &quot;y&quot;: int }</td>
</tr>
<tr>
<td>Polygon</td>
<td>A list of polygon vertices: vertices</td>
</tr>
<tr>
<td></td>
<td>Polygon vertices: { &quot;x&quot;: int, &quot;y&quot;: int }</td>
</tr>
<tr>
<td></td>
<td>A polygon is a closed shape and so the first point will also represent the last point.</td>
</tr>
<tr>
<td>Polyline</td>
<td>A list of polyline vertices: vertices</td>
</tr>
<tr>
<td></td>
<td>Polyline vertices: { &quot;x&quot;: int, &quot;y&quot;: int }</td>
</tr>
</tbody>
</table>

In addition to task type specific values, you will see the following in each JSON object:
• Values of any label-category-attributes that were specified for that label.
• The class-id of the box. Use the class-map in the output manifest file to see which label category this ID maps to.

The following is an example of a SeqLabel.json file from a bounding box video frame object detection labeling job. This file will be located under s3://your-output-bucket/output-prefix/annotations/consolidated-annotation/output/annotation-number/

```json
{
  "detection-annotations": [
    {
      "annotations": [
        {
          "height": 41,
          "width": 53,
          "top": 152,
          "left": 339,
          "class-id": "1",
          "label-category-attributes": {
            "occluded": "no",
            "size": "medium"
          }
        },
        {
          "height": 24,
          "width": 37,
          "top": 148,
          "left": 183,
          "class-id": "0",
          "label-category-attributes": {
```
Use Input and Output Data

Video Frame Object Tracking Output

The following is the output manifest file from a video frame object tracking labeling job. The red, italicized text in the examples below depends on labeling job specifications and output data.

In addition to the standard elements, the metadata includes a class map that lists each class that has at least one label in the sequence of frames. The metadata also includes job-name which is the name you assigned to the labeling job. For adjustment tasks, if one or more bounding boxes were modified, there is an adjustment-status parameter in the metadata for audit workflows that is set to adjusted.

```json
{
  "source-ref": "s3://DOC-EXAMPLE-BUCKET/example-path/input-manifest.json",
  "CarObjectTracking-ref": "s3://AWSDOC-EXAMPLE-BUCKET/output/labeling-job-name/
  annotations/consolidated-annotation/output/0/SeqLabel.json",
  "CarObjectTracking-ref-metadata": {
    "class-map": {
      "0": "car",
      "1": "bus"
    },
    "job-name": "labeling-job/labeling-job-name",
    "human-annotated": "yes",
    "creation-date": "2020-05-15T08:01:16+0000",
    "type": "groundtruth/video-object-tracking"
  }
}
```
Ground Truth creates one output sequence file for each sequence of video frames that was labeled. Each output sequence file contains the following:

- All annotations for all frames in a sequence in the `tracking-annotations` list of JSON objects.
- For each frame that was annotated by a worker, the frame (frame), number (frame-no), a list of JSON objects containing annotations (annotations), and if applicable, frame attributes (frame-attributes). The name of this list is defined by the task type you use: polylines, polygons, keypoints, and for bounding boxes, annotations.

Each JSON object contains information about a single annotation and associated label. The following table outlines the parameters you'll see for each video frame task type.

<table>
<thead>
<tr>
<th>Task Type</th>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bounding Box</td>
<td>Box dimensions: height and width</td>
</tr>
<tr>
<td></td>
<td>Box top, left corner pixel location: top and left</td>
</tr>
<tr>
<td>Keypoint</td>
<td>Keypoint vertices: { &quot;x&quot;: int, &quot;y&quot;: int }</td>
</tr>
<tr>
<td>Polygon</td>
<td>A list of polygon vertices: vertices</td>
</tr>
<tr>
<td></td>
<td>Polygon vertices: { &quot;x&quot;: int, &quot;y&quot;: int }</td>
</tr>
<tr>
<td></td>
<td>A polygon is a closed shape and so the first point will also represent the last point.</td>
</tr>
<tr>
<td>Polyline</td>
<td>A list of polyline vertices: vertices</td>
</tr>
<tr>
<td></td>
<td>Polyline vertices: { &quot;x&quot;: int, &quot;y&quot;: int }</td>
</tr>
</tbody>
</table>

In addition to task type specific values, you will see the following in each JSON object:

- Values of any `label-category-attributes` that were specified for that label.
- The `class-id` of the box. Use the `class-map` in the output manifest file to see which label category this ID maps to.
- An `object-id` which identifies an instance of a label. This ID will be the same across frames if a worker identified the same instance of an object in multiple frames. For example, if a car appeared in multiple frames, all bounding boxes uses to identify that car would have the same `object-id`.
- The `object-name` which is the instance ID of that annotation.

The following is an example of a `SeqLabel.json` file from a bounding box video frame object tracking labeling job. This file will be located under s3://your-output-bucket/output-prefix/annotations/consolidated-annotation/output/annotation-number/.

```json
{
   "tracking-annotations": [
   {
      "annotations": [
      {
         "height": 36,
         "width": 46,
         "top": 178,
         "left": 315,
         "class-id": "0",
         "label-category-attributes": {
            "occluded": "no"
         },
         "object-id": "480dc450-c0ca-11ea-961f-a9b1c5c97972",
```
The following is the output manifest file from a 3D point cloud semantic segmentation labeling job.

In addition to the standard elements, the metadata for the label includes a color map that defines which color is used to label the image, the class name associated with the color, and the confidence score for each color. Additionally, there is an adjustment-status parameter in the metadata for audit workflows that is set to adjusted if the color mask is modified. If you added one or more frameAttributes to your label category configuration file, worker responses for frame attributes are in the JSON object, dataset-object-attributes.

The your-label-attribute-ref parameter contains the location of a compressed file with a .zlib extension. When you uncompress this file, it contains an array. Each index in the array corresponds to the index of an annotated point in the input point cloud. The value of the array at a given index gives the class of the point at the same index in the point cloud, based on the semantic color map found in the color-map parameter of the metadata.

You can use Python code similar to the following to decompress a .zlib file:

```python
import zlib
```
from array import array

# read the label file
compressed_binary_file = open(zlib_file_path/file.zlib, 'rb').read()

# uncompress the label file
binary_content = zlib.decompress(compressed_binary_file)

# load labels to an array
my_int_array_data = array('B', binary_content);

print(my_int_array_data)

The code block above will produce an output similar to the following. Each element of the printed array contains the class of a point at the that index in the point cloud. For example, my_int_array_data[0] = 1 means point[0] in the input point cloud has a class 1. In the following output manifest file example, class 0 corresponds with "Background", 1 with Car, and 2 with Pedestrian.

>> array('B', [1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2])

The following is an example of a semantic segmentation 3D point cloud labeling job output manifest file. The red, italicized text in the examples below depends on labeling job specifications and output data.

3D Point Cloud Object Detection Output

The following is sample output from a 3D point cloud object detection job. For this task type, the data about 3D cuboids is returned in the `3d-bounding-box` parameter, in a list named `annotations`. In this list, each 3D cuboid is described using the following information.

- Each class, or label category, that you specify in your input manifest is associated with a `class-id`. Use the `class-map` to identify the class associated with each class ID.
- These classes are used to give each 3D cuboid an `object-name` in the format `<class>:<integer>` where `integer` is a unique number to identify that cuboid in the frame.
- `center-x`, `center-y`, and `center-z` are the coordinates of the center of the cuboid, in the same coordinate system as the 3D point cloud input data used in your labeling job.
- `length`, `width`, and `height` describe the dimensions of the cuboid.
- `yaw` is used to describe the orientation (heading) of the cuboid in radians.

The `yaw` measurement in the output data is 180 degrees, or π in radians, minus `yaw` in the right handed world coordinate system when looking down at the cuboid. In other words, when looking at a cuboid from the top-down, `yaw_in_output_data` is clockwise-positive (in contrast to the right handed world coordinate system, in which the top-down view is associated with counter-clockwise positive rotation). When looking up from the cuboid, `yaw_in_output_data` is counterclockwise-positive.

To convert `yaw_in_output_data` to the more common orientation of the right handed world coordinate system, use the following (all units are in radians):

\[
\text{yaw_right_handed_cartesian_system} = \pi - \text{yaw_in_output_data}
\]

- If you created a 3D point cloud adjustment labeling job and included `pitch` and `roll` in the input manifest file, the same `pitch` and `roll` measurements will appear in the output manifest file. Otherwise, `pitch` and `roll` will always be 0.
- If you included label attributes in your input manifest file for a given class, a `label-category-attributes` parameter is included for all cuboids for which workers selected label attributes.

If one or more cuboids were modified, there is an `adjustment-status` parameter in the metadata for audit workflows that is set to `adjusted`. If you added one or more `frameAttributes` to your label category configuration file, worker responses for frame attributes are in the JSON object, `dataset-object-attributes`.

The red, italicized text in the examples below depends on labeling job specifications and output data. The ellipses (...) denote a continuation of that list, where additional objects with the same format as the proceeding object can appear.

3D Point Cloud Object Tracking Output

The following is an example of an output manifest file from a 3D point cloud object tracking labeling job. The red, italicized text in the examples below depends on labeling job specifications and output data. The ellipses (...) denote a continuation of that list, where additional objects with the same format as the proceeding object can appear.

In addition to the standard elements, the metadata includes a class map that lists each class that has at least one label in the sequence. If one or more cuboids were modified, there is an adjustment-status parameter in the metadata for audit workflows that is set to adjusted.
In the above example, the cuboid data for each frame in seq1.json is in SeqLabel.json in the Amazon S3 location, s3://<customerOutputLocation>/<labelingJobName>/annotations/consolidated-annotation/output/<datasetObjectId>/SeqLabel.json. The following is an example of this label sequence file.

For each frame in the sequence, you see the frame-number, frame-name, if applicable, frame-attributes, and a list of annotations. This list contains 3D cuboids that were drawn for that frame. Each annotation includes the following information:

- An object-name in the format <class>:<integer> where class identifies the label category and integer is a unique ID across the dataset.
- When workers draw a cuboid, it is associated with a unique object-id which is associated with all cuboids that identify the same object across multiple frames.
- Each class, or label category, that you specified in your input manifest is associated with a class-id. Use the class-map to identify the class associated with each class ID.
- center-x, center-y, and center-z are the coordinates of the center of the cuboid, in the same coordinate system as the 3D point cloud input data used in your labeling job.
- length, width, and height describe the dimensions of the cuboid.
- yaw is used to describe the orientation (heading) of the cuboid in radians.

The yaw measurement in the output data is 180 degrees, or pi in radians, minus yaw in the right handed world coordinate system when looking down at the cuboid. In other words, when looking at a cuboid from the top-down, yaw_in_output_data is clockwise-positive (in contrast to the right handed world coordinate system, in which the top-down view is associated with counter-clockwise positive rotation). When looking up from the cuboid, yaw_in_output_data is counterclockwise-positive.

To convert yaw_in_output_data to the more common orientation of the right handed world coordinate system, use the following (all units are in radians):

\[
\text{yaw}_{\text{right handed cartesian system}} = \pi - \text{yaw}_{\text{in output data}}
\]

- If you created a 3D point cloud adjustment labeling job and included pitch and roll in the input manifest file, the same pitch and roll measurements will appear in the output manifest file. Otherwise, pitch and roll will always be 0.
- If you included label attributes in your input manifest file for a given class, a label-category-attributes parameter is included for all cuboids for which workers selected label attributes.
Enhanced Data Labeling

Amazon SageMaker Ground Truth manages sending your data objects to workers to be labeled. Labeling each data object is a task. Workers complete each task until the entire labeling job is complete. Ground Truth divides the total number of tasks into smaller batches that are sent to workers. A new batch is sent to workers when the previous one is finished.

Ground Truth provides two features that help improve the accuracy of your data labels and reduce the total cost of labeling your data:

- **Annotation consolidation** helps to improve the accuracy of your data object labels. It combines the results of multiple workers' annotation tasks into one high-fidelity label.
- **Automated data labeling** uses machine learning to label portions of your data automatically without having to send them to human workers.

**Topics**

- Control the Flow of Data Objects Sent to Workers (p. 457)
- Consolidate Annotations (p. 458)
- Automate Data Labeling (p. 459)
Chaining Labeling Jobs (p. 465)

Control the Flow of Data Objects Sent to Workers

Depending on the type of labeling job you create, Amazon SageMaker Ground Truth sends data objects to workers in batches or in a streaming fashion. You can control the flow of data objects to workers in the following ways:

- For both types of labeling jobs, you can use `MaxConcurrentTaskCount` to control the total number of data objects available to all workers at a given point in time when the labeling job is running.
- For streaming labeling jobs, you can control the flow of data objects to workers by monitoring and controlling the number of data objects sent to the Amazon SQS associated with your labeling job.

Use the following sections to learn more about these options. To learn more about streaming labeling jobs, see Ground Truth Streaming Labeling Jobs (p. 395).

Topics

- Use `MaxConcurrentTaskCount` to Control the Flow of Data Objects (p. 457)
- Use Amazon SQS to Control the Flow of Data Objects to Streaming Labeling Jobs (p. 458)

Use `MaxConcurrentTaskCount` to Control the Flow of Data Objects

`MaxConcurrentTaskCount` defines the maximum number of data objects that can be labeled by human workers at the same time. If you use the console, this parameter is set to 1,000. If you use `CreateLabelingJob`, you can set this parameter to any integer between 1 and 1,000, inclusive.

When you start a labeling job using an input manifest file, Ground Truth does the following:

1. For each data object listed in your input manifest file, one or more tasks are created, depending on the value you specify for `NumberOfHumanWorkersPerDataObject`. For example, if you set the number of workers per data object to 3, 3 tasks will be created for each dataset object. To be marked as successfully labeled, at least one worker must label the object. Alternatively, the tasks can expire or be declined.
2. If you are using the Mechanical Turk workforce, Ground Truth first sends a batch of 10 dataset objects to your workers. It uses this small batch to set up the labeling job and to make sure that the job is correctly configured.
3. Next, Ground Truth sends `MaxConcurrentTaskCount` number of dataset objects to workers. For example, if you have 2,000 input data objects in your input manifest file and have set the number of workers per data object to 3 and set `MaxConcurrentTaskCount` to 900, the first 900 data objects in your input manifest are sent to workers, corresponding to 2,700 tasks (900 x 3). This is the first full-sized set of objects sent to workers.
4. What happens next depends on the type of labeling job you create. This step assumes one or more dataset objects in your input manifest file, or sent using an Amazon SNS input data source (in a streaming labeling job) were not include in the set sent to workers in step 3.
   - **Streaming labeling job**: As long as the total number of objects available to workers is equal to `MaxConcurrentTaskCount`, all remaining dataset objects on your input manifest file and that you send in real time using Amazon SNS are placed on an Amazon SQS queue. When the total number of objects available to workers falls below `MaxConcurrentTaskCount` minus `NumberOfHumanWorkersPerDataObject`, a new data object from the queue is used to create `NumberOfHumanWorkersPerDataObject` tasks, which are sent to workers in real time.
   - **Non-streaming labeling job**: As workers finish labeling one set of objects, up to `MaxConcurrentTaskCount` times `NumberOfHumanWorkersPerDataObject` number of new
tasks will be sent to workers. This process is repeated until all data objects in the input manifest file are labeled.

Use Amazon SQS to Control the Flow of Data Objects to Streaming Labeling Jobs

When you create a streaming labeling job, an Amazon SQS queue is automatically created in your account. Data objects are only added to the Amazon SQS queue when the total number of objects sent to workers is above MaxConcurrentTaskCount. Otherwise, objects are sent directly to workers.

You can use this queue to manage the flow of data objects to your labeling job. To learn more, see Manage Labeling Requests with an Amazon SQS Queue (p. 398).

Consolidate Annotations

An annotation is the result of a single worker's labeling task. Annotation consolidation combines the annotations of two or more workers into a single label for your data objects. A label, which is assigned to each object in the dataset, is a probabilistic estimate of what the true label should be. Each object in the dataset typically has multiple annotations, but only one label or set of labels.

You decide how many workers annotate each object in your dataset. Using more workers can increase the accuracy of your labels, but also increases the cost of labeling. To learn more about Ground Truth pricing, see Amazon SageMaker Ground Truth pricing.

If you use the Amazon SageMaker console to create a labeling job, the following are the defaults for the number of workers who can annotate objects:

- Text classification—3 workers
- Image classification—3 workers
- Bounding boxes—5 workers
- Semantic segmentation—3 workers
- Named entity recognition—3 workers

When you use the CreateLabelingJob operation, you set the number of workers to annotate each data object with the NumberOfHumanWorkersPerDataObject parameter. You can override the default number of workers that annotate a data object using the console or the CreateLabelingJob operation.

Ground Truth provides an annotation consolidation function for each of its predefined labeling tasks: bounding box, image classification, name entity recognition, semantic segmentation, and text classification. These are the functions:

- Multi-class annotation consolidation for image and text classification uses a variant of the Expectation Maximization approach to annotations. It estimates parameters for each worker and uses Bayesian inference to estimate the true class based on the class annotations from individual workers.
- Bounding box annotation consolidates bounding boxes from multiple workers. This function finds the most similar boxes from different workers based on the Jaccard index, or intersection over union, of the boxes and averages them.
- Semantic segmentation annotation consolidation treats each pixel in a single image as a multi-class classification. This function treats the pixel annotations from workers as "votes," with more information from surrounding pixels incorporated by applying a smoothing function to the image.
- Named entity recognition clusters text selections by Jaccard similarity and calculates selection boundaries based on the mode, or the median if the mode isn't clear. The label resolves to the most assigned entity label in the cluster, breaking ties by random selection.
You can use other algorithms to consolidate annotations. For information, see Create Your Own Annotation Consolidation Function (p. 459).

**Create Your Own Annotation Consolidation Function**

You can choose to use your own annotation consolidation function to determine the final labels for your labeled objects. There are many possible approaches for writing a function and the approach that you take depends on the nature of the annotations to consolidate. Broadly, consolidation functions look at the annotations from workers, measure the similarity between them, and then use some form of probabilistic judgment to determine what the most probable label should be.

If you want to use other algorithms to create annotation consolidations functions, you can find the worker responses in the `project-name/annotations/worker-response` folder of the Amazon S3 bucket where you direct the job output.

**Assess Similarity**

To assess the similarity between labels, you can use one of the following strategies, or you can use one that meets your data labeling needs:

- For label spaces that consist of discrete, mutually exclusive categories, such as multi-class classification, assessing similarity can be straightforward. Discrete labels either match or do not match.
- For label spaces that don't have discrete values, such as bounding box annotations, find a broad measure of similarity. For bounding boxes, one such measure is the Jaccard index. This measures the ratio of the intersection of two boxes with the union of the boxes to assess how similar they are. For example, if there are three annotations, then there can be a function that determines which annotations represent the same object and should be consolidated.

**Assess the Most Probable Label**

With one of the strategies detailed in the previous sections in mind, make some sort of probabilistic judgment on what the consolidated label should be. In the case of discrete, mutually exclusive categories, this can be straightforward. One of the most common ways to do this is to take the results of a majority vote between the annotations. This weights the annotations equally.

Some approaches attempt to estimate the accuracy of different annotators and weight their annotations in proportion to the probability of correctness. An example of this is the Expectation Maximization method, which is used in the default Ground Truth consolidation function for multi-class annotations.

For more information about creating an annotation consolidation function, see Step 3: Processing with AWS Lambda (p. 335).

**Automate Data Labeling**

If you choose, Amazon SageMaker Ground Truth can use active learning to automate the labeling of your input data for certain built-in task types. Active learning is a machine learning technique that identifies data that should be labeled by your workers. In Ground Truth, this functionality is called automated data labeling. Automated data labeling helps to reduce the cost and time that it takes to label your dataset compared to using only humans. When you use automated labeling, you incur SageMaker training and inference costs.

We recommend using automated data labeling on large datasets because the neural networks used with active learning require a significant amount of data for every new dataset. Typically, as you provide more data, the potential for high accuracy predictions goes up. Data will only be auto-labeled if the neural network used in the auto-labeling model can achieve an acceptably high level of accuracy. Therefore, with larger datasets, there is more potential to automatically label the data because the neural network can achieve high enough accuracy for auto-labeling. Automated data labeling is most appropriate when you have thousands of data objects. The minimum number of objects allowed for automated data labeling is 1,250, but we strongly suggest providing a minimum of 5,000 objects.
Automated data labeling is available only for the following Ground Truth built-in task types:

- **Image Classification (Single Label)** (p. 208)
- **Image Semantic Segmentation** (p. 201)
- **Object detection (Bounding Box)** (p. 195)
- **Text Classification (Single Label)** (p. 219)

**Streaming labeling jobs** do not support automated data labeling.

To learn how to create a custom active learning workflow using your own model, see *Set up an active learning workflow with your own model* (p. 465).

Input data quotas apply for automated data labeling jobs. See *Input Data Quotas* (p. 400) for information about dataset size, input data size and resolution limits.

**Note**

Before you use the automated-labeling model in production, you need to fine-tune or test it, or both. You might fine-tune the model (or create and tune another supervised model of your choice) on the dataset produced by your labeling job to optimize the model's architecture and hyperparameters. If you decide to use the model for inference without fine-tuning it, we strongly recommend making sure that you evaluate its accuracy on a representative (for example, randomly selected) subset of the dataset labeled with Ground Truth and that it matches your expectations.

**How it Works**

You enable automated data labeling when you create a labeling job. This is how it works:

1. When Ground Truth starts an automated data labeling job, it selects a random sample of input data objects and sends them to human workers. If more than 10% of these data objects fail, the labeling job will fail. If the labeling job fails, in addition to reviewing any error message Ground Truth returns, check that your input data is displaying correctly in the worker UI, instructions are clear, and that you have given workers enough time to complete tasks.

2. When the labeled data is returned, it is used to create a training set and a validation set. Ground Truth uses these datasets to train and validate the model used for auto-labeling.

3. Ground Truth runs a batch transform job, using the validated model for inference on the validation data. Batch inference produces a confidence score and quality metric for each object in the validation data.

4. The auto-labeling component will use these quality metrics and confidence scores to create a confidence score threshold that ensures quality labels.

5. Ground Truth runs a batch transform job on the unlabeled data in the dataset, using the same validated model for inference. This produces a confidence score for each object.

6. The Ground Truth auto-labeling component determines if the confidence score produced in step 5 for each object meets the required threshold determined in step 4. If the confidence score meets the threshold, the expected quality of automatically labeling exceeds the requested level of accuracy and that object is considered auto-labeled.

7. Step 6 produces a dataset of unlabeled data with confidence scores. Ground Truth selects data points with low confidence scores from this dataset and sends them to human workers.

8. Ground Truth uses the existing human-labeled data and this additional labeled data from human workers to update the model.

9. The process is repeated until the dataset is fully labeled or until another stopping condition is met. For example, auto-labeling stops if your human annotation budget is reached.

The preceding steps happen in iterations. Select each tab in the following table to see an example of the processes that happen in each iteration for an object detection automated labeling job. The number of
data objects used in a given step in these images (for example, 200) is specific to this example. If there are fewer than 5,000 objects to label, the validation set size is 20% of the whole dataset. If there are more than 5,000 objects in your input dataset, the validation set size is 10% of the whole dataset. You can control the number of human labels collected per active learning iteration by changing the value for MaxConcurrentTaskCount when using the API operation CreateLabelingJob. This value is set to 1,000 when you create a labeling job using the console. In the active learning flow illustrated under the Active Learning tab, this value is set to 200.

Trained model
Accuracy of Automated Labels

The definition of accuracy depends on the built-in task type that you use with automated labeling. For all task types, these accuracy requirements are pre-determined by Ground Truth and cannot be manually configured.

- For image classification and text classification, Ground Truth uses logic to find a label-prediction confidence level that corresponds to at least 95% label accuracy. This means Ground Truth expects the accuracy of the automated labels to be at least 95% when compared to the labels that human labelers would provide for those examples.

- For bounding boxes, the expected mean Intersection Over Union (IoU) of the auto-labeled images is 0.6. To find the mean IoU, Ground Truth calculates the mean IoU of all the predicted and missed boxes on the image for every class, and then averages these values across classes.

- For semantic segmentation, the expected mean IoU of the auto-labeled images is 0.7. To find the mean IoU, Ground Truth takes the mean of the IoU values of all the classes in the image (excluding the background).

At every iteration of Active Learning (steps 3-6 in the list above), the confidence threshold is found using the human-annotated validation set so that the expected accuracy of the auto-labeled objects satisfies certain predefined accuracy requirements.

Create an Automated Data Labeling Job (Console)

To create a labeling job that uses automated labeling in the SageMaker console, use the following procedure.

To create an automated data labeling job (console)

2. Using Create a Labeling Job (Console) (p. 364) as a guide, complete the Job overview and Task type sections. Note that auto labeling is not supported for custom task types.
4. In the same section, choose **Enable automated data labeling**.
5. Using Step 4: Configure the Bounding Box Tool (p. 194) as a guide, create worker instructions in the section **Task Type labeling tool**. For example, if you chose **Semantic segmentation** as your labeling job type, this section is called **Semantic segmentation labeling tool**.
6. To preview your worker instructions and dashboard, choose **Preview**.
7. Choose **Create**. This creates and starts your labeling job and the auto labeling process.

You can see your labeling job appear in the **Labeling jobs** section of the SageMaker console. Your output data appears in the Amazon S3 bucket that you specified when creating the labeling job. For more information about the format and file structure of your labeling job output data, see **Output Data (p. 433)**.

### Create an Automated Data Labeling Job (API)

To create an automated data labeling job using the SageMaker API, use the `LabelingJobAlgorithmsConfig` parameter of the `CreateLabelingJob` operation. To learn how to start a labeling job using the `CreateLabelingJob` operation, see **Create a Labeling Job (API) (p. 367)**.

Specify the Amazon Resource Name (ARN) of the algorithm that you are using for automated data labeling in the `LabelingJobAlgorithmSpecificationArn` parameter. Choose from one of the four Ground Truth built-in algorithms that are supported with automated labeling:

- **Image Classification (Single Label) (p. 208)**
- **Image Semantic Segmentation (p. 201)**
- **Object detection** (Bounding Box (p. 195))
- **Text Classification (Single Label) (p. 219)**

When an automated data labeling job finishes, Ground Truth returns the ARN of the model it used for the automated data labeling job. Use this model as the starting model for similar auto-labeling job types by providing the ARN, in string format, in the `InitialActiveLearningModelArn` parameter. To retrieve the model's ARN, use an AWS Command Line Interface (AWS CLI) command similar to the following.

```python
# Fetch the mARN of the model trained in the final iteration of the previous labeling job.
ground_truth
pretrained_model_arn = sagemaker_client.describe_labeling_job(LabelingJobName=job_name)
['LabelingJobOutput']['FinalActiveLearningModelArn']
```

To encrypt data on the storage volume attached to the ML compute instance(s) that are used in automated labeling, include an AWS Key Management Service (AWS KMS) key in the `VolumeKmsKeyId` parameter. For information about AWS KMS keys, see **What is AWS Key Management Service?** in the **AWS Key Management Service Developer Guide**.

For an example that uses the `CreateLabelingJob` operation to create an automated data labeling job, see the `object_detection_tutorial` example in the **SageMaker Examples, Ground Truth Labeling Jobs** section of a SageMaker notebook instance. To learn how to create and open a notebook instance, see **Create a Notebook Instance (p. 141)**. To learn how to access SageMaker example notebooks, see **Example Notebooks (p. 152)**.

### Amazon EC2 Instances Required for Automated Data Labeling

The following table lists the Amazon Elastic Compute Cloud (Amazon EC2) instances that you need to run automated data labeling for training and batch inference jobs.
## Automated Data Labeling Job Types

<table>
<thead>
<tr>
<th>Automated Data Labeling Job Type</th>
<th>Training Instance Type</th>
<th>Inference Instance Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image classification</td>
<td>ml.p3.2xlarge*</td>
<td>ml.c5.xlarge</td>
</tr>
<tr>
<td>Object detection (bounding box)</td>
<td>ml.p3.2xlarge*</td>
<td>ml.c5.4xlarge</td>
</tr>
<tr>
<td>Text classification</td>
<td>ml.c5.2xlarge</td>
<td>ml.m4.xlarge</td>
</tr>
<tr>
<td>Semantic segmentation</td>
<td>ml.p3.2xlarge*</td>
<td>ml.p3.2xlarge*</td>
</tr>
</tbody>
</table>

* In the Asia Pacific (Mumbai) Region (ap-south-1) use ml.p2.8xlarge instead.

Automated data labeling incurs two separate charges: the per-item charge (see pricing), and the charge for the Amazon EC2 instance required to run the model (see Amazon EC2 pricing).

Ground Truth manages the instances that you use for automated data labeling jobs. It creates, configures, and terminates the instances as needed to perform your job. These instances don’t appear in your Amazon EC2 instance dashboard.

### Set up an active learning workflow with your own model

You can create an active learning workflow with your own algorithm to run training and inferences in that workflow to auto-label your data. The notebook `bring_your_own_model_for_sagemaker_labeling_workflows_with_active_learning.ipynb` demonstrates this using the SageMaker built-in algorithm, BlazingText. This notebook provides an AWS CloudFormation stack that you can use to execute this workflow using AWS Step Functions. You can find the notebook and supporting files in this GitHub repository.

You can also find this notebook in the SageMaker Examples repository. See Use Example Notebooks to learn how to find an Amazon SageMaker example notebook.

### Chaining Labeling Jobs

Amazon SageMaker Ground Truth can reuse datasets from prior jobs in two ways: cloning and chaining.

**Cloning** copies the setup of a prior labeling job and allows you to make additional changes before setting it to run.

**Chaining** uses not only the setup of the prior job, but also the results. This allows you to continue an incomplete job and add labels or data objects to a completed job. Chaining is a more complex operation.

For data processing:

- Cloning uses the prior job's *input* manifest, with optional modifications, as the new job's input manifest.
- Chaining uses the prior job's *output* manifest as the new job's input manifest.

Chaining is useful when you need to:

- Continue a labeling job that was manually stopped.
- Continue a labeling job that failed mid-job, after fixing issues.
- Switch to automated data labeling after manually labeling part of a job (or the other way around).
- Add more data objects to a completed job and start the job from there.
- Add another annotation to a completed job. For example, you have a collection of phrases labeled for topic, then want to run the set again, categorizing them by the topic's implied audience.

In Amazon SageMaker Ground Truth you can configure a chained labeling job with either the console or the API.

**Key Term: Label Attribute Name**

The *label attribute name* (LabelAttributeName in the API) is a string used as the key for the key-value pair formed with the label that a worker assigns to the data object.

The following rules apply for the label attribute name:

- It can't end with `-metadata`.
- The names `source` and `source-ref` are reserved and can't be used.
- For semantic segmentation labeling jobs, it must end with `-ref`. For all other labeling jobs, it can't end with `-ref`. If you use the console to create the job, Amazon SageMaker Ground Truth automatically appends `-ref` to all label attribute names except for semantic segmentation jobs.
- For a chained labeling job, if you're using the same label attribute name from the originating job and you configure the chained job to use auto-labeling, then if it had been in auto-labeling mode at any point, Ground Truth uses the model from the originating job.

In an output manifest, the label attribute name appears similar to the following.

```json
"source-ref": "<S3 URI>",
"<label attribute name>": {
   "annotations": [{
      "class_id": 0,
      "width": 99,
      "top": 87,
      "height": 62,
      "left": 175
   }],
   "image_size": [{
      "width": 344,
      "depth": 3,
      "height": 234
   }]
},
"<label attribute name>-metadata": {
   "job-name": "<job name>",
   "class-map": {
      "0": "<label attribute name>"
   },
   "human-annotated": "yes",
   "objects": [{
      "confidence": 0.09
   }],
   "creation-date": "<timestamp>",
   "type": "groundtruth/object-detection"
}
```

If you're creating a job in the console and don't explicitly set the label attribute name value, Ground Truth uses the job name as the label attribute name for the job.

**Start a Chained Job (Console)**

Choose a stopped, failed, or completed labeling job from the list of your existing jobs. This enables the **Actions** menu.
From the Actions menu, choose Chain.

Job Overview Panel

In the Job overview panel, a new Job name is set based on the title of the job from which you are chaining this one. You can change it.

You may also specify a label attribute name different from the labeling job name.

If you're chaining from a completed job, the label attribute name uses the name of the new job you're configuring. To change the name, select the check box.

If you're chaining from a stopped or failed job, the label attribute name uses the name of the job from which you're chaining. It's easy to see and edit the value because the name check box is checked.

Attribute label naming considerations

- The default uses the label attribute name Ground Truth has selected. All data objects without data connected to that label attribute name are labeled.
- Using a label attribute name not present in the manifest causes the job to process all the objects in the dataset.

The input dataset location in this case is automatically selected as the output manifest of the chained job. The input field is not available, so you cannot change it.

Adding data objects to a labeling job

You cannot specify an alternate manifest file. Manually edit the output manifest from the previous job to add new items before starting a chained job. The Amazon S3 URI helps you locate where you are storing the manifest in your Amazon S3 bucket. Download the manifest file from there, edit it locally on your computer, and then upload the new version to replace it. Make sure you are not introducing errors during editing. We recommend you use JSON linter to check your JSON. Many popular text editors and IDEs have linter plugins available.

Start a Chained Job (API)

The procedure is almost the same as setting up a new labeling job with CreateLabelingJob, except for two primary differences:

- Manifest location: Rather than use your original manifest from the prior job, the value for the ManifestS3Uri in the DataSource should point to the Amazon S3 URI of the output manifest from the prior labeling job.
- Label attribute name: Setting the correct LabelAttributeName value is important here. This is the key portion of a key-value pair where labeling data is the value. Sample use cases include:
  - Adding new or more specific labels to a completed job — Set a new label attribute name.
  - Labeling the unlabeled items from a prior job — Use the label attribute name from the prior job.

Use a Partially Labeled Dataset

You can get some chaining benefits if you use an augmented manifest that has already been partially labeled. Check the Label attribute name check box and set the name so that it matches the name in your manifest.

If you're using the API, the instructions are the same as those for starting a chained job. However, be sure to upload your manifest to an Amazon S3 bucket and use it instead of using the output manifest from a prior job.

The Label attribute name value in the manifest has to conform to the naming considerations discussed earlier.
Ground Truth Security and Permissions

Use the topics on this page to learn about Ground Truth security features and how to configure AWS Identity and Access Management (IAM) permissions to allow an IAM user or role to create a labeling job. Additionally, learn how to create an execution role. An execution role is the role that you specify when you create a labeling job. This role is used to start your labeling job.

If you are a new user and want to get started quickly, or if you do not require granular permissions, see Use IAM Managed Policies with Ground Truth (p. 469).

For more information about IAM users and roles, see Identities (Users, Groups, and Roles) in the IAM User Guide.

To learn more about using IAM with SageMaker, see Identity and Access Management for Amazon SageMaker (p. 2508).

Topics
- CORS Permission Requirement (p. 468)
- Assign IAM Permissions to Use Ground Truth (p. 469)
- Output Data and Storage Volume Encryption (p. 480)
- Workforce Authentication and Restrictions (p. 481)

CORS Permission Requirement

Earlier in 2020, widely used browsers like Chrome and Firefox changed their default behavior for rotating images based on image metadata, referred to as EXIF data. Previously, browsers would always display images in exactly the manner in which they are stored on disk, which is typically unrotated. After the change, images now rotate according to a piece of image metadata called orientation value. This has important implications for the entire machine learning (ML) community. For example, if applications that annotate images do not consider the EXIF orientation, they may display images in unexpected orientations, resulting in incorrect labels.

Starting with Chrome 89, AWS can no longer automatically prevent the rotation of images because the web standards group W3C has decided that the ability to control rotation of images violates the web’s Same-origin Policy. Therefore, to ensure human workers annotate your input images in a predictable orientation when you submit requests to create a labeling job, you must add a CORS header policy to the Amazon S3 buckets that contain your input images.

Important
If you do not add a CORS configuration to the Amazon S3 buckets that contain your input data, labeling tasks for those input data objects will fail.

If you create a job through the Ground Truth console, CORS is enabled by default. If all of your input data is not located in the same Amazon S3 bucket as your input manifest file, you must add a CORS configuration to all Amazon S3 buckets that contain input data using the following instructions.

If you are using the CreateLabelingJob API to create a Ground Truth labeling job, you can add a CORS policy to an Amazon S3 bucket that contains input data in the S3 console. To set the required CORS headers on the Amazon S3 bucket that contain your input images in the Amazon S3 console, follow the directions detailed in How do I add cross-domain resource sharing with CORS?. Use the following CORS configuration code for the buckets that host your images. If you use the Amazon S3 console to add the policy to your bucket, you must use the JSON format.

Important
If you create a 3D point cloud or video frame labeling job, you must add additional rules to your CORS configuration. To learn more, see 3D Point Cloud Labeling Job Permission Requirements (p. 290) and Video Frame Job Permission Requirements (p. 242) respectively.
Assign IAM Permissions to Use Ground Truth

Use the topics in this section to learn how to use AWS Identity and Access Management (IAM) managed and custom policies to manage access to Ground Truth and associated resources.

You can use the sections on this page to learn the following:

- How to create IAM policies that grant an IAM user or role permission to create a labeling job. Administrators can use IAM policies to restrict access to Amazon SageMaker and other AWS services that are specific to Ground Truth.
- How to create a SageMaker execution role. An execution role is the role that you specify when you create a labeling job. The role is used to start and manage your labeling job.

The following is an overview of the topics you'll find on this page:

- If you are getting started using Ground Truth, or you do not require granular permissions for your use case, it is recommended that you use the IAM managed policies described in Use IAM Managed Policies with Ground Truth (p. 469).
- Learn about the permissions required to use the Ground Truth console in Grant IAM Permission to Use the Amazon SageMaker Ground Truth Console (p. 470). This section includes policy examples that grant an IAM entity permission to create and modify private work teams, subscribe to vendor work teams, and create custom labeling workflows.
- When you create a labeling job, you must provide an execution role. Use Create a SageMaker Execution Role for a Ground Truth Labeling Job (p. 474) to learn about the permissions required for this role.

Use IAM Managed Policies with Ground Truth

SageMaker and Ground Truth provide AWS managed policies that you can use to create a labeling job. If you are getting started using Ground Truth and you do not require granular permissions for your use case, it is recommended that you use the following policies:

- **AmazonSageMakerFullAccess** – Use this policy to give an IAM user or role permission to create a labeling job. This is a broad policy that grants an IAM entity permission to use SageMaker features, as well as features of necessary AWS services through the console and API. This policy gives the IAM entity permission to create a labeling job and to create and manage workforces using Amazon Cognito. To learn more, see AmazonSageMakerFullAccess Policy.
- **AmazonSageMakerGroundTruthExecution** – To create an execution role, you can attach the policy AmazonSageMakerGroundTruthExecution to an IAM role. An execution role is the role that you
specify when you create a labeling job and it is used to start your labeling job. This policy allows you to create both streaming and non-streaming labeling jobs, and to create a labeling job using any task type. Note the following limits of this managed policy.

- **Amazon S3 permissions**: This policy grants an execution role permission to access Amazon S3 buckets with the following strings in the name: GroundTruth, Groundtruth, groundtruth, SageMaker, Sagemaker, and sagemaker or a bucket with an object tag that includes SageMaker in the name (case insensitive). Make sure your input and output bucket names include these strings, or add additional permissions to your execution role to grant it permission to access your Amazon S3 buckets. You must give this role permission to perform the following actions on your Amazon S3 buckets: AbortMultipartUpload, GetObject, and PutObject.

- **Custom Workflows**: When you create a custom labeling workflow, this execution role is restricted to invoking AWS Lambda functions with one of the following strings as part of the function name: GtRecipe, SageMaker, Sagemaker, sagemaker, or LabelingFunction. This applies to both your pre-annotation and post-annotation Lambda functions. If you choose to use names without those strings, you must explicitly provide lambda:InvokeFunction permission to the execution role used to create the labeling job.

To learn how to attach an AWS managed policy to an IAM user or role (identity), refer to Adding and removing IAM identity permissions in the IAM User Guide.

**Grant IAM Permission to Use the Amazon SageMaker Ground Truth Console**

To use the Ground Truth area of the SageMaker console, you need to grant permission to an IAM entity to access SageMaker and other AWS services that Ground Truth interacts with. Required permissions to access other AWS services depends on your use-case:

- Amazon S3 permissions are required for all use cases. These permissions must grant access to the Amazon S3 buckets that contain input and output data.
- AWS Marketplace permissions are required to use a vendor workforce.
- Amazon Cognito permission are required for private work team setup.
- AWS KMS permissions are required to view available AWS KMS keys that can be used for output data encryption.
- IAM permissions are required to either list pre-existing execution roles, or to create a new one. Additionally, you must use add a PassRole permission to allow SageMaker to use the execution role chosen to start the labeling job.

The following sections list policies you may want to grant to an IAM role to use one or more functions of Ground Truth.

**Topics**

- Ground Truth Console Permissions (p. 470)
- Custom Labeling Workflow Permissions (p. 473)
- Private Workforce Permissions (p. 474)
- Vendor Workforce Permissions (p. 474)

**Ground Truth Console Permissions**

To grant permission to an IAM user or role to use the Ground Truth area of the SageMaker console to create a labeling job, attach the following policy to the user or role. The following policy will give an IAM role permission to create a labeling job using a built-in task type task type. If you want to create a custom labeling workflow, add the policy in Custom Labeling Workflow Permissions (p. 473) to the following policy. Each Statement included in the following policy is described below this code block.
"Version": "2012-10-17",
"Statement": [
{"Sid": "SageMakerApis",
"Effect": "Allow",
"Action": [
  "sagemaker:*"
],
"Resource": "*"},
{"Sid": "KmsKeysForCreateForms",
"Effect": "Allow",
"Action": [
  "kms:DescribeKey",
  "kms:ListAliases"
],
"Resource": "*"},
{"Sid": "AccessAwsMarketplaceSubscriptions",
"Effect": "Allow",
"Action": [
  "aws-marketplace:ViewSubscriptions"
],
"Resource": "*"},
{"Sid": "SecretsManager",
"Effect": "Allow",
"Action": [
  "secretsmanager:CreateSecret",
  "secretsmanager:DescribeSecret",
  "secretsmanager:ListSecrets"
],
"Resource": "*"},
{"Sid": "ListAndCreateExecutionRoles",
"Effect": "Allow",
"Action": [
  "iam:ListRoles",
  "iam:CreateRole",
  "iam:CreatePolicy",
  "iam:AttachRolePolicy"
],
"Resource": "*"},
{"Sid": "PassRoleForExecutionRoles",
"Effect": "Allow",
"Action": [
  "iam:PassRole"
],
"Resource": "*",
"Condition": {
  "StringEquals": {
    "iam:PassedToService": "sagemaker.amazonaws.com"
  }
}]
]
This policy includes the following statements. You can scope down any of these statements by adding specific resources to the Resource list for that statement.

**SageMakerApis**

This statement includes sagemaker:*, which allows the user to perform all SageMaker API actions. You can reduce the scope of this policy by restricting users from performing actions that are not used to create and monitoring a labeling job.

**KmsKeysForCreateForms**

You only need to include this statement if you want to grant a user permission to list and select AWS KMS keys in the Ground Truth console to use for output data encryption. The policy above grants a user permission to list and select any key in the account in AWS KMS. To restrict the keys that a user can list and select, specify those key ARNs in Resource.

**SecretsManager**

This statement gives the user permission to describe, list, and create resources in AWS Secrets Manager required to create the labeling job.

**ListAndCreateExecutionRoles**

This statement gives a user permission to list (ListRoles) and create (CreateRole) IAM roles in your account. It also grants the user permission to create (CreatePolicy) policies and attach (AttachRolePolicy) policies to IAM entities. These are required to list, select, and if required, create an execution role in the console.
If you have already created an execution role, and want to narrow the scope of this statement so that users can only select that role in the console, specify the ARNs of the IAM roles you want the user to have permission to view in Resource and remove the actions CreateRole, CreatePolicy, and AttachRolePolicy.

**AccessAwsMarketplaceSubscriptions**

These permissions are required to view and choose vendor work teams that you are already subscribed to when creating a labeling job. To give the user permission to subscribe to vendor work teams, add the statement in Vendor Workforce Permissions (p. 474) to the policy above.

**PassRoleForExecutionRoles**

This is required to give the labeling job creator permission to preview the worker UI and verify that input data, labels, and instructions display correctly. This statement gives an IAM entity permissions to pass the IAM execution role used to create the labeling job to SageMaker to render and preview the worker UI. To narrow the scope of this policy, add the role ARN of the execution role used to create the labeling job under Resource.

**GroundTruthConsole**

- `groundtruthlabeling` – This allows a user to perform actions required to use certain features of the Ground Truth console. These include permissions to describe the labeling job status (DescribeConsoleJob), list all dataset objects in the input manifest file (ListDatasetObjects), filter the dataset if dataset sampling is selected (RunFilterOrSampleDatasetJob), and to generate input manifest files if automated data labeling is used (RunGenerateManifestByCrawlingJob). These actions are only available when using the Ground Truth console and cannot be called directly using an API.
- `lambda:InvokeFunction` and `lambda:ListFunctions` – these actions give users permission to list and invoke Lambda functions that are used to run a custom labeling workflow.
- `s3:*` – All Amazon S3 permissions included in this statement are used to view Amazon S3 buckets for automated data setup (ListAllMyBuckets), access input data in Amazon S3 (ListBucket, GetObject), check for and create a CORS policy in Amazon S3 if needed (GetBucketCors and PutBucketCors), and write labeling job output files to S3 (PutObject).
- `cognito-idp` – These permissions are used to create, view and manage a private workforce using Amazon Cognito. To learn more about these actions, refer to the Amazon Cognito API References.

**Custom Labeling Workflow Permissions**

Add the following statement to a policy similar to the one in Ground Truth Console Permissions (p. 470) to give an IAM user permission to select pre-existing pre-annotation and post-annotation Lambda functions while creating a custom labeling workflow.

```json
{
    "Sid": "GroundTruthConsoleCustomWorkflow",
    "Effect": "Allow",
    "Action": [
    "lambda:InvokeFunction",
    "lambda:ListFunctions"
    ],
    "Resource": "*"
}
```

To learn how to give an IAM entity permission to create and test pre-annotation and post-annotation Lambda functions, see Required Permissions To Use Lambda With Ground Truth.
**Private Workforce Permissions**

When added to a permissions policy, the following permission grants access to create and manage a private workforce and work team using Amazon Cognito. These permissions are not required to use an OIDC IdP workforce.

```json
{
    "Effect": "Allow",
    "Action": [
        "cognito-idp:AdminAddUserToGroup",
        "cognito-idp:AdminCreateUser",
        "cognito-idp:AdminDeleteUser",
        "cognito-idp:AdminDisableUser",
        "cognito-idp:AdminEnableUser",
        "cognito-idp:AdminRemoveUserFromGroup",
        "cognito-idp:CreateGroup",
        "cognito-idp:CreateUserPool",
        "cognito-idp:CreateUserPoolClient",
        "cognito-idp:CreateUserPoolDomain",
        "cognito-idp:DescribeUserPool",
        "cognito-idp:DescribeUserPoolClient",
        "cognito-idp:List",
        "cognito-idp:UpdateUserPool",
        "cognito-idp:UpdateUserPoolClient"
    ],
    "Resource": "*"
}
```

To learn more about creating private workforce using Amazon Cognito, see Create and Manage Amazon Cognito Workforce (p. 491).

**Vendor Workforce Permissions**

You can add the following statement to the policy in Grant IAM Permission to Use the Amazon SageMaker Ground Truth Console (p. 470) to grant an IAM entity permission to subscribe to a vendor workforce.

```json
{
    "Sid": "AccessAwsMarketplaceSubscriptions",
    "Effect": "Allow",
    "Action": [
        "aws-marketplace:Subscribe",
        "aws-marketplace:Unsubscribe",
        "aws-marketplace:ViewSubscriptions"
    ],
    "Resource": "*"
}
```

**Create a SageMaker Execution Role for a Ground Truth Labeling Job**

When you configure your labeling job, you need to provide an execution role, which is a role that SageMaker has permission to assume to start and run your labeling job.

This role must give Ground Truth permission to access the following:

- Amazon S3 to retrieve your input data and write output data to an Amazon S3 bucket. You can either grant permission for an IAM role to access an entire bucket by providing the bucket ARN, or you can grant access to the role to access specific resources in a bucket. For example, the ARN for a bucket may look similar to `arn:aws:s3:::awsexamplebucket1` and the ARN of a resource in an Amazon S3 bucket may look similar to `arn:aws:s3:::awsexamplebucket1/prefix/file-name.png`.
apply an action to all resources in an Amazon S3 bucket, you can use the wild card: *. For example, `arn:aws:s3:::awsexamplebucket1/prefix/*`. For more information, see Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

- CloudWatch to log worker metrics and labeling job statuses.
- AWS KMS for data encryption. (Optional)
- AWS Lambda for processing input and output data when you create a custom workflow.

Additionally, if you create a streaming labeling job, this role must have permission to access:

- Amazon SQS to create an interact with an SQS queue used to manage labeling requests.
- Amazon SNS to subscribe to and retrieve messages from your Amazon SNS input topic and to send messages to your Amazon SNS output topic.

All of these permissions can be granted with the AmazonSageMakerGroundTruthExecution managed policy except:

- Data and storage volume encryption of your Amazon S3 buckets. To learn how to configure these permissions, see Encrypt Output Data and Storage Volume with AWS KMS (p. 479).
- Permission to select and invoke Lambda functions that do not include GtRecipe, SageMaker, Sagemaker, sagemaker, or LabelingFunction in the function name.
- Amazon S3 buckets that do not include either GroundTruth, Groundtruth, groundtruth, SageMaker, Sagemaker, and sagemaker in the prefix or bucket name or an object tag that includes SageMaker in the name (case insensitive).

If you require more granular permissions than the ones provided in AmazonSageMakerGroundTruthExecution, use the following policy examples to create an execution role that fits your specific use case.

**Topics**

- Built-In Task Types (Non-streaming) Execution Role Requirements (p. 475)
- Built-In Task Types (Streaming) Execution Role Requirements (p. 476)
- Execution Role Requirements for Custom Task Types (p. 478)
- Automated Data Labeling Permission Requirements (p. 478)

**Built-In Task Types (Non-streaming) Execution Role Requirements**

The following policy grants permission to create a labeling job for a built-in task type. This execution policy does not include permissions for AWS KMS data encryption or decryption. Replace each red, italicized ARN with your own Amazon S3 ARNs.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "S3ViewBuckets",
            "Effect": "Allow",
            "Action": [
                "s3:ListBucket",
                "s3:GetBucketLocation"
            ],
            "Resource": [
                "arn:aws:s3:::<input-bucket-name>",
                "arn:aws:s3:::<output-bucket-name>"
            ]
        }
    ]
}
```
Built-In Task Types (Streaming) Execution Role Requirements

If you create a streaming labeling job, you must add a policy similar to the following to the execution role you use to create the labeling job. To narrow the scope of the policy, replace the * in Resource with specific AWS resources that you want to grant the IAM role permission to access and use.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:AbortMultipartUpload",
                "s3:GetObject",
                "s3:PutObject"
            ],
            "Resource": [
                "arn:aws:s3:::<input-bucket-name>/*",
                "arn:aws:s3:::<output-bucket-name>/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject"
            ],
            "Resource": "*",
            "Condition": {
                "StringEqualsIgnoreCase": {
                    "s3:ExistingObjectTag/SageMaker": "true"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:PutObject"
            ],
            "Resource": [
                "arn:aws:s3:::<input-bucket-name>/*",
                "arn:aws:s3:::<output-bucket-name>/*"
            ]
        }
    ]
}
```
"Action": [
  "s3:GetBucketLocation",
  "s3:ListBucket"
],
"Resource": [
  "arn:aws:s3::<input-bucket-name>",
  "arn:aws:s3::<output-bucket-name>
]}
}

"Sid": "CloudWatch",
"Effect": "Allow",
"Action": [
  "cloudwatch:PutMetricData",
  "logs:CreateLogStream",
  "logs:CreateLogGroup",
  "logs:DescribeLogStreams",
  "logs:PutLogEvents"
],
"Resource": "*
}

"Sid": "StreamingQueue",
"Effect": "Allow",
"Action": [
  "sqs:CreateQueue",
  "sqs:DeleteMessage",
  "sqs:GetQueueAttributes",
  "sqs:GetQueueUrl",
  "sqs:SendMessage",
  "sqs:SendMessageBatch",
  "sqs:SetQueueAttributes"
],
"Resource": "arn:aws:sqs:*::*:GroundTruth"
}

"Sid": "StreamingTopicSubscribe",
"Effect": "Allow",
"Action": "sns:Subscribe",
"Resource": [
  "arn:aws:sqs:<aws-region>:<aws-account-number>::<input-topic-name>",
  "arn:aws:sqs:<aws-region>:<aws-account-number>::<output-topic-name>
],
"Condition": {
  "StringEquals": {
    "sns:Protocol": "sqs"
  },
  "StringLike": {
    "sns:Endpoint": "arn:aws:sqs:<aws-region>:<aws-account-number>::*GroundTruth*
  }
}
},

"Sid": "StreamingTopic",
"Effect": "Allow",
"Action": ["sns:Publish"
],
"Resource": [
  "arn:aws:sqs:<aws-region>:<aws-account-number>::<input-topic-name>",
  "arn:aws:sqs:<aws-region>:<aws-account-number>::<output-topic-name>
]}
}
"Sid": "StreamingTopicUnsubscribe",
"Effect": "Allow",
"Action": [
  "sns:Unsubscribe"
],
"Resource": [
  "arn:aws:sqs:<aws-region>:<aws-account-number>:<output-topic-name>"
}
]
]]

Execution Role Requirements for Custom Task Types

If you want to create a custom labeling workflow, add the following statement to an execution role policy like the ones found in ??? (p. 475) or Built-In Task Types (Streaming) Execution Role Requirements (p. 476).

This policy gives the execution role permission to Invoke your pre-annotation and post-annotation Lambda functions.

```json
{
  "Sid": "LambdaFunctions",
  "Effect": "Allow",
  "Action": [
    "lambda:InvokeFunction"
  ],
  "Resource": [
    "arn:aws:lambda:<region>:<account-id>:function:<post-annotation-lambda-name>"
  ]
}
```

Automated Data Labeling Permission Requirements

If you want to create a labeling job with automated data labeling enabled, you must 1) add one policy to the IAM policy attached to the execution role and 2) update the trust policy of the execution role.

The following statement allows the IAM execution role to be passed to SageMaker so that it can be used to run the training and inference jobs used for active learning and automated data labeling respectively. Add this statement to an execution role policy like the ones found in ??? (p. 475) or Built-In Task Types (Streaming) Execution Role Requirements (p. 476). Replace `arn:aws:iam::<account-number>:role/<role-name>` with the execution role ARN. You can find your IAM role ARN in the IAM console under Roles.

```json
{
  "Effect": "Allow",
  "Action": [
    "iam:PassRole"
  ],
  "Resource": "arn:aws:iam::<account-number>:role/<execution-role-name>",
  "Condition": {
    "StringEquals": {
      "iam:PassedToService": [
        "sagemaker.amazonaws.com"
      ]
    }
  }
}
```
The following statement allows SageMaker to assume the execution role to create and manage the SageMaker training and inference jobs. This policy must be added to the trust relationship of the execution role. To learn how to add or modify an IAM role trust policy, see Modifying a role in the IAM User Guide.

```
{
"Version": "2012-10-17",
"Statement": {
  "Effect": "Allow",
  "Principal": {"Service": "sagemaker.amazonaws.com" },
  "Action": "sts:AssumeRole"
}
}
```

### Encrypt Output Data and Storage Volume with AWS KMS

You can use AWS Key Management Service (AWS KMS) to encrypt output data from a labeling job by specifying a customer managed key when you create the labeling job. If you use the API operation `CreateLabelingJob` to create a labeling job that uses automated data labeling, you can also use a customer managed key to encrypt the storage volume attached to the ML compute instances to run the training and inference jobs.

This section describes the IAM policies you must attach to your customer managed key to enable output data encryption and the policies you must attach to your customer managed key and execution role to use storage volume encryption. To learn more about these options, see Output Data and Storage Volume Encryption (p. 480).

#### Encrypt Output Data using KMS

If you specify an AWS KMS customer managed key to encrypt output data, you must add an IAM policy similar to the following to that key. This policy gives the IAM execution role that you use to create your labeling job permission to use this key to perform all of the actions listed in "Action". To learn more about these actions, see AWS KMS permissions in the AWS Key Management Service Developer Guide.

To use this policy, replace the IAM service-role ARN in "Principal" with the ARN of the execution role you use to create the labeling job. When you create a labeling job in the console, this is the role you specify for IAM Role under the Job overview section. When you create a labeling job using `CreateLabelingJob`, this is ARN you specify for RoleArn.

```
{
  "Sid": "AllowUseOfKmsKey",
  "Effect": "Allow",
  "Principal": {"AWS": "arn:aws:iam::111122223333:role/service-role/example-role"},
  "Action": [
    "kms:Encrypt",
    "kms:Decrypt",
    "kms:ReEncrypt*",
    "kms:GenerateDataKey*",
    "kms:DescribeKey"
  ],
  "Resource": "*"
}
```

### Encrypt Automated Data Labeling ML Compute Instance Storage Volume

If you specify a `VolumeKmsKeyId` to encrypt the storage volume attached to the ML compute instance used for automated data labeling training and inference, you must do the following:
• Attach permissions described in Encrypt Output Data using KMS (p. 479) to the customer managed key.
• Attach a policy similar to the following to the IAM execution role you use to create your labeling job. This is the IAM role you specify for RoleArn in CreateLabelingJob. To learn more about the "kms:CreateGrant" action that this policy permits, see CreateGrant in the AWS Key Management Service API Reference.

```
{
  "Version": "2012-10-17",
  "Statement":
  [
    {
      "Effect": "Allow",
      "Action": [
        "kms:CreateGrant"
      ],
      "Resource": "*"
    }
  ]
}
```

To learn more about Ground Truth storage volume encryption, see Use Your KMS Key to Encrypt Automated Data Labeling Storage Volume (API Only) (p. 481).

**Output Data and Storage Volume Encryption**

With Amazon SageMaker Ground Truth, you can label highly sensitive data, stay in control of your data, and employ security best practices. While your labeling job is running, Ground Truth encrypts data in transit and at rest. Additionally, you can use AWS Key Management Service (AWS KMS) with Ground Truth to do the following:

• Use a customer managed key to encrypt your output data.
• Use AWS KMS customer managed key with your automated data labeling job to encrypt the storage volume attached to the compute instance used for model training and inference.

Use the topics on this page to learn more about these Ground Truth security features.

**Use Your KMS Key to Encrypt Output Data**

Optionally, you can provide an AWS KMS customer managed key when you create a labeling job, which Ground Truth uses to encrypt your output data.

If you don't provide a customer managed key, Amazon SageMaker uses the default AWS managed key for Amazon S3 for your role's account to encrypt your output data.

If you provide a customer managed key, you must add the required permissions to the key described in Encrypt Output Data and Storage Volume with AWS KMS (p. 479). When you use the API operation CreateLabelingJob, you can specify your customer managed key ID using the parameter KmsKeyId.

See the following procedure to learn how to add a customer managed key when you create a labeling job using the console.

**To add an AWS KMS key to encrypt output data (console):**

1. Complete the first 7 steps in Create a Labeling Job (Console) (p. 364).
2. In step 8, select the arrow next to Additional configuration to expand this section.
3. For Encryption key, select the AWS KMS key that you want to use to encrypt output data.
4. Complete the rest of steps in Create a Labeling Job (Console) (p. 364) to create a labeling job.
Use Your KMS Key to Encrypt Automated Data Labeling Storage Volume (API Only)

When you create a labeling job with automated data labeling using the `CreateLabelingJob` API operation, you have the option to encrypt the storage volume attached to the ML compute instances that run the training and inference jobs. To add encryption to your storage volume, use the parameter `VolumeKmsKeyId` to input an AWS KMS customer managed key. For more information about this parameter, see `LabelingJobResourceConfig`.

If you specify a key ID or ARN for `VolumeKmsKeyId`, your SageMaker execution role must include permissions to call `kms:CreateGrant`. To learn how to add this permission to an execution role, see `Create a SageMaker Execution Role for a Ground Truth Labeling Job` (p. 474).

**Note**

If you specify an AWS KMS customer managed key when you create a labeling job in the console, that key is only used to encrypt your output data. It is not used to encrypt the storage volume attached to the ML compute instances used for automated data labeling.

Workforce Authentication and Restrictions

Ground Truth enables you to use your own private workforce to work on labeling jobs. A *private workforce* is an abstract concept which refers to a set of people who work for you. Each labeling job is created using a work team, composed of workers in your workforce. Ground Truth supports private workforce creation using Amazon Cognito.

A Ground Truth workforce maps to a Amazon Cognito user pool. A Ground Truth work team maps to a Amazon Cognito user group. Amazon Cognito manages the worker authentication. Amazon Cognito supports Open ID connection (OIDC) and customers can set up Amazon Cognito federation with their own identity provider (IdP).

Ground Truth only allows one workforce per account per AWS Region. Each workforce has a dedicated Ground Truth work portal login URL.

You can also restrict workers to a Classless Inter-Domain Routing (CIDR) block/IP address range. This means annotators must be on a specific network to access the annotation site. You can add up to ten CIDR blocks for one workforce. To learn more, see `Manage Private Workforce Using the Amazon SageMaker API` (p. 507).

To learn how you can create a private workforce, see `Create a Private Workforce (Amazon Cognito)` (p. 491).

Restrict Access to Workforce Types

Amazon SageMaker Ground Truth work teams fall into one of three *workforce types*: public (with Amazon Mechanical Turk), private, and vendor. To restrict IAM user access to a specific work team using one of these types or the work team ARN, use the `sagemaker:WorkteamType` and/or the `sagemaker:WorkteamArn` condition keys. For the `sagemaker:WorkteamType` condition key, use string condition operators. For the `sagemaker:WorkteamArn` condition key, use Amazon Resource Name (ARN) condition operators. If the user attempts to create a labeling job with a restricted work team, SageMaker returns an access denied error.

The policies below demonstrate different ways to use the `sagemaker:WorkteamType` and `sagemaker:WorkteamArn` condition keys with appropriate condition operators and valid condition values.

The following example uses the `sagemaker:WorkteamType` condition key with the `StringEquals` condition operator to restrict access to a public work team. It accepts condition values in the following format: `workforcetype-crowd`, where `workforcetype` can equal public, private, or vendor.

```
The following policies show how to restrict access to a public work team using the `sagemaker:WorkteamArn` condition key. The first shows how to use it with a valid IAM regex-variant of the work team ARN and the `ArnLike` condition operator. The second shows how to use it with the `ArnEquals` condition operator and the work team ARN.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "RestrictWorkteamType",
            "Effect": "Deny",
            "Action": "sagemaker:CreateLabelingJob",
            "Resource": "*",
            "Condition": {
                "ArnLike": {
                    "sagemaker:WorkteamArn": "arn:aws:sagemaker:*:*:workteam/public-crowd/*"
                }
            }
        }
    ]
}
```

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "RestrictWorkteamType",
            "Effect": "Deny",
            "Action": "sagemaker:CreateLabelingJob",
            "Resource": "*",
            "Condition": {
                "ArnEquals": {
                }
            }
        }
    ]
}
```

Monitor Labeling Job Status

To monitor the status of your labeling jobs, you can set up an Amazon CloudWatch Events (CloudWatch Events) rule for Amazon SageMaker Ground Truth (Ground Truth) to send an event to CloudWatch Events.
when a labeling job status changes to Completed, Failed, or Stopped or when a worker accepts, declines, submits, or returns a task.

Once you create a rule, you can add a target to it. CloudWatch Events uses this target to invoke another AWS service to process the event. For example, you can create a target using an Amazon Simple Notification Service (Amazon SNS) topic to send a notification to your email when a labeling job status changes.

**Prerequisites:**

To create a CloudWatch Events rule, you will need an AWS Identity and Access Management (IAM) role with an events.amazonaws.com trust policy attached. The following is an example of an events.amazonaws.com trust policy.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "",
            "Effect": "Allow",
            "Principal": {
                "Service": ["events.amazonaws.com"]
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

**Topics**

- Send Events to CloudWatch Events (p. 483)
- Set Up a Target to Process Events (p. 484)
- Labeling Job Expiration (p. 485)
- Declining Tasks (p. 485)

**Send Events to CloudWatch Events**

To configure a CloudWatch Events rule to get status updates, or events, for your Ground Truth labeling jobs, use the AWS Command Line Interface (AWS CLI) put-rule command. You can filter events that are sent to your rule by status change. For example, you can create a rule that notifies you only if a labeling job status changes to Completed. When using the put-rule command, specify the following to receive labeling job statuses:

- \"source\":\"aws.sagemaker\"
- \"detail-type\":\"SageMaker Ground Truth Labeling Job State Change\"

To configure a CloudWatch Events rule to watch for all status changes, use the following command and replace the placeholder text. For example, replace "GTLabellingJobStateChanges" with a unique CloudWatch Events rule name and "arn:aws:iam::111122223333:role/MyRoleForThisRule" with the Amazon Resource Number (ARN) of an IAM role with an events.amazonaws.com trust policy attached.

```bash
aws events put-rule --name "GTLabellingJobStateChanges"
    --event-pattern "{"source":\"aws.sagemaker\","detail-type":\"SageMaker Ground Truth Labeling Job State Change\"}"
    --role-arn "arn:aws:iam::111122223333:role/MyRoleForThisRule"
```

483
Monitor Labeling Job Status

To filter by job status, use the "detail":{"LabelingJobStatus": [{"Status"]}) syntax. Valid values for Status are Completed, Failed, and Stopped.

The following example creates a CloudWatch Events rule that notifies you when a labeling job in us-west-2 (Oregon) changes to Completed.

```bash
aws events put-rule --name "LabelingJobCompleted"
   --event-pattern "{"source":["aws.sagemaker"], "detail-type":["SageMaker Ground Truth Labeling Job State Change"], "detail":{"LabelingJobStatus": ["Completed"]}}"
   --role-arn "arn:aws:iam::111122223333:role/MyRoleForThisRule"
   --region us-west-2
```

The following example creates a CloudWatch Events rule that notifies you when a labeling job in us-east-1 (Virginia) changes to Completed or Failed.

```bash
aws events put-rule --name "LabelingJobCompletedOrFailed"
   --event-pattern "{"source":["aws.sagemaker"], "detail-type":["SageMaker Ground Truth Labeling Job State Change"], "detail":{"LabelingJobStatus": ["Completed", "Failed"]}}"
   --role-arn "arn:aws:iam::111122223333:role/MyRoleForThisRule"
   --region us-east-1
```

To learn more about the put-rule request, see Event Patterns in CloudWatch Events in the Amazon CloudWatch Events User Guide.

Set Up a Target to Process Events

After you have created a rule, events similar to the following are sent to CloudWatch Events. In this example, the labeling job test-labeling-job's status changed to Completed.

```json
{
   "version": "0",
   "id": "11e1111-11d1-111f-b111-111b11dcb11",
   "detail-type": "SageMaker Ground Truth Labeling Job State Change",
   "source": "aws.sagemaker",
   "account": "111122223333",
   "time": "2018-10-06T12:26:13Z",
   "region": "us-east-1",
   "resources": ["arn:aws:sagemaker:us-east-1:111122223333:labeling-job/test-labeling-job"],
   "detail": {"LabelingJobStatus": "Completed"}
}
```

To process events, you need to set up a target. For example, if you want to receive an email when your labeling job status changes, use a procedure in Setting Up Amazon SNS Notifications in the Amazon CloudWatch User Guide to set up an Amazon SNS topic and subscribe your email to it. Once you have create a topic, you can use it to create a target.

To add a target to your CloudWatch Events rule

1. Open the CloudWatch console: https://console.aws.amazon.com/cloudwatch/home
2. In the navigation pane, choose Rules.
3. Choose the rule that you want to add a target to.
4. Choose Actions, and then choose Edit.
5. Under Targets, choose Add Target and choose the AWS service you want to act when a labeling job status change event is detected.
6. Configure your target. For instructions, see the topic for configuring a target in the AWS documentation for that service.
7. Choose Configure details.
8. For Name, enter a name and, optionally, provide details about the purpose of the rule in Description.
9. Make sure that the check box next to State is selected so that your rule is listed as Enabled.
10. Choose Update rule.

Labeling Job Expiration

If your labeling job is not completed after 30 days, it will expire. If your labeling job expires, you can chain the job to create a new labeling job that will only send unlabeled data to workers. For more information, and to learn how to create a labeling job using chaining, see Chaining Labeling Jobs (p. 465).

Declining Tasks

Workers are able to decline tasks.

Workers decline a task if the instructions are not clear, input data is not displaying correctly, or if they encounter some other issue with the task. If the number of workers per dataset object (NumberOfHumanWorkersPerDataObject) decline the task, the data object is marked as expired and will not be sent to additional workers.

Create and Manage Workforces

A workforce is the group of workers that you have selected to label your dataset. You can choose either the Amazon Mechanical Turk workforce, a vendor-managed workforce, or you can create your own private workforce to label or review your dataset. Whichever workforce type you choose, Amazon SageMaker takes care of sending tasks to workers.

When you use a private workforce, you also create work teams, a group of workers from your workforce that are assigned to specific jobs—Amazon SageMaker Ground Truth labeling jobs or Amazon Augmented AI human review tasks. You can have multiple work teams and can assign one or more work teams to each job.

You can use Amazon Cognito or your own private OpenID Connect (OIDC) Identity Provider (IdP) to manage your private workforce and work teams. For more information about the permissions required to manage your workforce this way, see Permissions Required to Use the Amazon SageMaker Ground Truth Console (p. 2518).

Topics
- Using the Amazon Mechanical Turk Workforce (p. 485)
- Managing Vendor Workforces (p. 489)
- Use a Private Workforce (p. 490)

Using the Amazon Mechanical Turk Workforce

The Amazon Mechanical Turk (Mechanical Turk) workforce provides the most workers for your Amazon SageMaker Ground Truth labeling job and Amazon Augmented AI human review task. The Amazon
Mechanical Turk workforce is a world-wide resource. Workers are available 24 hours a day, 7 days a week. You typically get the fastest turnaround for your human review tasks and labeling jobs when you use the Amazon Mechanical Turk workforce.

Any Amazon Mechanical Turk workforce billing is handled as part of your Ground Truth or Amazon Augmented AI billing. You do not need to create a separate Mechanical Turk account to use the Amazon Mechanical Turk workforce.

**Important**
You should not share confidential information, personal information, or protected health information with this workforce. You should not use the Amazon Mechanical Turk workforce when you use Amazon A2I in conjunction with AWS HIPAA-eligible services, such as Amazon Textract and Amazon Rekognition, for workloads containing protected health information.

You can choose Mechanical Turk as your workforce when you create a Ground Truth labeling job or Amazon A2I human review workflow (flow definition). You can create a labeling job and a human review workflow using the SageMaker console and API.

When you use an API operation to create a labeling job or human review workflow, you use the following ARN for the Amazon Mechanical Turk workforce for your `WorkteamArn`. Replace `region` with the AWS Region you are using to create the labeling job or human loops. For example, if you create a labeling job in US West (Oregon), replace `region` with `us-west-2`.

Ground Truth and Amazon A2I require that your input data is free of personally identifiable information (PII) when you use Mechanical Turk. If you use the Mechanical Turk workforce and do not specify that your input data is free of PII, your Ground Truth labeling jobs and Augmented AI tasks will fail. You specify that your input data is free of PII when you create a Ground Truth labeling job and when you create a Amazon A2I human loop using a built-in integration or the `StartHumanLoop` operation.

Use the following sections to learn how to use Mechanical Turk with these services.

**Topics**
- Use Mechanical Turk with Ground Truth (p. 486)
- Use Mechanical Turk with Amazon A2I (p. 488)
- When is Mechanical Turk Not Supported? (p. 489)

**Use Mechanical Turk with Ground Truth**

You can use Mechanical Turk with Ground Truth when you create a labeling job using the console, or the `CreateLabelingJob` operation.

When you create a labeling job, we recommend you adjust the number of workers that annotate each data object based on the complexity of the job and the quality that you need. Amazon SageMaker Ground Truth uses annotation consolidation to improve the quality of the labels. More workers can make a difference in the quality of the labels for more complex labeling jobs, but might not make a difference for simpler jobs. For more information, see Consolidate Annotations (p. 458). Note that annotation consolidation is not supported for Amazon A2I human review workflows.

**To use Mechanical Turk when you create a labeling job (console):**

1. Use the following to create a labeling job using the Ground Truth area of the SageMaker console: Create a Labeling Job (Console) (p. 364).
2. When you are selecting **Worker types** in the **Workers** section, select **Amazon Mechanical Turk**.
3. Specify the total amount of time workers have to complete a task using **Task timeout**.

4. Specify the total amount of time a task remains available to workers in **Task expiration**. This is how long workers have to pick up a task before it fails.

5. Select the **Price per task** using the dropdown list. This is the amount of money a worker receives for completing a single task.

6. (Optional) If applicable, select **The dataset does not contain adult content**. SageMaker may restrict the Mechanical Turk workers that can view your task if it contains adult content.

7. You must read and confirm the following statement by selecting the check box to use the Mechanical Turk workforce. If your input data contains confidential information, personal information, or protected health information, you must select another workforce.

   **You understand and agree that the Mechanical Turk workforce consists of independent contractors located worldwide and that you should not share confidential information, personal information, or protected health information with this workforce.**

8. (Optional) Select the check box next to **Enable automated data labeling** if you want to enable automated data labeling. To learn more about this feature, see Automate Data Labeling (p. 459).

9. You can specify the **Number of workers per dataset object** under **Additional configuration**. For example, if you enter 3 in this field, each data object will be labeled by 3 workers.

When you create your labeling job by selecting **Create**, your labeling tasks are sent to Mechanical Turk workers.

**To use Mechanical Turk when you create a labeling job (API):**

1. Use the following to create a labeling job using the **CreateLabelingJob** operation: Create a Labeling Job (API) (p. 367).

2. Use the following for the **WorkteamArn**. Replace **region** with the AWS Region you are using to create the labeling job.

   ```
   arn:aws:sagemaker:region:394669845002:workteam/public-crowd/default
   ```

3. Use **TaskTimeLimitInSeconds** to specify the total amount of time workers have to complete a task.

4. Use **TaskAvailabilityLifetimeInSeconds** to specify the total amount of time a task remains available to workers. This is how long workers have to pick up a task before it fails.

5. Use **NumberOfHumanWorkersPerDataObject** to specify the number of workers per dataset object.

6. Use **PublicWorkforceTaskPrice** to set the price per task. This is the amount of money a worker receives for completing a single task.

7. Use **DataAttributes** to specify that your input data is free of confidential information, personal information, or protected health information.

   Ground Truth requires that your input data is free of personally identifiable information (PII) if you use the Mechanical Turk workforce. If you use Mechanical Turk and do not specify that your input data is free of PII using the **FreeOfPersonallyIdentifiableInformation** flag, your labeling job will fail.

   Use the **FreeOfAdultContent** flag to declare that your input data is free of adult content. SageMaker may restrict the Mechanical Turk workers that can view your task if it contains adult content.

You can see examples of how to use this API in the following notebooks, found on GitHub: **Ground Truth Jupyter Notebook Examples**. You can access these notebooks under the SageMaker Example Notebooks (p. 152) in a notebook instance.
Use Mechanical Turk with Amazon A2I

You can specify that you want to use Mechanical Turk with Amazon A2I when you create a human review workflow, also referred to as a flow definition, in the console, or with the CreateFlowDefinition API operation. When you use this human review workflow to configure human loops, you must specify that your input data is free of PII.

To use Mechanical Turk when you create a human review workflow (console):

1. Use the following to create a human review workflow in the Augmented AI section of the SageMaker console: Create a Human Review Workflow (Console) (p. 2428).
2. When you are selecting Worker types in the Workers section, select Amazon Mechanical Turk.
3. Select the Price per task using the dropdown list. This is the amount of money a worker receives for completing a single task.
4. (Optional) You can specify the Number of workers per dataset object under Additional configuration. For example, if you enter 3 in this field, each data object will be labeled by 3 workers.
5. (Optional) Specify the total amount of time workers have to complete a task using Task timeout.
6. (Optional) Specify the total amount of time a task remains available to workers in Task expiration. This is how long workers have to pick up a task before it fails.
7. Once you have created your human review workflow, you can use it to configure a human loop by providing its Amazon Resource Name (ARN) in the parameter FlowDefinitionArn. You configure a human loop using one of the API operations of a built-in task type, or the Amazon A2I runtime API operation, StartHumanLoop. To learn more, see Create and Start a Human Loop (p. 2446).

When you configure your human loop, you must specify that your input data is free of personally identifiable information (PII) using the FreeOfPersonallyIdentifiableInformation content classifier in DataAttributes. If you use Mechanical Turk and do not specify that your input data is free of PII, your human review tasks will fail.

Use the FreeOfAdultContent flag to declare that your input data is free of adult content. SageMaker may restrict the Mechanical Turk workers that can view your task if it contains adult content.

To use Mechanical Turk when you create a human review workflow (API):

1. Use the following to create a human review workflow using the CreateFlowDefinition operation: Create a Human Review Workflow (API) (p. 2430).
2. Use the following for the WorkteamArn. Replace region with the AWS Region you are using to create the labeling job.

   arn:aws:sagemaker:region:394669845002:workteam/public-crowd/default

3. Use TaskTimeLimitInSeconds to specify the total amount of time workers have to complete a task.
4. Use TaskAvailabilityLifetimeInSeconds to specify the total amount of time a task remains available to workers. This is how long workers have to pick up a task before it fails.
5. Use TaskCount to specify the number of workers per dataset object. For example, if you specify 3 for this parameter, each data object will be labeled by 3 workers.
6. Use PublicWorkforceTaskPrice to set the price per task. This is the amount of money a worker receives for completing a single task.
7. Once you have created your human review workflow, you can use it to configure a human loop by providing its Amazon Resource Name (ARN) in the parameter FlowDefinitionArn. You configure a human loop using one of the API operations of a built-in task type, or the Amazon A2I runtime API operation, StartHumanLoop. To learn more, see Create and Start a Human Loop (p. 2446).
When you configure your human loop, you must specify that your input data is free of personally identifiable information (PII) using the `FreeOfPersonallyIdentifiableInformation` content classifier in `DataAttributes`. If you use Mechanical Turk and do not specify that your input data is free of PII, your human review tasks will fail.

Use the `FreeOfAdultContent` flag to declare that your input data is free of adult content. SageMaker may restrict the Mechanical Turk workers that can view your task if it contains adult content.

You can see examples of how to use this API in the following notebooks, found on GitHub: Amazon A2I Jupyter Notebook Examples.

**When is Mechanical Turk Not Supported?**

This workforce is not supported under the following scenarios. In each scenario, you must use a private or vendor workforce.

- This workforce is not supported for Ground Truth video frame labeling jobs and 3D point cloud labeling jobs.
- You cannot use this workforce if your input data contains personally identifiable information (PII).
- Mechanical Turk is not available in some of the AWS special regions. If applicable, refer to the documentation for your special region for more information.

**Managing Vendor Workforces**

You can use a vendor-managed workforce to label your data using Amazon SageMaker Ground Truth (Ground Truth) and Amazon Augmented AI (Amazon A2I). Vendors have extensive experience in providing data labeling services for the purpose of machine learning. Vendor workforces for these two services must be created and managed separately through the Amazon SageMaker console.

Vendors make their services available via the AWS Marketplace. You can find details of the vendor's services on their detail page, such as the number of workers and the hours that they work. You can use these details to make estimates of how much the labeling job will cost and the amount of time that you can expect the job to take. Once you have chosen a vendor you subscribe to their services using the AWS Marketplace.

A subscription is an agreement between you and the vendor. The agreement spells out the details of the agreement, such as price, schedule, or refund policy. You work directly with the vendor if there are any issues with your labeling job.

You can subscribe to any number of vendors to meet your data annotation needs. When you create a labeling job or human review workflow you can specify that the job be routed to a specific vendor.

**Important**

Before you send sensitive data to a vendor, check the vendor's security and compliance practices on their detail page and review the end user license agreement (EULA) that is part of your subscription agreement. You are responsible for ensuring that the vendor meets your compliance requirements for personal or confidential information. Do not share protected health information with this workforce.

You must use the console to subscribe to a vendor workforce. Once you have a subscription, you can use the `ListSubscribedWorkteams` operation to list your subscribed vendors.

**To subscribe to a vendor workforce**

2. Choose the appropriate page in the SageMaker console.
   - For Ground Truth labeling jobs, choose **Labeling workforces**, choose Vendor, and then choose **Find data labeling services**.
   - For Amazon A2I human review workflows, choose **Human review workforces**, choose Vendor, and then choose **Find human review services**.

3. The console opens the AWS Marketplace with:
   - data labeling services category selected for Ground Truth
   - human review services category selected for Amazon A2I

   Here you see a list of the vendor services available for this service.

4. Choose a vendor. The AWS Marketplace shows detailed information about the data labeling or human review service. Use this information to determine if the vendor meets your requirements for your task.

5. If the vendor meets your requirements, choose **Continue to subscribe**.

6. Review the details of the subscription. If you agree to the terms, choose **Subscribe** to complete your subscription to the service.

**Use a Private Workforce**

A **private workforce** is a group of workers that you choose. These can be employees of your company or a group of subject matter experts from your industry. For example, if the task is to label medical images, you could create a private workforce of people knowledgeable about the images in question.

Each AWS account has access to a single private workforce per region, and the owner has the ability to create multiple **private work teams** within that workforce. A single private work team is used to complete a labeling job or human review task, or a job. You can assign each work team to a separate job or use a single team for multiple jobs. A single worker can be in more than one work team.

Your private workforce can either be created and managed using Amazon Cognito or your own private OpenID Connect (OIDC) Identity Provider (IdP).

If you are a new user of Amazon SageMaker Ground Truth or Amazon Augmented AI and do not require your workers to be managed with your own IdP, it is recommended that you use Amazon Cognito to create and manage your private workforce.

After you create a workforce, in addition to creating and managing work teams, you can do the following:

- Track worker performance
- Create and manage Amazon SNS topics to notify workers when labeling tasks are available
- Manage Private Workforce Access to Tasks Using IP Addresses

**Note**

Your private workforce is shared between Ground Truth and Amazon A2I. To create and manage private work teams used by Augmented AI, use the Ground Truth section of the SageMaker console.

**Topics**

- Create and Manage Amazon Cognito Workforce (p. 491)
- Create and Manage OIDC IdP Workforce (p. 498)
- Manage Private Workforce Using the Amazon SageMaker API (p. 507)
Create and Manage Amazon Cognito Workforce

Create and manage your private workforce using Amazon Cognito when you want to create your workforce using the Amazon SageMaker console or you don't want the overhead of managing worker credentials and authentication. When you create a private workforce with Amazon Cognito, it provides authentication, authorization, and user management for your private workers.

Topics
- Create a Private Workforce (Amazon Cognito) (p. 491)
- Manage a Private Workforce (Amazon Cognito) (p. 494)

Create a Private Workforce (Amazon Cognito)

When you use Amazon Cognito, you can create a private workforce in one of the following ways:

- Create a new workforce while you are creating your labeling job. To learn how, see Create an Amazon Cognito Workforce When Creating a Labeling Job (p. 492).
- Create a new workforce before you create your labeling job. To learn how, see Create an Amazon Cognito Workforce Using the Labeling Workforces Page (p. 492).
- Import an existing workforce after creating a user pool in the Amazon Cognito console. To learn how, see Create a Private Workforce (Amazon Cognito Console) (p. 493).

Once you create a private workforce, that workforce and all work teams and workers associated with it are available to use for all Ground Truth labeling job tasks and Amazon Augmented AI human review workflows tasks.

If you are new to Amazon SageMaker and want to test Ground Truth or Amazon A2I, we suggest that you create a private work team consisting of people from your organization using the console. Use this work team when creating labeling or human review workflows (flow definitions) to test your worker UI and job workflow.

Topics
- Create a Private Workforce (Amazon SageMaker Console) (p. 491)
- Create a Private Workforce (Amazon Cognito Console) (p. 493)

Create a Private Workforce (Amazon SageMaker Console)

You can create a private workforce in the Amazon SageMaker console in one of two ways:

- When creating a labeling job in the Labeling jobs page of the Amazon SageMaker Ground Truth section.
- Using the Labeling workforces page of the Amazon SageMaker Ground Truth section. If you are creating a private workforce for an Amazon A2I human review workflow, use this method.

Both of these methods also create a default work team containing all of the members of the workforce. This private workforce is available to use for both Ground Truth and Amazon Augmented AI jobs.

When you create a private workforce using the console, SageMaker uses Amazon Cognito as an identity provider for your workforce. If you want to use your own OpenID Connect (OIDC) Identity Provider (IdP)
to create and manage your private workforce, you must create a workforce using the SageMaker API operation CreateWorkforce. To learn more, see Create a Private Workforce (OIDC IdP) (p. 498).

Create an Amazon Cognito Workforce When Creating a Labeling Job

If you haven’t created a private workforce when you create your labeling job and you choose to use private workers, you are prompted to create a work team. This will create a private workforce using Amazon Cognito.

To create a workforce while creating a labeling job (console)

2. In the navigation pane, choose Labeling jobs and fill in all required fields. For instructions on how to start a labeling job, see Getting started (p. 190). Choose Next.
3. Choose Private for the workforce type.
4. In the Workers section, enter:
   a. The Team name.
   b. Email addresses for up to 100 workforce members. Email addresses are case sensitive. Your workers must log in using the same case used when the address was initially entered. You can add additional workforce members after the job has been created.
   c. The name of your organization. SageMaker uses this to customize the email sent to the workers.
   d. A contact email address for workers to report issues related to the task.

When you create the labeling job, an email is sent to each worker inviting them to join the workforce. After creating the workforce, you can add, delete, and disable workers using the SageMaker console or the Amazon Cognito console.

Create an Amazon Cognito Workforce Using the Labeling Workforces Page

To create and manage your private workforce using Amazon Cognito, you can use the Labeling workforces page. When following the instructions below, you have the option to create a private workforce by entering worker emails importing a pre-existing workforce from an Amazon Cognito user pool. To import a workforce, see Create a Private Workforce (Amazon Cognito Console) (p. 493).

To create a private workforce using worker emails

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the navigation pane, choose Labeling workforces.
3. Choose Private, then choose Create private team.
4. Choose Invite new workers by email.
5. Paste or type a list of up to 50 email addresses, separated by commas, into the email addresses box.
6. Enter an organization name and contact email.
7. Optionally, choose an SNS topic to which to subscribe the team so workers are notified by email when new Ground Truth labeling jobs become available. Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to receive SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.
8. Click the Create private team button.

After you import your private workforce, refresh the page. On the Private workforce summary page, you can see information about the Amazon Cognito user pool for your workforce, a list of work teams for your workforce, and a list of all of the members of your private workforce.
Note
If you delete all of your private work teams, you have to repeat this process to use a private workforce in that region.

Create a Private Workforce (Amazon Cognito Console)

Amazon Cognito is used to define and manage your private workforce and your work teams. It is a service that you can use to create identities for your workers and authenticate these identities with identity providers. A private workforce corresponds to a single Amazon Cognito user pool. Private work teams correspond to Amazon Cognito user groups within that user pool.

Example identity providers supported by Amazon Cognito:

- Social sign-in providers such as Facebook and Google
- OpenID Connect (OIDC) providers
- Security Assertion Markup Language (SAML) providers such as Active Directory
- The Amazon Cognito built-in identity provider

For more information, see What Is Amazon Cognito?.

To create a private workforce using Amazon Cognito, you must have an existing Amazon Cognito user pool containing at least one user group. See Tutorial: Creating a User Pool to learn how to create a user pool. See Adding Groups to a User Pool to learn how to add a user group to a pool.

Once your user pool has been created, follow the steps below to create a private workforce by importing that user pool into Amazon SageMaker.

To create a private workforce by importing a Amazon Cognito user pool

2. In the navigation pane, choose Labeling workforces.
3. Choose Private.
4. Choose Create private team. This creates a private workforce and a work team.
5. Choose Import workers from existing Amazon Cognito user groups.
6. Choose a user pool that you have created. User pools require a domain and an existing user group. If you get an error that the domain is missing, set it in the Domain name options on the App integration page of the Amazon Cognito console for your group.
7. Choose an app client. We recommend using a client generated by SageMaker.
8. Choose a user group from your pool to import its members.
9. Optionally choose an Amazon Simple Notification Service (Amazon SNS) topic to which to subscribe the team so that workers are notified by email when new labeling jobs become available. Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to receive SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.
10. Choose Create private team.

Important
After you create a workforce using an Amazon Cognito user pool, it should not be deleted without first deleting all work teams associated with that pool in the SageMaker console.

After you import your private workforce, refresh the page to see the Private workforce summary page. On this page, you can see information about the Amazon Cognito user pool for your workforce, a list of work teams for your workforce, and a list of all of the members of your private workforce. This workforce is now available to use in both Amazon Augmented AI and Amazon SageMaker Ground Truth for human review tasks and data labeling jobs respectively.
Manage a Private Workforce (Amazon Cognito)

After you have created a private workforce using Amazon Cognito, you can create and manage work teams using the Amazon SageMaker console and API operations.

You can do the following using either the SageMaker console or Amazon Cognito console.

- Add and delete work teams.
- Add workers to your workforce and one or more work teams.
- Disable or remove workers from your workforce and one or more workteams. If you add workers to a workforce using the Amazon Cognito console, you must use the same console to remove the worker from the workforce.

You can restrict access to tasks to workers at specific IP addresses using the SageMaker API. For more information, see Manage Private Workforce Using the Amazon SageMaker API (p. 507).

Topics
- Manage a Workforce (Amazon SageMaker Console) (p. 494)
- Manage a Private Workforce (Amazon Cognito Console) (p. 496)

Manage a Workforce (Amazon SageMaker Console)

You can use the Amazon SageMaker console to create and manage the work teams and individual workers that make up a private workforce.

Use a work team to assign members of your private workforce to a labeling or human review job. When you create your workforce using the SageMaker console, there is a work team called Everyone-in-private-workforce that enables you to assign your entire workforce to a job. Because an imported Amazon Cognito user pool may contain members that you don’t want to include in your work teams, a similar work team is not created for Amazon Cognito user pools.

You have two choices to create a new work team:

- You can create a work team in the SageMaker console and add members from your workforce to the team.
- You can create a user group by using the Amazon Cognito console and then create a work team by importing the user group. You can import more than one user group into each work team. You manage the members of the work team by updating the user group in the Amazon Cognito console. See Manage a Private Workforce (Amazon Cognito Console) (p. 496) for more information.

Create a Work Team Using the SageMaker Console

You can create a new Amazon Cognito user group or import an existing user group using the SageMaker console, on the Labeling workforces page. For more information on creating a user group in the Amazon Cognito console, see Manage a Private Workforce (Amazon Cognito Console) (p. 496).

To create a work team using the SageMaker console

2. Choose Labeling workforces from the left menu.
3. Under Private, choose Create private team.
4. Under Team details, enter a Team name. The name must be unique in your account in an AWS Region.
5. Under Add workers, choose a method to add workers to the team using a user group.
• If you chose **Create a team by adding workers to a new Amazon Cognito user group**, select the workers to add to the team.

• If you chose **Create a team by importing existing Amazon Cognito user groups**, choose the user groups that are part of the new team.

6. If you select an **SNS topic**, all workers added to the team are subscribed to the Amazon SNS topic and notified when new work items are available to the team. Select from a list of your existing Ground Truth related Amazon SNS topics or select **Create new topic** to open a topic-creation dialog.

Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to receive SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.

Workers in a workteam subscribed to a topic receive notifications when a new Ground Truth labeling job for that team becomes available and when one is about to expire.

Read [Create and manage Amazon SNS topics for your work teams (p. 509)](https://console.aws.amazon.com/sagemaker/) for more information about using Amazon SNS topic.

**Subscriptions**

After you have created a work team, you can see more information about the team and change or set the Amazon SNS topic to which its members are subscribed by visiting the Amazon Cognito console. If you added any team members before you subscribed the team to a topic, you need to manually subscribe those members to that topic. Read [Create and manage Amazon SNS topics for your work teams](https://console.aws.amazon.com/sagemaker/) for more information on creating and managing the Amazon SNS topic.

**Add or Remove Workers**

A **work team** is a group of workers within your workforce to whom you can assign jobs. A worker can be added to more than one work team. Once a worker has been added to a work team, that worker can be disabled or removed.

**Add Workers to the Workforce**

Adding a worker to the workforce enables you to add that worker to any work team within that workforce.

**To add workers using the private workforce summary page**

2. Choose **Labeling workforces** to navigate to your private workforce summary page.
3. Choose **Private**.
4. Choose **Invite new workers**.
5. Paste or type a list of email addresses, separated by commas, into the email addresses box. You can have up to 50 email addresses in this list.

**Add a Worker to a Work Team**

A worker must be added to the workforce before being added to a work team. To add a worker to a work team, first navigate to the **Private workforce summary** page using the steps above.

**To add a worker to a work team from the private workforce summary page**

1. In the **Private teams** section, choose the team to which you want to add the workers.
2. Choose the **Workers** tab.
3. Choose **Add workers to team** and choose the boxes next to the workers that you want to add.
4. Click **Add workers to team**.

**Disable and Remove a Worker from the Workforce**

Disabling a worker stops the worker from receiving a job. This action does not remove the worker from the workforce, or from any work team with which the worker is associated. To disable or remove a worker from a work team, first navigate to the private workforce summary page using the steps above.

**To deactivate a worker using the private workforce summary page**

1. In the **Workers** section, choose the worker that you would like to disable.
2. Choose **Disable**.

If desired, you can subsequently **Enable** a worker after they have been disabled.

You can remove workers from your private workforce directly in the SageMaker console if that worker was added in this console. If you added the worker (user) in the Amazon Cognito console, see Manage a Private Workforce (Amazon Cognito Console) (p. 496) to learn how to remove the worker in the Amazon Cognito console.

**To remove a worker using the private workforce summary page**

1. In the **Workers** section, choose the worker that you would like to delete.
2. If the worker has not been disabled, choose **Disable**.
3. Select the worker and choose **Delete**.

**Manage a Private Workforce (Amazon Cognito Console)**

A private workforce corresponds to a single Amazon Cognito user pool. Private work teams correspond to Amazon Cognito user groups within that user pool. Workers correspond to Amazon Cognito users within those groups.

After your workforce has been created, you can add work teams and individual workers through the Amazon Cognito console. You can also delete workers from your private workforce or remove them from individual teams in the Amazon Cognito console.

**Important**

You can’t delete work teams from the Amazon Cognito console. Deleting a Amazon Cognito user group that is associated with an Amazon SageMaker work team will result in an error. To remove work teams, use the SageMaker console.

**Create Work Teams (Amazon Cognito Console)**

You can create a new work team to complete a job by adding a Amazon Cognito user group to the user pool associated with your private workforce. To add a Amazon Cognito user group to an existing worker pool, see Adding groups to a User Pool.

**To create a work team using an existing Amazon Cognito user group**

2. In the navigation pane, choose **Workforces**.
3. For **Private teams**, choose **Create private team**.
4. Under **Team details**, give the team a name. The name must be unique in your account in an AWS Region.
5. For **Add workers**, choose **Import existing Amazon Cognito user groups**, and choose one or more user groups that are part of the new team.

6. If you choose an **SNS topic**, all workers added to the team are subscribed to the Amazon Simple Notification Service (Amazon SNS) topic and notified when new work items are available to the team. Choose from a list of your existing SNS topics related to SageMaker Ground Truth or Amazon Augmented AI or choose **Create new topic** to create one.

   **Note**
   Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to receive SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.

**Subscriptions**

After you have created a work team, you can see more information about the team and change or set the SNS topic to which its members are subscribed using the Amazon Cognito console. If you added any team members before you subscribed the team to a topic, you need to manually subscribe those members to that topic. For more information, see Create and manage Amazon SNS topics for your work teams (p. 509).

**Add and Remove Workers (Amazon Cognito Console)**

When using the Amazon Cognito console to add workers to a work team, you must add a user to the user pool associated with the workforce before adding that user to a user group. Users can be added to a user pool in various ways. For more information, see Signing Up and Confirming User Accounts.

**Add a Worker to a Work Team**

After a user has been added to a pool, the user can be associated with user groups inside of that pool. After a user has been added to a user group, that user becomes a worker on any work team created using that user group.

**To add a user to a user group**

1. Open the Amazon Cognito console: https://console.aws.amazon.com/cognito/.
2. Choose **Manage User Pools**.
3. Choose the user pool associated with your SageMaker workforce.
4. Under **General Settings**, choose **Users and Groups** and do one of the following:
   - Choose **Groups**, choose the group that you want to add the user to, and choose **Add users**. Choose the users that you want to add by choosing the plus-icon to the right of the user's name.
   - Choose **Users**, choose the user that you want to add to the user group, and choose **Add to group**. From the dropdown menu, choose the group and choose **Add to group**.

**Disable and Remove a Worker From a Work Team**

Disabling a worker stops the worker from receiving jobs. This action doesn't remove the worker from the workforce, or from any work team the worker is associated with. To remove a user from a work team in Amazon Cognito, you remove the user from the user group associated with that team.

**To deactivate a worker (Amazon Cognito console)**

1. Open the Amazon Cognito console: https://console.aws.amazon.com/cognito/.
2. Choose **Manage User Pools**.
3. Choose the user pool associated with your SageMaker workforce.
4. Under **General Settings**, choose **Users and Groups**.
5. Choose the user that you want to disable.
6. Choose **Disable User**.

You can enable a disabled user by choosing **Enable User**.

**To remove a user from a user group (Amazon Cognito console)**
1. Open the Amazon Cognito console: https://console.aws.amazon.com/cognito/.
2. Choose **Manage User Pools**.
3. Choose the user pool associated with your SageMaker workforce.
4. Under **General Settings**, choose **Users and Groups**.
5. For **User** tab, choose the X icon to the right of the group from which you want to remove the user.

**Create and Manage OIDC IdP Workforce**

Create a private workforce using an OpenID Connect (OIDC) Identity Provider (IdP) when you want to manage and authenticate your workers using your own OIDC IdP. Individual worker credentials and other data will be kept private. Ground Truth and Amazon A2I will only have visibility into worker information you provide through the claims that you send to these services. To create a workforce using an OIDC IdP, your IdP must support *groups* because Ground Truth and Amazon A2I map one or more groups in your IdP to a work team. To learn more, see **Send Required and Optional Claims to Ground Truth and Amazon A2I** (p. 499).

If you are a new user of Ground Truth or Amazon A2I, you can test your worker UI and job workflow by creating a private work team and adding yourself as a worker. Use this work team when you create a labeling job or human review workflow. First, create a private OIDC IdP workforce using the instructions in **Create a Private Workforce (OIDC IdP)** (p. 498). Next, refer to **Manage a Private Workforce (OIDC IdP)** (p. 504) to learn how to create a work team.

**Topics**
- **Create a Private Workforce (OIDC IdP)** (p. 498)
- **Manage a Private Workforce (OIDC IdP)** (p. 504)

**Create a Private Workforce (OIDC IdP)**

Create a private workforce using an OpenID Connect (OIDC) Identity Provider (IdP) when you want to authenticate and manage workers using your own identity provider. Use this page to learn how to configure your IdP to communicate with Amazon SageMaker Ground Truth (Ground Truth) or Amazon Augmented AI (Amazon A2I) and to learn how to create a workforce using your own IdP.

To create a workforce using an OIDC IdP, your IdP must support *groups* because Ground Truth and Amazon A2I use one or more groups that you specify to create work teams. You use work teams to specify workers for your labeling jobs and human review tasks. Because groups are not a standard claim, your IdP may have a different naming convention for a group of users (workers). Therefore, you must identify one or more user groups to which a worker belongs using the custom claim `sagemaker:groups` that is sent to Ground Truth or Amazon A2I from your IdP. To learn more, see **Send Required and Optional Claims to Ground Truth and Amazon A2I** (p. 499).

You create an OIDC IdP workforce using the SageMaker API operation `CreateWorkforce`. Once you create a private workforce, that workforce and all work teams and workers associated with it are available to use for all Ground Truth labeling job tasks and Amazon A2I human review workflows tasks. To learn more, see **Create an OIDC IdP Workforce** (p. 501).
Send Required and Optional Claims to Ground Truth and Amazon A2I

When you use your own IdP, Ground Truth and Amazon A2I use your Issuer, ClientId, and ClientSecret to authenticate workers by obtaining an authentication CODE from your AuthorizationEndpoint.

Ground Truth and Amazon A2I will use this CODE to obtain a custom claim from either your IdP's TokenEndpoint or UserInfoEndpoint. You can either configure TokenEndpoint to return a JSON web token (JWT) or UserInfoEndpoint to return a JSON object. The JWT or JSON object must contain required and optional claims that you specify. A claim is a key-value pair that contains information about a worker or metadata about the OIDC service. The following table lists the claims that must be included, and that can optionally be included in the JWT or JSON object that your IdP returns.

**Note**

Some of the parameters in the following table can be specified using a : or a -. For example, you can specify the groups a worker belongs to using `sagemaker:groups` or `sagemaker-groups` in your claim.

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Accepted Format and Values</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sagemaker:groups</code></td>
<td>Yes</td>
<td>Data type:</td>
<td>Assigns a worker to one or more groups. Groups are used to map the worker into work teams.</td>
<td>Example of worker that belongs to a single group: &quot;work_team1&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If a worker belongs to a single group, identify the group using a string.</td>
<td></td>
<td>Example of a worker that belongs to more than one groups: [&quot;work_team1&quot;, &quot;work_team2&quot;]</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If a worker belongs to multiple groups, use a list of up to 10 strings.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Allowable characters:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Regex: <code>[\p{L}\p{M}\p{S}\p{N}\p{P}]</code>+</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Quotas:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>10 groups per worker</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>63 characters per group name</td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>sagemaker:sub</code></td>
<td>Yes</td>
<td>Data type: String</td>
<td>This is mandatory to track a worker identity inside the Ground Truth platform for auditing and to identify tasks worked on by that worker.</td>
<td>&quot;111011101-123456789-3687056437-1111&quot;</td>
</tr>
<tr>
<td>Name</td>
<td>Required</td>
<td>Accepted Format and Values</td>
<td>Description</td>
<td>Example</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>----------</td>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------------------------------------------------</td>
</tr>
<tr>
<td>sagemaker:client_id</td>
<td>Required</td>
<td>Data type: String</td>
<td>A client ID. All tokens must be issued for this client ID.</td>
<td>&quot;00b600bb-1f00-05d0-bd00-00be00fbd0e0&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Allowable characters:</td>
<td>Regex: [\w+-]+ Quotes: 128 characters</td>
<td></td>
</tr>
<tr>
<td>sagemaker:name</td>
<td>Yes</td>
<td>Data type: String</td>
<td>The worker name to be displayed in the worker portal.</td>
<td>&quot;Jane Doe&quot;</td>
</tr>
<tr>
<td>or sagemaker-name</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>email</td>
<td>No</td>
<td>Data type: String</td>
<td>The worker email. Ground Truth uses this email to notify workers that they have been invited to work on labeling tasks. Ground Truth will also use this email to notify your workers when labeling tasks become available if you set up an Amazon SNS topic for a work team that this worker is on.</td>
<td>&quot;<a href="mailto:example-email@domain.com">example-email@domain.com</a>&quot;</td>
</tr>
<tr>
<td>email_verified</td>
<td>No</td>
<td>Data type: Bool</td>
<td>Indicates if the user email was verified or not.</td>
<td>True</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Accepted Values: True, False</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The following an example of the JSON object syntax your UserInfoEndpoint can return.

```
{
  "sub":"122",
  "exp":"10000",
  "sagemaker-groups":["group1","group2"],
  "sagemaker-name":"name",
  "sagemaker-sub":"122",
  "sagemaker-client_id":"123456"
}
```

Ground Truth or Amazon A2I compares the groups listed in sagemaker:groups or sagemaker-groups to verify that your worker belongs to the work team specified in the labeling job or human review task. After the work team has been verified, labeling or human review tasks are sent to that worker.
Create an OIDC IdP Workforce

You can create a workforce using the SageMaker API operation `CreateWorkforce` and associated language-specific SDKs. Specify a `WorkforceName` and information about your OIDC IDP in the parameter `OidcConfig`. It is recommended that you configure your OIDC with a place-holder redirect URI, and then update the URI with the worker portal URL after you create the workforce. To learn more, see Configure your OIDC IdP (p. 501).

The following shows an example of the request. See `CreateWorkforce` to learn more about each parameter in this request.

CreateWorkforceRequest: {
  #required fields
  WorkforceName: "example-oidc-workforce",
  OidcConfig: {
    ClientId: "clientId",
    ClientSecret: "secret",
    Issuer: "https://example-oidc-idp.com/adfs",
    TokenEndpoint: "https://example-oidc-idp.com/adfs/oauth2/token",
    UserInfoEndpoint: "https://example-oidc-idp.com/adfs/oauth2/userInfo",
    JwksUri: "https://example-oidc-idp.com/adfs/discovery/keys"
  },
  SourceIpConfig: {
    Cidsrs: ["string", "string"]
  }
}

Configure your OIDC IdP

How you configure your OIDC IdP depends on the IdP you use, and your business requirements.

When you configure your IdP, you must to specify a callback or redirect URI. After Ground Truth or Amazon A2I authenticates a worker, this URI will redirect the worker to the worker portal where the workers can access labeling or human review tasks. To create a worker portal URL, you need to create a workforce with your OIDC IdP details using the `CreateWorkforce` API operation. Specifically, you must configure your OIDC IdP with required custom sagemaker claims (see the next section for more details). Therefore, it is recommended that you configure your OIDC with a place-holder redirect URI, and then update the URI after you create the workforce. See Create an OIDC IdP Workforce (p. 501) to learn how to create a workforce using this API.

You can view your worker portal URL in the SageMaker Ground Truth console, or using the SageMaker API operation, `DescribeWorkforce`. The worker portal URL is in the `SubDomain` parameter in the response.

**Important**
Make sure you add the workforce subdomain to your OIDC IdP allow list. When you add the subdomain to your allow list, it must end with `/oauth2/idpresponse`.

To view your worker portal URL after creating a private workforce (Console):

2. In the navigation pane, choose Labeling workforces.
3. Select the Private tab.
4. In Private workforce summary you will see Labeling portal sign-in URL. This is your worker portal URL.

To view your worker portal URL after creating a private workforce (API):
When you create a private workforce using `CreateWorkforce`, you specify a `WorkforceName`. Use this name to call `DescribeWorkforce`. The following table includes examples of requests using the AWS CLI and AWS SDK for Python (Boto3).

**SDK for Python (Boto3)**

```python
response = client.describe_workforce(WorkforceName='string')
print(f'The workforce subdomain is: {response['SubDomain']}')
```

**AWS CLI**

```bash
# C:\> describe-workforce --workforce-name 'string'
```

**Validate Your OIC IdP Workforce Authentication Response**

After you have created your OIDC IdP workforce, you can use the following procedure to validate its authentication workflow using cURL. This procedure assumes you have access to a terminal, and that you have cURL installed.

**To validate your OIDC IdP authorization response:**

1. Get an authorization code using a URI configured as follows:

   `{AUTHORIZE ENDPOINT}?client_id={CLIENT ID}&redirect_uri={REDIRECT URI}&scope={SCOPE}&response_type=code`

   a. Replace `{AUTHORIZE ENDPOINT}` with the authorize endpoint for your OIDC IdP.
   b. Replace `{CLIENT ID}` with the Client ID from your OAuth client.
   c. Replace `{REDIRECT URI}` with the worker portal URL. If it is not already present, you must add `/oauth2/idpresponse` to the end of the URL.
   d. If you have a custom scope, use it to replace `{SCOPE}`. If you do not have a custom scope, replace `{SCOPE}` with `openid`.

   The following is an example of a URI after the modifications above are made:

   ```
   https://example.com/authorize?
   client_id=f49oa907-9bf1-4471-97aa-6bf159f81ac&redirect_uri=https%3A%2F%2Fexample.labeling.sagemaker.aws%2Foauth2%2Fidpresponse&response_type=code&scope=openid
   ```

2. Copy and paste the modified URI from step 1 into your browser and press Enter on your keyboard.
3. Authenticate using your IdP.
4. Copy the authentication code query parameter in the URI. This parameter beings with `code=`. The following is an example of what the response might look like. In this example, copy `code=MCNYDB...` and everything thereafter.

   ```
   https://example.labeling.sagemaker.aws/oauth2/idpresponse?code=MCNYDB....
   ```

5. Open a terminal and enter the following command after making required modifications listed below:

   ```
   $ curl --request POST \
   --url '{TOKEN ENDPOINT}' \
   --header 'content-type: application/x-www-form-urlencoded'
   ```

---

502
Use a Private Workforce

```bash
--data grant_type=authorization_code \
--data 'client_id={CLIENT ID}' \ 
--data client_secret={CLIENT SECRET} \ 
--data code={CODE} \ 
--data 'redirect_uri={REDIRECT URI}'
```

a. Replace `{TOKEN ENDPOINT}` with the token endpoint for your OIDC IdP.
b. Replace `{CLIENT ID}` with the Client ID from your OAuth client.
c. Replace `{CLIENT SECRET}` with the Client Secret from your OAuth client.
d. Replace `{CODE}` with the authentication code query parameter you copied in step 4.
e. Replace `{REDIRECT URI}` with the worker portal URL.

The following is an example of the cURL request after making the modifications described above:

```bash
# curl --request POST \ 
--url 'https://example.com/token' \ 
--header 'content-type: application/x-www-form-urlencoded' \ 
--data grant_type=authorization_code \ 
--data 'client_id=f490a907-9bf1-4471-97aa-6bfd159f81ac' \ 
--data client_secret=client-secret \ 
--data code=MCNYDB... \ 
--data 'redirect_uri=https://example.labeling.sagemaker.aws/oauth2/idpresponse'
```

6. This step depends on the type of `access_token` your IdP returns, a plain text access token or a JWT access token.

- If your IdP does not support JWT access tokens, `access_token` may be plain text (for example, a UUID). The response you see may look similar to the following. In this case, move to step 7.

```json
{
    "access_token":"179c144b-fccb-4d96-a28f-eea060f39c13",
    "token_type":"Bearer",
    "expires_in":3600,
    "refresh_token":null,
    "scope":null
}
```

- If your IdP supports JWT access tokens, step 5 should generate an access token in JWT format. For example, the response may look similar to the following:

```json
{
    "access_token":"eyJh...JV_adQssw5c",
    "refresh_token":null,
    "refresh_token_expires_in":null,
    "scope":null,
    "id_token":null
}
```

Copy the JWT and decode it. You can use python script or a third party website to decode it. For example, you can go to the website https://jwt.io/ and paste the JWT into the **Encoded** box to decode it.

Make sure the decoded response contains the following:

- The **Required** SageMaker claims in the table found in *Send Required and Optional Claims to Ground Truth and Amazon A2I* (p. 499). If it does not, you must reconfigure your OIDC IdP to contain these claims.
- The **Issuer** you specified when you set up the IdP workforce.
7. In a terminal and enter the following command after making required modifications listed below:

```
curl -X POST -H 'Authorization: Bearer {ACCESS TOKEN}' -d '' -k -v {USERINFO ENDPOINT}
```

a. Replace `{USERINFO ENDPOINT}` with the user info endpoint for your OIDC IdP.
b. Replace `{ACCESS TOKEN}` with the access token in the response you received in step 7. This is the entry for the "access_token" parameter.

The following is an example of the cURL request after making the modifications described above:

```
curl -X POST -H 'Authorization: Bearer eyJ0eX...' -d '' -k -v https://example.com/userinfo
```

8. The response to the final step in the procedure above may look similar to the following code block.

If the `access_token` returned in step 6 was plain text, you must verify that this response contains required information. In this case, the response must contain the **Required** SageMaker claims in the table found in Send Required and Optional Claims to Ground Truth and Amazon A2I (p. 499). For example, `sagemaker-groups`, `sagamaker-name`.

```
{
  "sub":"122",
  "exp":10000,
  "sagemaker-groups":["group1","group2"],
  "sagemaker-name":"name",
  "sagemaker-sub":"122",
  "sagemaker-client_id":"123456"
}
```

Next Steps

Once you've created a private workforce using your IdP and verified your IdP authentication response, you can create work teams using your IdP groups. To learn more, see Manage a Private Workforce (OIDC IdP) (p. 504).

You can restrict worker access to tasks to specific IP addresses, and update or delete your workforce using the SageMaker API. To learn more, see Manage Private Workforce Using the Amazon SageMaker API (p. 507).

**Manage a Private Workforce (OIDC IdP)**

Once you've created a private workforce using your OpenID Connect (OIDC) Identity Provider (IdP), you can manage your workers using your IdP. For example, you can add, remove, and group workers directly through your IdP.

To add workers to an Amazon SageMaker Ground Truth (Ground Truth) labeling job or Amazon Augmented AI (Amazon A2I) human review task, you create work teams using 1-10 IdP groups and assign that work team to the job or task. You assign a work team to a job or task by specifying that work team when you create a labeling job (Ground Truth) or a human review workflow (Amazon A2I).

You can only assign one team to each labeling job or human review workflow. You can use the same team to create multiple labeling jobs or human review tasks. You can also create multiple work teams to work on different labeling jobs or human review tasks.
Prerequisites

To create and manage private work teams using your OIDC IdP groups, first you must create a workforce using the SageMaker API operation `CreateWorkforce`. To learn more, see Create a Private Workforce (OIDC IdP) (p. 498).

Add work teams

You can use the SageMaker console to create a private work team using your OIDC IdP workforce on the Labeling workforces page under Ground Truth. If you are creating a Ground Truth labeling job, you can also create a private work team while creating a labeling job.

**Note**

You create and manage work teams for Amazon A2I in the Ground Truth area of the SageMaker console.

You can also use the SageMaker API and associated language-specific SDKs to create a private work team.

Use the following procedures to learn how to create a private work team using the SageMaker console and API.

**To create a private work team on the Labeling workforces page (console)**

2. Select Labeling workforces.
3. Select Private.
4. In the Private teams section, select Create private team.
5. In the Team details section, enter a Team name.
6. In the Add workers section, enter the name of a single user group. All workers associated with this group in your IdP are added to this work team.
7. To add more than one user group, select Add new user group and enter the names of the user groups you want to add to this work team. Enter one user group per line.
8. (Optional) For Ground Truth labeling jobs, if you provide an email for workers in your JWT, Ground Truth notifies workers when a new labeling task is available if you select an SNS topic.
9. Select Create private team.

**To create a private work team while creating a Ground Truth labeling job (console)**

2. Select Labeling jobs.
3. Use the instructions in Create a Labeling Job (Console) (p. 364) to create a labeling job. Stop when you get to the Workers section on the second page.
4. Select Private for your worker type.
5. Enter a Team name.
6. In the Add workers section, enter the name of a single user group under User groups. All workers associated with this group in your IdP are added to this work team.

**Important**

The group names you specify for User groups must match the group names specified in your OIDC IdP.

7. To add more than one user group, select Add new user group and enter the names of the user groups you want to add to this work team. Enter one user group per line.
8. Complete all remaining steps to create your labeling job.

The private team that you create is used for this labeling job, and is listed in the Labeling workforces section of the SageMaker console.

**To create a private work team using the SageMaker API**

You can create a private work team using the SageMaker API operation `CreateWorkteam`.

When you use this operation, list all user groups that you want included in the work team in the `OidcMemberDefinition` parameter `Groups`.

**Important**

The group names you specify for `Groups` must match the group names specified in your OIDC IdP.

For example, if your user group names are `group1`, `group2`, and `group3` in your OIDC IdP, configure `OidcMemberDefinition` as follows:

```json
"OidcMemberDefinition": {
  "Groups": ["group1", "group2", "group3"]
}
```

Additionally, you must give the work team a name using the `WorkteamName` parameter.

**Add or remove IdP groups from work teams**

After you've created a work team, you can use the SageMaker API to manage that work team. Use the `UpdateWorkteam` operation to update the IdP user groups included in that work team.

- Use the `WorkteamName` parameter to identify the work team that you want to update.
- When you use this operation, list all user groups that you want included in the work team in the `OidcMemberDefinition` parameter `Groups`. If a user group is associated with a work team and you do not include it in this list, that user group is no longer associated with this work team.

**Delete a work team**

You can delete a work team using the SageMaker console and SageMaker API.

**To delete a private work team in the SageMaker console**

2. Select Labeling workforces.
3. Select Private.
4. In the Private teams section, select the work team that you want to delete.
5. Select Delete.

**To delete a private work team (API)**

You can delete a private work team using the SageMaker API operation `DeleteWorkteam`.

**Manage Individual Workers**

When you create a workforce using your own OIDC IdP, you cannot use Ground Truth or Amazon A2I to manage individual workers.
• To add a worker to a work team, add that worker to a group associated with that work team.
• To remove a worker from a work team, remove that worker from all user groups associated with that work team.

**Update, Delete, and Describe Your Workforce**

You can update, delete, and describe your OIDC IdP workforce using the SageMaker API. The following is a list of API operations that you can use to manage your workforce. For additional details, including how you can locate your workforce name, see Manage Private Workforce Using the Amazon SageMaker API (p. 507).

- **UpdateWorkforce** – You may want to update a workforce created using your own OIDC IdP to specify a different authorization endpoint, token endpoint, or issuer. You can update any parameter found in OidcConfig using this operation.

  You can only update your OIDC IdP configuration when there are no work teams associated with your workforce. To learn how to delete work teams, see Delete a work team (p. 506).

- **DeleteWorkforce** – Use this operation to delete your private workforce. If you have any work teams associated with your workforce, you must delete those work teams before you delete your work force. For more information, see Delete a work team (p. 506).

- **DescribeWorkforce** – Use this operation to list private workforce information, including workforce name, Amazon Resource Name (ARN), and, if applicable, allowed IP address ranges (CIDRs).

**Manage Private Workforce Using the Amazon SageMaker API**

You can use Amazon SageMaker API operations to manage, update, and delete your private workforce. For each API operation linked on this page, you can find a list of supported language-specific SDKs and their documentation in the See Also section of the API documentation.

**Find Your Workforce Name**

Some of the SageMaker workforce-related API operations require your workforce name as input. You can see your Amazon Cognito or OIDC IdP private and vendor workforce names in an AWS Region using the ListWorkforces API operation in that AWS Region.

If you created your workforce using your own OIDC IdP, you can find your workforce name in the Ground Truth area of the SageMaker console.

**To find your workforce name in the SageMaker console**

2. Select Labeling workforces.
3. Select Private.
4. In the Private workforce summary section, locate your workforce ARN. Your workforce name is located at the end of this ARN. For example, if the ARN is arn:aws:sagemaker:us-east-2:111122223333:workforce/example-workforce, the workforce name is example-workforce.

**Restrict Worker Access to Tasks to Allowable IP Addresses**

By default, a workforce isn’t restricted to specific IP addresses. You can use the UpdateWorkforce operation to require that workers use a specific range of IP addresses (CIDRs) to access tasks. If you
specify one or more CIDRs, workers who attempt to access tasks using any IP address outside the
specified ranges are denied and will get a HTTP 204 No Content error message on the worker portal. You
can specify up to 10 CIDR values using UpdateWorkforce.

After you have restricted your workforce to one or more CIDRs, the output of UpdateWorkforce lists all
allowable CIDRs. You can also use the DescribeWorkforce operation to view all allowable CIDRs for a
workforce.

**Update OIDC Identity Provider Workforce Configuration**

You may want to update a workforce created using your own OIDC IdP to specify a different
authorization endpoint, token endpoint, or issuer. You can update any parameter found in OidcConfig
using the UpdateWorkforce operation.

**Important**
You can only update your OIDC IdP configuration when there are no work teams associated with
your workforce. You can delete a private work team using the DeleteWorkteam operation.

**Delete a Private Workforce**

You can only have one private workforce in each AWS Region. You may want to delete your private
workforce in an AWS Region when:

- You want to create a workforce using a new Amazon Cognito user pool.
- You have already created a private workforce using Amazon Cognito and you want to create a
  workforce using your own OpenID Connect (OIDC) Identity Provider (IdP).

To delete a private workforce, use the DeleteWorkforce API operation. If you have any work teams
associated with your workforce, you must delete those work teams before you delete your workforce.
You can delete a private work team using the DeleteWorkteam operation.

**Track Worker Performance**

Amazon SageMaker Ground Truth logs worker events to Amazon CloudWatch, such as when a worker
starts or submits a task. Use Amazon CloudWatch metrics to measure and track throughput across a
team or for individual workers.

**Important**
Worker event tracking is not available for Amazon Augmented AI human review workflows.

**Enable Tracking**

During the set-up process for a new work team, the permissions for Amazon CloudWatch logging of
worker events are created. Since this feature was added in August 2019, work teams created prior to that
may not have the correct permissions. If all of your work teams were created before August 2019, create
a new work team. It does not need any members and may be deleted after creation, but by creating it,
you establish the permissions and apply them to all of your work teams, regardless of when they were
created.

**Examine Logs**

After tracking is enabled, the activity of your workers is logged. Open the Amazon CloudWatch
console and choose Logs in the navigation pane. You should see a log group named /aws/sagemaker/
groundtruth/WorkerActivity.

Each completed task is represented by a log entry, which contains information about the worker, their
team, the job, when the task was accepted, and when it was submitted.
Example Log entry

```json
{
  "worker_id": "cd449a289e129409",
  "cognito_user_pool_id": "us-east-2:IpicoXXXX",
  "cognito_sub_id": "d6947aeb-0650-447a-ab5d-89db61017fd",
  "task_accepted_time": "Wed Aug 14 16:00:59 UTC 2019",
  "task_submitted_time": "Wed Aug 14 16:01:04 UTC 2019",
  "task_returned_time": "",
  "task_declined_time": "",
  "workteam_arn": "arn:aws:sagemaker:us-east-2:############:workteam/private-crowd/Sample-labeling-team",
  "labeling_job_arn": "arn:aws:sagemaker:us-east-2:############:labeling-job/metrics-demo",
  "work_requester_account_id": "############",
  "job_reference_code": "############",
  "job_type": "Private",
  "event_type": "TasksSubmitted",
  "event_timestamp": "1565798464"
}
```

A useful data point in each event is the `cognito_sub_id`. You can match that to an individual worker.

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. Under the **Ground Truth** section, choose **Workforces**.
3. Choose **Private**.
4. Choose the name of a team in the **Private teams** section.
5. In the **Team summary** section, choose the user group identified under **Amazon Cognito user group**. That will take you to the group in the Amazon Cognito console.
6. The **Group** page lists the users in the group. Choose any user's link in the **Username** column to see more information about the user, including a unique `sub ID`.

To get information about all of the team's members, use the `ListUsers` action (examples) in the Amazon Cognito API.

**Use Log Metrics**

If you don't want to write your own scripts to process and visualize the raw log information, Amazon CloudWatch metrics provide insights into worker activity for you.

**To view metrics**

2. In the navigation pane, choose **Metrics**.
3. Choose the `AWS/SageMaker/Workteam` name space, then explore the available metrics (p. 2624). For example, selecting the `Workteam` and `Workforce` metrics lets you calculate the average time per submitted task for a specific labeling job.

For more information, see Using Amazon CloudWatch Metrics.

**Create and manage Amazon SNS topics for your work teams**

Use the procedures in this topic when you want to:

- Create a topic to which you want an existing work team to subscribe.
- Create a topic before you've created a work team.
- Create or modify the work team with an API call, and specify a topic Amazon Resource Name (ARN).
If you create a work team using the console, the console provides an option to create a new topic for the team so that you don't have to perform these steps.

**Important**

The Amazon SNS feature is not supported by Amazon A2I. If you subscribe your work team to an Amazon SNS topic, workers will only receive notifications about Ground Truth labeling jobs. Workers will not receive notifications about new Amazon A2I human review tasks.

**Create the Amazon SNS topic**

The steps for creating Amazon SNS topics for work team notifications are similar to the steps in Getting Started in the Amazon SNS Developer Guide, with one significant addition—you must add an access policy so that Amazon SageMaker can publish messages to the topic on your behalf.

**To add the policy when you create the topic**

2. In Create topic, enter the name of your topic and then choose Next steps.
4. In the JSON editor, find the Resource property, which displays the topic's ARN.
5. Copy the Resource ARN value.
6. Before the final closing brace (}), add the following policy.

   ```json
   , {
     "Sid": "AwsSagemaker_SnsAccessPolicy",
     "Effect": "Allow",
     "Principal": {
       "Service": "sagemaker.amazonaws.com"
     },
     "Action": "sns:Publish",
     "Resource": "ARN of the topic you copied in the previous step"
   }
   ```
7. Create the topic.

After you create the topic, it appears in your Topics summary screen. For more information about creating topics, see Creating a Topic in the Amazon SNS Developer Guide.

**Manage worker subscriptions**

If you subscribe a work team to a topic after you've already created the work team, the individual work team members who were added to the team when the work team was created are not automatically subscribed to the topic. For information about subscribing workers' email addresses to the topic, see Subscribing an Endpoint to an Amazon SNS Topic in the Amazon SNS Developer Guide.

The only situation in which workers are automatically subscribed to your topic is when you create or import an Amazon Cognito user group at the time that you create a work team and you set up the topic subscription when you create that work team. For more information about creating and managing your workteams with Amazon Cognito, see Create Work Teams (Amazon Cognito Console) (p. 496).

**Crowd HTML Elements Reference**

Crowd HTML Elements are web components, a web standard that abstracts HTML markup, CSS, and JavaScript functionality into an HTML tag or set of tags. Amazon SageMaker provides customers with the ability to design their own custom task templates in HTML.
As a starting point, you can use a template built using Crowd HTML Elements from one of the following GitHub repositories:

- Example task UIs for Amazon SageMaker Ground Truth
- Over 60 example task UIs for Amazon Augmented AI (A2I)

These repositories include templates designed for audio, image, text, video, and other types of data labeling and annotation tasks.

For more information about how to implement custom templates in Amazon SageMaker Ground Truth, see Creating Custom Labeling Workflows (p. 328). To learn more about custom templates in Amazon Augmented AI, see Create Custom Worker Task Templates (p. 2456).

**SageMaker Crowd HTML Elements**

Following is a list of Crowd HTML Elements that make building a custom template easier and provide a familiar UI for workers. These elements are supported in Ground Truth, Augmented AI, and Mechanical Turk.

**Topics**

- crowd-alert (p. 512)
- crowd-badge (p. 513)
- crowd-button (p. 515)
- crowd-bounding-box (p. 516)
- crowd-card (p. 520)
- crowd-checkbox (p. 522)
- crowd-classifier (p. 524)
- crowd-classifier-multi-select (p. 526)
- crowd-entity-annotation (p. 528)
- crowd-fab (p. 531)
- crowd-form (p. 533)
- crowd-icon-button (p. 534)
- crowd-image-classifier (p. 535)
- crowd-image-classifier-multi-select (p. 539)
- crowd-input (p. 541)
- crowd-instance-segmentation (p. 543)
- crowd-instructions (p. 547)
- crowd-keypoint (p. 549)
- crowd-line (p. 553)
- crowd-modal (p. 556)
- crowd-polygon (p. 557)
- crowd-polyline (p. 562)
- crowd-radio-button (p. 566)
- crowd-radio-group (p. 568)
- crowd-semantic-segmentation (p. 570)
- crowd-slider (p. 573)
- crowd-tab (p. 575)
- crowd-tabs (p. 576)
• crowd-text-area (p. 578)
• crowd-toast (p. 580)
• crowd-toggle-button (p. 581)

crowd-alert

A message that alerts the worker to a current situation.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the `<crowd-alert>` element. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <div id="errorBox"></div>
  <crowd-keypoint src="{{ task.input.taskObject | grant_read_access }}"
    labels="['Item A', 'Item B', 'Item C']"
    header="Please locate the centers of each item."
    name="annotatedResult">
    <short-instructions>
      Describe your task briefly here and give examples
    </short-instructions>
    <full-instructions>
      Give additional instructions and good/bad examples here
    </full-instructions>
  </crowd-keypoint>
</crowd-form>

<script>
  var num_obj = 1;

  document.querySelector('crowd-form').onsubmit = function(e) {
    const keypoints = document.querySelector('crowd-keypoint').value.keypoints ||
    document.querySelector('crowd-keypoint')._submittableValue.keypoints;
    const labels = keypoints.map(function(p) {
      return p.label;
    });

    // 1. Make sure total number of keypoints is correct.
    var original_num_labels = document.getElementsByTagName("crowd-keypoint")
    [0].getAttribute("labels");
    original_num_labels = original_num_labels.substring(2, original_num_labels.length - 2).split("","");
    var goalNumKeypoints = num_obj*original_num_labels.length;
    if (keypoints.length != goalNumKeypoints) {
      e.preventDefault();
      errorBox.innerHTML = '<crowd-alert type="error" dismissible>You must add all keypoint
      annotations and use each label only once.</crowd-alert>';
      errorBox.scrollIntoView();
      return;
    }

    // 2. Make sure all labels are unique.
    labelCounts = {};
    for (var i = 0; i < labels.length; i++) {
      if (!labelCounts[labels[i]]) {
```
```
labelCounts[labels[i]] = 0;
}
labelCounts[labels[i]]++;
}
const goalNumSingleLabel = num_obj;

const numLabels = Object.keys(labelCounts).length;

Object.entries(labelCounts).forEach(entry => {
  if (entry[1] != goalNumSingleLabel) {
    e.preventDefault();
    errorBox.innerHTML = '<crowd-alert type="error" dismissible>You must use each label only once.</crowd-alert>';  
    errorBox.scrollIntoView();
  }
});
</script>

Attributes

The following attributes are supported by this element.

**dismissible**

A Boolean switch that, if present, allows the message to be closed by the worker.

**type**

A string that specifies the type of message to be displayed. The possible values are "info" (the default), "success", "error", and "warning".

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: none

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

**crowd-badge**

An icon that floats over the top right corner of another element to which it is attached.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a template that uses the `<crowd-badge>` element. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-image-classifier
    name="crowd-image-classifier"
    src="https://unsplash.com/photos/NLUkAA-nDdE"
    header="Choose the correct category for this image."
    categories="[Person', 'Umbrella', 'Chair', 'Dolphin']">
    <full-instructions header="Classification Instructions">
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.</p>
    </full-instructions>
    <short-instructions id="short-instructions">
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.</p>
    </short-instructions>
  </crowd-image-classifier>
</crowd-form>

## Attributes

The following attributes are supported by this element.

**for**

A string that specifies the ID of the element to which the badge is attached.

**icon**

A string that specifies the icon to be displayed in the badge. The string must be either the name of an icon from the open-source iron-icons set, which is pre-loaded, or the URL to a custom icon.

This attribute overrides the label attribute.

The following is an example of the syntax that you can use to add an iron-icon to a <crowd-badge> HTML element. Replace `icon-name` with the name of the icon you'd like to use from this Icons set.

```html
<crowd-badge icon="icon-name" for="short-instructions"/>
```

**label**

The text to display in the badge. Three characters or less is recommended because text that is too large will overflow the badge area. An icon can be displayed instead of text by setting the icon attribute.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: none

## See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
• Crowd HTML Elements Reference (p. 510)

**crowd-button**

A styled button that represents some action.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a template that uses the `<crowd-button>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-image-classifier
    name="crowd-image-classifier"
    src="https://unsplash.com/photos/NLUkAA-nDdE"
    header="Please select the correct category for this image"
    categories="['Person', 'Umbrella', 'Chair', 'Dolphin']"
  >
    <full-instructions header="Classification Instructions">
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.</p>
    </full-inSTRUCTIONS>
    <short-instructions>
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.</p>
    </short-instructions>
    <crowd-button>
      <iron-icon icon="question-answer"/>
    </crowd-button>
  </crowd-image-classifier>
</crowd-form>
```

**Attributes**

The following attributes are supported by this element.

**disabled**

A Boolean switch that, if present, displays the button as disabled and prevents clicks.

**form-action**

A switch that either submits its parent `<crowd-form>` element, if set to "submit", or resets its parent `<crowd-form>` element, if set to "reset".

**href**

The URL to an online resource. Use this property if you need a link styled as a button.

**icon**

A string that specifies the icon to be displayed next to the button's text. The string must be the name of an icon from the open-source `iron-icons` set, which is pre-loaded. For example, to insert the `search` iron-icon, use the following:

```html
<crowd-button>
  ...
</crowd-button>
```
The icon is positioned to either the left or the right of the text, as specified by the icon-align attribute.

To use a custom icon see icon-url.

icon-align
The left or right position of the icon relative to the button's text. The default is "left".

icon-url
A URL to a custom image for the icon. A custom image can be used in place of a standard icon that is specified by the icon attribute.

loading
A Boolean switch that, if present, displays the button as being in a loading state. This attribute has precedence over the disabled attribute if both attributes are present.

target
When you use the href attribute to make the button act as a hyperlink to a specific URL, the target attribute optionally targets a frame or window where the linked URL should load.

variant
The general style of the button. Use "primary" for primary buttons, "normal" for secondary buttons, "link" for tertiary buttons, or "icon" to display only the icon without text.

Element Hierarchy
This element has the following parent and child elements.

- Parent elements: crowd-form (p. 533)
- Child elements: none

See Also
For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

crowd-bounding-box
A widget for drawing rectangles on an image and assigning a label to the portion of the image that is enclosed in each rectangle.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the <crowd-bounding-box> element. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template. For more examples, see this GitHub repository.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
```
<crowd-form>
  <crowd-bounding-box
    name="annotatedResult"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="Draw bounding boxes around all the cats and dogs in this image"
    labels="['Cat', 'Dog']"
  >
    <full-instructions header="Bounding Box Instructions">
      <p>Use the bounding box tool to draw boxes around the requested target of interest:</p>
      <ol>
        <li>Draw a rectangle using your mouse over each instance of the target.</li>
        <li>Make sure the box does not cut into the target, leave a 2 - 3 pixel margin.</li>
        <li>When targets are overlapping, draw a box around each object, include all contiguous parts of the target in the box. Do not include parts that are completely overlapped by another object.</li>
        <li>Do not include parts of the target that cannot be seen, even though you think you can interpolate the whole shape of the target.</li>
        <li>Avoid shadows, they're not considered as a part of the target.</li>
        <li>If the target goes off the screen, label up to the edge of the image.</li>
      </ol>
    </full-instructions>
    <short-instructions>
      Draw boxes around the requested target of interest.
    </short-instructions>
  </crowd-bounding-box>
</crowd-form>

Attributes

The following attributes are supported by this element.

header

The text to display above the image. This is typically a question or simple instruction for the worker.

initial-value

An array of JSON objects, each of which sets a bounding box when the component is loaded. Each JSON object in the array contains the following properties. Bounding boxes set via the initial-value property can be adjusted and whether or not a worker answer was adjusted is tracked via an initialValueModified boolean in the worker answer output.

- **height** – The height of the box in pixels.
- **label** – The text assigned to the box as part of the labeling task. This text must match one of the labels defined in the labels attribute of the <crowd-bounding-box> element.
- **left** – Distance of the top-left corner of the box from the left side of the image, measured in pixels.
- **top** – Distance of the top-left corner of the box from the top of the image, measured in pixels.
- **width** – The width of the box in pixels.

You can extract the bounding box initial value from a manifest file of a previous job in a custom template using the Liquid templating language:

```liquid
initial-value="["
{% for box in task.input.manifestLine.label-attribute-name-from-prior-job.annotations %}
    {% capture class_id %}{{ box.class_id }}{% endcapture %}
    {% assign label = task.input.manifestLine.label-attribute-name-from-prior-job-class-map[class_id] %}
    {
        label: {{label | to_json}},
        left: {{box.left}},
        top: {{box.top}},
        width: {{box.width}},
        height: {{box.height}},
    },
{% endfor %}
"

labels
A JSON formatted array of strings, each of which is a label that a worker can assign to the image portion enclosed by a rectangle. **Limit:** 10 labels.

name
The name of this widget. It's used as a key for the widget's input in the form output.

src
The URL of the image on which to draw bounding boxes.

**Element Hierarchy**
This element has the following parent and child elements.

- **Parent elements:** crowd-form (p. 533)
- **Child elements:** full-instructions (p. 518), short-instructions (p. 518)

**Regions**
The following regions are required by this element.

full-instructions
General instructions about how to draw bounding boxes.

short-instructions
Important task-specific instructions that are displayed in a prominent place.

**Output**
The following output is supported by this element.

boundingBoxes
An array of JSON objects, each of which specifies a bounding box that has been created by the worker. Each JSON object in the array contains the following properties.

- **height** – The height of the box in pixels.
• **label** – The text assigned to the box as part of the labeling task. This text must match one of the labels defined in the `labels` attribute of the `<crowd-bounding-box>` element.
• **left** – Distance of the top-left corner of the box from the left side of the image, measured in pixels.
• **top** – Distance of the top-left corner of the box from the top of the image, measured in pixels.
• **width** – The width of the box in pixels.

**inputImageProperties**
A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.
• **height** – The height, in pixels, of the image.
• **width** – The width, in pixels, of the image.

**Example: Sample Element Outputs**
The following are samples of outputs from common use scenarios for this element.

**Single Label, Single Box / Multiple Label, Single Box**

```
[  
  {  
    "annotatedResult": {  
      "boundingBoxes": [  
        {  
          "height": 401,  
          "label": "Dog",  
          "left": 243,  
          "top": 117,  
          "width": 187  
        },  
      ],  
      "inputImageProperties": {  
        "height": 533,  
        "width": 800  
      }  
    }  
  }  
]
```

**Single Label, Multiple Box**

```
[  
  {  
    "annotatedResult": {  
      "boundingBoxes": [  
        {  
          "height": 401,  
          "label": "Dog",  
          "left": 243,  
          "top": 117,  
          "width": 187  
        },  
        {  
          "height": 283,  
          "label": "Dog",  
          "left": 684,  
          "top": 120,  
          "width": 116  
        }  
      ]  
    }  
  }  
]
```
Multiple Label, Multiple Box

```json
[
  {
    "annotatedResult": {
      "boundingBoxes": [
        {
          "height": 395,
          "label": "Dog",
          "left": 241,
          "top": 125,
          "width": 158
        },
        {
          "height": 298,
          "label": "Cat",
          "left": 699,
          "top": 116,
          "width": 101
        }
      ],
      "inputImageProperties": {
        "height": 533,
        "width": 800
      }
    }
  }
]
```

You could have many labels available, but only the ones that are used appear in the output.

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

**crowd-card**

A box with an elevated appearance for displaying information.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a template designed for sentiment analysis tasks that uses the `<crowd-card>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
```
<style>
  h3 {
    margin-top: 0;
  }

  crowd-card {
    width: 100%;
  }

  .card {
    margin: 10px;
  }

  .left {
    width: 70%;
    margin-right: 10px;
    display: inline-block;
    height: 200px;
  }

  .right {
    width: 20%;
    height: 200px;
    display: inline-block;
  }
</style>

<crowd-form>
  <short-instructions>
    Your short instructions here.
  </short-instructions>

  <full-instructions>
    Your full instructions here.
  </full-instructions>

  <div class="left">
    <h3>What sentiment does this text convey?</h3>
    <crowd-card>
      <div class="card">
        Nothing is great.
      </div>
    </crowd-card>
  </div>

  <div class="right">
    <h3>Select an option</h3>
    <select name="sentiment1" style="font-size: large" required>
      <option value="">(Please select)</option>
      <option>Negative</option>
      <option>Neutral</option>
      <option>Positive</option>
      <option>Text is empty</option>
    </select>
  </div>

  <div class="left">
    <h3>What sentiment does this text convey?</h3>
    <crowd-card>
      <div class="card">
        Everything is great!
      </div>
    </crowd-card>
  </div>
</crowd-form>
<div class="right">
<h3>Select an option</h3>
<select name="sentiment2" style="font-size: large" required>
  <option value="">(Please select)</option>
  <option>Negative</option>
  <option>Neutral</option>
  <option>Positive</option>
  <option>Text is empty</option>
</select>
</div>
</crowd-form>

Attributes

The following attributes are supported by this element.

**heading**

The text displayed at the top of the box.

**image**

A URL to an image to be displayed within the box.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: none

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

crowd-checkbox

A UI component that can be checked or unchecked allowing a user to select multiple options from a set.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the `<crowd-checkbox>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <p>Find the official website for: <strong>{{ task.input.company }}</strong></p>
  <p>Do not give Yelp pages, LinkedIn pages, etc.</p>
  <p>Include the http:// prefix from the website</p>
  <crowd-input name="website" placeholder="http://example.com"></crowd-input>
</crowd-form>
```
Attributes

The following attributes are supported by this element.

**checked**

A Boolean switch that, if present, displays the check box as checked.

The following is an example of the syntax used to check a checkbox by default.

```html
<crowd-checkbox name="checkedBox" value="checked" checked>This box is checked</crowd-checkbox>
```

**disabled**

A Boolean switch that, if present, displays the check box as disabled and prevents it from being checked.

The following is an example of the syntax used to disable a checkbox.

```html
<crowd-checkbox name="disabledCheckBox" value="Disabled" disabled>Cannot be selected</crowd-checkbox>
```

**name**

A string that is used to identify the answer submitted by the worker. This value will match a key in the JSON object that specifies the answer.

**required**

A Boolean switch that, if present, requires the worker to provide input.

The following is an example of the syntax used to require a checkbox be selected.

```html
<crowd-checkbox name="work_verified" required>Instructions were clear</crowd-checkbox>
```

**value**

A string used as the name for the check box state in the output. Defaults to "on" if not specified.

**Element Hierarchy**

This element has the following parent and child elements.

- Parent elements: crowd-form (p. 533)
- Child elements: none

**Output**

Provides a JSON object. The name string is the object name and the value string is the property name for a Boolean value based on the check box state; true if checked, false if not checked.
Example: Sample Element Outputs

Using the same `name` value for multiple boxes.

```html
<!-- INPUT -->
<div><crowd-checkbox name="image_attributes" value="blurry"> Blurry </crowd-checkbox></div>
<div><crowd-checkbox name="image_attributes" value="dim"> Too Dim </crowd-checkbox></div>
<div><crowd-checkbox name="image_attributes" value="exposed"> Too Bright </crowd-checkbox></div>

//Output with "blurry" and "dim" checked
[
  {
    "image_attributes": {
      "blurry": true,
      "dim": true,
      "exposed": false
    }
  }
]
```

Note that all three color values are properties of a single object.

Using different `name` values for each box.

```html
<!-- INPUT -->
<div><crowd-checkbox name="Stop" value="Red"> Red </crowd-checkbox></div>
<div><crowd-checkbox name="Slow" value="Yellow"> Yellow </crowd-checkbox></div>
<div><crowd-checkbox name="Go" value="Green"> Green </crowd-checkbox></div>

//Output with "Red" checked
[
  {
    "Go": {
      "Green": false
    },
    "Slow": {
      "Yellow": false
    },
    "Stop": {
      "Red": true
    }
  }
]
```

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

**crowd-classifier**

A widget for classifying non-image content, such as audio, video, or text.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.
The following is an example of an HTML worker task template built using `crowd-classifier`. This example uses the Liquid template language to automate:

- Label categories in the `categories` parameter
- The objects that are being classified in the `classification-target` parameter.

Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-classifier
    name="category"
    categories="{{ task.input.labels | to_json | escape }}"
    header="What type of a document is this?"
  >
    <classification-target>
      <iframe style="width: 100%; height: 600px;" src="{{ task.input.taskObject | grant_read_access }}" type="application/pdf"></iframe>
    </classification-target>
    <full-instructions header="Document Classification Instructions">
      <p>Read the task carefully and inspect the document.</p>
      <p>Choose the appropriate label that best suits the document.</p>
    </full-instructions>
    <short-instructions>
      Please choose the correct category for the document
    </short-instructions>
  </crowd-classifier>
</crowd-form>
```

**Attributes**

The following attributes are supported by this element.

- **categories**
  A JSON formatted array of strings, each of which is a category that a worker can assign to the text. You should include "other" as a category, otherwise the worker may not be able to provide an answer.

- **header**
  The text to display above the image. This is typically a question or simple instruction for the worker.

- **name**
  The name of this widget. It is used as a key for the widget's input in the form output.

**Element Hierarchy**

This element has the following parent and child elements.

- **Parent elements**: `crowd-form` (p. 533)
- **Child elements**: `classification-target` (p. 526), `full-instructions` (p. 526), `short-instructions` (p. 526)

**Regions**

The following regions are supported by this element.
classification-target

The content to be classified by the worker. This can be plain text or HTML. Examples of how the HTML can be used include but are not limited to embedding a video or audio player, embedding a PDF, or performing a comparison of two or more images.

full-instructions

General instructions about how to do text classification.

short-instructions

Important task-specific instructions that are displayed in a prominent place.

Output

The output of this element is an object using the specified name value as a property name, and a string from the categories as the property's value.

Example : Sample Element Outputs

The following is a sample of output from this element.

```
[
  {
    "<name>": {
      "label": "<value>"
    }
  }
]
```

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

crowd-classifier-multi-select

A widget for classifying various forms of content—such as audio, video, or text—into one or more categories. The content to classify is referred to as an object.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of an HTML worker task template built using this element. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<form>
  <crowd-classifier-multi-select name="category"
                               categories="['Positive', 'Negative', 'Neutral']"
                               header="Select the relevant categories"
                               exclusion-category="{ text: 'None of the above' }"
  >
    <classification-target>
```

Attributes

The following attributes are supported by the `crowd-classifier-multi-select` element. Each attribute accepts a string value or string values.

**categories**

Required. A JSON-formatted array of strings, each of which is a category that a worker can assign to the object.

**header**

Required. The text to display above the image. This is typically a question or simple instruction for workers.

**name**

Required. The name of this widget. In the form output, the name is used as a key for the widget’s input.

**exclusion-category**

Optional. A JSON-formatted string with the following format: "{ text: '\default-value' }". This attribute sets a default value that workers can choose if none of the labels applies to the object shown in the worker UI.

Element Hierarchy

This element has the following parent and child elements:

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: classification-target (p. 526), full-instructions (p. 526), short-instructions (p. 526)

Regions

This element uses the following regions.

**classification-target**

The content to be classified by the worker. Content can be plain text or an object that you specify in the template using HTML. For example, you can use HTML elements to include a video or audio player, embedding a PDF file, or include a comparison of two or more images.
**full-instructions**

General instructions about how to classify text.

**short-instructions**

Important task-specific instructions. These instructions are displayed prominently.

**Output**

The output of this element is an object that uses the specified name value as a property name, and a string from categories as the property's value.

**Example : Sample Element Outputs**

The following is a sample of output from this element.

```json
[{
  "<name>": {
    labels: ["label_a", "label_b"]
  }
}]
```

**See Also**

For more information, see the following:

- Text Classification (Multi-label) (p. 222)
- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

---

### crowd-entity-annotation

A widget for labeling words, phrases, or character strings within a longer text. Workers select a label, and highlight the text that the label applies to.

**Important: Self-contained Widget**

Do not use `<crowd-entity-annotation>` element with the `<crowd-form>` element. It contains its own form submission logic and Submit button.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](https://codepen.io).

The following is an example of a template that uses the `<crowd-entity-annotation>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-entity-annotation
  name="crowd-entity-annotation"
  header="Highlight parts of the text below"
  labels="[{ 'label': 'person', 'shortDisplayName': 'per', 'fullDisplayName': 'Person' },
  { 'label': 'date', 'shortDisplayName': 'dat', 'fullDisplayName': 'Date' },
  { 'label': 'company', 'shortDisplayName': 'com', 'fullDisplayName': 'Company' }]
  text="Amazon SageMaker Ground Truth helps you build highly accurate training datasets for machine learning quickly."
```
<full-instructions header="Named entity recognition instructions">
<ol>
<li><strong>Read</strong> the text carefully.</li>
<li><strong>Highlight</strong> words, phrases, or sections of the text.</li>
<li><strong>Choose</strong> the label that best matches what you have highlighted.</li>
<li>To <strong>change</strong> a label, choose highlighted text and select a new label.</li>
<li>To <strong>remove</strong> a label from highlighted text, choose the X next to the abbreviated label name on the highlighted text.</li>
<li>You can select all of a previously highlighted text, but not a portion of it.</li>
</ol>
</full-instructions>
<short-instructions>
Apply labels to words or phrases.
</short-instructions>
<additionalQuestions style="margin-top: 20px">
<h3>What is the overall subject of this text?</h3>
</additionalQuestions>
<script>
document.addEventListener('all-crowd-elements-ready', () => {
    document.querySelector('crowd-entity-annotation').shadowRoot.querySelector('crowd-form').form.appendChild(additionalQuestions);
});
</script>

Attributes

The following attributes are supported by this element.

header

The text to display above the image. This is typically a question or simple instruction for the worker.

initial-value

A JSON formatted array of objects, each of which defines an annotation to apply to the text at initialization. Objects contain a label value that matches one in the labels attribute, an integer startOffset value for labeled span's starting unicode offset, and an integer endOffset value for the ending unicode offset.

Example

```
[
  { label: 'person',
```
labels

A JSON formatted array of objects, each of which contains:

- **label** (required): The name used to identify entities.
- **fullDisplayName** (optional): Used for the label list in the task widget. Defaults to the label value if not specified.
- **shortDisplayName** (optional): An abbreviation of 3-4 letters to display above selected entities. Defaults to the label value if not specified.

  **shortDisplayName is highly recommended**

Values displayed above the selections can overlap and create difficulty managing labeled entities in the workspace. Providing a 3-4 character shortDisplayName for each label is highly recommended to prevent overlap and keep the workspace manageable for your workers.

Example

```
[
  {
    label: 'person',
    shortDisplayName: 'per',
    fullDisplayName: 'person'
  }
]
```

name

Serves as the widget's name in the DOM. It is also used as the label attribute name in form output and the output manifest.

text

The text to be annotated. The templating system escapes quotes and HTML strings by default. If your code is already escaped or partially escaped, see Variable filters (p. 333) for more ways to control escaping.

Element Hierarchy

This element has the following parent and child elements.

- **Child elements**: full-instructions (p. 530), short-instructions (p. 531)

Regions

The following regions are supported by this element.

full-instructions

General instructions about how to work with the widget.
short-instructions

Important task-specific instructions that are displayed in a prominent place.

Output

The following output is supported by this element.

entities

A JSON object that specifies the start, end, and label of an annotation. This object contains the following properties.

- **label** – The assigned label.
- **startOffset** – The Unicode offset of the beginning of the selected text.
- **endOffset** – The Unicode offset of the first character after the selection.

Example : Sample Element Outputs

The following is a sample of the output from this element.

```json
{
    "myAnnotatedResult": {
        "entities": [
            {
                "endOffset": 54,
                "label": "person",
                "startOffset": 47
            },
            {
                "endOffset": 97,
                "label": "event",
                "startOffset": 93
            },
            {
                "endOffset": 219,
                "label": "date",
                "startOffset": 212
            },
            {
                "endOffset": 271,
                "label": "location",
                "startOffset": 260
            }
        ]
    }
}
```

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

crowd-fab

A floating button with an image in its center.
See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template designed for image classification that uses the `<crowd-fab>` element. This template uses JavaScript to enable workers to report issues with the worker UI. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-image-classifier
    src="${image_url}"
    categories="['Cat', 'Dog', 'Bird', 'None of the Above']"
    name="category">

    <short-instructions>
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.</p>
      <p>If there is an issue with the image or tools, please select <b>None of the Above</b>, describe the issue in the text box and click the button below.</p>
      <crowd-input label="Report an Issue" name="template-issues"></crowd-input>
  </short-instructions>

  <full-instructions header="Classification Instructions">
    <p>Read the task carefully and inspect the image.</p>
    <p>Choose the appropriate label that best suits the image. Use the <b>None of the Above</b> option if none of the other labels suit the image.</p>
  </full-instructions>

  <crowd-fab id="button1" icon="report-problem" title="Issue"/>

</crowd-image-classifier>
</crowd-form>

<script>
[ button1, ].forEach(function(button) {
  button.addEventListener('click', function() {
    document.querySelector('crowd-form').submit();
  });
});
</script>

**Attributes**

The following attributes are supported by this element.

**disabled**

A Boolean switch that, if present, displays the floating button as disabled and prevents clicks.

**icon**

A string that specifies the icon to be displayed in the center of the button. The string must be either the name of an icon from the open-source `iron-icons` set, which is pre-loaded, or the URL to a custom icon.

The following is an example of the syntax that you can use to add an iron-icon to a `<crowd-fab>` HTML element. Replace `icon-name` with the name of the icon you'd like to use from this `Icons set`.

532
<crowd-fab id="button1" icon="icon-name" title="Issue"/>

**label**

A string consisting of a single character that can be used instead of an icon. Emojis or multiple characters may result in the button displaying an ellipsis instead.

**title**

A string that will display as a tool tip when the mouse hovers over the button.

### Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** crowd-form (p. 533)
- **Child elements:** none

### See Also

For more information, see the following.

- [Use Amazon SageMaker Ground Truth to Label Data](p. 189)
- [Crowd HTML Elements Reference](p. 510)

### crowd-form

The form wrapper for all custom tasks. Sets and implements important actions for the proper submission of your form data.

If a crowd-button (p. 515) of type "submit" is not included inside the `<crowd-form>` element, it will automatically be appended within the `<crowd-form>` element.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](https://codepen.io).

The following is an example of an image classification template that uses the `<crowd-form>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-image-classifier
    src="${image_url}"
    categories="['Cat', 'Dog', 'Bird', 'None of the Above']"
    header="Choose the correct category for the image"
    name="category">

    <short-instructions>
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.</p>
    </short-instructions>

    <full-instructions header="Classification Instructions">
      <p>Read the task carefully and inspect the image.</p>
    </full-instructions>

  </crowd-image-classifier>
</crowd-form>
```
Choose the appropriate label that best suits the image.
Use the <b>None of the Above</b> option if none of the other labels suit the image.
</full-instructions></crowd-image-classifier></crowd-form>

Element Hierarchy
This element has the following parent and child elements.

- **Parent elements**: none
- **Child elements**: Any of the UI Template (p. 510) elements

Element Events
The crowd-form element extends the standard HTML form element and inherits its events, such as onclick and onsubmit.

See Also
For more information, see the following.

- **Use Amazon SageMaker Ground Truth to Label Data (p. 189)**
- **Crowd HTML Elements Reference (p. 510)**

crowd-icon-button
A button with an image placed in the center. When the user touches the button, a ripple effect emanates from the center of the button.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template designed for image classification that uses the <crowd-icon-button> element. This template uses JavaScript to enable workers to report issues with the worker UI. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-image-classifier
    src="${image_url}"
    categories="['Cat', 'Dog', 'Bird', 'None of the Above']"
    header="Choose the correct category for the image"
    name="category">
</crowd-image-classifier>

  <short-instructions>
    <p>Read the task carefully and inspect the image.</p>
    <p>Choose the appropriate label that best suits the image.</p>
    <p>If there is an issue with the image or tools, please select</p>
    <b>None of the Above</b>, describe the issue in the text box and click the button below.</p>
    <crowd-input label="Report an Issue" name="template-issues"/>
    <crowd-icon-button id="button1" icon="report-problem" title="Issue"/>
  </short-instructions>
</crowd-form>
```
Attributes

The following attributes are supported by this element.

**disabled**

A Boolean switch that, if present, displays the button as disabled and prevents clicks.

**icon**

A string that specifies the icon to be displayed in the center of the button. The string must be either the name of an icon from the open-source iron-icons set, which is pre-loaded, or the URL to a custom icon.

The following is an example of the syntax that you can use to add an iron-icon to a `<crowd-icon-button>` HTML element. Replace `icon-name` with the name of the icon you'd like to use from this Icons set.

```html
<crowd-icon-button id="button1" icon="icon-name" title="Issue"/>
```

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: none

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

**crowd-image-classifier**

A widget for classifying an image. Use one of the following supported image formats: APNG, BMP, GIF, ICO, JPEG, PNG, SVG. Images do not have a size limit.
See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of an image classification template that uses the `<crowd-image-classifier>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-image-classifier
    src="${image_url}"
    categories="['Cat', 'Dog', 'Bird', 'None of the Above']"
    header="Choose the correct category for the image"
    name="category">

    <short-instructions>
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.</p>
    </short-instructions>

    <full-instructions header="Classification Instructions">
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image. Use the <b>None of the Above</b> option if none of the other labels suit the image.</p>
    </full-instructions>

  </crowd-image-classifier>
</crowd-form>
```

**Attributes**

The following attributes are required by this element.

- **categories**
  A JSON formatted array of strings, each of which is a category that a worker can assign to the image. You should include “other” as a category, so that the worker can provide an answer. You can specify up to 10 categories.

- **header**
  The text to display above the image. This is typically a question or simple instruction for the worker.

- **name**
  The name of this widget. It is used as a key for the widget's input in the form output.

- **overlay**
  Information to be overlaid on the source image. This is for verification workflows of bounding-box, semantic-segmentation, and instance-segmentation tasks.

It is a JSON object containing an object with the name of the task-type in camelCase as the key. That key's value is an object that contains the labels and other necessary information from the previous task.

An example of a `crowd-image-classifier` element with attributes for verifying a bounding-box task follows:

```html
<crowd-image-classifier
```
name="boundingBoxClassification"
header="Rate the quality of the annotations based on the background section in the instructions on the left hand side."
src="https://i.imgur.com/CIPKVJo.jpg"
categories="[good', 'bad', 'okay']"
overlay='{
  "boundingBox": {
    labels: ["bird", "cat"],
    value: [
      {
        height: 284,
        label: "bird",
        left: 230,
        top: 974,
        width: 223
      },
      {
        height: 69,
        label: "bird",
        left: 79,
        top: 889,
        width: 247
      }
    ]
  }
}
> ... </crowd-image-classifier>

A semantic segmentation verification task would use the overlay value as follows:

<crowd-image-classifier
name='crowd-image-classifier'
categories='["good", "bad"]'
src='URL of image to be classified'
header='Please classify'
overlays='{
  "semanticSegmentation": {
    "labels": ["Cat", "Dog", "Bird", "Cow"],
    "labelMappings": {
      "Bird": {
        "color": "#ff7f0e"
      },
      "Cat": {
        "color": "#2ca02c"
      },
      "Cow": {
        "color": "#d62728"
      },
      "Dog": {
        "color": "#2acf59"
      }
    },
    "src": "URL of overlay image",
  }
}
> ... </crowd-image-classifier>

An instance-segmentation task would use the overlay value as follows:

<crowd-image-classifier
name='crowd-image-classifier'
categories='["good", "bad"]'
src='URL of image to be classified'
header='Please classify instances of each category'
overlay={
  "instanceSegmentation": {
    "labels": ["Cat", "Dog", "Bird", "Cow"],
    "instances": [
      {
        "color": "#2ca02c",
        "label": "Cat"
      },
      {
        "color": "#1f77b4",
        "label": "Cat"
      },
      {
        "color": "#d62728",
        "label": "Dog"
      }
    ],
    "src": "URL of overlay image",
  }
}

src
The URL of the image to be classified.

**Element Hierarchy**

This element has the following parent and child elements.

- **Parent elements:** crowd-form (p. 533)
- **Child elements:** full-instructions (p. 538), short-instructions (p. 538), worker-comment (p. 538)

**Regions**

The following regions are used by this element.

- **full-instructions**
  General instructions for the worker on how to classify an image.

- **short-instructions**
  Important task-specific instructions that are displayed in a prominent place.

- **worker-comment**
  Use this in verification workflows when you need workers to explain why they made the choice they did. Use the text between the opening and closing tags to provide instructions for workers on what information should be included in the comment.

It uses the following attributes:

- **header**
  A phrase with a call to action for leaving a comment. Used as the title text for a modal window where the comment is added.

  Optional. Defaults to "Add a comment."
link-text
This text appears below the categories in the widget. When clicked, it opens a modal window where the
worker may add a comment.

Optional. Defaults to "Add a comment."

placeholder
An example text in the comment text area that is overwritten when worker begins to type. This does not
appear in output if the worker leaves the field blank.

Optional. Defaults to blank.

Output
The output of this element is a string that specifies one of the values defined in the categories attribute
of the <crowd-image-classifier> element.

Example : Sample Element Outputs
The following is a sample of output from this element.

```
[
  {
    "<name>": {
      "label": "<value>",
      "workerComment": "Comment - if no comment is provided, this field will not be
present"
    }
  }
]
```

See Also
For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

crowd-image-classifier-multi-select
A widget for classifying an image into one or more categories. Use one of the following supported image
formats: APNG, BMP, GIF, ICO, JPEG, PNG, SVG. Images do not have a size limit.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of an HTML worker task template built using this crowd element. Copy the
following code and save it in a file with the extension .html. Open the file in any browser to preview
and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<form>
  <crowd-image-classifier-multi-select
      name="animals"
      categories="["Cat", "Dog", "Horse", "Pig", "Bird"]"
  ></crowd-image-classifier-multi-select>
</form>
```
Attributes

The following attributes are supported by the `crowd-image-classifier-multi-select` element. Each attribute accepts a string value or string values.

**categories**

Required. A JSON-formatted array of strings, each of which is a category that a worker can assign to the image. A worker must choose at least one category and can choose all categories.

**header**

Required. The text to display above the image. This is typically a question or simple instruction for workers.

**name**

Required. The name of this widget. In the form output, the name is used as a key for the widget's input.

**src**

Required. The URL of the image to be classified.

**exclusion-category**

Optional. A JSON-formatted string with the following format: "{ text: 'default-value' }". This attribute sets a default value that workers can choose if none of the labels applies to the image shown in the worker UI.

Element Hierarchy

This element has the following parent and child elements:

- **Parent elements**: `crowd-form (p. 533)`
- **Child elements**: `full-instructions (p. 538), short-instructions (p. 538), worker-comment (p. 538)`

Regions

This element uses the following regions

**full-instructions**

General instructions for the worker on how to classify an image.
short-instructions

Important task-specific instructions. These instructions are displayed prominently.

Output

The output of this element is a string that specifies one or more of the values defined in the categories attribute of the `<crowd-image-classifier-multi-select>` element.

Example: Sample Element Outputs

The following is a sample of output from this element.

```
[
  {
    "<name>": {
      labels: ["label_a", "label_b"]
    }
  }
]
```

See Also

For more information, see the following:

- Image Classification (Multi-label) (p. 210)
- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

crowd-input

A box that accepts input data.

Cannot be self-closing

Unlike the `input` element in the HTML standard, this element cannot be self-closed by putting a slash before the ending bracket, e.g. `<crowd-input ... />`. It must be followed with a `</crowd-input>` to close the element.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the `<crowd-input>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <img style="max-width: 35vw; max-height: 50vh" src="{{ task.input.taskObject | grant_read_access }}">
  <crowd-input name="tag1" label="Word/phrase 1" required/>
  <crowd-input name="tag2" label="Word/phrase 2" required/>
  <crowd-input name="tag3" label="Word/phrase 3" required/>
</crowd-form>
```

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.
Attributes

The following attributes are supported by this element.

allowed-pattern

A regular expression that is used with the auto-validate attribute to ignore non-matching characters as the worker types.

auto-focus

When the value is set to true, the browser places focus inside the input area after loading. This way, the worker can start typing without having to select it first.

auto-validate

A Boolean switch that, if present, turns on input validation. The behavior of the validator can be modified by the error-message and allowed-pattern attributes.

disabled

A Boolean switch that, if present, displays the input area as disabled.

error-message

The text to be displayed below the input field, on the left side, if validation fails.

label

A string that is displayed inside a text field.

This text shrinks and rises up above a text field when the worker starts typing in the field or when the value attribute is set.

max-length

A maximum number of characters the input will accept. Input beyond this limit is ignored.

min-length

A minimum length for the input in the field

name

Sets the name of the input to be used in the DOM and the output of the form.

placeholder

A string value that is used as placeholder text, displayed until the worker starts entering data into the input. It is not used as a default value.

required

A Boolean switch that, if present, requires the worker to provide input.
type
Takes a string to set the HTML5 input-type behavior for the input. Examples include file and date.

value
A preset that becomes the default if the worker does not provide input. The preset appears in a text field.

Element Hierarchy
This element has the following parent and child elements.

- Parent elements: crowd-form (p. 533)
- Child elements: none

Output
Provides a name string as the property name, and the text that was entered in the field as its value.

Example: Sample JSON Output
The values for multiple elements are output in the same object, with their name attribute value as their property name. Elements with no input do not appear in the output. For example, let's use three inputs:

```html
<crowd-input name="tag1" label="Word/phrase 1"></crowd-input>
<crowd-input name="tag2" label="Word/phrase 2"></crowd-input>
<crowd-input name="tag3" label="Word/phrase 3"></crowd-input>
```

This is the output if only two have input:

```json
[{
  "tag1": "blue",
  "tag2": "red"
}]
```

This means any code built to parse these results should be able to handle the presence or absence of each input in the answers.

See Also
For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

crowd-instance-segmentation
A widget for identifying individual instances of specific objects within an image and creating a colored overlay for each labeled instance.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the <crowd-instance-segmentation>.
Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-instance-segmentation id="annotatedResult" name="annotatedResult"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="Please label each of the requested objects in this image"
    labels="['Cat', 'Dog', 'Bird']">
    <full-instructions header="Segmentation Instructions">
      <ol>
        <li><strong>Read</strong> the task carefully and inspect the image.</li>
        <li><strong>Read</strong> the options and review the examples provided to understand more about the labels.</li>
        <li><strong>Choose</strong> the appropriate label that best suits the image.</li>
      </ol>
    </full-instructions>
    <short-instructions>
      <p>Use the tools to label all instances of the requested items in the image</p>
    </short-instructions>
  </crowd-instance-segmentation>
</crowd-form>

Use a template similar to the following to allow workers to add their own categories (labels).

<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-instance-segmentation id="annotator" name="myTexts"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="Click Instructions to add new labels."
    labels="['placeholder']">
    <short-instructions>
      <h3>Add a label to describe each type of object in this image.</h3>
      <h3>Cover each instance of each object with a segmentation mask.</h3>
      <br>
      <h3>Add new label</h3>
      <crowd-input id="customLabel"></crowd-input>
      <crowd-button id="addLabel">Add</crowd-button>
      <br>
      <h3>Manage labels</h3>
      <div id="labelsSection"></div>
    </short-instructions>
    <full-instructions>
      Describe your task in more detail here.
    </full-instructions>
  </crowd-instance-segmentation>
</crowd-form>

<script>
  document.addEventListener('all-crowd-elements-ready', function(event) {
    document.querySelector('crowd-instance-segmentation').labels = [];
  });
  function populateLabelsSection() {
    // Code to populate labels section
  }
</script>
labelsSection.innerHTML = '';
annotator.labels.forEach(function(label) {
    const labelContainer = document.createElement('div');
    labelContainer.innerHTML = label + ' <a href="javascript:void(0)">(Delete)</a>';
    labelContainer.querySelector('a').onclick = function() {
        return l !== label;
    });
    populateLabelsSection();
});
labelsSection.appendChild(labelContainer);
}
addLabel.onclick = function() {
    annotator.labels = annotator.labels.concat([customLabel.value]);
    customLabel.value = null;
    populateLabelsSection();
};
</script>

Attributes

The following attributes are supported by this element.

header

The text to display above the image. This is typically a question or simple instruction for the worker.

labels

A JSON formatted array of strings, each of which is a label that a worker can assign to an instance of an object in the image. Workers can generate different overlay colors for each relevant instance by selecting "add instance" under the label in the tool.

name

The name of this widget. It is used as a key for the labeling data in the form output.

src

The URL of the image that is to be labeled.

initial-value

A JSON object containing the color mappings of a prior instance segmentation job and a link to the overlay image output by the prior job. Include this when you want a human worker to verify the results of a prior labeling job and adjust it if necessary.

The attribute will appear as follows:

```json
initial-value="{
    "instances": [
        {"color": "#2ca02c", "label": "Cat"},
        {"color": "#1f77b4", "label": "Cat"
```
Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: full-instructions (p. 546), short-instructions (p. 546)

Regions

The following regions are supported by this element.

- **full-instructions**
  General instructions about how to do image segmentation.

- **short-instructions**
  Important task-specific instructions that are displayed in a prominent place.

Output

The following output is supported by this element.

- **labeledImage**
  A JSON Object containing a Base64 encoded PNG of the labels.

- **instances**
  A JSON Array containing objects with the instance labels and colors.

  - **color** – The hexadecimal value of the label's RGB color in the labeledImage PNG.
  - **label** – The label given to overlay(s) using that color. This value may repeat, because the different instances of the label are identified by their unique color.

- **inputImageProperties**
  A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

  - **height** – The height, in pixels, of the image.
  - **width** – The width, in pixels, of the image.

Example : Sample Element Outputs

The following is an example of output from this element.
See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

crowd-instructions

An element that displays instructions on three tabbed pages, Summary, Detailed Instructions, and Examples, when the worker clicks on a link or button.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that used the `<crowd-instructions>` element. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<form>
  <crowd-instructions link-text="View instructions" link-type="button">
    <short-summary>
      <p>Given an image, write three words or short phrases that summarize its contents.</p>
    </short-summary>
    
    <detailed-instructions>
      <p>Imagine that you are describing an image to a friend or tagging it for a news website. Provide three specific words or short phrases that describe it.</p>
    </detailed-instructions>
    
    <positive-example>
    </positive-example>
  </crowd-instructions>
</form>
```
<p>
<ul>
<li>Highway</li>
<li>Cars</li>
<li>Gas station</li>
</ul>
</p>

</positive-example>

</negative-example>

</crowd-instructions>

</p><strong>Instructions:</strong> Given an image, write three words or short phrases that summarize its contents.

If someone were to see these three words or phrases, they should understand the subject and context of the image, as well as any important actions.

View the instructions for detailed instructions and examples.

</p><img style="max-width: 100%; max-height: 100%" src="{{ task.input.taskObject | grant_read_access }}"></p>

</crowd-input>

</crowd-input>

</crowd-input>

</crowd-form>

Attributes

The following attributes are supported by this element.

**link-text**

The text to display for opening the instructions. The default is **Click for instructions**.

**link-type**

A string that specifies the type of trigger for the instructions. The possible values are "link" (default) and "button".

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: none

Regions

The following regions are supported by this element.

**detailed-instructions**

Content that provides specific instructions for a task. This appears on the page of the "Detailed Instructions" tab.
negative-example

Content that provides examples of inadequate task completion. This appears on the page of the "Examples" tab. More than one example may be provided within this element.

positive-example

Content that provides examples of proper task completion. This appears on the page of the "Examples" tab.

short-summary

A brief statement that summarizes the task to be completed. This appears on the page of the "Summary" tab. More than one example may be provided within this element.

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

crowd-keypoint

Generates a tool to select and annotate key points on an image.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of an Liquid template that uses the <crowd-keypoint> element. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <div id="errorBox"></div>
  <crowd-keypoint
    src="{{ task.input.taskObject | grant_read_access }}"
    labels="['Item A', 'Item B', 'Item C']"
    header="Please locate the centers of each item."
    name="annotatedResult">
    <short-instructions>
      Describe your task briefly here and give examples
    </short-instructions>
    <full-instructions>
      Give additional instructions and good/bad examples here
    </full-instructions>
  </crowd-keypoint>
</crowd-form>
<script>
  var num_obj = 1;

  document.querySelector('crowd-form').onsubmit = function(e) {
    const keypoints = document.querySelector('crowd-keypoint').value.keypoints ||
    document.querySelector('crowd-keypoint')._submittableValue.keypoints;
    const labels = keypoints.map(function(p) {
      return p.label;
    });
```
// 1. Make sure total number of keypoints is correct.
var original_num_labels = document.getElementsByTagName("crowd-keypoint")
[0].getAttribute("labels");
original_num_labels = original_num_labels.substring(2, original_num_labels.length - 2).split("","");
var goalNumKeypoints = num_obj*original_num_labels.length;
if (keypoints.length != goalNumKeypoints) {
    e.preventDefault();
    errorBox.innerHTML = '<crowd-alert type="error" dismissible>You must add all keypoint annotations and use each label only once.</crowd-alert>';
    errorBox.scrollIntoView();
    return;
}

// 2. Make sure all labels are unique.
labelCounts = {};
for (var i = 0; i < labels.length; i++) {
    if (!labelCounts[labels[i]]) {
        labelCounts[labels[i]] = 0;
    }
    labelCounts[labels[i]]++;
}
const goalNumSingleLabel = num_obj;
const numLabels = Object.keys(labelCounts).length;
Object.entries(labelCounts).forEach(entry => {
    if (entry[1] != goalNumSingleLabel) {
        e.preventDefault();
        errorBox.innerHTML = '<crowd-alert type="error" dismissible>You must use each label only once.</crowd-alert>';
        errorBox.scrollIntoView();
    }
});
</script>

**Attributes**

The following attributes are supported by this element.

**header**

The text to display above the image. This is typically a question or simple instruction for the worker.

**initial-value**

An array, in JSON format, of keypoints to be applied to the image on start. For example:

```javascript
initial-value="[
    {
        'label': 'Left Eye',
        'x': 1022,
        'y': 429
    },
    {
        'label': 'Beak',
        'x': 941,
        'y': 403
    }
]
```
Note
Please note that label values used in this attribute must have a matching value in the labels attribute or the point will not be rendered.

labels
An array, in JSON format, of strings to be used as keypoint annotation labels.

name
A string used to identify the answer submitted by the worker. This value will match a key in the JSON object that specifies the answer.

csrc
The source URI of the image to be annotated.

Element Hierarchy
This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: full-instructions (p. 551), short-instructions (p. 551)

Regions
The following regions are required by this element.

full-instructions
General instructions about how to annotate the image.

short-instructions
Important task-specific instructions that are displayed in a prominent place.

Output
The following output is supported by this element.

inputImageProperties
A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

keypoints
An array of JSON objects containing the coordinates and label of a keypoint. Each object contains the following properties.

- **label** – The assigned label for the keypoint.
• x – The X coordinate, in pixels, of the keypoint on the image.
• y – The Y coordinate, in pixels, of the keypoint on the image.

Note
X and Y coordinates are based on 0,0 being the top left corner of the image.

Example: Sample Element Outputs

The following is a sample output from using this element.

```
[
  {  
    "crowdKeypoint": {  
      "inputImageProperties": {  
        "height": 1314,  
        "width": 962  
      },  
      "keypoints": [  
        {  
          "label": "dog",  
          "x": 155,  
          "y": 275  
        },  
        {  
          "label": "cat",  
          "x": 341,  
          "y": 447  
        },  
        {  
          "label": "cat",  
          "x": 491,  
          "y": 513  
        },  
        {  
          "label": "dog",  
          "x": 714,  
          "y": 578  
        },  
        {  
          "label": "cat",  
          "x": 712,  
          "y": 763  
        },  
        {  
          "label": "cat",  
          "x": 397,  
          "y": 814  
        }  
      ]  
    }  
  }  
]
```

You may have many labels available, but only the ones that are used appear in the output.

See Also

For more information, see the following.

• Use Amazon SageMaker Ground Truth to Label Data (p. 189)
• Crowd HTML Elements Reference (p. 510)
crowd-line

A widget for drawing lines on an image. Each line is associated with a label, and output data will report the starting and ending points of each line.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the <crowd-line> element. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template. For more examples, see this GitHub repository.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form
  <crowd-line
    name="crowdLine"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="Add header here to describe the task"
    labels="['car','pedestrian','street car']"
  
  <short-instructions>
    <p>Read the task carefully and inspect the image.</p>
    <p>Choose the appropriate label that best suits the image.</p>
    <p>Draw a line on each objects that the label applies to.</p>
  </short-instructions>

  <full-instructions>
    <p>Read the task carefully and inspect the image.</p>
    <p>Choose the appropriate label that best suits the image.</p>
    <p>Draw a line along each object that the image applies to. Make sure that the line does not extend beyond the boundaries of the object.</p>
    <p>Each line is defined by a starting and ending point. Carefully place the starting and ending points on the boundaries of the object.</p>
  </full-instructions>

</crowd-line>
</crowd-form>
```

Attributes

The following attributes are supported by this element.

header

Optional. The text to display above the image. This is typically a question or simple instruction for the worker.

initial-value

Optional. An array of JSON objects, each of which sets a line when the component is loaded. Each JSON object in the array contains the following properties:

- **label** – The text assigned to the line as part of the labeling task. This text must match one of the labels defined in the `labels` attribute of the `<crowd-line>` element.
- **vertices** – the x and y pixel coordinates of the start point and end point of the line, relative to the top-left corner of the image.

```javascript
initial-value="{
```
Lines set via the `initial-value` property can be adjusted. Whether or not a worker answer was adjusted is tracked via an `initialValueModified` boolean in the worker answer output.

**labels**

Required. A JSON formatted array of strings, each of which is a label that a worker can assign to the line.

**Limit:** 10 labels

**label-colors**

Optional. An array of strings. Each string is a hexadecimal (hex) code for a label.

**name**

Required. The name of this widget. It’s used as a key for the widget’s input in the form output.

**src**

Required. The URL of the image on which to draw lines.

**Regions**

The following regions are required by this element.

**full-instructions**

General instructions about how to draw lines.

**short-instructions**

Important task-specific instructions that are displayed in a prominent place.
Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: short-instructions (p. 554), full-instructions (p. 554)

Output

**inputImageProperties**

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

**lines**

A JSON Array containing objects with the line labels and vertices.

- **label** – The label given to a line.
- **vertices** – the x and y pixel coordinates of the start point and end point of the line, relative to the top-left corner of the image.

Example: Sample Element Outputs

The following is an example of output from this element.

```json
{
  "crowdLine": { //This is the name you set for the crowd-line
    "inputImageProperties": {
      "height": 1254,
      "width": 2048
    },
    "lines": [
      {
        "label": "yardline",
        "vertices": [
          {
            "x": 58,
            "y": 295
          },
          {
            "x": 1342,
            "y": 398
          }
        ]
      },
      {
        "label": "sideline",
        "vertices": [
          {
            "x": 1480,
            "y": 555
          }
        ]
      }
    ]
  }
}
```
See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

**crowd-modal**

A small window that pops up on the display when it is opened.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of the syntax that you can use with the `<crowd-modal>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-modal
  link-text = "See Examples"
  link-type = "button">
  Example Modal Text</crowd-modal>
```

**Attributes**

The following attributes are supported by this element.

- **link-text**
  The text to display for opening the modal. The default is "Click to open modal".

- **link-type**
  A string that specifies the type of trigger for the modal. The possible values are "link" (default) and "button".

**Element Hierarchy**

This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: none

Amazon SageMaker Developer Guide
SageMaker Crowd HTML Elements

• Use Amazon SageMaker Ground Truth to Label Data (p. 189)
• Crowd HTML Elements Reference (p. 510)

crowd-polygon
A widget for drawing polygons on an image and assigning a label to the portion of the image that is
enclosed in each polygon.
See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.
The following is an example of a Liquid template that uses the <crowd-polygon> element. Copy the
following code and save it in a ﬁle with the extension .html. Open the ﬁle in any browser to preview
and interact with this template.
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
<crowd-polygon
name="annotatedResult"
src="{{ task.input.taskObject | grant_read_access }}"
header="Draw a polygon around each of the requested target(s) of interest"
labels="['Cat', 'Dog', 'Bird']"
>
<full-instructions header="Polygon instructions">
<ul>
<li>Make the polygon tight around the object</li>
<li>You need to select a label before starting a polygon</li>
<li>You will need to select a label again after completing a polygon</li>
<li>To select a polygon, you can click on its borders</li>
<li>You can start drawing a polygon from inside another polygon</li>
<li>You can undo and redo while you're drawing a polygon to go back and forth
between points you've placed</li>
<li>You are prevented from drawing lines that overlap other lines from the same
polygon</li>
</ul>
</full-instructions>
<short-instructions>
<p>Draw a polygon around each of the requested target(s) of interest</p>
<p>Make the polygon tight around the object</p>
</short-instructions>
</crowd-polygon>
</crowd-form>

Attributes
The following attributes are supported by this element.

header
The text to display above the image. This is typically a question or simple instruction for the worker.

labels
A JSON formatted array of strings, each of which is a label that a worker can assign to the image portion
enclosed by a polygon.

name
The name of this widget. It's used as a key for the widget's input in the form output.

557


**src**

The URL of the image on which to draw polygons.

**initial-value**

An array of JSON objects, each of which defines a polygon to be drawn when the component is loaded. Each JSON object in the array contains the following properties.

- **label** – The text assigned to the polygon as part of the labeling task. This text must match one of the labels defined in the `labels` attribute of the `<crowd-polygon>` element.
- **vertices** – An array of JSON objects. Each object contains an x and y coordinate value for a point in the polygon.

**Example**

An `initial-value` attribute might look something like this.

```javascript
initial-value = '[
  {
    "label": "dog",
    "vertices":
      [
        {
          "x": 570,
          "y": 239
        },
        ...
        {
          "x": 759,
          "y": 281
        }
      ]
  }
]
```

Because this will be within an HTML element, the JSON array must be enclosed in single or double quotes. The example above uses single quotes to encapsulate the JSON and double quotes within the JSON itself. If you must mix single and double quotes inside your JSON, replace them with their HTML entity codes (`&quot;` for double quote, `&#39;` for single) to safely escape them.

**Element Hierarchy**

This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: full-instructions (p. 558), short-instructions (p. 558)

**Regions**

The following regions are required.

**full-instructions**

General instructions about how to draw polygons.

**short-instructions**

Important task-specific instructions that are displayed in a prominent place.
Output

The following output is supported by this element.

polygons

An array of JSON objects, each of which describes a polygon that has been created by the worker. Each JSON object in the array contains the following properties.

- **label** – The text assigned to the polygon as part of the labeling task.
- **vertices** – An array of JSON objects. Each object contains an x and y coordinate value for a point in the polygon. The top left corner of the image is 0,0.

inputImageProperties

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

Example: Sample Element Outputs

The following are samples of outputs from common use scenarios for this element.

**Single Label, Single Polygon**

```json
{
    "annotatedResult": {
        "inputImageProperties": {
            "height": 853,
            "width": 1280
        },
        "polygons": [
            {
                "label": "dog",
                "vertices": [
                    {
                        "x": 570,
                        "y": 239
                    },
                    {
                        "x": 603,
                        "y": 513
                    },
                    {
                        "x": 823,
                        "y": 645
                    },
                    {
                        "x": 901,
                        "y": 417
                    },
                    {
                        "x": 759,
                        "y": 281
                    }
                ]
            }
        ]
    }
}```
Single Label, Multiple Polygons

[{
  "annotatedResult": {
    "inputImageProperties": {
      "height": 853,
      "width": 1280
    },
    "polygons": [
      {
        "label": "dog",
        "vertices": [
          {
            "x": 570,
            "y": 239
          },
          {
            "x": 603,
            "y": 513
          },
          {
            "x": 823,
            "y": 645
          },
          {
            "x": 901,
            "y": 417
          },
          {
            "x": 759,
            "y": 281
          }
        ]
      },
      {
        "label": "dog",
        "vertices": [
          {
            "x": 870,
            "y": 278
          },
          {
            "x": 908,
            "y": 446
          },
          {
            "x": 1009,
            "y": 602
          },
          {
            "x": 1116,
            "y": 519
          },
          {
            "x": 1174,
            "y": 498
          }
        ]
      }
    ]
  }
}]

Multiple Labels, Multiple Polygons

```json
[
  {
    "annotatedResult": {
      "inputImageProperties": {
        "height": 853,
        "width": 1280
      },
      "polygons": [
        {
          "label": "dog",
          "vertices": [
            {
              "x": 570,
              "y": 239
            },
            {
              "x": 603,
              "y": 513
            },
            {
              "x": 823,
              "y": 645
            },
            {
              "x": 901,
              "y": 417
            },
            {
              "x": 759,
              "y": 281
            }
          ]
        },
        {
          "label": "cat",
          "vertices": [
            {
              "x": 870,
              "y": 278
            },
            {
              "x": 908,
              "y": 446
            }
          ]
        }
      ]
    }
  }
]```
You could have many labels available, but only the ones that are used appear in the output.

**See Also**

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

**crowd-polyline**

A widget for drawing polylines or lines on an image. Each polyline is associated with a label and can include two or more vertices. A polyline can intersect itself and its starting and ending points can be placed anywhere on the image.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](https://codepen.io).

The following is an example of a Liquid template that uses the `<crowd-polyline>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template. For more examples, see this [GitHub repository](https://github.com).

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-polyline
    name="crowdPolyline"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="Add header here to describe the task"
    labels="[\'car\', \'pedestrian\', \'street car\']"
  >
    <full-instructions>
```
Attributes

The following attributes are supported by this element.

header

Optional. The text to display above the image. This is typically a question or simple instruction for the worker.

initial-value

Optional. An array of JSON objects, each of which sets a polyline when the component is loaded. Each JSON object in the array contains the following properties:

- **label** – The text assigned to the polyline as part of the labeling task. This text must match one of the labels defined in the labels attribute of the <crowd-polyline> element.
- **vertices** – the x and y pixel coordinates of the vertices of a polyline, relative to the top-left corner of the image.

```json
initial-value= "{
    polylines: [
        { label: 'sideline', // label of this line annotation
          vertices:[0, // an array of vertices which decide the position of the line
            x: 84,
            y: 110
          ],
          { x: 60,
            y: 100
          }
        ],
        { label: 'yardline',
          vertices:[

```
Polylines set via the initial-value property can be adjusted. Whether or not a worker answer was adjusted is tracked via an initialValueModified boolean in the worker answer output.

**labels**
Required. A JSON formatted array of strings, each of which is a label that a worker can assign to the line.

**Limit**: 10 labels

**label-colors**
Optional. An array of strings. Each string is a hexadecimal (hex) code for a label.

**name**
Required. The name of this widget. It's used as a key for the widget's input in the form output.

**src**
Required. The URL of the image on which to draw polylines.

**Regions**
The following regions are required by this element.

**full-instructions**
General instructions about how to draw polylines.

**short-instructions**
Important task-specific instructions that are displayed in a prominent place.

**Element Hierarchy**
This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: short-instructions (p. 564), full-instructions (p. 564)

**Output**

**inputImageProperties**
A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.
• **height** – The height, in pixels, of the image.
• **width** – The width, in pixels, of the image.

**polylines**

A JSON Array containing objects with polylines' labels and vertices.

• **label** – The label given to a line.
• **vertices** – the x and y pixel coordinates of the vertices of a polyline, relative to the top-left corner of the image.

**Example: Sample Element Outputs**

The following is an example of output from this element.

```json
{
   "crowdPolyline": { //This is the name you set for the crowd-polyline
      "inputImageProperties": {
         "height": 1254,
         "width": 2048
      },
      "polylines": [
         {
            "label": "sideline",
            "vertices": [
               {
                  "x": 651,
                  "y": 498
               },
               {
                  "x": 862,
                  "y": 869
               },
               {
                  "x": 1449,
                  "y": 611
               }
            ]
         },
         {
            "label": "yardline",
            "vertices": [
               {
                  "x": 1148,
                  "y": 322
               },
               {
                  "x": 1705,
                  "y": 474
               },
               {
                  "x": 1755,
                  "y": 474
               }
            ]
         }
      ]
   }
}
```
See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

crowd-radio-button

A button that can be either checked or unchecked. When radio buttons are inside a radio group, exactly one radio button in the group can be checked at any time. The following is an example of how to configure a crowd-radio-button element inside of a crowd-radio-group element.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of the syntax that you can use with the <crowd-radio-button> element. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-radio-group>
    <crowd-radio-button name="tech" value="tech">Technology</crowd-radio-button>
    <crowd-radio-button name="politics" value="politics">Politics</crowd-radio-button>
  </crowd-radio-group>
</crowd-form>
```

The previous example can be seen in a custom worker task template in this GitHub example: entity recognition labeling job custom template.

Crowd HTML Element radio buttons do not support the HTML tag, required. To make a radio button selection required, use <input type="radio"> elements to create radio buttons and add the required tag. The name attribute for all <input> elements that belong to the same group of radio buttons must be the same. For example, the following template requires the user to select a radio button in the animal-type group before submitting.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <p>Select an animal type:</p>
  <img src="https://images.unsplash.com/photo-1537151608828-ea2b11777ee8?ixlib=rb-1.2.1&ixid=eyJhcHBfaWQiOjEyMDd9&auto=format&fit=crop&w=1539&q=80" style="height: 500; width: 400;"/>
  <br><br>
  <div>
    <input type="radio" id="cat" name="animal-type" value="cat" required>
    <label for="cat">Cat</label>
  </div>
  <div>
    <input type="radio" id="dog" name="animal-type" value="dog">
    <label for="dog">Dog</label>
  </div>
  <div>
    <input type="radio" id="unknown" name="animal-type" value="unknown">
    <label for="unknown">Unknown</label>
  </div>
  <full-instructions header="Classification Instructions">
    <p>Read the task carefully and inspect the image.</p>
    <p>Choose the appropriate label that best suits the image.</p>
  </full-instructions>
</crowd-form>
```
Attributes

The following attributes are supported by this element.

checked
A Boolean switch that, if present, displays the radio button as checked.

disabled
A Boolean switch that, if present, displays the button as disabled and prevents it from being checked.

name
A string that is used to identify the answer submitted by the worker. This value will match a key in the JSON object that specifies the answer.

Note
If you use the buttons outside of a crowd-radio-group (p. 568) element, but with the same name string and different value strings, the name object in the output will contain a Boolean value for each value string. To ensure that only one button in a group is selected, make them children of a crowd-radio-group (p. 568) element and use different name values.

value
A property name for the element's boolean value. If not specified, it uses "on" as the default, e.g. { "<name>": { "<value>": <true or false> } }.

Element Hierarchy

This element has the following parent and child elements.

• Parent elements: crowd-radio-group (p. 568)
• Child elements: none

Output

Outputs an object with the following pattern: { "<name>": { "<value>": <true or false> } }. If you use the buttons outside of a crowd-radio-group (p. 568) element, but with the same name string and different value strings, the name object will contain a Boolean value for each value string. To ensure that only one button in a group is selected, make them children of a crowd-radio-group (p. 568) element and use different name values.

Example Sample output of this element

```
[
  { "btn1": { "yes": true }, "btn2": { "no": false } }
]```

- Crowd HTML Elements Reference (p. 510)

crowd-radio-group

A group of radio buttons. Only one radio button within the group can be selected. Choosing one radio button clears any previously chosen radio button within the same group. For an example of a custom UI template that uses the crowd-radio-group element, see this entity recognition labeling job custom template.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of the syntax that you can use with the <crowd-radio-group> element. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<style>
body {
  padding-left: 20px;
  margin-bottom: 20px;
}
#outer-container {
  display: flex;
  justify-content: space-around;
  max-width: 900px;
  margin-left: 100px;
}
.left-container {
  margin-right: auto;
  padding-right: 50px;
}
.right-container {
  margin-left: auto;
  padding-left: 50px;
}
#vertical-separator {
  border: solid 1px #d5dbdb;
}
</style>
</crowd-form>

<crowd-form>
  <div>
    <h1>Instructions</h1>
    Lorem ipsum...
  </div>
  <div>
    <h2>Background</h2>
    Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo consequat.
  </div>
  <div id="outer-container">
  </div>
</crowd-form>
```
Attributes

No special attributes are supported by this element.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: crowd-radio-button (p. 566)

Output

Outputs an array of objects representing the crowd-radio-button (p. 566) elements within it.

Example Sample of Element Output

```json
[
  {
    "btn1": {
      "yes": true
    },
    "btn2": {
      "no": false
    }
  }
]
```

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)
crowd-semantic-segmentation

A widget for segmenting an image and assigning a label to each image segment.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the `<crowd-semantic-segmentation>` element. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.

```html
<scrip src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-semantic-segmentation
    name="annotatedResult"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="Please label each of the requested objects in this image"
    labels="['Cat', 'Dog', 'Bird']"
  >
    <full-instructions header="Segmentation Instructions">
      <ol>
        <li><strong>Read</strong> the task carefully and inspect the image.</li>
        <li><strong>Read</strong> the options and review the examples provided to understand more about the labels.</li>
        <li><strong>Choose</strong> the appropriate label that best suits the image.</li>
      </ol>
    </full-instructions>
    <short-instructions>
      <p>Use the tools to label the requested items in the image</p>
    </short-instructions>
  </crowd-semantic-segmentation>
</crowd-form>

Attributes

The following attributes are supported by this element.

header

The text to display above the image. This is typically a question or simple instruction for the worker.

initial-value

A JSON object containing the color mappings of a prior semantic segmentation job and a link to the overlay image output by the prior job. Include this when you want a human worker to verify the results of a prior labeling job and adjust it if necessary.

The attribute would appear as follows:

```json
initial-value='{
  "labelMappings": {
    "Bird": {
      "color": "#ff7f0e"
    },
    "Cat": {
      "color": "#2ca02c"
    },
    "Cow": {
      "color": "#d62728"
    },
  }'
}'
When using Ground Truth built in task types with annotation consolidation (where more than one worker labels a single image), label mappings are included in individual worker output records, however the overall result is represented as the internal-color-map in the consolidated results.

You can convert the internal-color-map to label-mappings in a custom template using the Liquid templating language:

```liquid
initial-value="{
  'src' : '{{ task.input.manifestLine.label-attribute-name-from-prior-job | grant_read_access }}',
  'labelMappings': {
    {% for box in task.input.manifestLine.label-attribute-name-from-prior-job-
      metadata.internal-color-map %}
      {% if box[1][’class-name’] != ’BACKGROUND’ %}
        {{ box[1][’class-name’] | to_json }}: {
          'color': {{ box[1][’hex-color’] | to_json }}
        },
      {% endif %}
    {% endfor %}
  }
}"
```

labels
A JSON formatted array of strings, each of which is a label that a worker can assign to a segment of the image.

name
The name of this widget. It is used as a key for the widget's input in the form output.

src
The URL of the image that is to be segmented.

Element Hierarchy
This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: full-instructions (p. 571), short-instructions (p. 571)

Regions
The following regions are supported by this element.

full-instructions
General instructions about how to do image segmentation.

short-instructions
Important task-specific instructions that are displayed in a prominent place.
Output

The following output is supported by this element.

labeledImage

A JSON Object containing a Base64 encoded PNG of the labels.

labelMappings

A JSON Object containing objects with named with the segmentation labels.

- **color** – The hexadecimal value of the label's RGB color in the labeledImage PNG.

initialValueModified

A boolean representing whether the initial values have been modified. This is only included when the output is from an adjustment task.

inputImageProperties

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

Example : Sample Element Outputs

The following is a sample of output from this element.

```
[
  {
    "annotatedResult": {
      "inputImageProperties": {
        "height": 533,
        "width": 800
      },
      "labelMappings": {
        "<Label 2>": {
          "color": "#ff7f0e"
        },
        "<label 3>": {
          "color": "#2ca02c"
        },
        "<label 1>": {
          "color": "#1f77b4"
        }
      },
      "labeledImage": {
        "pngImageData": "<Base-64 Encoded Data>"
      }
    }
  }
]
```

See Also

For more information, see the following.
crowd-slider

A bar with a sliding knob that allows a worker to select a value from a range of values by moving the knob. The slider makes it a great choice for settings that reflect intensity levels, such as volume, brightness, or color saturation.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a survey template that uses the `<crowd-slider>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>

<crowd-instructions link-text="View instructions" link-type="button">
  <short-summary>
    <p>Provide a brief instruction here</p>
  </short-summary>

  <detailed-instructions>
    <h3>Provide more detailed instructions here</h3>
    <p>Include additional information</p>
  </detailed-instructions>

  <positive-example>
    <p>Provide an example of a good answer here</p>
    <p>Explain why it's a good answer</p>
  </positive-example>

  <negative-example>
    <p>Provide an example of a bad answer here</p>
    <p>Explain why it's a bad answer</p>
  </negative-example>
</crowd-instructions>

<div>
  <p>What is your favorite color for a bird?</p>
  <crowd-input name="favoriteColor" placeholder="example: pink" required>
  </crowd-input>
</div>

<div>
  <p>Check this box if you like birds</p>
  <crowd-checkbox name="likeBirds" checked="true" required>
  </crowd-checkbox>
</div>

<div>
  <p>On a scale of 1-10, how much do you like birds?</p>
  <crowd-slider name="howMuch" min="1" max="10" step="1" pin="true" required>
  </crowd-slider>
</div>

<div>
  <p>Write a short essay describing your favorite bird</p>
  <crowd-text-area name="essay" rows="4" placeholder="Lorem ipsum..." required>
  </crowd-text-area>
</div>

</crowd-form>
```
Attributes

The following attributes are supported by this element.

disabled

A Boolean switch that, if present, displays the slider as disabled.

editable

A Boolean switch that, if present, displays an up/down button that can be chosen to select the value.
Selecting the value via the up/down button is an alternative to selecting the value by moving the knob on the slider. The knob on the slider will move synchronously with the up/down button choices.

max

A number that specifies the maximum value on the slider.

min

A number that specifies the minimum value on the slider.

name

A string that is used to identify the answer submitted by the worker. This value will match a key in the JSON object that specifies the answer.

pin

A Boolean switch that, if present, displays the current value above the knob as the knob is moved.

required

A Boolean switch that, if present, requires the worker to provide input.

secondary-progress

When used with a crowd-slider-secondary-color CSS attribute, the progress bar is colored to the point represented by the secondary-progress. For example, if this was representing the progress on a streaming video, the value would represent where the viewer was in the video timeline. The secondary-progress value would represent the point on the timeline to which the video had buffered.

step

A number that specifies the difference between selectable values on the slider.

value

A preset that becomes the default if the worker does not provide input.

Element Hierarchy

This element has the following parent and child elements.

- Parent elements: crowd-form (p. 533)
- Child elements: none

**crowd-tab**

A component styled to look like a tab with information below.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example template that uses the `<crowd-tab>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-tabs>
    <crowd-tab header="Tab 1">
      <h2>Image</h2>
      <img src="https://images.unsplash.com/photo-1478382188900-5bb598fe27d3?ixlib=rb-1.2.1&ixid=eyJhcHBfaWQiOjEyMDd9&auto=format&fit=crop&w=1351&q=80" style="max-width: 40%" />
      <h2>Text</h2>
      <p>Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magna aliqua.</p>
      <p>Sed risus ultricies tristique nulla aliquet enim tortor at auctor. Tempus egestas sed sed risus.</p>
    </crowd-tab>
    <crowd-tab header="Tab 2">
      <h2>Description</h2>
      <p>Sed risus ultricies tristique nulla aliquet enim tortor at auctor. Tempus egestas sed sed risus.</p>
    </crowd-tab>
    <crowd-tab header="Tab 3">
      <div style="width: 40%; display: inline-block">

        <crowd-input label="Input inside tab" name="inputInsideTab"></crowd-input>
        <input type="checkbox" name="checkbox" value="foo">Foo
        <input type="checkbox" name="checkbox" value="bar">Bar
        <crowd-button>Some button</crowd-button>
      </div>
    </crowd-tab>
  </crowd-tabs>
</crowd-form>
```
Attributes

The following attributes are supported by this element.

header

The text appearing on the tab. This is usually some short descriptive name indicative of the information contained below the tab.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-tabs (p. 576)
- **Child elements**: none

Attributes

This element has no attributes.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: crowd-tab (p. 575)

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

crowd-text-area

A field for text input.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template designed to transcribe audio clips that uses the <crowd-text-area> element. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <audio controls>
    <source src="{{ task.input.taskObject | grant_read_access }}" type="audio/mpeg">
    Your browser does not support the audio element.
  </audio>
  <h3>Instructions</h3>
  <p>Transcribe the audio</p>
  <p>Ignore "umms", "hmms", "uhs" and other non-textual phrases</p>
  <crowd-text-area name="transcription" rows="4"></crowd-text-area>
</crowd-form>
```
Attributes

The following attributes are supported by this element.

**auto-focus**

A Boolean switch that, if present, puts the cursor in this element on-load so that users can immediately begin typing without having to click inside the element.

**auto-validate**

A Boolean switch that, if present, turns on input validation. The behavior of the validator can be modified by the `error-message` and `allowed-pattern` attributes.

**char-counter**

A Boolean switch that, if present, puts a small text field beneath the lower-right corner of the element, displaying the number of characters inside the element.

**disabled**

A Boolean switch that, if present, displays the input area as disabled.

**error-message**

The text to be displayed below the input field, on the left side, if validation fails.

**label**

A string that is displayed inside a text field.

This text shrinks and rises up above a text field when the worker starts typing in the field or when the `value` attribute is set.

**max-length**

An integer that specifies the maximum number of characters allowed by the element. Characters typed or pasted beyond the maximum are ignored.

**max-rows**

An integer that specifies the maximum number of rows of text that are allowed within a crowd-text-area. Normally the element expands to accommodate new rows. If this is set, after the number of rows exceeds it, content scrolls upward out of view and a scrollbar control appears.

**name**

A string used to represent the element's data in the output.

**placeholder**

A string presented to the user as placeholder text. It disappears after the user puts something in the input area.

**rows**

An integer that specifies the height of the element in rows of text.

**value**

A preset that becomes the default if the worker does not provide input. The preset appears in a text field.
Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: none

Output

This element outputs the `name` as a property name and the element's text contents as the value. Carriage returns in the text are represented as `\n`.

**Example Sample output for this element**

```
[
  {
    "textInput1": "This is the text; the text that\nmakes the crowd go wild."
  }
]
```

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

**crowd-toast**

A subtle notification that temporarily appears on the display. Only one crowd-toast is visible.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the `<crowd-toast>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <p>Find the official website for: <strong>{{ task.input.company }}</strong></p>
  <p>Do not give Yelp pages, LinkedIn pages, etc.</p>
  <p>Include the http:// prefix from the website</p>
  <crowd-input name="website" placeholder="http://example.com"></crowd-input>
  <crowd-toast duration="10000" opened> This is a message that you want users to see when opening the template. This message will disappear in 10 seconds. </crowd-toast>
</crowd-form>
```

Attributes

The following attributes are supported by this element.
duration
A number that specifies the duration, in milliseconds, that the notification appears on the screen.

text
The text to display in the notification.

Element Hierarchy
This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: none

See Also
For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data (p. 189)
- Crowd HTML Elements Reference (p. 510)

crowd-toggle-button
A button that acts as an ON/OFF switch, toggling a state.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following example shows different ways you can use to use the `<crowd-toggle-button>` HTML element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <!--Toggle button without value-->
  <crowd-toggle-button name="toggleButtonWithoutValue"></crowd-toggle-button>
  <!--Toggle button with value-->
  <crowd-toggle-button name="toggleButtonWithValue" value="someValue"></crowd-toggle-button>
  <!--Toggle button disabled-->
  <crowd-toggle-button name="toggleButtonDisabled" disabled></crowd-toggle-button>
  <!--Toggle button marked invalid-->
  <crowd-toggle-button name="toggleButtonInvalid" invalid></crowd-toggle-button>
  <!--Toggle button marked required-->
  <crowd-toggle-button name="toggleButtonRequired" required></crowd-toggle-button>
</crowd-form>
```

Attributes
The following attributes are supported by this element.

**checked**
A Boolean switch that, if present, displays the button switched to the ON position.
disabled

A Boolean switch that, if present, displays the button as disabled and prevents toggling.

invalid

When in an off position, a button using this attribute, will display in an alert color. The standard is red, but may be changed in CSS. When toggled on, the button will display in the same color as other buttons in the on position.

name

A string that is used to identify the answer submitted by the worker. This value matches a key in the JSON object that specifies the answer.

required

A Boolean switch that, if present, requires the worker to provide input.

disabled

A value used in the output as the property name for the element's Boolean state. Defaults to "on" if not provided.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form (p. 533)
- **Child elements**: none

Output

This element outputs the **name** as the name of an object, containing the **value** as a property name and the element's state as Boolean value for the property. If no value for the element is specified, the property name defaults to "on."

Example Sample output for this element

```
[
  {
    "theToggler": {
      "on": true
    }
  }
]
```

crowd-textract-analyze-document

A widget to enable human review of a Amazon Textract document analysis result.

Attributes

The following attributes are supported by this element.

header

This is the text that is displayed as the header.

src

This is a link to the image to be analyzed by the worker.

initialValue

This sets initial values for attributes found in the worker UI.

The following is an example of an initialValue input:

```json
[
  {
    "blockType": "KEY_VALUE_SET",
    "confidence": 38.43309020996094,
    "geometry": {
      "boundingBox": {
        "width": 0.32613086700439453,
        "weight": 0.0942094624042511,
        "left": 0.4833833575248718,
        "top": 0.5227988958358765
      },
      "polygon": [
        {"X": 0.123, "Y": 0.345}, ...
      ]
    },
    "id": "8c97b240-0969-4678-834a-646c95da9cf4",
    "relationships": [
      {
        "type": "CHILD",
        "ids": [
          "7ee7b7da-ee1b-428d-a567-55a3e3affa56",
          "4d6da730-ba43-467c-a9a5-c6137ba0c472"
        ]
      },
      {
        "type": "VALUE",
        "ids": [
          "6ee7b7da-ee1b-428d-a567-55a3e3affa54"
        ]
      }
    ],
    "entityTypes": [
      "KEY"
    ],
    "text": "Foo bar"
  }
]```
blockTypes

This determines the kind of analysis the workers can do. Only KEY_VALUE_SET is currently supported.

keys

This specifies new keys and the associated text value the worker can add. The input values for keys can include the following elements:

- importantFormKey accepts strings, and is used to specify a single key.
- importantFormKeyAliases can be used to specify aliases that are acceptable alternatives to the keys supplied. Use this element to identify alternative spellings or presentations of your keys. This parameter accepts a list of one or more strings.

The following is an example of an input for keys.

```
[
    {
        importantFormKey: 'Address',
        importantFormKeyAliases: [
            'address',
            'Addr.',
            'Add.'
        ]
    },
    {
        importantFormKey: 'Last name',
        importantFormKeyAliases: ['Surname']
    }
]
```

no-key-edit

This prevents the workers from editing the keys of annotations passed through initialValue. This prevents workers from editing the keys that have been detected on your documents. This is required.

no-geometry-edit

This prevents workers from editing the polygons of annotations passed through initialValue. For example, this would prevent the worker from editing the bounding box around a given key. This is required.

Element Hierarchy

This element has the following parent and child elements.

- Parent elements – crowd-form
- Child elements – full-instructions (p. 585), short-instructions (p. 585)

Regions

The following regions are supported by this element. You can use custom HTML and CSS code within these regions to format your instructions to workers. For example, use the short-instructions section to provide good and bad examples of how to complete a task.
**full-instructions**

General instructions about how to work with the widget.

**short-instructions**

Important task-specific instructions that are displayed in a prominent place.

**Example of a Worker Template Using the crowd Element**

An example of a worker template using this crowd element would look like the following.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

{% capture s3_uri %}http://s3.amazonaws.com/{{ task.input.aiServiceRequest.document.s3Object.bucket }}/{{ task.input.aiServiceRequest.document.s3Object.name }}{% endcapture %}

<crowd-form>
  <crowd-textract-analyze-document
    src="{{ s3_uri | grant_read_access }}"
    initial-value="{{ task.input.selectedAiServiceResponse.blocks }}"
    header="Review the key-value pairs listed on the right and correct them if they don't match the following document."
    no-key-edit
    no-geometry-edit
    keys="{{ task.input.humanLoopContext.importantFormKeys }}"
    block-types=["KEY_VALUE_SET"]>
    <short-instructions header="Instructions">
      <style>
        .instructions {
          white-space: pre-wrap;
        }
        .instructionsImage {
          display: inline-block;
          max-width: 100%;
        }
      </style>
      <p class='instructions'>Click on a key-value block to highlight the corresponding key-value pair in the document.

      If it is a valid key-value pair, review the content for the value. If the content is incorrect, correct it.

      The text of the value is incorrect, correct it.
      <img class='instructionsImage' src='https://assets.crowd.aws/images/a2i-console/correct-value-text.png' />

      A wrong value is identified, correct it.
      <img class='instructionsImage' src='https://assets.crowd.aws/images/a2i-console/correct-value.png' />

      If it is not a valid key-value relationship, choose No.
      <img class='instructionsImage' src='https://assets.crowd.aws/images/a2i-console/not-a-key-value-pair.png' />

      If you can’t find the key in the document, choose Key not found.
      <img class='instructionsImage' src='https://assets.crowd.aws/images/a2i-console/key-is-not-found.png' />

      If the content of a field is empty, choose Value is blank.
      <img class='instructionsImage' src='https://assets.crowd.aws/images/a2i-console/value-is-blank.png' />
    </short-instructions>
  </crowd-textract-analyze-document>
</crowd-form>
```
Examples

Key and value are often displayed next or below to each other.

Key and value displayed in one line.

Key and value displayed in two lines.

If the content of the value has multiple lines, enter all the text without line break. Include all value text even if it extends beyond the highlight box.

Output

The following is a sample of the output from this element. You can find a detailed explanation of this output in the Amazon Textract AnalyzeDocument API documentation.

```
{
"AWS/Textract/AnalyzeDocument/Forms/V1": {
blocks: [

{ "blockType": "KEY_VALUE_SET",
"id": "8c97b240-0969-4678-834a-646c95da9cf4",
"relationships": [
{ "type": "CHILD",
"ids": ["7ee7b7da-ee1b-428d-a567-55a3e3affa56", "4d6da730-ba43-467c-a9a5-c6137ba0c472"]
},
{ "type": "VALUE",
"ids": ["6ee7b7da-ee1b-428d-a567-55a3e3affa54"]
}
],
"entityTypes": ["KEY"],
"text": "Foo bar baz"
}
]
}
```

crowd-rekognition-detect-moderation-labels

A widget to enable human review of an Amazon Rekognition image moderation result.

Attributes

The following attributes are supported by this element.

header

This is the text that is displayed as the header.
src
This is a link to the image to be analyzed by the worker.

categories
This supports categories as an array of strings or an array of objects where each object has a name field.

If the categories come in as objects, the following applies:

• The displayed categories are the value of the name field.
• The returned answer contains the full objects of any selected categories.

If the categories come in as strings, the following applies:

• The returned answer is an array of all the strings that were selected.

exclusion-category
By setting this attribute you create a button underneath the categories in the UI.

• When a user chooses the button, all categories are deselected and disabled.
• Choosing the button again re-enables the categories so that users can choose them.
• If you submit after choosing the button, it returns an empty array.

Element Hierarchy
This element has the following parent and child elements.

• Parent elements – crowd-form
• Child elements – full-instructions (p. 587), short-instructions (p. 587)

AWS Regions
The following AWS Regions are supported by this element. You can use custom HTML and CSS code within these Regions to format your instructions to workers. For example, use the short-instructions section to provide good and bad examples of how to complete a task.

full-instructions
General instructions about how to work with the widget.

short-instructions
Important task-specific instructions that are displayed in a prominent place.

Example Worker Template with the crowd Element
An example of a worker template using the crowd element would look like the following.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/{{ task.input.aiServiceRequest.image.s3Object.bucket }}/\n  {{ task.input.aiServiceRequest.image.s3Object.name }}{% endcapture %}
```
<crowd-form>
  <crowd-rekognition-detect-moderation-labels
categories='[
  {% for label in task.input.selectedAiServiceResponse.moderationLabels %}
    {name: "{{ label.name }}", parentName: "{{ label.parentName }}"},
  {% endfor %}
]
  src="{{ s3_uri | grant_read_access }}"
  header="Review the image and choose all applicable categories."
'>
  <short-instructions header="Instructions">
    <style>
      .instructions {
        white-space: pre-wrap;
      }
    </style>
    <p class='instructions'>Review the image and choose all applicable categories. If no categories apply, choose None.

    <b>Nudity</b>
    Visuals depicting nude male or female person or persons

    <b>Graphic Male Nudity</b>
    Visuals depicting full frontal male nudity, often close ups

    <b>Graphic Female Nudity</b>
    Visuals depicting full frontal female nudity, often close ups

    <b>Sexual Activity</b>
    Visuals depicting various types of explicit sexual activities and pornography

    <b>Illustrated Nudity or Sexual Activity</b>
    Visuals depicting animated or drawn sexual activity, nudity or pornography

    <b>Adult Toys</b>
    Visuals depicting adult toys, often in a marketing context

    <b>Female Swimwear or Underwear</b>
    Visuals depicting female person wearing only swimwear or underwear

    <b>Male Swimwear Or Underwear</b>
    Visuals depicting male person wearing only swimwear or underwear

    <b>Partial Nudity</b>
    Visuals depicting covered up nudity, for example using hands or pose

    <b>Revealing Clothes</b>
    Visuals depicting revealing clothes and poses, such as deep cut dresses

    <b>Graphic Violence or Gore</b>
    Visuals depicting prominent blood or bloody injuries

    <b>Physical Violence</b>
    Visuals depicting violent physical assault, such as kicking or punching

    <b>Weapon Violence</b>
    Visuals depicting violence using weapons like firearms or blades, such as shooting

    <b>Weapons</b>
    Visuals depicting weapons like firearms and blades

    <b>Self Injury</b>
  </p>
</short-instructions>
</crowd-form>
Visuals depicting self-inflicted cutting on the body, typically in distinctive patterns using sharp objects

<b>Emaciated Bodies</b>
Visuals depicting extremely malnourished human bodies

<b>Corpses</b>
Visuals depicting human dead bodies

<b>Hanging</b>
Visuals depicting death by hanging

Output

The following is a sample of the output from this element. For details about this output, see Amazon Rekognition <code>DetectModerationLabels</code> API documentation.

```json
{
   "AWS/Rekognition/DetectModerationLabels/Image/V3": {
      "ModerationLabels": [
         { name: 'Gore', parentName: 'Violence' },
         { name: 'Corpses', parentName: 'Violence' }
      ]
   }
}
```
Prepare and Analyze Datasets

Import, prepare, transform, visualize and analyze data with Amazon SageMaker Data Wrangler. You can integrate Data Wrangler into your machine learning workflows to simplify and streamline data pre-processing and feature engineering using little to no coding. You can also add your own Python scripts and transformations to customize your data prep workflow.

Import data from Amazon S3, Amazon Redshift, Amazon Athena, and use Data Wrangler to create sophisticated machine learning data prep workflows with built-in and custom data transformations and analysis including feature target leakage and quick modeling.

After you have defined a data prep workflow, or data flow, you can integrate it with SageMaker Processing, SageMaker Pipelines, and SageMaker Feature Store, simplify the task of processing, sharing and storing ML training data. You can also export your data flow to a python script and create a custom ML data prep pipeline.

For more information, see Prepare ML Data with Amazon SageMaker Data Wrangler (p. 606).

Topics

- Prepare ML Data with Amazon SageMaker Data Wrangler (p. 606)
- Prepare Data at Scale with Studio Notebooks (p. 691)

Detect Pretraining Data Bias

Algorithmic bias, discrimination, fairness, and related topics have been studied across disciplines such as law, policy, and computer science. A computer system might be considered biased if it discriminates against certain individuals or groups of individuals. The machine learning models powering these applications learn from data and this data could reflect disparities or other inherent biases. For example, the training data may not have sufficient representation of various demographic groups or may contain biased labels. The machine learning models trained on datasets that exhibit these biases could end up learning them and then reproduce or even exacerbate those biases in their predictions. The field of machine learning provides an opportunity to address biases by detecting them and measuring them at each stage of the ML lifecycle. You can use Amazon SageMaker Clarify to determine whether data used for training models encodes any bias.

Bias can be measured before training and after training, and monitored against baselines after deploying models to endpoints for inference. Pretraining bias metrics are designed to detect and measure bias in the raw data before it is used to train a model. The metrics used are model-agnostic because they do not depend on any model outputs. However, there are different concepts of fairness that require distinct measures of bias. Amazon SageMaker Clarify provides bias metrics to quantify various fairness criteria.

For additional information about bias metrics, see Fairness Measures for Machine Learning in Finance.

Amazon SageMaker Clarify Terms for Bias and Fairness

SageMaker Clarify uses the following terminology to discuss bias and fairness.

Feature
An individual measurable property or characteristic of a phenomenon being observed, contained in a column for tabular data.
Label

Feature that is the target for training a machine learning model. Referred to as the observed label or observed outcome.

Predicted label

The label as predicted by the model. Also referred to as the predicted outcome.

Sample

An observed entity described by feature values and label value, contained in a row for tabular data.

Dataset

A collection of samples.

Bias

An imbalance in the training data or the prediction behavior of the model across different groups, such as age or income bracket. Biases can result from the data or algorithm used to train your model. For instance, if an ML model is trained primarily on data from middle-aged individuals, it may be less accurate when making predictions involving younger and older people.

Bias metric

A function that returns numerical values indicating the level of a potential bias.

Bias report

A collection of bias metrics for a given dataset, or a combination of a dataset and a model.

Positive label values

Label values that are favorable to a demographic group observed in a sample. In other words, designates a sample as having a positive result.

Negative label values

Label values that are unfavorable to a demographic group observed in a sample. In other words, designates a sample as having a negative result.

Group variable

Categorical column of the dataset that is used to form subgroups for the measurement of Conditional Demographic Disparity (CDD). Required only for this metric with regards to Simpson's paradox.

Facet

A column or feature that contains the attributes with respect to which bias is measured.

Facet value

The feature values of attributes that bias might favor or disfavor.

Predicted probability

The probability, as predicted by the model, of a sample having a positive or negative outcome.

Sample Notebooks

Amazon SageMaker Clarify provides the following sample notebook for bias detection:

- Explainability and bias detection with Amazon SageMaker Clarify – Use SageMaker Clarify to create a processing job for the detecting bias and explaining model predictions with feature attributions.
This notebook has been verified to run in Amazon SageMaker Studio only. If you need instructions on how to open a notebook in Amazon SageMaker Studio, see Create or Open an Amazon SageMaker Studio Notebook (p. 70). If you’re prompted to choose a kernel, choose Python 3 (Data Science).

Topics
- Measure Pretraining Bias (p. 592)
- Generate Reports for Bias in Pretraining Data in SageMaker Studio (p. 601)

Measure Pretraining Bias

Measuring bias in ML models is a first step to mitigating bias. Each measure of bias corresponds to a different notion of fairness. Even considering simple concepts of fairness leads to many different measures applicable in various contexts. For example, consider fairness with respect to age, and, for simplicity, that middle-aged and rest of the age groups are the two relevant demographics, referred to as facets. In the case of an ML model for lending, we may want small business loans to be issued to equal numbers of both demographics. Or, when processing job applicants, we may want to see equal numbers of members of each demographic hired. However, this approach may assume that equal numbers of both age groups apply to these jobs, so we may want to condition on the number that apply. Further, we may want to consider not whether equal numbers apply, but whether we have equal numbers of qualified applicants. Or, we may consider fairness to be an equal acceptance rate of qualified applicants across both age demographics, or, an equal rejection rate of applicants, or both. You might use datasets with different proportions of data on the attributes of interest. This imbalance can confound the bias measure you choose. The models might be more accurate in classifying one facet than in the other. Thus, you need to choose bias metrics that are conceptually appropriate for the application and the situation.

We use the following notation to discuss the bias metrics. The conceptual model described here is for binary classification, where events are labeled as having only two possible outcomes in their sample space, referred to as positive (with value 1) and negative (with value 0). This framework is usually extensible to multiclassification in a straightforward way or to cases involving continuous valued outcomes when needed. In the binary classification case, positive and negative labels are assigned to outcomes recorded in a raw dataset for a favored facet \( a \) and for a disfavored facet \( d \). These labels \( y \) are referred to as observed labels to distinguish them from the predicted labels \( y' \) that are assigned by a machine learning model during the training or inference stages of the ML lifecycle. These labels are used to define probability distributions \( P_a(y) \) and \( P_d(y) \) for their respective facet outcomes.

- labels:
  - \( y \) represents the \( n \) observed labels for event outcomes in a training dataset.
  - \( y' \) represents the predicted labels for the \( n \) observed labels in the dataset by a trained model.
- outcomes:
  - A positive outcome (with value 1) for a sample, such as an application acceptance.
    - \( n^{(1)} \) is the number of observed labels for positive outcomes (acceptances).
    - \( n^{(1)} \) is the number of predicted labels for positive outcomes (acceptances).
  - A negative outcome (with value 0) for a sample, such as an application rejection.
    - \( n^{(0)} \) is the number of observed labels for negative outcomes (rejections).
    - \( n^{(0)} \) is the number of predicted labels for negative outcomes (rejections).
- facet values:
  - facet \( a \) – The feature value that defines a demographic that bias favors.
    - \( n_a \) is the number of observed labels for the favored facet value: \( n_a = n_a^{(1)} + n_a^{(0)} \) the sum of the positive and negative observed labels for the value facet \( a \).
    - \( n_a' \) is the number of predicted labels for the favored facet value: \( n_a' = n_a'^{(1)} + n_a'^{(0)} \) the sum of the positive and negative predicted outcome labels for the facet value \( a \). Note that \( n_a' = n_a \).
  - facet \( d \) – The feature value that defines a demographic that bias disfavors.
• \( n_d \) is the number of observed labels for the disfavored facet value: \( n_d = n_d^{(1)} + n_d^{(0)} \) the sum of the positive and negative observed labels for the facet value \( d \).
• \( n'_d \) is the number of predicted labels for the disfavored facet value: \( n'_d = n'_d^{(1)} + n'_d^{(0)} \) the sum of the positive and negative predicted labels for the facet value \( d \). Note that \( n'_d = n_d \).

• probability distributions for outcomes of the labeled facet data outcomes:
  • \( P_a(y) \) is the probability distribution of the observed labels for facet \( a \). For binary labeled data, this distribution is given by the ratio of the number of samples in facet \( a \) labeled with positive outcomes to the total number, \( P_a(y^1) = n_a^{(1)}/n_a \), and the ratio of the number of samples with negative outcomes to the total number, \( P_a(y^0) = n_a^{(0)}/n_a \).
  • \( P_d(y) \) is the probability distribution of the observed labels for facet \( d \). For binary labeled data, this distribution is given by the number of samples in facet \( d \) labeled with positive outcomes to the total number, \( P_d(y^1) = n_d^{(1)}/n_d \), and the ratio of the number of samples with negative outcomes to the total number, \( P_d(y^0) = n_d^{(0)}/n_d \).

Models trained on data biased by demographic disparities might learn and even exacerbate them. To identify bias in the data before expending resources to train models on it, SageMaker Clarify provides data bias metrics that you can compute on raw datasets before training. All of the pretraining metrics are model-agnostic because they do not depend on model outputs and so are valid for any model. The first bias metric examines facet imbalance, but not outcomes. It determines the extent to which the amount of training data is representative across different facets, as desired for the application. The remaining bias metrics compare the distribution of outcome labels in various ways for facets \( a \) and \( d \) in the data. The metrics that range over negative values can detect negative bias. The following table contains a cheat sheet for quick guidance and links to the pretraining bias metrics.

## Measure Pretraining Bias

**Bias metric** | **Description** | **Example question** | **Interpreting metric values**
--- | --- | --- | ---
$L_p$-norm (LP) (p. 598) | Measures a $p$-norm difference between distinct demographic distributions of the outcomes associated with different facets in a dataset. | How different are the distributions for loan application outcomes for different demographics? | Range for binary, multicategory, continuous: $[0, +\infty)$
Interpretation:
- Values near zero indicate the labels are similarly distributed.
- Positive values indicate the label distributions diverge, the more positive the larger the divergence.

Total Variation Distance (TVD) (p. 599) | Measures half of the $L_1$-norm difference between distinct demographic distributions of the outcomes associated with different facets in a dataset. | How different are the distributions for loan application outcomes for different demographics? | Range for binary, multicategory, and continuous outcomes: $[0, +\infty)$
- Values near zero indicate the labels are similarly distributed.
- Positive values indicate the label distributions diverge, the more positive the larger the divergence.

Kolmogorov-Smirnov (KS) (p. 599) | Measures maximum divergence between outcomes in distributions for different facets in a dataset. | Which college application outcomes manifest the greatest disparities by demographic group? | Range of KS values for binary, multicategory, and continuous outcomes: $[0,1 +]$:
- Values near zero indicate the labels were evenly distributed between facets in all outcome categories.
- Values near one indicate the labels for one category were all in one facet, so very imbalanced.
- Intermittent values indicate relative degrees of maximum label imbalance.
Bias metric | Description | Example question | Interpreting metric values |
---|---|---|---|
**Conditional Demographic Disparity (CDD) (p. 600)** | Measures the disparity of outcomes between different facets as a whole, but also by subgroups. | Do some groups have a larger proportion of rejections for college admission outcomes than their proportion of acceptances? | Range of CDD: [-1, +1] |
- Positive values indicate a outcomes where facet \( d \) is rejected more than accepted. |
- Near zero indicates no demographic disparity on average. |
- Negative values indicate a outcomes where facet \( a \) is rejected more than accepted. |

For additional information about bias metrics, see Fairness Measures for Machine Learning in Finance.

### Class Imbalance (CI)

Class imbalance (CI) bias occurs when a facet value \( d \) has fewer training samples when compared with another facet \( a \) in the dataset. This is because models preferentially fit the larger facets at the expense of the smaller facets and so can result in a higher training error for facet \( d \). Models are also at higher risk of overfitting the smaller data sets, which can cause a larger test error for facet \( d \). Consider the example where a machine learning model is trained primarily on data from middle-aged individuals, it might be less accurate when making predictions involving younger and older people.

The formula for the (normalized) facet imbalance measure:

\[
CI = (n_a - n_d)/(n_a + n_d)
\]

Where \( n_a \) is the number of members of facet \( a \) and \( n_d \) the number for facet \( d \). Its values range over the interval [-1, 1].

- Positive CI values indicate the facet \( a \) has more training samples in the dataset and a value of 1 indicates the data only contains members of the facet \( a \).
- Values of CI near zero indicate a more equal distribution of members between facets and a value of zero indicates a perfectly equal partition between facets and represents a balanced distribution of samples in the training data.
• Negative CI values indicate the facet $d$ has more training samples in the dataset and a value of -1 indicates the data only contains members of the facet $d$.

• CI values near either of the extremes values of -1 or 1 are very imbalanced and are at a substantial risk of making biased predictions.

If a significant facet imbalance is found to exist among the facets, you might want to rebalance the sample before proceeding to train models on it.

**Difference in Proportions of Labels (DPL)**

The difference in proportions of labels (DPL) compares the proportion of observed outcomes with positive labels for facet $d$ with the proportion of observed outcomes with positive labels of facet $a$ in a training dataset. For example, you could use it to compare the proportion of middle-aged individuals (facet $a$) and other age groups (facet $d$) approved for financial loans. Machine learning models try to mimic the training data decisions as closely as possible. So a machine learning model trained on a dataset with a high DPL is likely to reflect the same imbalance in its future predictions.

The formula for the difference in proportions of labels is as follows:

$$DPL = (q_a - q_d)$$

Where:

• $q_a = n_a^{(1)}/n_a$ is the proportion of facet $a$ who have an observed label value of 1. For example, the proportion of a middle-aged demographic who get approved for loans. Here $n_a^{(1)}$ represents the number of members of facet $a$ who get a positive outcome and $n_a$ the is number of members of facet $a$.

• $q_d = n_d^{(1)}/n_d$ is the proportion of facet $d$ who have an observed label value of 1. For example, the proportion of people outside the middle-aged demographic who get approved for loans. Here $n_d^{(1)}$ represents the number of members of the facet $d$ who get a positive outcome and $n_d$ the is number of members of the facet $d$.

If DPL is close enough to 0, then we say that *demographic parity* has been achieved.

For binary and multicategory facet labels, the DPL values range over the interval (-1, 1). For continuous labels, we set a threshold to collapse the labels to binary.

• Positive DPL values indicate that facet $a$ is has a higher proportion of positive outcomes when compared with facet $d$.

• Values of DPL near zero indicate a more equal proportion of positive outcomes between facets and a value of zero indicates perfect demographic parity.

• Negative DPL values indicate that facet $d$ has a higher proportion of positive outcomes when compared with facet $a$.

Whether or not a high magnitude of DPL is problematic varies from one situation to another. In a problematic case, a high-magnitude DPL might be a signal of underlying issues in the data. For example, a dataset with high DPL might reflect historical biases or prejudices against age-based demographic groups that would be undesirable for a model to learn.

**Kullback-Leibler Divergence (KL)**

The Kullback-Leibler divergence (KL) measures how much the observed label distribution of facet $a$, $P_a(y)$, diverges from distribution of facet $d$, $P_d(y)$. It is also known as the relative entropy of $P_a(y)$ with respect to $P_d(y)$ and quantifies the amount of information lost when moving from $P_a(y)$ to $P_d(y)$. 

597
The formula for the Kullback-Leibler divergence is as follows:

$$KL(P_a \| P_d) = \sum_y P_d(y) \cdot \log[P_a(y)/P_d(y)]$$

It is the expectation of the logarithmic difference between the probabilities $P_a(y)$ and $P_d(y)$, where the expectation is weighted by the probabilities $P_d(y)$. This is not a true distance between the distributions as it is asymmetric and does not satisfy the triangle inequality. The implementation uses natural logarithms, giving KL in units of nats. Using different logarithmic bases gives proportional results but in different units. For example, using base 2 gives KL in units of bits.

For example, assume that a group of applicants for loans have a 30% approval rate (facet $d$) and that the approval rate for other applicants (facet $a$) is 80%. The Kullback-Leibler formula gives you the label distribution divergence of facet $a$ from facet $d$ as follows:

$$KL = 0.8\ln(0.8/0.3) + 0.2\ln(0.2/0.7) = 0.53$$

There are two terms in the formula here because labels are binary in this example. This measure can be applied to multiple labels in addition to binary ones. For example, in a college admissions scenario, assume an applicant may be assigned one of three category labels: $y_i = \{y_0, y_1, y_2\} = \{rejected, waitlisted, accepted\}$.

Range of values for the KL metric for binary, multicategory, and continuous outcomes is $[0, +\infty)$.
- Values near zero mean the outcomes are similarly distributed for the different facets.
- Positive values mean the label distributions diverge, the more positive the larger the divergence.

### Jensen-Shannon Divergence (JS)

The Jensen-Shannon divergence (JS) measures how much the label distributions of different facets diverge from each other entropically. It is based on the Kullback-Leibler divergence, but it is symmetric.

The formula for the Jensen-Shannon divergence is as follows:

$$JS = \frac{1}{2}[KL(P_a \| P) + KL(P_d \| P)]$$

Where $P = \frac{1}{2}(P_a + P_d)$, the average label distribution across facets $a$ and $d$.

The range of JS values for binary, multicategory, continuous outcomes is $[0, \ln(2))$.
- Values near zero mean the labels are similarly distributed.
- Positive values mean the label distributions diverge, the more positive the larger the divergence.

This metric indicates whether there is a big divergence in one of the labels across facets.

### L_p-norm (LP)

The $L_p$-norm (LP) measures the p-norm distance between the facet distributions of the observed labels in a training dataset. This metric is non-negative and so cannot detect reverse bias.

The formula for the $L_p$-norm is as follows:

$$L_p(P_a, P_d) = \left( \sum \|P_a - P_d\|^p \right)^{1/p}$$

Where the p-norm distance between the points $x$ and $y$ is defined as follows:

$$L_p(x, y) = (|x_1 - y_1|^p + |x_2 - y_2|^p + \ldots + |x_n - y_n|^p)^{1/p}$$
The 2-norm is the Euclidean norm. Assume you have an outcome distribution with three categories, for example, \( y_i = \{y_0, y_1, y_2\} = \{\text{accepted, waitlisted, rejected}\} \) in a college admissions multicategory scenario. You take the sum of the squares of the differences between the outcome counts for facets \( a \) and \( d \). The resulting Euclidean distance is calculated as follows:

\[
L_2(P_a, P_d) = \left( (n_a^{(0)} - n_d^{(0)})^2 + (n_a^{(1)} - n_d^{(1)})^2 + (n_a^{(2)} - n_d^{(2)})^2 \right)^{1/2}
\]

Where:
- \( n_a^{(i)} \) is number of the \( i \)th category outcomes in facet \( a \): for example \( n_a^{(0)} \) is number of facet \( a \) acceptances.
- \( n_d^{(i)} \) is number of the \( i \)th category outcomes in facet \( d \): for example \( n_d^{(2)} \) is number of facet \( d \) rejections.

The range of \( L_2 \) values for binary, multicategory, and continuous outcomes is \([0, \sqrt{2})\), where:
- Values near zero mean the labels are similarly distributed.
- Positive values mean the label distributions diverge, the more positive the larger the divergence.

**Total Variation Distance (TVD)**

The total variation distance data bias metric (TVD) is half the \( L_1 \)-norm. The TVD is the largest possible difference between the probability distributions for label outcomes of facets \( a \) and \( d \). The \( L_1 \)-norm is the Hamming distance, a metric used compare two binary data strings by determining the minimum number of substitutions required to change one string into another. If the strings were to be copies of each other, it determines the number of errors that occurred when copying. In the bias detection context, TVD quantifies how many outcomes in facet \( a \) would have to be changed to match the outcomes in facet \( d \).

The formula for the Total variation distance is as follows:

\[
TVD = \frac{1}{2}L_1(P_a, P_d)
\]

For example, assume you have an outcome distribution with three categories, \( y_i = \{y_0, y_1, y_2\} = \{\text{accepted, waitlisted, rejected}\} \) in a college admissions multicategory scenario. You take the differences between the counts of facets \( a \) and \( d \) for each outcome to calculate TVD. The result is as follows:

\[
L_1(P_a, P_d) = |n_a^{(0)} - n_d^{(0)}| + |n_a^{(1)} - n_d^{(1)}| + |n_a^{(2)} - n_d^{(2)}|
\]

Where:
- \( n_a^{(i)} \) is number of the \( i \)th category outcomes in facet \( a \): for example \( n_a^{(0)} \) is number of facet \( a \) acceptances.
- \( n_d^{(i)} \) is number of the \( i \)th category outcomes in facet \( d \): for example \( n_d^{(2)} \) is number of facet \( d \) rejections.

The range of TVD values for binary, multicategory, and continuous outcomes is \([0, 1)\), where:
- Values near zero mean the labels are similarly distributed.
- Positive values mean the label distributions diverge, the more positive the larger the divergence.

**Kolmogorov-Smirnov (KS)**

The Kolmogorov-Smirnov bias metric (KS) is equal to the maximum divergence between labels in the distributions for facets \( a \) and \( d \) of a dataset. The two-sample KS test implemented by SageMaker Clarify complements the other measures of label imbalance by finding the most imbalanced label.

The formula for the Kolmogorov-Smirnov metric is as follows:
KS = \max(|P_a(y) - P_d(y)|)

For example, assume a group of applicants (facet \(a\)) to college are rejected, waitlisted, or accepted at 40%, 40%, 20% respectively and that these rates for other applicants (facet \(d\)) are 20%, 10%, 70%. Then the Kolmogorov-Smirnov bias metric value is as follows:

\[
KS = \max([0.4-0.2], [0.4-0.1], [0.2-0.7]) = 0.5
\]

This tells us the maximum divergence between facet distributions is 0.5 and occurs in the acceptance rates. There are three terms in the equation because labels are multiclass of cardinality three.

The range of LP values for binary, multicategory, and continuous outcomes is \([0, +1]\), where:

- Values near zero indicate the labels were evenly distributed between facets in all outcome categories. For example, both facets applying for a loan got 50% of the acceptances and 50% of the rejections.
- Values near one indicate the labels for one outcome were all in one facet. For example, facet \(a\) got 100% of the acceptances and facet \(d\) got none.
- Intermittent values indicate relative degrees of maximum label imbalance.

**Conditional Demographic Disparity (CDD)**

The demographic disparity metric (DD) determines whether facet \(d\) has a larger proportion of the rejected outcomes in the dataset than of the accepted outcomes. For example, in the case of college admissions, if women applicants comprised 60% of the rejected applicants and comprised only 50% of the accepted applicants, we say that there is demographic disparity because the rate at which women were rejected exceeds the rate at which they are accepted.

The formula for the demographic disparity for the less favored facet \(d\) is as follows:

\[
DD_d = \frac{n_d(0)}{n(0)} - \frac{n_d(1)}{n(1)} = P_d^R(y^0) - P_d^A(y^1)
\]

Where:

- \(n(0) = n_a(0) + n_d(0)\) is the number of rejected outcomes in the dataset.
- \(n(1) = n_a(1) + n_d(1)\) is the number of accepted outcomes in the dataset.
- \(P_d^R(y^0)\) is the proportion of rejected outcomes (with value 0) in facet \(d\).
- \(P_d^A(y^1)\) is the proportion of accepted outcomes (value 1) in facet \(d\).

For the college admission example, the demographic disparity is \(DD = 0.6 - 0.5 = 0.1\).

A conditional demographic disparity (CDD) metric that conditions DD on attributes that define a strata of subgroups on the dataset is needed to rule out Simpson's paradox. The regrouping can provide insights into the cause of apparent demographic disparities for less favored facets. The classic case arose in the case of Berkeley admissions where men were accepted at a higher rate overall than women. However, when departmental subgroups were examined, women were shown to have higher admission rates than men by department. The explanation was that women had applied to departments with lower acceptance rates than men had. Examining the subgrouped acceptance rates revealed that women were actually accepted at a higher rate than men for the departments with lower acceptance rates.

The CDD metric gives a single measure for all of the disparities found in the subgroups defined by an attribute of a dataset by averaging them. It is defined as the weighted average of demographic disparities \((DD_i)\) for each of the subgroups, with each subgroup disparity weighted in proportion to the number of observations in contains. The formula for the conditional demographic disparity is as follows:

\[
CDD = \frac{1}{n} \sum n_i \cdot DD_i
\]
Generate Reports for Bias in Pretraining Data in SageMaker Studio

Where:

- $\sum n_i = n$ is the total number of observations and $n_i$ is the number of observations for each subgroup.
- $DD_i = n_i(0)/n(0) - n_i(1)/n(1) = P_i^R(y^0) - P_i^A(y^1)$ is the demographic disparity for the $i$th subgroup.

The demographic disparity for a subgroup (DD) are the difference between the proportion of rejected outcomes and the proportion of accepted outcomes for each subgroup.

The range of DD values for binary outcomes is (-1, +1).

- +1: when there are no rejections in facet $a$ or subgroup and no acceptances in facet $d$ or subgroup
- Positive values indicate there is a demographic disparity as facet $d$ or subgroup has a smaller proportion of the rejected outcomes in the dataset than of the accepted outcomes. The higher the value the greater the disparity.
- Negative values indicate there is a demographic disparity as facet $a$ or subgroup has a larger proportion of the rejected outcomes in the dataset than of the accepted outcomes. The lower the value the greater the disparity.
- -1: when there are no rejections in facet $d$ or subgroup and no acceptances in facet $a$ or subgroup

If you don't condition on anything then CDD is zero if and only if DPL is zero.

This metric is useful for exploring the concepts of direct and indirect discrimination and of objective justification in EU and UK non-discrimination law and jurisprudence. For additional information, see Why Fairness Cannot Be Automated.

Generate Reports for Bias in Pretraining Data in SageMaker Studio

SageMaker Clarify is integrated with Amazon SageMaker Data Wrangler, which can help you identify bias during data preparation without having to write your own code. Data Wrangler provides an end-to-end solution to import, prepare, transform, featurize, and analyze data with Amazon SageMaker Studio. For an overview of the Data Wrangler data prep workflow, see Prepare ML Data with Amazon SageMaker Data Wrangler (p. 606). You specify attributes of interest, such as gender or age, and SageMaker Clarify runs a set of algorithms to detect the presence of bias in those attributes. After the algorithm runs, SageMaker Clarify provides a visual report with a description of the sources and severity of possible bias so that you can plan steps to mitigate. For example, in a financial dataset that contains few examples of business loans to one age group as compared to others, SageMaker flags the imbalance so that you can avoid a model that disfavors that age group.

To analyze and report on data bias

To get started with Data Wrangler, see Get Started with Data Wrangler (p. 607).

1. Open Amazon SageMaker Studio and choose Create Data Flow from the Import and prepare your data tile.
2. From the **Import data** tab, choose **Amazon S3** and then specify your data source on the **Data sources/S3 source** page.

3. After you have imported your data, choose the plus sign on the **Data flow** page and then choose **Add Analysis**.
4. On the **Create Analysis** page, go to the **Configure** panel and then choose **Bias Report** from the **Chart** menu.

5. Configure the bias report by providing the **Name**, the column to predict and whether it is a value or threshold, the column to analyze for bias (the facet) and whether it is a value or threshold.
6. Continue configuring the bias report by choosing the bias metrics.
7. Choose **Check for bias** to generate and view the bias report. Scroll down to view all of the reports.

8. Choose the carrot to the right of the bias metric description to see documentation that can help you interpret the significance of the metric values.

9. To view a table summary of the bias metric values, choose the table. You can save the report for export by choosing **Create** in the lower-right corner of the page.
10. On the page where your data bias reports are stored, choose the **Export** tab to download the reports.

---

**Prepare ML Data with Amazon SageMaker Data Wrangler**

Amazon SageMaker Data Wrangler (Data Wrangler) is a feature of SageMaker Studio that provides an end-to-end solution to import, prepare, transform, featurize, and analyze data. You can integrate a Data Wrangler data flow into your machine learning (ML) workflows to simplify and streamline data pre-processing and feature engineering using little to no coding. You can also add your own Python scripts and transformations to customize workflows.
The following are the core functionalities that Data Wrangler provides to help you analyze and prepare data for machine learning applications.

- **Import** – Connect to and import data from Amazon Simple Storage Service (Amazon S3), Amazon Athena (Athena), and Amazon Redshift.

- **Data Flow** – Create a data flow to define a series of ML data prep steps. You can use a flow to combine datasets from different data sources, identify the number and types of transformations you want to apply to datasets, and define a data prep workflow that can be easily integrated into an ML pipeline.

- **Transform** – Clean and transform your dataset using standard transforms like string, vector, and numeric data formatting tools. Featurize your data using transforms like text and date/time embedding and categorical encoding.

- **Analyze** – Analyze features in your dataset at any point in your flow. Data Wrangler includes built-in data visualization tools like scatter plots and histograms, as well as data analysis tools like target leakage analysis and quick modeling to understand feature correlation.

- **Export** – Data Wrangler offers export options to other SageMaker services, including Data Wrangler jobs, Feature Store, and pipelines, making it easy to integrate your data prep flow into your ML workflow. You can also export your Data Wrangler flow to Python code.

To start using Data Wrangler, see *Get Started with Data Wrangler* (p. 607).

**Topics**

- Get Started with Data Wrangler (p. 607)
- Import (p. 617)
- Create and Use a Data Wrangler Flow (p. 647)
- Transform Data (p. 650)
- Analyze and Visualize (p. 666)
- Export (p. 672)
- Shut Down Data Wrangler (p. 677)
- Update Data Wrangler (p. 610)
- Security and Permissions (p. 680)
- Release Notes (p. 687)
- Troubleshoot (p. 689)

**Get Started with Data Wrangler**

Amazon SageMaker Data Wrangler is a feature in SageMaker Studio. Use this section to learn how to access and get started using Data Wrangler. Do the following:

1. Complete each step in Prerequisites (p. 607).
2. Follow the procedure in Access Data Wrangler (p. 608) to start using Data Wrangler.

**Prerequisites**

To use Data Wrangler, you must do the following:

1. To use Data Wrangler, you need access to a m5.4xlarge Amazon Elastic Compute Cloud (Amazon EC2) instance. To learn how to view your quotas, and if necessary, request a quota increase, see AWS service quotas.
2. Configure the required permissions described in Security and Permissions (p. 680).

To use Data Wrangler, you need an active SageMaker Studio instance. To learn how to launch a new instance, see Onboard to Amazon SageMaker Studio (p. 34). When your Studio instance is Ready, use the instructions in Access Data Wrangler (p. 608).

**Access Data Wrangler**

The following procedure assumes you have completed the Prerequisites (p. 607).

**To access Data Wrangler in Studio:**

1. Next to the user you want to use to launch Studio, select Open Studio.
2. When Studio opens, select the + sign on the New data flow card under ML tasks and components. This creates a new directory in Studio with a .flow file inside, which contains your data flow. The .flow file automatically opens in Studio.

You can also create a new flow by selecting File, then New, and choosing Data Wrangler Flow in the top navigation bar.

3. (Optional) Rename the new directory and the .flow file.
4. When you create a new .flow file in Studio, you may see a message within the Data Wrangler interface that says:

Data Wrangler is Loading...

This may take a few minutes.

5. To get started, choose a data source and use it to import a dataset. See Import (p. 617) to learn more.

When you import a dataset, it appears in your data flow. To learn more, see Create and Use a Data Wrangler Flow (p. 647).

6. After you import a dataset, Data Wrangler automatically infers the type of data in each column. Choose + next to the Data types step and select Edit data types.
**Important**
After you add transforms to the **Data types** step, you cannot bulk-update column types using **Update types**.

7. Use the data flow to add transforms and analyses. To learn more see Transform Data (p. 650) and Analyze and Visualize (p. 666).

8. To export a complete data flow, choose **Export** and choose an export option. To learn more, see Export (p. 672).

9. Finally, choose the **Components and registries** icon, and select **Data Wrangler** from the dropdown list to see all .flow files you've created. You can use this menu to find and move between data flows.

After you have launched Data Wrangler, you can use the following section to walk through how you might use Data Wrangler to create an ML data prep flow.

**Update Data Wrangler**

It is recommended that you periodically update the Data Wrangler Studio app to access the latest features and updates. The data wrangler app name starts with `sagemaker-data-wrangler`. To learn how to update a SageMaker Studio app, see Update Studio Apps (p. 118).

**Demo: Data Wrangler Titanic Dataset Walkthrough**

The following sections provide a walkthrough to help you get started using Data Wrangler. This walkthrough assumes that you have already followed the steps in Access Data Wrangler (p. 608) and have a new data flow file open that you intend to use for the demo. You may want to rename this .flow file to something similar to `titanic-demo.flow`.

This walk through uses the **Titanic dataset**. This data set contains the survival status, age, gender, and class (which serves as a proxy for economic status) of passengers aboard the maiden voyage of the RMS Titanic in 1912.

In this tutorial, you:

- Upload the **Titanic dataset** to Amazon Simple Storage Service (Amazon S3), and then import this dataset into Data Wrangler.
- Analyze this dataset using Data Wrangler analyses.
- Define a data flow using Data Wrangler data transforms.
• Export your flow to a Jupyter Notebook that you can use to create a Data Wrangler job.
• Process your data, and kick off a SageMaker training job to train an XGBoost Binary Classifier.

**Upload Dataset to S3 and Import**

To get started, download the Titanic dataset and upload it to an S3 bucket in the AWS Region in which you want to complete this demo.

If you are a new user of Amazon S3, you can do this using drag and drop in the Amazon S3 console. To learn how, see Uploading Files and Folders by Using Drag and Drop in the Amazon Simple Storage Service Console User Guide.

**Important**

Upload your dataset to an S3 bucket in the same AWS Region you want to use to complete this demo.

When your dataset has been successfully uploaded to Amazon S3, it you can import it into Data Wrangler.

**Import the Titanic dataset to Data Wrangler**

1. Select the Import tab in your Data Wrangler flow file.
2. Select Amazon S3.
3. Use the Import a dataset from S3 table to find the bucket to which you added the Titanic dataset. Choose the Titanic dataset CSV file to open the Details pane.
4. Under Details, the File type should be CSV. Choose Add header to table to specify that the first row of the dataset is a header. You can also name the dataset something more friendly, such as Titanic-train.
5. Select Import dataset.

When your dataset is imported into Data Wrangler, it appears in your data flow. You can view your data flow at any time by selecting the Data Flow tab. You can double click on a node to enter the node detail view which will allow you to add transformations or analysis, otherwise you can use the plus icon to navigate for a quick navigation. In the next section, you use this data flow to add analysis and transform steps.
Data Flow

In the data flow section, you'll notice that the only steps in the data flow are your recently imported dataset and a **Data type** step. After applying transformations, you can come back to this tab see what the data flow looks like. Now, add some basic transformations under the **Prepare** and **Analyze** tabs.

Prepare and Visualize

Data Wrangler has built-in transformations and visualizations that you can use to analyze, clean, and transform your data.

In the **Data** tab of the node detail view, all built-in transformations are listed in the right panel, which also contains an area in which you can add custom transformations. The following use case showcases how to use these transformations.

Data Exploration

First, create a table summary of the data using an analysis. Do the following:

1. Choose the + next to the **Data type** step in your data flow and select **Add analysis**.
2. In the **Analysis** area, select **Table summary** from the dropdown list.
3. Give the table summary a **Name**.
4. Select **Preview** to preview the table that will be created.
5. Choose **Create** to save it to your data flow. It appears under **All Analyses**.

Using the statistics you see, you can make observations similar to the following about this dataset:

- Fare average (mean) is around $33, while the max is over $500. This column likely has outliers.
- This dataset uses ? to indicate missing values. A number of columns have missing values: *cabin*, *embarked*, and *home.dest*
- The age category is missing over 250 values.

Choose **Prepare** to go back to the data flow. Next, clean your data using the insights gained from these stats.

Drop Unused Columns

Using the analysis from the previous section, clean up the dataset to prepare it for training. To add a new transform to your data flow, choose + next to the **Data type** step in your data flow and choose **Add transform**.

First, drop columns that you don't want to use for training. You can use Pandas data analysis library to do this, or you can use one of the built-in transforms.

To do this using Pandas, do the following:

1. In the **Custom Transform** section, select **Python (Pandas)** from the dropdown list.
2. Enter the following in the code box.

   ```python
cols = ['name', 'ticket', 'cabin', 'sibsp', 'parch', 'home.dest', 'boat', 'body']
df = df.drop(cols, axis=1)
```
3. Choose **Preview** to preview the change and then choose **Add** to add the transformation.
To use the built-in transformations, do the following:

1. Choose **Manage columns** from the right panel.
2. For **Input column**, choose **cabin**, and choose **Preview**.
3. Verify that the **cabin** column has been dropped, then choose **Add**.
4. Repeat these steps for the following columns: **ticket**, **name**, **sibsp**, **parch**, **home.dest**, **boat**, and **body**.

**Clean up Missing Values**

Now, clean up missing values. You can do this with the **Handling missing values** transform group.

A number of columns have missing values. Of the remaining columns, **age** and **fare** contain missing values. Inspect this using the **Custom Transform**.

Using the **Python (Pandas)** option, use the following to quickly review the number of entries in each column:

```python
df.info()
```
To drop rows with missing values in the *age* category, do the following:

1. Choose **Handling missing values**.
2. Choose **Drop missing** for the **Transformer**.
3. Choose **Drop Rows** for the **Dimension**.
4. Choose **age** for the **Input column**.
5. Choose **Preview** to see the new data frame, and then choose **Add** to add the transform to your flow.
6. Repeat the same process for **fare**.

You can use `df.info()` in the **Custom transform** section to confirm that all rows now have 1,045 values.

**Custom Pandas: Encode**

Try flat encoding using Pandas. Encoding categorical data is the process of creating a numerical representation for categories. For example, if your categories are Dog and Cat, you may encode this information into two vectors: `[1, 0]` to represent Dog, and `[0, 1]` to represent Cat.

1. In the **Custom Transform** section, choose **Python (Pandas)** from the dropdown list.
2. Enter the following in the code box.
import pandas as pd

dummies = []
cols = ['pclass', 'sex', 'embarked']
for col in cols:
    dummies.append(pd.get_dummies(df[col]))

encoded = pd.concat(dummies, axis=1)
df = pd.concat((df, encoded), axis=1)

3. Choose **Preview** to preview the change. The encoded version of each column is added to the dataset.
4. Choose **Add** to add the transformation.

**Custom SQL: SELECT Columns**

Now, select the columns you want to keep using SQL. For this demo, select the columns listed in the following `SELECT` statement. Because `survived` is your target column for training, put that column first.

1. In the **Custom Transform** section, select **SQL (PySpark SQL)** from the dropdown list.
2. Enter the following in the code box.

```
SELECT survived, age, fare, 1, 2, 3, female, male, C, Q, S FROM df;
```
3. Choose **Preview** to preview the change. The columns listed in your `SELECT` statement above are the only remaining columns.
4. Choose **Add** to add the transformation.

**Export**

When you've finished creating a data flow, you have a number of export options. The following section explains how to export to a Data Wrangler job notebook. A Data Wrangler job is used to process your data using the steps defined in your data flow. To learn more about all export options, see Export (p. 672).

**Export to Data Wrangler Job Notebook**

When you export your data flow using a Data Wrangler job, a Jupyter Notebook is automatically created. This notebook automatically opens in your Studio instance and is configured to run a SageMaker processing job to run your Data Wrangler data flow, which is referred to as a Data Wrangler job.

1. Save your data flow. Select **File** and then select **Save Data Wrangler Flow**.
2. Choose the **Export** tab.
3. Select the last step in your data flow.

![Data Wrangler Job](image)

4. Choose **Data Wrangler Job**. This opens a Jupyter Notebook.
5. Choose any **Python 3 (Data Science)** kernel for the **Kernel**.
6. When the kernel starts, run the cells in the notebook book until **Kick off SageMaker Training Job (Optional)**.
7. Optionally, you can run the cells in **Kick off SageMaker Training Job (Optional)** if you want to create a SageMaker training job to train an XGBoost classifier. You can find the cost to run an SageMaker training job in [Amazon SageMaker Pricing](https://aws.amazon.com/sagemaker/pricing).

   Alternatively, you can add the code blocks found in Training XGBoost Classifier (p. 616) to the notebook and run them to use the XGBoost open source library to train an XGBoost classifier.

8. Uncomment and run the cell under **Cleanup** and run it to revert the SageMaker Python SDK to its original version.

You can monitor your Data Wrangler job status in the SageMaker console in the **Processing** tab. Additionally, you can monitor your Data Wrangler job using Amazon CloudWatch. For additional information, see [Monitor Amazon SageMaker Processing Jobs with CloudWatch Logs and Metrics](https://docs.aws.amazon.com/sagemaker/latest/dg/monitor-training-jobs-cloudwatch.html).

If you kicked off a training job, you can monitor its status using the SageMaker console under **Training jobs** in the **Training section**.

**Training XGBoost Classifier**

In the same notebook that kicked off the Data Wrangler job, you can pull the data and train a XGBoost Binary Classifier using the prepared data with minimal data preparation.

1. First, upgrade necessary modules using pip and remove the _SUCCESS file (this last file is problematic when using awswrangler).

   ```
   ! pip install --upgrade awscli awswrangler boto sklearn
   ! aws s3 rm {output_path} --recursive --exclude "*" --include "*_SUCCESS*"
   ```

2. Read the data from Amazon S3. You can use awswrangler to recursively read all the CSV files in the S3 prefix. The data is then split into features and labels. The label is the first column of the dataframe.

   ```python
   import awswrangler as wr
   df = wr.s3.read_csv(path=output_path, dataset=True)
   X, y = df.iloc[:, :-1], df.iloc[:, -1]
   ```

   • Finally, create DMatrices (the XGBoost primitive structure for data) and do cross-validation using the XGBoost binary classification.

   ```python
   import xgboost as xgb
   dmatrix = xgb.DMatrix(data=X, label=y)
   params = {"objective":"binary:logistic","learning_rate": 0.1, 'max_depth': 5, 'alpha': 10}
   xgb.cv(
       dtrain=dmatrix,
       params=params,
       nfold=3,
       num_boost_round=50,
       early_stopping_rounds=10,
       metrics="rmse",
       as_pandas=True,
       seed=123)
   ```
Shut down Data Wrangler

When you are finished using Data Wrangler, we recommend you shut down the instance it runs on to avoid incurring additional charges. To learn how to shut down the Data Wrangler app and associated instance, see Shut Down Data Wrangler (p. 677).

Import

You can use Amazon SageMaker Data Wrangler to import data from the following data sources: Amazon Simple Storage Service (Amazon S3), Amazon Athena, Amazon Redshift, and Snowflake.

Topics

- Import data from Amazon S3 (p. 617)
- Import data from Athena (p. 619)
- Import data from Amazon Redshift (p. 620)
- Import data from Snowflake (p. 623)
- Imported Data Storage (p. 646)

Some data sources allow you to add multiple data connections:

- You can connect to multiple Amazon Redshift clusters. Each cluster becomes a data source.
- You can query any Athena database in your account to import data from that database.

When you import a dataset from a data source, it appears in your data flow. Data Wrangler automatically infers the data type of each column in your dataset. To modify these types, select the Data types step and select Edit data types.

When you import data from Athena or Amazon Redshift, the imported data is automatically stored in the default SageMaker S3 bucket for the AWS Region in which you are using Studio. Additionally, Athena stores data you preview in Data Wrangler in this bucket. To learn more, see Imported Data Storage (p. 646).

Important

The default Amazon S3 bucket may not have the least permissive security settings like bucket policy and server-side encryption (SSE). We strongly recommend that you Add a Bucket Policy To Restrict Access to Datasets Imported to Data Wrangler.

Important

In addition, if you use the managed policy for SageMaker, we strongly recommend that you scope it down to the most restricted policy that allows you to perform your use case. For more information, see Grant an IAM Role Permission to Use Data Wrangler.

Import data from Amazon S3

Amazon Simple Storage Service (Amazon S3) can be used to store and retrieve any amount of data at any time, from anywhere on the web. You can accomplish these tasks using the AWS Management Console, which is a simple and intuitive web interface, and the Amazon S3 API. If your dataset is stored locally, we recommend that you add it to an S3 bucket for import into Data Wrangler. To learn how, see Uploading an object to a bucket in the Amazon Simple Storage Service Developer Guide.

Data Wrangler uses S3 Select to allow you to preview your Amazon S3 files in Data Wrangler. You incur standard charges for each file preview. To learn more about pricing, see the Requests & data retrievals tab on Amazon S3 pricing.
Important
If you plan to export a data flow and launch a Data Wrangler job, ingest data into a SageMaker feature store, or create a SageMaker pipeline, be aware that these integrations require Amazon S3 input data to be located in the same AWS region.

You can browse all buckets in your AWS account and import CSV and Parquet files using the Amazon S3 import in Data Wrangler.

When you choose a dataset for import, you can rename it, specify the file type, and identify the first row as a header.

Important
If you’re importing a CSV file, make sure it meets the following requirements:

• A record in your dataset can’t be longer than one line.
• A backslash, \, is the only valid escape character.
• Your dataset must use one of the following delimiters:
  • Comma – ,
  • Colon – :
  • Semicolon – ;
  • Pipe – |
  • Tab – [TAB]

To save space, you can import compressed CSV files.

To import a dataset into Data Wrangler from Amazon S3:

1. If you are not currently on the Import tab, choose Import.
2. Under Data Preparation, choose Amazon S3 to see the Import S3 Data Source view.
3. From the table of available S3 buckets, select a bucket and navigate to the dataset you want to import.
4. Select the file that you want to import. You can import CSV and Parquet files. If your dataset does not have a .csv or .parquet extension, select the data type from the File Type dropdown list.
5. If your CSV file has a header, select the check box next to Add header to table.
6. Use the Preview table to preview your dataset. This table shows up to 100 rows.
7. In the Details pane, verify or change the Name and File Type for your dataset. If you add a Name that contains spaces, these spaces are replaced with underscores when your dataset is imported.
8. Enable sampling is selected by default. If you do not uncheck this box, Data Wrangler will sample and import up to 100 MB of data. To disable sampling, uncheck this check box.
9. Choose Import dataset.
Import data from Athena

Amazon Athena is an interactive query service that makes it easy to analyze data directly in Amazon S3 using standard SQL. With a few actions in the AWS Management Console, you can point Athena at your data stored in Amazon S3 and begin using standard SQL to run ad-hoc queries and get results in seconds. To learn more, see What is Amazon Athena? in the Amazon Athena User Guide.

You can query Athena databases and import the results in Data Wrangler. To use this import option, you must create at least one database in Athena. To learn how, see Getting Started in the Amazon Athena User Guide.

Note the following about the Athena import option in Data Wrangler:

- Data Wrangler supports using an Athena primary workgroup. Other workgroups are not supported.
- Data Wrangler does not support federate queries.

Data Wrangler uses the default S3 bucket in the same AWS Region in which your Studio instance is located to store Athena query results. When you import from Athena, Data Wrangler creates a new database in your Athena account named sagemaker_data_wrangler if one does not already exist. It creates temporary tables in this database to move the query output to this S3 bucket. It deletes these
tables after data has been imported; however the database, sagemaker_data_wrangler, persists. To learn more, see Imported Data Storage (p. 646).

If you use AWS Lake Formation with Athena, make sure your Lake Formation IAM permissions do not override IAM permissions for the database sagemaker_data_wrangler.

To import a dataset into Data Wrangler from Athena:

1. On the import screen, choose Amazon Athena.
2. For Catalog, choose AWSDataCatalog.
3. Use the Database dropdown list to select the database that you want to query. When you select a database, you can preview all tables in your database using the Tables listed under Details.
4. Enter a query in the code box.
5. Under Advanced configuration, Enable sampling is selected by default. If you do not uncheck this box, Data Wrangler samples and imports approximately 50% of the queried data. Unselect this check box to disable sampling.
6. Enter your query in the query editor and use the Run button to run the query. After a successful query, you can preview your result under the editor.
7. To import the queried results, select Import dataset.
8. Enter a Dataset name. If you add a Dataset name that contains spaces, these spaces are replaced with underscores when your dataset is imported.
9. Select Add.

Import data from Amazon Redshift

Amazon Redshift is a fully managed, petabyte-scale data warehouse service in the cloud. The first step to create a data warehouse is to launch a set of nodes, called an Amazon Redshift cluster. After you provision your cluster, you can upload your dataset and then perform data analysis queries.
You can connect to and query one or more Amazon Redshift clusters in Data Wrangler. To use this import option, you must create at least one cluster in Amazon Redshift. To learn how, see Getting started with Amazon Redshift.

Data Wrangler uses the default S3 bucket in the same AWS Region in which your Studio instance is located to store Amazon Redshift query results. To learn more, see Imported Data Storage (p. 646).

If you use the IAM managed policy, AmazonSageMakerFullAccess, to grant a role permission to use Data Wrangler in Studio, your Database User name must have the prefix sagemaker_access.

Use the following procedures to learn how to add a new cluster.

**Note**
Data Wrangler uses the Amazon Redshift Data API with temporary credentials. To learn more about this API, refer to Using the Amazon Redshift Data API in the Amazon Redshift Cluster Management Guide.

**To connect to a Amazon Redshift cluster:**

1. Choose Import.
2. Choose + under Add data connection.
3. Choose Amazon Redshift.
4. Choose Temporary credentials (IAM) for Type.
5. Enter a Connection Name. This is a name used by Data Wrangler to identify this connection.
6. Enter the Cluster Identifier to specify to which cluster you want to connect. Note: Enter only the cluster identifier and not the full endpoint of the Amazon Redshift cluster.
7. Enter the Database Name of the database to which you want to connect to.
8. Enter a Database User to identify the user you want to use to connect to the database.
9. For UNLOAD IAM Role, enter the IAM role ARN of the role that the Amazon Redshift cluster should assume to move and write data to Amazon S3. For more information about this role, see Authorizing Amazon Redshift to access other AWS services on your behalf in the Amazon Redshift Cluster Management Guide.
10. Choose Connect.
After your connection is successfully established, it appears as a data source under **Data Import**. Select this data source to query your database and import data.

**To query and import data from Redshift:**

1. Select the connection that you want to query from **Data Sources**.
2. Select a **Schema**. To learn more about Redshift Schemas, see **Schemas** in the Amazon Redshift Database Developer Guide.
3. Under **Advanced configuration**, **Enable sampling** is selected by default. If you do not uncheck this box, Data Wrangler samples and imports approximately 50% of the queried data. Unselect this check box to disable sampling.
4. Enter your query in the query editor and use the **Run** button to run the query. After a successful query, you can preview your result under the editor.
5. Select **Import dataset** to import the dataset that has been queried.
6. Enter a **Dataset name**. If you add a **Dataset name** that contains spaces, these spaces are replaced with underscores when your dataset is imported.
7. Select **Add**.
Import data from Snowflake

You can use Snowflake as a data source in SageMaker Data Wrangler to prepare data in Snowflake for machine learning.

With Snowflake as a data source in Data Wrangler, you can quickly and easily connect to Snowflake without writing a single line of code. Additionally, you can join your data in Snowflake with data stored in Amazon S3 and data queried through Amazon Athena and Amazon Redshift to prepare data for machine learning.

Once connected, you can interactively query data stored in Snowflake, easily transform data with 300+ pre-configured data transformations, understand data and identify potential errors and extreme values with a set of robust pre-configured visualization templates, and quickly identify inconsistencies in your data preparation workflow and diagnose issues before models are deployed into production. Finally, you can export your data preparation workflow to Amazon S3 for use with other SageMaker features such as SageMaker Autopilot, Amazon Feature Store and SageMaker Pipelines.

Administrator Guide

Important
To learn more about granular access control and best practices, see Security Access Control.

This section is for Snowflake administrators who are setting up access to Snowflake from within SageMaker Data Wrangler.

Important
Your administrator is responsible for managing and monitoring the access control within Snowflake. This includes what data a user can access, what storage integration a user can use, and what queries a user can run. Data Wrangler does not add a layer of access control with respect to Snowflake.

Important
Note that granting monitor privileges can enable users the ability to see details within an object e.g., queries, usage within a warehouse.
Configure Snowflake with Data Wrangler

To import data from Snowflake, Snowflake admins will need to configure access from Data Wrangler via Amazon S3.

This feature is currently not available in the opt-in regions.

To do this, follow these steps.

1. Configure access permissions for the S3 Bucket.

   **AWS Access Control Requirements**

   Snowflake requires the following permissions on an S3 bucket and directory to be able to access files in the directory.

   - s3:GetObject
   - s3:GetObjectVersion
   - s3:ListBucket

   **Create an IAM policy**

   The following describes how to configure access permissions for Snowflake in your AWS Management Console so you can use an Amazon S3 bucket to load and unload data:

   - Log in to the AWS Management Console.
   - From the home dashboard, choose Identity and Access Management (IAM):
Choose Policies from the left navigation panel.

Choose Create Policy:

- Select the JSON tab.
- Add a policy document that allows Snowflake to access the S3 bucket and directory.

The following policy (in JSON format) provides Snowflake with the required permissions to load and unload data using a single bucket and directory path. Note: Make sure to replace bucket and prefix with your actual bucket name and directory path prefix.

```json
# Example policy for S3 write access
# This needs to be updated
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:PutObject",
                "s3:GetObject",
                "s3:GetObjectVersion",
                "s3:DeleteObject",
                "s3:DeleteObjectVersion"
            ],
            "Resource": "arn:aws:s3:::bucket/prefix/*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:ListBucket"
            ],
            "Resource": "arn:aws:s3:::bucket/",
            "Condition": {
                "StringLike": {
                    "s3:prefix": ["prefix/*"]
                }
            }
        }
    ]
}
```

Choose the button Next: Tags.

Choose the button Next: Review.

Enter the policy name (e.g., snowflake_access and an optional description. Choose Create policy.
2. Create the IAM Role in AWS.
3. Create a Cloud Storage Integration in Snowflake.
4. Retrieve the AWS IAM User for your Snowflake Account.
5. Grant the IAM User Permissions to Access Bucket.
6. Grant the data scientist's Snowflake role usage permission to the storage integration.
   • In the Snowflake console, run `GRANT USAGE ON INTEGRATION integration_name TO snowflake_role;`
   • `integration_name` is the name of your storage integration.
   • `snowflake_role` is the name of the default Snowflake role given to the data scientist user.

**What information needs to be provided to the Data Scientist**

1. To allow your data scientist to access Snowflake from SageMaker Data Wrangler, provide them with one of following:
   • A Snowflake account name, user name and password.
   • Create a secret with [AWS Secrets Manager](https://aws.amazon.com/secretsmanager/) and provide the ARN of the secret. Use the following procedure below to create the secret for Snowflake if you choose this option.
     
     **Important**
     If your data scientists use the Snowflake Credentials (User name and Password) option to connect to Snowflake, note that Secrets Manager is used to store the credentials in a secret and rotates secrets as part of a best practice security plan. The secret created in Secrets Manager is only accessible with the Studio role configured when you set up Studio User profile. This will require you to add this permission, `secretsmanager:PutResourcePolicy` to the policy that is attached to your Studio role.
     It is strongly recommended that you scope the role policy to use different roles for different groups of Studio users. You can add additional resource-based permissions for the Secrets Manager secrets. See Manage Secret Policy for condition keys you can use.
     • **How to create an Amazon Secret for Snowflake.**
       • Sign in to the AWS Secrets Manager console.
       • Choose **Store a new secret**.
       • In the **Select secret type** section, select **Other type of secrets**.
• Specify the details of your custom secret as Key and Value pairs. The name of the keys are case sensitive and so the username key must be username, the password key must be password, and the account ID key must be accountid. If you enter any of these incorrectly, Data Wrangler will raise an error. Quotes for username, password, and accountid are not required if using secret key/value. Alternatively, you can select the Plaintext tab and enter the secret value in JSON as shown in the following example:

```json
{
    "username": "snowflake username",
    "password": "snowflake password",
    "accountid": "snowflake accountid"
}
```

• Choose next, and on the following screen, prefix the name of your secret with AmazonSageMaker-. Additionally, add a tag with key SageMaker (without quotes) and value: true (without quotes). The rest of the fields are optional. You can scroll to the bottom of the page and click next. The rest of the screens are optional. Choose next until the secret has been stored.
• Select on the secret name and save the ARN of the secret. Next, choose the final Store button.
• Select the secret you just created.

![Image of AWS Secrets Manager]

• You will see your ARN on the screen. Provide the ARN to the data scientist if they are using the ARN to connect to Snowflake.

![Image of AWS Secrets Manager]

2. You will need to provide the data scientist the name of the storage integration you created in Step 3: Create a Cloud Storage Integration in Snowflake. This is the name of the new integration and is called integration_name in the CREATE INTEGRATION SQL command you ran which is shown below:

```sql
CREATE STORAGE INTEGRATION integration_name
    TYPE = EXTERNAL_STAGE
    STORAGE_PROVIDER = S3
```
Data Scientist Guide

This section outlines how to access your Snowflake data warehouse from within SageMaker Data Wrangler and how to use Data Wrangler features.

**Important**

Note: Your administrator needs to follow the Administer Guide set up above before you can use Data Wrangler within Snowflake.

1. Access Data Wrangler

   To start, access Data Wrangler through Amazon SageMaker Studio by following the Prerequisites steps.

   Once you have completed the Prerequisite steps you can now access Data Wrangler in Studio.

   - Next to the user you want to use to launch Studio, select **Open Studio**.
   - Once you have launched Studio, select **File** then **New** then **Terminal**.
• Enter `cat /opt/conda/share/jupyter/lab/staging/yarn.lock | grep -A 1 "@amzn/sagemaker-ui-data-prep-plugin@"` to print the version of your Studio instance. You must have Studio version 1.3.0 to enable Snowflake.

• If you do not have this version then update your Studio version. To do this, close your Studio window and navigate to the SageMaker Studio Console.

• Next, you will select the user you are using to access Studio and then select **Delete app**. After the deletion is complete, launch Studio again by selecting **Open Studio**.
2. Create a new data flow from within Data Wrangler

Once you have accessed Data Wrangler from within Studio and have version 1.3.0, select the + sign on the New data flow card under ML tasks and components. This creates a new directory in Studio with a .flow file inside, which contains your data flow. The .flow file automatically opens in Studio.

Alternatively, you can also create a new flow by selecting File, then New, and choosing Flow in the top navigation bar.
When you create a new .flow file in Studio, you may see a message at the top of the Data Wrangler interface that says:

**Connecting to engine**

**Establishing connection to engine...**

3. Connect to Snowflake

There are two ways to connect to Snowflake from within Data Wrangler. You will only need to choose one of the two ways.

1. Specify your Snowflake credentials (Account name, user name and password) in Data Wrangler.
2. Provide an Amazon Resource Name (ARN) of a secret.
Important
If you do not have your Snowflake credentials or ARN, reach out to your administrator. Your administrator can tell you which of the preceding methods to use to connect to Snowflake.

Start on the Import data screen and first select Add data source from the top right corner dropdown menu and then select Snowflake. The following screenshot illustrates where to find the Snowflake option.

Choose an Authentication method. For this step as previously mentioned, you can use your Snowflake credentials or ARN name. One of the two will be provided by your administrator.

Next we explain both Authentications methods and provide screenshots for each.

1. **Snowflake Credentials Option**.

   Select the Basic (user name and password) option from the Authentication method dropdown. Then, enter your credentials to the following fields:

   - **Storage integration**: Provide the name of the storage integration. This is provided from your administrator.
   - **Snowflake account name**: The full name of your Snowflake account.
   - **User name**: Snowflake account user name.
   - **Password**: Snowflake account password.
   - **Connection Name**: Choose a connection name of your choice.

   Select Connect.

   Below is a screenshot of this screen and an example on how these fields should be completed.
2. ARN Option

Select the ARN option under the Authentication method dropdown. Then, provide your ARN name under Secrets Manager ARN and your storage integration which is provided by your administrator. Lastly, create a connection name and select Connect.

Below is a screenshot of this screen.

3. The workflow at this point is to connect your Snowflake account to Data Wrangler, then run some queries on your data and then finally use Data Wrangler for performing data transformations etc.

The next few steps explain the import and querying step from within Data Wrangler.
After creating your Snowflake connection you will be taken to the **Import data from Snowflake** screen. Below is a screenshot of this.

![Import data from Snowflake screenshot](image)

From here, select your warehouse. You can also optionally select your database and schema, in which case the written query should specify them. If **Database** and **Schema** are provided in the dropdown list, the written query does not need to specify the database and schema names.

Your schemas and tables from your Snowflake account are listed in the left panel. You can select and unravel these entities. When you select a specific table, select the eye icon on the right side of each table name to preview the table.

The following screenshot shows the panel with your data warehouses, databases, and schemas, along with the eye icon with which you can preview your table. Once you select the **Preview Table** icon, the schema preview of that table is generated. You must select a warehouse before you can preview a table.
After selecting a data warehouse, database and schema, you can now write queries and select run them. The output of your query will show under Query results. Below is a screenshot of this.

Once you have settled on the output of your query, you can then import the output of your query into a Data Wrangler flow to perform data transformations.

To do this, select **Import**, then specify a name and select **Ok**, as shown in the following screenshot.
From here, transition to the **Data flow** screen to prepare your data transformation, as shown in the following screenshot.
Private Connectivity between Data Wrangler and Snowflake via AWS PrivateLink

This sections explains how to use AWS PrivateLink to establish a private connection between Data Wrangler and Snowflake. The steps are explained below.

Create a VPC

If you do not have a VPC set up, then follow the Create a new VPC instructions to create one.

Once you have a chosen VPC you would like to use for establishing a private connection, provide the following credentials to your Snowflake Administrator to enable AWS PrivateLink:

- VPC ID.
- AWS Account ID.
- Your corresponding account URL you use to access Snowflake.

Important
As per Snowflake's documentation, enabling for your Snowflake account can take up to two business days.

Set up Snowflake AWS PrivateLink Integration

After AWS PrivateLink is enabled, retrieve the AWS PrivateLink configuration for your region by executing the following command in a Snowflake worksheet. Log into your Snowflakes console, under worksheets enter the following: select SYSTEM$GET_PRIVATELINK_CONFIG();

1. Retrieve the values for the following: privatelink-account-name, privatelink_ocsp-url, privatelink-account-url, and privatelink_ocsp-url from the resulting JSON object. Examples of each value are below. Store these values for later use.

| privatelink-account-name: xxxxxxxx.region.privatelink |
| privatelink-vpce-id: com.amazonaws.vpce.region.vpce-svc-xxxxxxxxxxxxxxxxx |
| privatelink-account-url: xxxxxxxx.region.privatelink.snowflakecomputing.com |
privatelink_ocsp-url: ocsp.xxxxxxxx.region.privatelink.snowflakecomputing.com

2. Switch to your AWS Console and navigate to the VPC menu.
3. From the left side panel, click the link for “Endpoints” to navigate to VPC Endpoints set up.

Once there, click the **Create Endpoint** button in the top left.
4. Select the radio button for "Find service by name".

5. In the Service Name field, paste in the value for privatelink-vpce-id that you retrieved in the step above and select the **Verify** button.

   If successful a green alert with "Service name found" will appear on your screen and the VPC and Subnet options will automatically expand. Below is a screenshot showing this. Note: Depending on your targeted region, your resulting screen may show another AWS region name.

6. Select the same VPC ID that you sent to Snowflake from the VPC dropdown menu.
7. If you have not yet created a subnet, then following the next set of instructions on how to do this.
8. Select the Subnets from the VPC dropdown menu. Then select Create subnet and follow the prompts to create a subnet in your VPC. Ensure you select the VPC ID you sent Snowflake.
9. Scroll down to the Security Group Configuration, select Create New Security Group. This will open the default Security Group screen in a new tab. In this new tab, select the Create Security Group button in the top right corner.
10. Provide a new security group a name (e.g., datawrangler-doc-snowflake-privatelink-connection) and a description. Be sure to select the VPC ID you have used in previous steps.
11. You now will need to add two rules to allow traffic from within your VPC to this VPC endpoint.
Navigate to your VPC under Your VPCs in a separate tab, and retrieve your CIDR block for your VPC. Then select the Add Rule button in the Inbound Rules section in Select HTTPS for the type, leave the Source as Custom in the form, paste in the value retrieved from the above describe-vpcs call (e.g., 10.0.0.0/16).

12. Select the Create Security Group button in the bottom right. Retrieve the Security Group ID from the newly created security group (e.g., sg-xxxxxxxxxxxxxxxxxx).

13. In the VPC Endpoint configuration screen, remove the default security group. Paste in the security group ID in the search field and select the check box.

14. Scroll down to the bottom of the page and select the Create Endpoint button.

15. On success you will be navigated to page that has a link to your VPC Endpoint configuration, specified by the VPC ID. Select the link to view the configuration in full.

Retrieve the topmost record in the DNS names list. This can be differentiated from other DNS names because it will only include the region name (e.g., us-west-2), and no availability zone letter notation (e.g., us-west-2a). Store this information for later use.

Configure DNS for Snowflake Endpoints in your VPC

This section explains how to configure DNS for Snowflake Endpoints in your VPC. This will allow your VPC to resolve requests to the Snowflake AWS PrivateLink endpoint.

1. Navigate to the Route 53 menu within your AWS console.
2. From the left hand menu (this might need to be expanded) select the Hosted Zones option.
3. Select the Create Hosted Zone button in the top right.
   - In the domain name form field, reference the value that was stored for privatelink-account-url in the steps above. In this field, your Snowflake account ID will be removed from the DNS name and will only use the value starting with the region identifier. A Resource Record Set will also be created later for the subdomain. E.g., region.privatelink.snowflakecomputing.com.
   - Select the radio button for Private Hosted Zone in the Type Section. Your region code may not be us-west-2. Reference the DNS name returned to you by Snowflake.
In the VPCs to associate with the hosted zone section, select the region in which your VPC is located and the VPC ID used in previous steps.

Select the Created hosted zone button in the bottom right

4. Next we will create two records, one for privatelink-account-url and one for privatelink_ocsp-url.

Within the Hosted Zone menu, select the Create Record Set button.

a. For the record name, enter your Snowflake Account ID only (the first 8 characters in privatelink-account-url).

b. For record type, select CNAME.

c. For value, enter the DNS name for the regional VPC Endpoint you retrieved in the last step of the Set up the Snowflake AWS PrivateLink Integration section.
d. Select the Create Record button.

e. Repeat the above steps for the OCSP record we notated as privatelink-ocsp-url earlier, starting with "ocsp" through the 8 character Snowflake ID for the record name (e.g., ocsp.xxxxxxxx).

Configure Route 53 Resolver Inbound Endpoint for your VPC

This section explains how to configure Route 53 resolvers inbound endpoints for your VPC.

1. Navigate to the Route 53 menu within your AWS console.
   - In the left hand panel in the security section, select the Security Groups option.
2. Select the Create Security Group button in the top right corner.
   - Provide your security group a name (e.g., datawranger-doc-route53-resolver-sg) and description.
   - Select the VPC ID used in previous steps.
   - Create rules that allow for DNS over UDP and TCP from within the VPC CIDR block.
• Select the **Create Security Group** button. Note the Security Group ID because it will now add a rule to allow traffic to the VPC Endpoint Security Group.

3. Navigate to the **Route 53 menu** within your AWS console.
   • In the left hand panel in the resolver section, select the Inbound Endpoint option.

4. Select the **Create Inbound Endpoint** button.
   • Provide an endpoint a name.
   • In the VPC in the Region dropdown, select the VPC ID you have used in all previous steps.
   • In the Security Group dropdown, select the security group ID from Step 2 in this section.

   ![General settings for inbound endpoint](image)

   • In the IP Addresses Section, select two Availability Zones, subnets and leave the radio selector for **Use an IP address that is selected automatically** selected.
Select the Submit button.
5. Select the Inbound Endpoint after it was created.
6. Once the Inbound Endpoint is created, note the two IP addresses for the resolvers.

SageMaker VPC Endpoints

This section explains how to create VPC endpoints for the following: SageMaker Studio, SageMaker Notebook, SageMaker API, SageMaker Runtime, SageMaker FeatureStore Runtime.

Create a security group that will be applied to all endpoints.
1. Navigate to the EC2 menu in the AWS Console.
2. From the left hand panel, select the Security Groups option, in the Network & Security section.
3. Select the Create Security Group button in the upper right hand corner.
4. Provide your security group a name and description (e.g., datawrangler-doc-sagemaker-vpce-sg). Note that a rule will be added to allow traffic over HTTPS from SageMaker to this group later.

Creating the endpoints.
1. Navigate to the VPC menu in the AWS console.
2. Select the Endpoints option from the left hand panel.
3. Select the Create Endpoint button.
4. Search for the service in the search bar (e.g., enter “sagemaker” in the search bar).
5. From the VPC dropdown, select the VPC in which your Snowflake AWS PrivateLink connection exists.
6. In the Subnets section, select the Subnets which have access to the Snowflake PrivateLink connection.
7. Leave the Enable DNS Name checkbox ticked.
8. In the Security Groups section, select the security group you created in the section above.
9. Select the Create Endpoint button.

Configure SageMaker Studio and SageMaker Data Wrangler
This section explains how to configure SageMaker Studio and SageMaker Data Wrangler.

1. Configure Security Group
   • Navigate to the EC2 menu in the AWS Console.
   • From the left hand panel, select the Security Groups option, in the Network & Security section.
   • Select the Create Security Group button in the upper right hand corner.
   • Provide your security group a name and description (e.g., datawrangler-doc-sagemaker-studio).
   • Create the following inbound rules.
     • HTTPS to the Security Group you provisioned for the Snowflake PrivateLink connection.
       • As created in Set up the Snowflake PrivateLink Integration step.
     • HTTP to the Security Group you provisioned for the Snowflake PrivateLink connection.
       • As created in Set up the Snowflake PrivateLink Integration step.
     • UDP and TCP for DNS (port 53) to Route 53 Resolver Inbound Endpoint security group.
       • As created in Step 2 of Configure Route 53 Resolver Inbound Endpoint for your VPC.
   • Select the Create Security Group button in the lower right hand corner.
2. Configure SageMaker Studio
   • Navigate to the SageMaker menu in the AWS console.
   • From the left hand console, Select the SageMaker Studio option.
   • If you do not have any domains configured, the Get Started menu is present.
   • Select the Standard Setup option from the Get Started menu.
   • For Authentication method, select AWS Identity and Access Management (IAM).
   • Under the Permissions menu you can create a new role or use a pre-existing role, depending on your use case.
     • If you chose Create a new role you are presented the option to provide an S3 bucket name, and a policy is generated for you.
     • If you already have a role created with permissions to the S3 buckets you require access to, select the role from the dropdown. This role should have the AmazonSageMakerFullAccess policy attached to it.
• Select the **Network and Storage** dropdown to configure the VPC, Security, and Subnets SageMaker will use.
  • For **VPC** select the VPC in which your Snowflake PrivateLink connection exists.
  • For **Subnet(s)** select the Subnets which have access to the Snowflake PrivateLink connection.
  • For **Network Access for Studio** select VPC Only.
  • For **Security Group(s)** select the security group you created earlier in Step 1.
• Select the **Submit** button in the bottom right hand corner.

• Create the following inbound rules:
  • Port 2049 to the inbound and outbound NFS Security Groups created automatically by SageMaker in Step 2 (the security group names will contain the Studio domain ID).
  • Access to all TCP ports to itself (required for SageMaker for VPC Only).

4. Edit the VPC Endpoint Security Groups:
• Navigate to the EC2 menu in the AWS console.
• Locate the Security Group you created earlier.
• Add an inbound rule allowing for HTTPS traffic from the security group created in Step 1.

5. Create a user profile.
• From the **SageMaker Studio Control Panel** select the **Add User** button in the top right.
• Provide a user name.
• For the **Execution Role**, choose to create a new role or to use a pre-existing role.
  • If you chose **Create a new role** you are presented the option to provide an Amazon S3 bucket name, and a policy is generated for you.
  • If you already have a role created with permissions to the Amazon S3 buckets you require access to, select the role from the dropdown. This role should have the **AmazonSageMakerFullAccess** policy attached to it.
• Select the **Submit** button.

6. Create a Data Flow (follow the Data Scientist guide outlined above).
• When adding a Snowflake connection enter the value of `privatelink-account-name` (from Step **Set up Snowflake PrivateLink Integration**) into the Snowflake account name (alphanumeric) field, instead of the plain Snowflake account name. Everything else is left unchanged.

### Important Data Storage

**Important**
We strongly recommend that you follow the best practices around protecting your Amazon S3 bucket by following Security best practices.

When you query data from Amazon Athena or Amazon Redshift, the queried dataset is automatically stored in Amazon S3. Data is stored in the default SageMaker S3 bucket for the AWS Region in which you are using Studio.

Default S3 buckets have the following naming convention: `sagemaker-region-account number`. For example, if your account number is 111122223333 and you are using Studio in us-east-1, your imported datasets are stored in sagemaker-us-east-1-111122223333.

Data Wrangler flows depend on this Amazon S3 dataset location, so you should not modify this dataset in Amazon S3 while you are using a dependent flow. If you do modify this S3 location, and you want to continue using your data flow, you must remove all objects in `trained_parameters` in your .flow file. To do this, download the .flow file from Studio and for each instance of `trained_parameters`, delete all entries. When you are done, `trained_parameters` should be an empty JSON object.
When you export and use your data flow to process your data, the .flow file you export refers to this dataset in Amazon S3. Use the following sections to learn more.

**Amazon Redshift Import Storage**

Data Wrangler stores the datasets that result from your query in a Parquet file in your default SageMaker S3 bucket.

This file is stored under the following prefix (directory): redshift/uuid/data/, where *uuid* is a unique identifier that gets created for each query.

For example, if your default bucket is sagemaker-us-east-1-111122223333, a single dataset queried from Amazon Redshift is located in s3://sagemaker-us-east-1-111122223333/redshift/uuid/data/.

**Amazon Athena Import Storage**

When you query an Athena database and import a dataset, Data Wrangler stores the dataset, as well as a subset of that dataset, or preview files, in Amazon S3.

The dataset you import by selecting **Import dataset** is stored in Parquet format in Amazon S3.

Preview files are written in CSV format when you select **Run** on the Athena import screen, and contain up to 100 rows from your queried dataset.

The dataset you query is located under the prefix (directory): athena/uuid/data/, where *uuid* is a unique identifier that gets created for each query.

For example, if your default bucket is sagemaker-us-east-1-111122223333, a single dataset queried from Athena is located in s3://sagemaker-us-east-1-111122223333/redshift/uuid/data/example_dataset.parquet.

The subset of the dataset that is stored to preview dataframes in Data Wrangler is stored under the prefix: athena/.

**Create and Use a Data Wrangler Flow**

Use an Amazon SageMaker Data Wrangler flow, or a **data flow**, to create and modify a data preparation pipeline. The data flow connects the datasets, transformations, and analyses, or **steps**, you create and can be used to define your pipeline.

**Instances**

When creating a Data Wrangler flow you can select an ml.m5 instance from the following table:

<table>
<thead>
<tr>
<th>Standard Instances</th>
<th>vCPU</th>
<th>Memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>ml.m5.4xlarge</td>
<td>16</td>
<td>64 GiB</td>
</tr>
<tr>
<td>ml.m5.12xlarge</td>
<td>48</td>
<td>192 GiB</td>
</tr>
<tr>
<td>ml.m5.24xlarge</td>
<td>96</td>
<td>384 GiB</td>
</tr>
</tbody>
</table>

For more information about the cost per hour for using the available instance types, see [SageMaker Pricing](https://aws.amazon.com/sagemaker/pricing/).
The Data Flow UI

When you import a dataset, the original dataset appears on the data flow and is named **Source**. If you enabled sampling when you imported your data, this dataset is named **Source - sampled**. Data Wrangler automatically infers the types of each column in your dataset and creates a new dataframe named **Data types**. You can select this frame to update the inferred data types. You will see results similar to those shown in the following image after you upload a single dataset:

![Image of Data Flow UI with a dataset named Source and a transformed dataset named Data types]

Each time you add a transform step, you create a new dataframe. When multiple transform steps (other than Join or Concatenate) are added to the same dataset, they are stacked.

Join and Concatenate create stand-alone steps that contain the new joined or concatenated dataset.

The following diagram shows a data flow with a join between two datasets, as well as two stacks of steps. The first stack (**Steps (2)**) adds two transforms to the type inferred in the **Data types** dataset. The downstream stack, or the stack to the right, adds transforms to the dataset resulting from a join named **demo-join**.

![Image of Data Flow UI with a join and two stacks of steps]

The small, gray box in the bottom-right corner of the data flow provides an overview of number of stacks and steps in the flow and the layout of the flow. The lighter box inside the gray box indicates the steps that are within the UI view. You can use this box to see sections of your data flow that fall outside...
of the UI view. Use the fit screen icon ( ) to fill all steps and datasets into your UI view.

The bottom left navigation bar includes icons that you can use to zoom in ( ) and out ( ) of your data flow and resize the data flow to fit the screen.

( ). Use the lock icon ( ) to lock and unlock the location of each step on the screen.

**Add a Step to Your Data Flow**

Select + next to any dataset or previously added step and then select one of the following options:

- **Edit data types** (For Data types step only): If you have not added any transforms to a Data types step, you can select Edit data types to update the data types Data Wrangler inferred when importing your dataset.
- **Add transform**: Adds a new transform step. See Transform Data (p. 650) to learn more about the data transformations you can add.
- **Add analysis**: Adds an analysis. You can use this option to analyze your data at any point in the data flow. When you add one or more analyses to a step, an analysis icon ( ) appears on that step. See Analyze and Visualize (p. 666) to learn more about the analyses you can add.
- **Join**: Joins two datasets and adds the resulting dataset to the data flow. To learn more, see Join Datasets (p. 653).
- **Concatenate**: Concatenates two datasets and adds the resulting dataset to the data flow. To learn more, see Concatenate Datasets (p. 654).

**Delete a step from your Data Flow**

To delete a step, select the step and select **Delete**. When you delete a step, all subsequent steps connected to that step, or downstream steps, are also deleted.
To delete a step from a stack of steps, select the stack and then select the step you want to delete.

**Note**
You cannot delete the **Data type** step directly. To remove this dataset, you must delete the corresponding **Source** dataset.

## Transform Data

Amazon SageMaker Data Wrangler provides numerous ML data transforms to streamline cleaning, transforming, and featurizing your data. When you add a transform, it adds a step to the data flow. Each transform you add modifies your dataset and produces a new dataframe. All subsequent transforms apply to the resulting dataframe.

Data Wrangler includes built-in transforms, which you can use to transform columns without any code. You can also add custom transformations using PySpark, Pandas, and PySpark SQL. Some transforms operate in place, while others create a new output column in your dataset.

Use this page to learn more about these built-in and custom transforms.

## Transform UI

Most of the built-in transforms are located in the **Prepare** tab of the Data Wrangler UI. The Join and Concatenate transforms are accessed through the data flow view. Use the following table to preview these two views.

### Join View

To join two datasets, select the first dataset in your data flow and choose **Join**. When you select **Join**, you see results similar to those shown in the following image. Your left and right datasets are displayed in the left panel. The main panel displays your data flow, with the newly joined dataset added.

When you select **Configure** to configure your join, you see results similar to those shown in the following image. Your join configuration is display in the left panel. You can use this panel to choose the joined dataset name, join type, and columns to join on. The main panel displays three tables.
The top-two tables display the Left and Right datasets on the left and right respectively. Under this table, you can preview the joined dataset.

See Join Datasets (p. 653) to learn more.

Concatenate View

To concatenate two datasets, you select the first dataset in your data flow and choose **Concatenate**. When you select **Concatenate**, you see results similar to those shown in the following image. Your left and right datasets are displayed in the left panel. The main panel displays your data flow, with the newly concatenated dataset added.

When you select **Configure** to configure your concatenation, you see results similar to those shown in the following image. Your concatenate configuration is display in the left panel. You can use
this panel to choose the concatenated dataset's name, and choose to remove duplicates after concatenation and add columns to indicate the source dataframe. The main panel displays three tables. The top-two tables display the Left and Right datasets on the left and right respectively. Under this table, you can preview the concatenated dataset.

See Concatenate Datasets (p. 654) to learn more.

Transforms in the Prepare Tab

To access transforms on the Prepare tab, select + next to a step in your data flow, and select Add transform.

On the Prepare tab, you add steps under Add.

You can use the Previous steps tab to view and remove transformations that you have added, in sequential order.
Join Datasets

You join dataframes directly in your data flow. When you join two datasets, the resulting joined dataset appears in your flow. The following join types are supported by Data Wrangler.

- **Left Outer** – Include all rows from the left table. If the value for the column joined on in a left table row does not match any right table row values, that row contains null values for all right table columns in the joined table.
- **Left Anti** – Include rows from the left table that do not contain values in the right table for the joined column.
- **Left semi** – Include a single row from the left table for all identical rows that satisfy the criteria in the join statement. This excludes duplicate rows from the left table that match the criteria of the join.
- **Right Outer** – Include all rows from the right table. If the value for the joined column in a right table row does not match any left table row values, that row contains null values for all left table columns in the joined table.
- **Inner** – Include rows from left and right tables that contain matching values in the joined column.
- **Full Outer** – Include all rows from the left and right tables. If the row value for the joined column in either table does not match, separate rows are created in the joined table. If a row doesn't contain a value for a column in the joined table, null is inserted for that column.
- **Cartesian Cross** – Include rows which combine each row from the first table with each row from the second table. This is a Cartesian product of rows from tables in the join. The result of this product is the size of the left table times the size of the right table. Therefore, we recommend caution in using this join between very large datasets.

Use the following procedure to join two dataframes.

1. Select + next to the left dataframe that you want to join. The first dataframe you select is always the left table in your join.
2. Select Join.
3. Select the right dataframe. The second dataframe you select is always the right table in your join.
4. Select Configure to configure your join.
5. Give your joined dataset a name using the Name field.
6. Select a Join type.
7. Select a column from the left and right tables to join on.
8. Select Apply to preview the joined dataset on the right.
9. To add the joined table to your data flow, select Add in the top right corner.

**Concatenate Datasets**

**Concatenate two datasets:**

1. Select + next to the left dataframe that you want to concatenate. The first dataframe you select is always the left table in your concatenate.
2. Select Concatenate.
3. Select the right dataframe. The second dataframe you select is always the right table in your concatenate.
4. Select Configure to configure your concatenate.
5. Give your concatenated dataset a name using the Name field.
6. (Optional) Select the check box next to Remove duplicates after concatenation to remove duplicate columns.
7. (Optional) Select the check box next to Add column to indicate source dataframe if, for each column in the new dataset, you want to add an indicator of the column's source.
8. Select Apply to preview the new dataset.
9. Select Add to add the new dataset to your data flow.

**Custom Transforms**

The Custom Transforms group allows you to use Pyspark, Pandas, or Pyspark (SQL) to define custom transformations. For all three options, you use the variable df to access the dataframe to which you want to apply the transform. You do not need to include a return statement. Select Preview to preview the result of the custom transform. Select Add to add the custom transform to your list of Previous steps.

You can import the popular libraries with an import statement in the custom transform code block such as the following:

- Numpy version 1.19.0
- Scikit-learn version 0.23.2
- Scipy version 1.5.4
- Pandas version 1.0.3
- Pyspark version 3.0.0

If you include print statements in the code block, the result appears when you select Preview.

The following are examples of how you can use the custom transforms code block:

**Pyspark**

The following example extracts date and time from a timestamp.

```python
from pyspark.sql.functions import from_unixtime, to_date, date_format
df = df.withColumn('DATE_TIME', from_unixtime('TIMESTAMP'))
df = df.withColumn( 'EVENT_DATE', to_date('DATE_TIME')).withColumn('EVENT_TIME', date_format('DATE_TIME', 'HH:mm:ss'))
```

**Pandas**

654
The following example provides an overview of the dataframe to which you are adding transforms.

```python
df.info()
```

**Pyspark (SQL)**

The following creates a new dataframe with five columns: *name*, *fare*, *pclass*, *survived*.

```sql
SELECT name, fare, pclass, survived FROM df
```

**Custom Formula**

Use **Custom formula** to define a new column using a Spark SQL expression to query data in the current dataframe. The query must use the conventions of Spark SQL expressions.

**Important**

**Custom formula** does not support columns with spaces in the name. You can use the **Rename column** transform in the **Manage columns** transform group to remove spaces from a column's name. You can also add a **Pandas Custom transform** similar to the following to remove spaces from multiple columns in a single step. This example changes columns named A_column and B_column to A_column and B_column respectively.

```python
df.rename(columns={"A_column": "A_column", "B_column": "B_column"})
```

You can use this transform to perform operations on columns, referencing the columns by name. For example, assuming the current dataframe contains columns named col_a and col_b, you can use the following operation to produce an **Output column** that is the product of these two columns with the following code:

```python
col_a * col_b
```

Other common operations include the following, assuming a dataframe contains col_a and col_b columns:

- Concatenate two columns: `concat(col_a, col_b)`
- Add two columns: `col_a + col_b`
- Subtract two columns: `col_a - col_b`
- Divide two columns: `col_a / col_b`
- Take the absolute value of a column: `abs(col_a)`

For more information, see the Spark documentation on selecting data.

**Encode Categorical**

Categorical data is usually composed of a finite number of categories, where each category is represented with a string. For example, if you have a table of customer data, a column that indicates the country a person lives in is categorical. The categories would be Afghanistan, Albania, Algeria, and so on. Categorical data can be **nominal or ordinal**. Ordinal categories have an inherent order, and nominal categories do not. The highest degree obtained (High school, Bachelors, Master) is an example of ordinal categories.

Encoding categorical data is the process of creating a numerical representation for categories. For example, if your categories are Dog and Cat, you may encode this information into two vectors, `[1, 0]` to represent dog, and `[0, 1]` to represent cat.
When you encode ordinal categories, you may need to translate the natural order of categories into your encoding. For example, you can represent highest degree obtained with the following map: {"High school": 1, "Bachelors": 2, "Masters":3}.

Use categorical encoding to encode categorical data that is in string format into arrays of integers.

The Data Wrangler categorical encoders create encodings for all categories that exist in a column at the time the step is defined. If new categories have been added to a column when you start a Data Wrangler job to process your dataset at time \( t \), and this column was the input for a Data Wrangler categorical encoding transform at time \( t-1 \), these new categories are considered missing in the Data Wrangler job. The option you select for invalid handling strategy is applied to these missing values. Examples of when this can occur are:

- When you use a .flow file to create a Data Wrangler job to process a dataset that was updated after the creation of the data flow. For example, you may use a data flow to regularly process sales data each month. If that sales data is updated weekly, new categories may be introduced into columns for which an encode categorical step is defined.
- When you select Sampling when you import your dataset, some categories may be left out of the sample.

In these situations, these new categories are considered missing values in the Data Wrangler job.

You can choose from and configure an ordinal and a one-hot encode. Use the following sections to learn more about these options.

Both transforms create a new column named Output column name. You specify the output format of this column with Output style:

- Select Vector to produce a single column with a sparse vector.
- Select Columns to create a column for every category with an indicator variable for whether the text in the original column contains a value that is equal to that category.

**Ordinal Encode**

Select Ordinal encode to encode categories into an integer between 0 and the total number of categories in the Input column you select.

Invalid handing strategy: Select a method to handle invalid or missing values.

- Choose Skip if you want to omit the rows with missing values.
- Choose Keep to retain missing values as the last category.
- Choose Error if you want Data Wrangler to throw an error if missing values are encountered in the Input column.
- Choose Replace with NaN to replace missing with NaN. This option is recommended if your ML algorithm can handle missing values. Otherwise, the first three options in this list may produce better results.

**One-Hot Encode**

Select One-hot encode for Transform to use one-hot encoding. Configure this transform using the following:

- Drop last category: If True, the last category does not have a corresponding index in the one-hot encoding. When missing values are possible, a missing category is always the last one and setting this to True means that a missing value results in an all zero vector.
• **Invalid handing strategy**: Select a method to handle invalid or missing values.
  - Choose **Skip** if you want to omit the rows with missing values.
  - Choose **Keep** to retain missing values as the last category.
  - Choose **Error** if you want Data Wrangler to throw an error if missing values are encountered in the **Input column**.

• **Is input ordinal encoded**: Select this option if the input vector contains ordinal encoded data. This option requires that input data contain non-negative integers. **If True**, input i is encoded as a vector with a non-zero in the i-th location.

### Featurize Text

Use the **Feature Text** transform group to inspect string typed columns and use text embedding to featurize these columns.

This feature group contains two features, **Character statistics** and **Vectorize**. Use the following sections to learn more about these transforms. For both options, the **Input column** must contain text data (string type).

#### Character Statistics

Use **Character statistics** to generate statistics for each row in a column containing text data.

This transform computes the following ratios and counts for each row, and creates a new column to report the result. The new column is named using the input column name as a prefix and a suffix that is specific to the ratio or count.

- **Number of words**: The total number of words in that row. The suffix for this output column is `-stats_word_count`.
- **Number of characters**: The total number of characters in that row. The suffix for this output column is `-stats_char_count`.
- **Ratio of upper**: The number of upper-case characters, from A to Z, divided by all characters in the column. The suffix for this output column is `-stats_capital_ratio`.
- **Ratio of lower**: The number of lower-case characters, from a to z, divided by all characters in the column. The suffix for this output column is `-stats_lower_ratio`.
- **Ratio of digits**: The ratio of digits in a single row over the sum of digits in the input column. The suffix for this output column is `-stats_digit_ratio`.
- **Special characters ratio**: The ratio of non-alphanumeric (characters like #$&%:@) characters to over the sum of all characters in the input column. The suffix for this output column is `-stats_special_ratio`.

#### Vectorize

Text embedding involves mapping words or phrases from a vocabulary to vectors of real numbers. Use the Data Wrangler text embedding transform to tokenize and vectorize text data into term frequency-inverse document frequency (TF-IDF) vectors.

When TF-IDF is calculated for a column of text data, each word in each sentence is converted to a real number that represents its semantic importance. Higher numbers are associated with less frequent words, which tend to be more meaningful.

When you define a **Vectorize** transform step, the count vectorizer and TF-IDF methods are defined using data available in Data Wrangler when defining this step. These same methods will be used when running a Data Wrangler job.

You configure this transform using the following:
• **Output column name**: This transform will create a new column with the text embedding. Use this field to specify a name for this output column.

• **Tokenizer**: A tokenizer converts the sentence into a list of words, or tokens.

Choose **Standard** to use a tokenizer that splits by white space and converts each word to lowercase. For example, "Good dog" is tokenized to ["good", "dog"].

Choose **Custom** to use a customized tokenizer. If you choose **Custom**, you can use the following fields to configure the tokenizer:

• **Minimum token length**: The minimum length, in characters, for a token to be valid. Defaults to 1. For example, if you specify 3 for minimum token length, words like a, at, in are dropped from the tokenized sentence.

• **Should regex split on gaps**: If selected, regex splits on gaps. Otherwise, it matches tokens. Defaults to True.

• **Regex pattern**: Regex pattern that defines the tokenization process. Defaults to ' \s+'.

• **To lowercase**: If chosen, all characters are converted to lowercase before tokenization. Defaults to True.

To learn more, refer to the Spark documentation on **Tokenizer**.

• **Vectorizer**: The vectorizer converts the list of tokens into a sparse numeric vector. Each token corresponds to an index in the vector and a non-zero indicates the existence of the token in the input sentence. You can choose from two vectorizer options, **Count** and **Hashing**.

• **Count vectorize** allows customizations that filter infrequent or too common tokens. **Count vectorize parameters** include the following:

  • **Minimum term frequency**: In each row, terms (tokens) with smaller frequency are filtered. If you specify an integer, this is an absolute threshold (inclusive). If you specify a fraction between 0 (inclusive) and 1, the threshold is relative to the total term count. Defaults to 1.

  • **Minimum document frequency**: Minimum number of rows in which a term (token) must appear to be included. If you specify an integer, this is an absolute threshold (inclusive). If you specify a fraction between 0 (inclusive) and 1, the threshold is relative to the total term count. Defaults to 1.

  • **Maximum document frequency**: Maximum number of documents (rows) in which a term (token) can appear to be included. If you specify an integer, this is an absolute threshold (inclusive). If you specify a fraction between 0 (inclusive) and 1, the threshold is relative to the total term count. Defaults to 0.999.

  • **Maximum vocabulary size**: Maximum size of the vocabulary. The vocabulary is made up of all terms (tokens) in all rows of the column. Defaults to 262144.

  • **Binary outputs**: If selected, the vector outputs do not include the number of appearances of a term in a document, but rather are a binary indicator of its appearance. Defaults to False.

To learn more about this option, refer to the Spark documentation on **CountVectorizer**.

• **Hashing** is computationally faster. **Hash vectorize parameters** includes the following:

  • **Number of features during hashing**: A hash vectorizer maps tokens to a vector index according to their hash value. This feature determines the number of possible hash values. Large values result in fewer collisions between hash values but a higher dimension output vector.

To learn more about this option, refer to the Spark documentation on **FeatureHasher**.

• **Apply IDF**: When chosen, an IDF transformation is applied, which multiplies the term frequency with the standard inverse document frequency used for TF-IDF embedding. **IDF parameters** include the following:

  • **Minimum document frequency**: Minimum number of documents (rows) in which a term (token) must appear to be included. If **count_vectorize** is the chosen vectorizer, we recommend that you keep the default value and only modify the **min_doc_freq** field in **Count vectorize parameters**. Defaults to 5.
• **Output format:** The output format of each row.
  • Select **Vector** to produce a single column with a sparse vector.
  • Select **Flattened** to create a column for every category with an indicator variable for whether the text in the original column contains a value that is equal to that category. You can only choose flattened when Vectorizer is set as **Count vectorizer**.

**Featurize Date/Time**

Use **Featurize date/time** to create a vector embedding representing a date/time field. To use this transform, your date/time data must be in one of the following formats:

- Strings describing date/time, for example, "January 1st, 2020, 12:44pm".
- A unix timestamp. A unix timestamp describes the number of seconds, milliseconds, microseconds, or nanoseconds from 1/1/1970.

You can choose to **Infer datetime format** and provide a **Datetime format**. If you provide a date/time format, you must use the codes described in this Python documentation. The options you select for these two configurations have implications for the speed of the operation, and the final results:

- The most manual and computationally fastest option is to specify a **Datetime format** and select **No** for **Infer datetime format**.
- To reduce manual labor, you can simply choose **Infer datetime format** and not specify a date/time format. This is also a computationally fast operation; however, the first date/time format encountered in the input column is assumed to be the format for the entire column. Therefore, if other formats are encountered in the column, these values are NaN in the final output. Therefore, this option can result in unparsed strings.
- If you do not specify a format and you select **No** for **Infer datetime format**, you get the most robust results. All valid date/time strings are parsed. However, this operation can be an order of magnitude slower than the first two options in this list.

When you use this transform, you specify an **Input column** which contains date/time data in one of the formats listed above. The transform creates an output column named **Output column name**. The format of the output column depends on your configuration using the following:

- **Vector**: Outputs a single column with a sparse vector.
- **Columns**: Creates a new column for every feature. For example, if the output contains a year, month, and day, three separate columns are created for year, month, and day.

Additionally, you must choose an **Embedding mode**. For linear models and deep networks, **cyclic** is recommended. For tree based algorithms, **ordinal** is recommended.

**Format String**

The **Format string** transforms contain standard string formatting operations. For example, you can use these operations to remove special characters, normalize string lengths, and update string casing.

This feature group contains the following transforms. All transforms return copies of the strings in the **Input column** and add the result to a new, output column.
### Transform Data

<table>
<thead>
<tr>
<th>Name</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left pad</td>
<td>Left-pad the string with a given <strong>Fill character</strong> to the given <strong>width</strong>. If the string is longer than <strong>width</strong>, the return value is shortened to <strong>width</strong> characters.</td>
</tr>
<tr>
<td>Right pad</td>
<td>Right-pad the string with a given <strong>Fill character</strong> to the given <strong>width</strong>. If the string is longer than <strong>width</strong>, the return value is shortened to <strong>width</strong> characters.</td>
</tr>
<tr>
<td>Center (pad on either side)</td>
<td>Center-pad the string (add padding on both sides of the string) with a given <strong>Fill character</strong> to the given <strong>width</strong>. If the string is longer than <strong>width</strong>, the return value is shortened to <strong>width</strong> characters.</td>
</tr>
<tr>
<td>Prepend zeros</td>
<td>Left-fill a numeric string with zeros, up to a given <strong>width</strong>. If the string is longer than <strong>width</strong>, the return value is shortened to <strong>width</strong> characters.</td>
</tr>
<tr>
<td>Strip left and right</td>
<td>Returns a copy of the string with the leading and trailing characters removed.</td>
</tr>
<tr>
<td>Strip characters from left</td>
<td>Returns a copy of the string with leading characters removed.</td>
</tr>
<tr>
<td>Strip characters from right</td>
<td>Returns a copy of the string with trailing characters removed.</td>
</tr>
<tr>
<td>Lower case</td>
<td>Convert all letters in text to lowercase.</td>
</tr>
<tr>
<td>Upper case</td>
<td>Convert all letters in text to uppercase.</td>
</tr>
<tr>
<td>Capitalize</td>
<td>Capitalize the first letter in each sentence.</td>
</tr>
<tr>
<td>Swap case</td>
<td>Converts all uppercase characters to lowercase and all lowercase characters to uppercase characters of the given string, and returns it.</td>
</tr>
<tr>
<td>Add prefix or suffix</td>
<td>Adds a prefix and a suffix the string column. You must specify at least one of <strong>Prefix</strong> and <strong>Suffix</strong>.</td>
</tr>
<tr>
<td>Remove Symbols</td>
<td>Removes given symbols from a string. All listed characters will be removed. Defaults to white space.</td>
</tr>
</tbody>
</table>

### Handle Outliers

Machine learning models are sensitive to the distribution and range of your feature values. Outliers, or rare values, can negatively impact model accuracy and lead to longer training times. Use this feature group to detect and update outliers in your dataset.

When you define a **Handle outliers** transform step, the statistics used to detect outliers are generated on the data available in Data Wrangler when defining this step. These same statistics are used when running a Data Wrangler job.

Use the following sections to learn more about the transforms this group contains. You specify an **Output name** and each of these transforms produces an output column with the resulting data.
Robust standard deviation numeric outliers

This transform detects and fixes outliers in numeric features using statistics that are robust to outliers.

You must define an Upper quantile and a Lower quantile, which are used in the statistics used to calculate outliers. You also need to specify the number of Standard deviations from which a value must vary from the mean to be considered an outlier. For example, if you specify 3 for Standard deviations, a value must fall more than 3 standard deviations from the mean to be considered an outlier.

The Fix method is the method used to handle outliers when they are detected. You can choose from the following:

- **Clip**: Use this option to clip the outliers to the corresponding outlier detection bound.
- **Remove**: Use this to remove rows with outliers from the dataframe.
- **Invalidate**: Use this to replace outliers with invalid values.

Standard Deviation Numeric Outliers

This transform detects and fixes outliers in numeric features using the mean and standard deviation.

You specify the number of Standard deviations a value must vary from the mean to be considered an outlier. For example, if you specify 3 for Standard deviations, a value must fall more than 3 standard deviations from the mean to be considered an outlier.

The Fix method is the method used to handle outliers when they are detected. You can choose from the following:

- **Clip**: Use this option to clip the outliers to the corresponding outlier detection bound.
- **Remove**: Use this to remove rows with outliers from the dataframe.
- **Invalidate**: Use this to replace outliers with invalid values.

Quantile Numeric Outliers

Use this transform to detect and fix outliers in numeric features using quantiles. You can define an Upper quantile and a Lower quantile, and all values that fall above or below those quantile-values, respectively, are considered outliers.

The Fix method is the method used to handle outliers when they are detected. You can choose from the following:

- **Clip**: Use this option to clip the outliers to the corresponding outlier detection bound.
- **Remove**: Use this to remove rows with outliers from the dataframe.
- **Invalidate**: Use this to replace outliers with invalid values.

Min-Max Numeric Outliers

This transform detects and fixes outliers in numeric features using upper and lower thresholds. Use this method if you know threshold values that demark outliers.

You specify a Upper threshold and a Lower threshold, and if values fall above or below those thresholds respectively, they are considered outliers.

The Fix method is the method used to handle outliers when they are detected. You can choose from the following:

- **Clip**: Use this option to clip the outliers to the corresponding outlier detection bound.
• **Remove**: Use this to remove rows with outliers from the dataframe.
• **Invalidate**: Use this to replace outliers with invalid values.

**Replace Rare**

When you use the **Replace rare** transform, you specify a threshold and Data Wrangler finds all values that meet that threshold and replaces them with a string that you specify. For example, you may want to use this transform to categorize all outliers in a column into an "Others" category.

• **Replacement string**: The string with which to replace outliers.
• **Absolute threshold**: A category is rare if the number of instances is less than or equal to this absolute threshold.
• **Fraction threshold**: A category is rare if the number of instances is less than or equal to this fraction threshold multiplied by the number of rows.
• **Max common categories**: Maximum not-rare categories that remain after the operation. If the threshold does not filter enough categories, those with the top number of appearances are classified as not rare. If set to 0 (default), there is no hard limit to the number of categories.

**Handle Missing Values**

Missing values are a common occurrence in machine learning datasets. In some situations, it is appropriate to impute missing data with a calculated value, such as an average or categorically common value. You can process missing values using the **Handle missing values** transform group. This group contains the following transforms.

**Fill Missing**

Use the **Fill missing** transform to replace missing values with a **Fill value** you define.

**Impute Missing**

Use the **Impute missing** transform to create a new column that contains imputed values where missing values were found in input categorical and numerical data. The configuration depends on your data type. Configure this transform using the following:

• **Imputing strategy**: The strategy used to determine the new value to impute.
  
  For numeric data, the chosen statistic is computed over the present values and is used as the imputed value for all missing values. The choices are **mean** and **median**.

  For categorical data, you can choose to impute the **Most frequent value** in the column, or you can define a custom string to impute.

**Add Indicator for Missing**

Use the **Add indicator for missing** transform to create a new indicator column, which contains a boolean "false" if a row contains a value, and "true" if a row contains a missing value.

**Drop Missing**

Use the **Drop missing** option to drop rows that contain missing values from the **Input column**.

**Manage Columns**

You can use the following transforms to quickly update and manage columns in your dataset:
### Transform Data

<table>
<thead>
<tr>
<th>Name</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drop Column</td>
<td>Delete a column.</td>
</tr>
<tr>
<td>Duplicate Column</td>
<td>Duplicate a column.</td>
</tr>
<tr>
<td>Rename Column</td>
<td>Rename a column.</td>
</tr>
<tr>
<td>Move Column</td>
<td>Move a column's location in the dataset. Choose to move your column to the start or end of the dataset, before or after a reference column, or to a specific index.</td>
</tr>
</tbody>
</table>

### Manage Rows

Use this transform group to quickly perform sort and shuffle operations on rows. This group contains the following:

- **Sort**: Sort the entire dataframe by a given column. Select the check box next to **Ascending order** for this option; otherwise, deselect the check box and descending order is used for the sort.
- **Shuffle**: Randomly shuffle all rows in the dataset.

### Manage Vectors

Use this transform group to combine or flatten vector columns. This group contains the following transforms.

- **Assemble**: Use this transform to combine Spark vectors and numeric data into a single column. For example, you can combine three columns: two containing numeric data and one containing vectors. Add all the columns you want to combine in **Input columns** and specify a **Output column name** for the combined data.
- **Flatten**: Use this transform to flatten a single column containing vector data. The input column must contain PySpark vectors, or array-like objects. You can control the number of columns that get created by specifying a **Method to detect number of outputs**. For example, if you select **Length of first vector**, the number of elements in the first valid vector or array found in the column determines the number of output columns that gets created. All other input vectors with too many items are truncated. Inputs with too few items are filled with NaNs.

You also specify an **Output prefix**, which is used as the prefix for each output column.

### Process Numeric

Use the **Process Numeric** feature group to process numeric data. Each scalar in this group is defined using the Spark library. The following scalars are supported:

- **Standard Scaler**: Standardize the input column by subtracting the mean from each value and scaling to unit variance. To learn more, refer to the Spark documentation for **StandardScaler**.
- **Robust Scaler**: Scale the input column using statistics that are robust to outliers. To learn more, refer to the Spark documentation for **RobustScaler**.
- **Min Max Scaler**: Transform the input column by scaling each feature to a given range. To learn more, refer to the Spark documentation for **MinMaxScaler**.
- **Max Absolute Scaler**: Scale the input column by dividing each value by the maximum absolute value. To learn more, refer to the Spark documentation for **MaxAbsScaler**.
Search and Edit

Use this section to search for and edit specific patterns within strings. For example, you can find and update strings within sentences or documents, split strings by delimiters, and find occurrences of specific strings.

The following transforms are supported under **Search and edit**. All transforms return copies of the strings in the **Input column** and add the result to a new output column.

<table>
<thead>
<tr>
<th>Name</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Find substring</td>
<td>Returns the index of the first occurrence of the Substring for which you searched optionally, starting and ending the search at Start and End respectively.</td>
</tr>
<tr>
<td>Find substring (from right)</td>
<td>Returns the index of the last occurrence of the Substring for which you searched, optionally, starting and ending the search at Start and End respectively.</td>
</tr>
<tr>
<td>Matches prefix</td>
<td>Returns a Boolean if the string contains a given Pattern. A pattern can be a character sequence or regular expression. Optionally, you can make the pattern case sensitive.</td>
</tr>
<tr>
<td>Find all occurrences</td>
<td>Returns an array with all occurrences of a given pattern. A pattern can be a character sequence or regular expression.</td>
</tr>
<tr>
<td>Extract using regex</td>
<td>Returns a string that matches a given Regex pattern.</td>
</tr>
<tr>
<td>Extract between delimiters</td>
<td>Returns a string with all characters found between Left delimiter and Right delimiter.</td>
</tr>
<tr>
<td>Extract from position</td>
<td>Returns a string, starting from Start position in the input string, that contains all characters up to the start position plus Length.</td>
</tr>
<tr>
<td>Find and replace substring</td>
<td>Returns a string with all matches of a given Pattern (regular expression) replaced by Replacement string.</td>
</tr>
<tr>
<td>Replace between delimiters</td>
<td>Returns a string with the substring found between the first appearance of a Left delimiter and the last appearance of a Right delimiter replaced by Replacement string. If no match is found, nothing is replaced.</td>
</tr>
<tr>
<td>Replace from position</td>
<td>Returns a string with the substring between Start position and Start position plus Length replaced by Replacement string. If Start position plus Length is greater than the length of the replacement string, the output contains ….</td>
</tr>
<tr>
<td>Convert regex to missing</td>
<td>Converts a string to None if invalid and returns the result. Validity is defined with a regular expression in Pattern.</td>
</tr>
</tbody>
</table>
### Transform Data

<table>
<thead>
<tr>
<th>Name</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Split string by delimiter</td>
<td>Returns an array of strings from the input string, split by Delimiter, with up to Max number of splits (optional). Delimiter defaults to white space.</td>
</tr>
</tbody>
</table>

#### Parse Value as Type

Use this transform to cast a column to a new type. The supported Data Wrangler data types are:

- Long
- Float
- Boolean
- Date, in the format dd-MM-yyyy, representing day, month, and year respectively.
- String

#### Validate String

Use the Validate string transforms to create a new column that indicates that a row of text data meets a specified condition. For example, you can use a Validate string transform to verify that a string only contains lowercase characters. The following transforms are supported under Validate string.

The following transforms are included in this transform group. If a transform outputs a Boolean value, True is represented with a 1 and False is represented with a 0.

<table>
<thead>
<tr>
<th>Name</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>String length</td>
<td>Returns True if a string length equals specified length. Otherwise, returns False.</td>
</tr>
<tr>
<td>Starts with</td>
<td>Returns True if a string starts will a specified prefix. Otherwise, returns False.</td>
</tr>
<tr>
<td>Ends with</td>
<td>Returns True if a string length equals specified length. Otherwise, returns False.</td>
</tr>
<tr>
<td>Is alphanumeric</td>
<td>Returns True if a string only contains numbers and letters. Otherwise, returns False.</td>
</tr>
<tr>
<td>Is alpha (letters)</td>
<td>Returns True if a string only contains letters. Otherwise, returns False.</td>
</tr>
<tr>
<td>Is digit</td>
<td>Returns True if a string only contains digits. Otherwise, returns False.</td>
</tr>
<tr>
<td>Is space</td>
<td>Returns True if a string only contains numbers and letters. Otherwise, returns False.</td>
</tr>
<tr>
<td>Is title</td>
<td>Returns True if a string contains any white spaces. Otherwise, returns False.</td>
</tr>
<tr>
<td>Is lowercase</td>
<td>Returns True if a string only contains lower case letters. Otherwise, returns False.</td>
</tr>
</tbody>
</table>
### Name and Function

<table>
<thead>
<tr>
<th>Name</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is uppercase</td>
<td>Returns True if a string only contains upper case letters. Otherwise, returns False.</td>
</tr>
<tr>
<td>Is numeric</td>
<td>Returns True if a string only contains numbers. Otherwise, returns False.</td>
</tr>
<tr>
<td>Is decimal</td>
<td>Returns True if a string only contains decimal numbers. Otherwise, returns False.</td>
</tr>
</tbody>
</table>

## Analyze and Visualize

Amazon SageMaker Data Wrangler includes built-in analyses that help you generate visualizations and data analyses in a few clicks. You can also create custom analyses using your own code.

You add an analysis to a dataframe by selecting a step in your data flow, and then choosing **Add analysis**. To access an analysis you've created, select the step that contains the analysis, and select the analysis.

All analyses are generated using 100,000 rows of your dataset.

You can add the following analysis to a dataframe:

- Data visualizations, including histograms and scatter plots.
- A quick summary of your dataset, including number of entries, minimum and maximum values (for numeric data), and most and least frequent categories (for categorical data).
- A quick model of the dataset, which can be used to generate an importance score for each feature.
- A target leakage report, which you can use to determine if one or more features are strongly correlated with your target feature.
- A custom visualization using your own code.

Use the following sections to learn more about these options.

### Histogram

Use histograms to see the counts of feature values for a specific feature. You can inspect the relationships between features using the **Color by** option. For example, the following histogram charts the distribution of user ratings of the best-selling books on Amazon from 2009–2019, colored by genre.
You can use the **Facet by** feature to create histograms of one column, for each value in another column. For example, the following diagram shows histograms of user reviews of best-selling books on Amazon if faceted by year.

**Scatter Plot**

Use the **Scatter Plot** feature to inspect the relationship between features. To create a scatter plot, select a feature to plot on the **X axis** and the **Y axis**. Both of these columns must be numeric typed columns.

You can color scatter plots by an additional column. For example, the following example shows a scatter plot comparing the number of reviews against user ratings of top-selling books on Amazon between 2009 and 2019. The scatter plot is colored by book genre.
Additionally, you can facet scatter plots by features. For example, the following shows an example of the same review versus user rating scatter plot, faceted by year.

**Table Summary**

Use the **Table Summary** analysis to quickly summarize your data.

For columns with numerical data, including log and float data, a table summary reports the number of entries (count), minimum (min), maximum (max), mean, and standard deviation (stddev) for each column.

For columns with non-numerical data, including columns with string, Boolean, or date/time data, a table summary reports the number of entries (count), least frequent value (min), and most frequent value (max).
Quick Model

Use the **Quick Model** visualization to quickly evaluate your data and produce importance scores for each feature. A **feature importance score** score indicates how useful a feature is at predicting a target label. The feature importance score is between [0, 1] and a higher number indicates that the feature is more important to the whole dataset. On the top of the quick model chart, there is a model score. A classification problem shows an F1 score. A regression problem has a mean squared error (MSE) score.

When you create a quick model chart, you select a dataset you want evaluated, and a target label against which you want feature importance to be compared. Data Wrangler does the following:

- Infers the data types for the target label and each feature in the dataset selected.
- Determines the problem type. Based on the number of distinct values in the label column, Data Wrangler determines if this is a regression or classification problem type. Data Wrangler sets a categorical threshold to 100. If there are more than 100 distinct values in the label column, Data Wrangler classifies it as a regression problem; otherwise, it is classified as a classification problem.
- Pre-process features and label data for training. The algorithm used requires encoding features to vector type and encoding labels to double type.
- Trains a random forest algorithm with 70% of data. Spark's RandomForestRegressor is used to train a model for regression problems. The RandomForestClassifier is used to train a model for classification problems.
- Evaluates a random forest model with the remaining 30% of data. Data Wrangler evaluates classification models using an F1 score and evaluates regression models using an MSE score.
- Calculates feature importance for each feature using the Gini importance method.

Below is the user interface for the Quick Model feature.

Target Leakage

Target leakage occurs when there is data in a machine learning training dataset that is strongly correlated with the target label, but is not available in real-world data. For example, you may have a column in your dataset that serves as a proxy for the column you want to predict with your model.

When you use the **Target Leakage** analysis, you specify the following:

- **Target**: This is the feature about which you want your ML model to be able to make predictions.
• **Problem type**: This is the ML problem type on which you are working. Problem type can either be **classification** or **regression**.

• (Optional) **Max features**: This is the maximum number of features to present in the visualization, which shows features ranked by their risk of being target leakage.

For classification, the Target Leakage analysis uses the area under the receiver operating characteristic, or AUC - ROC curve for each column, up to **Max features**. For regression, it uses a coefficient of determination, or R2 metric.

The AUC - ROC curve provides a predictive metric, computed individually for each column using cross-validation, on a sample of up to around 1000 rows. A score of 1 indicates perfect predictive abilities, which often indicates target leakage. A score of 0.5 or lower indicates that the information on the column could not provide, on its own, any useful information towards predicting the target. Although it can happen that a column is uninformative on its own but is useful in predicting the target when used in tandem with other features, a low score could indicate the feature is redundant.

For example, the following image shows a target leakage report for a diabetes classification problem, that is, predicting if a person has diabetes or not. An AUC - ROC curve is used to calculate the predictive ability of five features, and all are determined to be safe from target leakage.

![Target Leakage Report](image)

**Bias Report**

You can use the bias report in Data Wrangler to uncover potential biases in your data. To generate a bias report, you must specify the target column, or **Label**, that you want to predict and a **Facet**, or the column that you want to inspect for biases.

**Label** – The feature about which you want a model to make predictions. For example, if you are predicting customer conversion, you may select a column containing data on whether or not a customer has placed an order. You must also specify whether this feature is a label or a threshold. If you specify a label, you must specify what a **positive outcome** looks like in your data. In the customer conversion example, a positive outcome may be a 1 in the orders column, representing the positive outcome of a customer placing an order within the last three months. If you specify a threshold, you must specify a lower bound defining a positive outcome. For example, if your customer orders columns contains the number of orders placed in the last year, you may want to specify 1.

**Facet** – The column that you want to inspect for biases. For example, if you are trying to predict customer conversion, your facet may be the age of the customer. You may choose this facet because
you believe that your data is biased toward a certain age group. You must identify whether the facet is measured as a value or threshold. For example, if you wanted to inspect one or more specific ages, you select **Value** and specify those ages. If you want to look at an age group, you select **Threshold** and specify the threshold of ages you want to inspect.

After you select your feature and label, you select the types of bias metrics you want to calculate.

**To learn more, see** Generate reports for bias in pre-training data.

**Create Custom Visualizations**

Use the **Code** tab to create custom visualizations. Your dataset, after undergoing the most recently added transformation, is available as a Pandas DataFrame in this code block via the `df` variable.

You must provide an output variable, `chart`, to store an Altair output chart. For example, the following is an example of a code block that can be used to generate a custom histogram using the titanic dataset.

```python
import altair as alt
df = df.iloc[:30]
df = df.rename(columns={"Age": "value"})
df = df.assign(count=df.groupby('value').value.transform('count'))
df = df[['value', 'count']]  
base = alt.Chart(df)
bar = base.mark_bar().encode(x=alt.X('value', bin=True, axis=None), y=alt.Y('count'))
rule = base.mark_rule(color='red').encode(
    x='mean(value):Q',
    size=alt.value(5)
)
chart = bar + rule
```

**To create a custom visualization:**

1. In the **Visualize** area of Data Wrangler, choose the **Code** tab.
2. Give your visualization a **Name**.
3. Enter your code in the code box.
4. Choose **Preview** to preview your visualization.
5. Choose **Add Visualization** to add your visualization.
Export

When you create a Data Wrangler data flow, you can choose from four export options to easily integrate that data flow into your data processing pipeline. Data Wrangler offers export options to SageMaker Data Wrangler Job, Pipeline, Python code, Feature Store and Amazon S3.

The following options create a Jupyter Notebook to run your data flow and integrate with the respective SageMaker feature.

- Data Wrangler Job
- Pipeline
- Feature Store
- Amazon S3

For these options, you choose one or more steps in your data flow to export. When you select a step, all downstream steps are also exported. For example, if you have defined seven consecutive steps in your data flow, and you choose to export the 7th step, code is exported to run steps 1 through 7. The Jupyter Notebooks automatically open when you select one of these export options, and you can run the notebook directly in Studio using a Python 3 (Data science) kernel.

If you select Python code, a Python file is created containing all steps in your data flow.

When you choose an export option that creates a Jupyter Notebook and you run the notebook, it exports your data flow (.flow file) to the default SageMaker S3 bucket for the AWS Region in which the data flow was created, under the prefix data_wrangler_flows. Default S3 buckets have the following naming convention: sagemaker-region-account number. For example, if your account number is 111122223333 and you are using Studio in us-east-1, your imported datasets are stored in sagemaker-us-east-1-111122223333. In this example, your .flow files created in us-east-1 are stored in s3://sagemaker-region-account number/data_wrangler_flows/.

Important

If you do not use the IAM managed policy, AmazonSageMakerFullAccess, to grant AWS roles permission to use Data Wrangler, make sure you grant these roles permission to access this bucket. See Security and Permissions (p. 680) for an example IAM policy you can use to grant these permissions.

Use the following procedure to export a data flow. Use the sections on this page to learn more about each export option.

To export your Data Wrangler flow:

1. Save your Data Wrangler flow. Select File and then select Save Data Wrangler Flow.
2. Navigate to the Export tab.
3. Select the last step in your Data Wrangler flow.
5. Select the export option that you want. Data Wrangler generates a Jupyter Notebook after you choose the export option.

**Export to a Data Wrangler Job**

When you export a Data Wrangler job, Data Wrangler generates a Jupyter Notebook. You run the notebook to export the Data Wrangler flow to a processing job. For the notebook, Data Wrangler automatically selects **Python 3 (Data Science)** as the **Kernel**. Follow the instructions in the notebook to launch your Data Wrangler job.

Data Wrangler uses processing jobs to process your data. You can run these processing jobs using `ml.m5.4xlarge`, `ml.m5.12xlarge`, and `ml.m5.24xlarge` instances and support one instance count. By default, the notebook that is exported from Data Wrangler sets the following `instance_count` and `instance_type`:

```python
instance_count = 1
instance_type = "ml.m5.xlarge"
```

You can monitor your Data Wrangler job status in the SageMaker console in the **Processing** tab. The processing job is named `data-wrangler-flow-processing-flow_id`. The `flow_id` is defined in the notebook using the day and time the notebook is ran.

Additionally, you can monitor your Data Wrangler job using Amazon CloudWatch. For additional information, see Monitor Amazon SageMaker Processing Jobs with CloudWatch Logs and Metrics.

**Export to SageMaker Pipelines**

When you want to build and deploy large-scale machine learning workflows, you can use SageMaker ML Pipelines to create end-to-end workflows that manage and deploy SageMaker jobs. ML Pipelines allows you to build workflows that manage your SageMaker data preparation, model training, and model deployment jobs. Because of this, you can take advantage of the first-party algorithms that SageMaker offers. To learn more about SageMaker Pipelines, see SageMaker Pipelines.

When you export one or more steps from your data flow to SageMaker Pipelines, Data Wrangler creates a Jupyter Notebook that you can use to define, instantiate, run, and manage a pipeline.
Use A Jupyter Notebook to Create a Pipeline

The Jupyter Notebook that Data Wrangler produces can be used to define a pipeline. The pipeline includes a data processing step that is defined by your data flow.

You can add additional steps to your pipeline by adding steps to the steps list in the following code in the notebook:

```python
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[instance_type, instance_count],
    steps=[step_process],  # Add more steps to this list to run in your Pipeline
)
```

To learn more about defining pipelines, see Define SageMaker Pipeline.

Export to Python Code

To export all steps in your data flow to a Python file that you can manually integrate into any data processing workflow, choose the Export to Code option.

You may need to configure the Python script to make it runnable. For example, you may need to modify your Spark environment, and ensure you are running the script from an environment that has permission to access AWS resources.

Export to the SageMaker Feature Store

The SageMaker Feature Store can be used to create, share, and manage curated data for machine learning (ML) development. You can configure an online and offline feature store to be a centralized store for features and associated metadata so features can be easily discovered and reused. To learn more about the Data Wrangler feature store, see Amazon SageMaker Feature Store.

Use A Jupyter Notebook to Add Features to a Feature Store

The Jupyter Notebook that SageMaker produces can be used to process your dataset using a SageMaker Data Wrangler job, and then ingest the data into an online and offline feature store.

**Important**

The IAM role you use to run this notebook must have the following AWS managed policies attached: AmazonSageMakerFullAccess and AmazonSageMakerFeatureStoreAccess.

You only need to enable one online or offline feature store when you create a feature group. Optionally, you can enable both. To disable online store creation, set EnableOnlineStore to False:

```python
# Online Store Configuration
online_store_config = {
    "EnableOnlineStore": False
}
```

The notebook uses the column names and types of the dataframe you export to create a feature group schema, which is used to create a feature group. A feature group is a group of features defined in the feature store to describe a record. The feature group defines the schema and features contained in the feature group. A feature group definition is composed of a list of features, a record identifier feature name, an event time feature name, and configurations for its online store and offline store.

Each feature in a feature group can have one of the following types: String, Fractional, or Integral. If a column in your exported dataframe is not one of these types, it defaults to String.
The following is an example of a feature group schema.

```python
column_schema = [
    {
        "name": "Height",
        "type": "long"
    },
    {
        "name": "Input",
        "type": "string"
    },
    {
        "name": "Output",
        "type": "string"
    },
    {
        "name": "Sum",
        "type": "string"
    },
    {
        "name": "Time",
        "type": "string"
    }
]
```

Additionally, you must specify a record identifier name and event time feature name:

- The record identifier name is the name of the feature whose value uniquely identifies a record defined in the feature store. Only the latest record per identifier value is stored in the online store. The record identifier feature name must be one of feature definitions' names.
- The event time feature name is the name of the feature that stores the EventTime of a record in a feature group. An EventTime is a point in time when a new event occurs that corresponds to the creation or update of a record in a feature. All records in the feature group must have a corresponding EventTime.

The notebook uses these configurations to create a feature group, process your data at scale, and then ingest the processed data into your online and offline feature stores. To learn more, see Data Sources and Ingestion.

Export to Amazon S3

Data Wrangler allows you to export your data directly to an Amazon S3 bucket.

Save your data to Amazon S3

1. After you have imported your data into Data Wrangler, choose Export Data under the Prepare tab to save the current transformed dataset you are viewing.
2. An Export Data screen will appear as shown in the following screenshot. You can save your data to the default Amazon S3 bucket. You can also use the search bar to modify and select an Amazon S3 bucket path of your choosing. You can choose different options for File Type, Delimiter, and Compression. After you complete setting up your bucket path and options, select Export Data.

3. A progress bar will appear to show the status of data export. After it is successfully exported and saved to the Amazon S3 bucket, success screen appears as shown in the following screenshot.
Shut Down Data Wrangler

When you are not using Data Wrangler, it is important to shut down the instance on which it runs to avoid incurring additional fees.

To avoid losing work, save your data flow before shutting Data Wrangler down. To save your data flow in Studio, select File and then select **Save Data Wrangler Flow**. Note that Data Wrangler automatically saves your data flow every 60 seconds.
To shut down the Data Wrangler instance in Studio:

1. In Studio, select the Running Instances and Kernels icon ( ).
2. Under RUNNING APPS is the sagemaker-data-wrangler-1.0 app. Select the shut down icon next to this app ( ).

Data Wrangler runs on an ml.m5.xlarge instance. This instance disappears from RUNNING INSTANCES when you shut down the Data Wrangler app.

After you shut down the Data Wrangler app, it has to restart the next time you open a Data Wrangler flow file. This can take a few minutes.

Update Data Wrangler

To update Data Wrangler to the latest release, you must first shut down the corresponding KernelGateway app from the SageMaker Studio Control Panel. After the KernelGateway app is shut down, you must restart it by opening a new or existing Data Wrangler flow in SageMaker Studio. When you open a new or existing Data Wrangler flow, the kernel that starts contains the latest version of Data Wrangler.

Update your Studio and Data Wrangler instance

1. Navigate to your SageMaker Console.
2. Choose SageMaker and then SageMaker Studio.
3. Choose your user name.
5. Choose Yes, delete app.
6. Type delete in the confirmation box.
7. Choose Delete.
8. Reopen your Studio instance. When you begin to create a Data Wrangler flow, your instance will now use the latest version of Data Wrangler.

Alternatively, if you are using a Data Wrangler application version that is not the latest version, and you have an existing Data Wrangler flow open, you are prompted to update your Data Wrangler application version in the Studio UI. Below is a screenshot showing this prompt.

**Important**
Note that this will update the Data Wrangler Kernel gateway app only. You still need to shut down the JupyterServer app in your user account. To do this, follow the steps above.

![Update Data Wrangler prompt](image)

You can also select Remind me later in which case an Update button will appear in the top right corner of the screen.
Security and Permissions

When you query data from Athena or Amazon Redshift, the queried dataset is automatically stored in the default SageMaker S3 bucket for the AWS Region in which you are using Studio. Additionally, when you export a Jupyter Notebook from Amazon SageMaker Data Wrangler and run it, your data flows, or .flow files, are saved to the same default bucket, under the prefix `data_wrangler_flows`.

For high-level security needs, you can configure a bucket policy that restricts the AWS roles that have access to this default SageMaker S3 bucket. Use the following section to add this type of policy to an S3 bucket. To follow the instructions on this page, use the AWS Command Line Interface (AWS CLI). To learn how, see Configuring the AWS CLI in the IAM User Guide.

Additionally, you need to grant each IAM role that uses Data Wrangler permissions to access required resources. If you do not require granular permissions for the IAM role you use to access Data Wrangler, you can add the IAM managed policy, `AmazonSageMakerFullAccess`, to an IAM role that you use to create your Studio user. This policy grants you full permission to use Data Wrangler. If you require more granular permissions, refer to the section, Grant an IAM Role Permission to Use Data Wrangler (p. 681).

Add a Bucket Policy To Restrict Access to Datasets Imported to Data Wrangler

You can add a policy to the S3 bucket that contains your Data Wrangler resources using an Amazon S3 bucket policy. Resources that Data Wrangler uploads to your default SageMaker S3 bucket in the AWS Region you are using Studio in include the following:

- Queried Amazon Redshift results. These are stored under the `redshift/` prefix.
- Queried Athena results. These are stored under the `athena/` prefix.
- The .flow files uploaded to Amazon S3 when you run an exported Jupyter Notebook Data Wrangler produces. These are stored under the `data_wrangler_flows/` prefix.

Use the following procedure to create an S3 bucket policy that you can add to restrict IAM role access to that bucket. To learn how to add a policy to an S3 bucket, see How do I add an S3 Bucket policy?
To set up a bucket policy on the S3 bucket that stores your Data Wrangler resources:

1. Configure one or more IAM roles that you want to be able to access Data Wrangler.
2. Open a command prompt or shell. For each role that you create, replace `role-name` with the name of the role and run the following:

   ```bash
   $ aws iam get-role --role-name role-name
   ```

   In the response, you'll see a `RoleId` string which begins with `AROA`. Copy this string.
3. Add the following policy to the SageMaker default bucket in the AWS Region in which you are using Data Wrangler. Replace `region` with the AWS Region in which the bucket is located, and `account-id` with your AWS account ID. Replace `userIds` starting with `AROAEXAMPLEID` with the IDs of an AWS roles to which you want to grant permission to use Data Wrangler.

   ```json
   {
     "Version": "2012-10-17",
     "Statement": [
       {
         "Effect": "Deny",
         "Principal": "*",
         "Action": "s3:*",
         "Resource": [
           "arn:aws:s3:::sagemaker-region-account-id/data_wrangler_flows/",
           "arn:aws:s3:::sagemaker-region-account-id/data_wrangler_flows/**",
           "arn:aws:s3:::sagemaker-region-account-id/athena",
           "arn:aws:s3:::sagemaker-region-account-id/athena/**",
           "arn:aws:s3:::sagemaker-region-account-id/redshift",
           "arn:aws:s3:::sagemaker-region-account-id/redshift/**"
         ],
         "Condition": {
           "StringNotLike": {
             "aws:userId": [
               "AROAEXAMPLEID_1:*",
               "AROAEXAMPLEID_2:*
             ]
           }
         }
       }
     ]
   }
   ```

Grant an IAM Role Permission to Use Data Wrangler

You can grant an IAM role permission to use Data Wrangler with the general IAM managed policy, `AmazonSageMakerFullAccess`. This is a general policy that includes permissions required to use all SageMaker services. This policy grants an IAM role full access to Data Wrangler. You should be aware of the following when using `AmazonSageMakerFullAccess` to grant access to Data Wrangler:

- If you import data from Amazon Redshift, the Database User name must have the prefix `sagemaker_access`.

- This managed policy only grants permission to access buckets with one of the following in the name: `SageMaker`, `SageMaker`, `sagemaker`, or `aws-glue`. If want to use Data Wrangler to import from an S3 bucket without these phrases in the name, refer to the last section on this page to learn how to grant permission to an IAM entity to access your S3 buckets.
If you have high-security needs, you can attach the policies in this section to an IAM entity to grant permissions required to use Data Wrangler.

If you have datasets in Amazon Redshift or Athena that an IAM role needs to import from Data Wrangler, you must add a policy to that entity to access these resources. The following policies are the most restrictive policies you can use to give an IAM role permission to import data from Amazon Redshift and Athena.

To learn how to attach a custom policy to an IAM role, refer to Managing IAM policies in the IAM User Guide.

Policy example to grant access to an Athena dataset import

The following policy assumes that the IAM role has permission to access the underlying S3 bucket where data is stored through a separate IAM policy.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "athena:ListDataCatalogs",
            "athena:ListDatabases",
            "athena:ListTableMetadata",
            "athena:GetQueryExecution",
            "athena:GetQueryResults",
            "athena:StartQueryExecution",
            "athena:StopQueryExecution"
         ],
         "Resource": ["*"]
      },
      {
         "Effect": "Allow",
         "Action": [
            "glue:CreateTable"
         ],
         "Resource": [
            "arn:aws:glue:*:*:table/*/sagemaker_tmp_*",
            "arn:aws:glue:*:*:table/sagemaker_featurestore/*",
            "arn:aws:glue:*:*:catalog",
            "arn:aws:glue:*:*:database/*"
         ]
      },
      {
         "Effect": "Allow",
         "Action": [
            "glue:DeleteTable"
         ],
         "Resource": [
            "arn:aws:glue:*:*:table/*/sagemaker_tmp_*",
            "arn:aws:glue:*:*:catalog",
            "arn:aws:glue:*:*:database/*"
         ]
      },
      {
         "Effect": "Allow",
         "Action": [
            "glue:GetDatabases",
            "glue:GetTable",
            "glue:GetTables"
         ]
      }
   ]
}
```
Policy example to grant access to an Amazon Redshift dataset import

The following policy grants permission to set up an Amazon Redshift connection to Data Wrangler using database users that have the prefix `sagemaker_access` in the name. To grant permission to connect using additional database users, add additional entries under "Resources" in the following policy. The following policy assumes that the IAM role has permission to access the underlying S3 bucket where data is stored through a separate IAM policy, if applicable.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "redshift-data:ExecuteStatement",
                "redshift-data:DescribeStatement",
                "redshift-data:CancelStatement",
                "redshift-data:GetStatementResult",
                "redshift-data:ListSchemas",
                "redshift-data:ListTables"
            ],
            "Resource": [ "*" ]
        },
        {
            "Effect": "Allow",
            "Action": [ "redshift:GetClusterCredentials" ],
            "Resource": [ "arn:aws:redshift:*:*:dbuser:*/*sagemaker_access*", "arn:aws:redshift:*:*:dbname:*" ]
        }
    ]
}
```

Policy to grant access to an S3 bucket
If your dataset is stored in Amazon S3, you can grant an IAM role permission to access this bucket with a policy similar to the following. This example grants programmatic read-write access to the bucket named `test`:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": ["s3:ListBucket"],
      "Resource": ["arn:aws:s3:::test"]
    },
    {
      "Effect": "Allow",
      "Action": ["s3:PutObject", "s3:GetObject", "s3:DeleteObject"],
      "Resource": ["arn:aws:s3:::test/*"]
    }
  ]
}
```

To import data from Athena and Amazon Redshift, you must grant an IAM role permission to access the following prefixes under the default Amazon S3 bucket in the AWS Region Data Wrangler is being used in: `athena/`, `redshift/`. If a default Amazon S3 bucket does not already exist in the AWS Region, you must also give the IAM role permission to create a bucket in this region.

Additionally, if you want the IAM role to be able to use the SageMaker Feature Store, SageMaker Pipeline, and Data Wrangler job export options, you must grant access to the prefix `data_wrangler_flows/` in this bucket.

Data Wrangler uses the `athena/` and `redshift/` prefixes to store preview files and imported datasets. To learn more, see Imported Data Storage (p. 646).

Data Wrangler uses the `data_wrangler_flows/` prefix to store .flow files when you run a Jupyter Notebook exported from Data Wrangler. To learn more, see Export (p. 672).

Use a policy similar to the following to grant the permissions described above:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": ["s3:GetObject", "s3:PutObject"],
    },
    {
      "Effect": "Allow",
      "Action": ["s3:GetObject", "s3:PutObject"]
    }
  ]
}
```
You can also access data in your Amazon S3 bucket from another AWS account by specifying the Amazon S3 bucket URI. To do this, the IAM policy that grants access to the Amazon S3 bucket in the other account should use a policy similar to this below where BucketFolder is the specific directory in the users bucket UserBucket. This policy should be added to the user granting access to their bucket for another user.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:PutObject",
                "s3:PutObjectAcl"
            ],
            "Resource": "arn:aws:s3:::UserBucket/BucketFolder/*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:ListBucket"
            ],
            "Resource": "arn:aws:s3:::UserBucket",
            "Condition": {
                "StringLike": {
                    "s3:prefix": ["BucketFolder/*"]
                }
            }
        }
    ]
}
```

The user that will be accessing bucket (not the bucket owner) will need to add a policy similar to this below to their user. Note that AccountX and TestUser below refers to the bucket owner and their User respectively.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": { "AWS": "arn:aws:iam::AccountX:user/TestUser"
        },
```
"Action": [  
  "s3:GetObject",
  "s3:PutObject",
  "s3:PutObjectAcl"
],
"Resource": [  
  "arn:aws:s3:::UserBucket/BucketFolder/*"
}
},
{  
  "Effect": "Allow",
  "Principal": {  
    "AWS": "arn:aws:iam::AccountX:user/TestUser"
  },
  "Action": [  
    "s3:ListBucket"
  ],
  "Resource": [  
    "arn:aws:s3:::UserBucket"
  ]
}

Policy example to grant access to use SageMaker Studio

Use a policy like the following to create an IAM execution role that can be used to set up a Studio instance.

{
  "Version": "2012-10-17",
  "Statement": [
    {  
      "Effect": "Allow",
      "Action": [  
        "sagemaker:CreatePresignedDomainUrl",
        "sagemaker:DescribeDomain",
        "sagemaker:ListDomains",
        "sagemaker:DescribeUserProfile",
        "sagemaker:ListUserProfiles",
        "sagemaker:*App",
        "sagemaker:ListApps"
      ],
      "Resource": "*"
    }
  ]
}

Snowflake and Data Wrangler

All permissions for AWS resources will be managed via your IAM role attached to your SageMaker Studio instance. Snowflake specific permissions are to be managed by the Snowflake admin, as they can grant granular permissions/privileges to each Snowflake user. This includes databases, schemas, tables, warehouses, and storage integration objects. You will have to ensure that the correct permissions are set up outside of Data Wrangler.

Note that the Snowflake COPY INTO Amazon S3 command moves data from Snowflake to S3 over the public internet by default but data in transit will be secured using SSL. Data at rest in Amazon S3 will be encrypted with SSE-KMS using the default AWS KMS key.

With respect to Snowflake credentials storage, Data Wrangler does not store customer credentials. Data Wrangler uses AWS Secrets Manager to store the credentials in a Secret and rotates secrets as
part of a best practice security plan. The Snowflake or Studio administrator needs to ensure that the data scientist's Studio execution role is granted permission to perform GetSecretValue on the Secret where the credentials are stored. If already attached to the Studio execution role, the AmazonSageMakerFullAccess policy will have the necessary permissions to read secrets created by Data Wrangler and secrets created by following the naming and tagging convention in the instructions above. Secrets that do not follow the conventions will need to be separately granted access. It is recommended to use Secrets Manager to prevent sharing credentials over unsecured channels, however note that a logged-in user can retrieve the plain-text password by launching a terminal or Python notebook in Studio and then invoking API calls from the Secrets Manager API.

**Data Encryption with AWS KMS**

For files stored in Amazon S3 that have server-side encryption enabled and the encryption type is SSE-KMS, the SageMaker Studio user role will need to be added as a Key user for them to be able to decrypt the file and import in Data Wrangler.

Below is a screenshot that shows a Studio user role added as a Key user. See IAM Roles to access Users under the left panel to make this change.

---

**Amazon S3 customer managed key setup for Data Wrangler imported data storage**

By default, Data Wrangler uses Amazon S3 buckets that have the following naming convention: sagemaker-region-account number. For example, if your account number is 111122223333 and you are using Studio in us-east-1, your imported datasets are stored with the following naming convention: sagemaker-us-east-1-111122223333.

Below are instructions on how to setup a customer managed key for your default Amazon S3 bucket.

1. To enable server-side encryption and setup a customer managed key for your default S3 bucket, see Using KMS Encryption.
2. After following Step 1, navigate to KMS in your AWS Management Console. Find the customer managed key you selected in Step 1 of the previous step, and add the Studio role as the key user. To do this, follow the Allows key users to use a customer managed key.

**Release Notes**

Data Wrangler is regularly updated with new features and bug fixes. To upgrade the version of Data Wrangler you are using in Studio, follow the instructions in Update Studio Apps (p. 118).
## Release Notes

### New Functionalities:
- **Snowflake** is now supported. You can use Snowflake as a data source in Data Wrangler.
- Added support for custom field delimiter in CSV. Now comma, colon, semicolon, pipe (|) and Tab are supported.
- Now you can export results directly to Amazon S3.
- Added a few new multicollinearity analyzers: Variance Inflation Factors, Principal Component Analysis and Lasso feature selection.

### Enhancements:
- The analyze charts can no longer be packed with overlapping labels.

### Bug Fixes:
- One-hot encoder handles empty string gracefully.
- Fixed crashes that occurred when a dataframe column name contained dots.

### 4/26/2021

### Enhancements:
- Added support for distributed Processing Jobs. You can use multiple instances when running a processing job.
- Data Wrangler Processing job now automatically coalesces small outputs when estimated result size is less than 1 gigabytes.
- Feature Store Notebook: Improved feature store ingestion performance
- Data Wrangler Processing job now use 1.x as the authoritative container tag for future releases.

### Bug Fixes:
- Fixed rendering issues for faceted histogram.
- Fixed Export to Processing Job to support vector type columns.
- Fixed "Extract using regex" operator to return the first captured group if one or more exists in the regular expression or regex.

### 2/8/2021

### New Functionalities:
- Data Wrangler Flows supports multiple instances.
- Updated Export to Data Wrangler Job Notebook to use SageMaker SDK 2.20.0.
- Updated Export to Pipeline Notebook to use SageMaker SDK 2.20.0.
- Updated Export to Pipeline Notebook to add XGBoost training example as an optional step.

### Enhancements:
- To improve performance, importing CSV files that contain multiple lines in a single field is no longer supported.
Release Notes

Bug Fixes:

- Fixed type inference issue in Quick model.
- Fixed the bias metric bug in bias reports.
- Fixed the Featurize text transform to work with columns with missing values.
- Fixed Histogram and Scatter plot built-in visualizations to work with datasets that contain array-like columns.
- Athena query now re-runs if the query execution ID has expired.

Troubleshoot

If an issue arises when using Amazon SageMaker Data Wrangler, we recommend you do the following:

- If an error message is provided, read the message and resolve the issue it reports if possible.
- Make sure the IAM role of your Studio user has the required permissions to perform the action. Reference Security and Permissions (p. 680).
- If the issue occurs when you are trying to import from another AWS service, such as Amazon Redshift or Athena, make sure that you have configured the necessary permissions and resources to perform the data import. Reference Import (p. 617).

As a last resort, you can try restarting the kernel on which Data Wrangler is running.

1. Save and exit out of the .flow file for which you want to restart the kernel.
2. Select the Running Terminals and Kernels icon, as shown in the following image.
3. Select the **Stop** icon to the right of the .flow file for which you want to terminate the kernel, as shown in the following image.
4. Refresh the browser.
5. Reopen the .flow file on which you were working.

Prepare Data at Scale with Studio Notebooks

Amazon SageMaker Studio makes it easy for data scientists, machine learning engineers, and general practitioners to visually discover and easily connect to Amazon EMR clusters from within Studio. Once connected to an Amazon EMR cluster from Studio you can interactively explore and query data, and use Apache Spark to preprocess and prepare large amounts of data for analysis and model training from within SageMaker Studio notebooks.

The analytic capabilities supported from SageMaker Studio by being able to connect to an Amazon EMR cluster from within a notebook instance provides a unified notebook experience for analytics and machine learning (ML). You can interactively explore and query data using Amazon EMR, can run data processing and feature engineering jobs through Spark workloads or SageMaker Processing jobs, can
train and debug ML models and deploy them, all from a single Studio notebook instance. Studio also supports a tool to share your notebook with colleagues for collaboration through the UI. With this capability, you can now build end-to-end ML workflows directly from within Studio notebooks. Being able to connect to an Amazon EMR cluster from within SageMaker Studio reduces the number of tools and set up time required for creating ML workflows and maximizes efficiency amongst teams.

You can visually browse a list of Amazon EMR clusters in your account from within SageMaker Studio. You can simply click to connect to a remote cluster from within the Studio UI. Studio will then automatically inject a command into your notebook to initiate connection with the remote cluster using Kerberos, HTTP or non-auth authentication methods.

The supported images and kernels for connecting to an Amazon EMR cluster are as follows:

- **Images**: Data Science, SparkMagic
- **Kernel**: PySpark and Spark kernels for the SparkMagic image under running apps, and Python 3 (IPython) for the Data Science image.

The Sparkmagic display name has been changed from sparkmagic-1.0 to sagemaker-sparkmagic. The current application name is sagemaker-sparkmagic, and subsequent versions may have a suffix like -v2.

For a full walkthrough on how to connect to an Amazon EMR cluster from Studio, see this blog, **Perform interactive data engineering and data science workflows from SageMaker Studio notebooks.**

**Discover Amazon EMR Clusters from Studio**

To connect to an Amazon EMR cluster from Studio you will first need to access SageMaker Studio. If you have not yet set up SageMaker Studio then follow the **Get Started guide.**

If you created a new domain in the setup of Studio then this new feature should be available to you. If you are reusing an existing domain you will need to update both Studio and Studio Apps. See, **Update Studio** and **Update Studio Apps** for detailed information on how to do this.

To connect to an Amazon EMR cluster in Studio, you will need to enable the discovering functionality by adding a required policy to your Studio execution role. The following steps explain how to do this.

1. Open the IAM console.
2. Select **Roles** in the left panel.
3. Find the Studio execution role you will be using and select it.
4. Under the **Permissions** tab, select **Attach policies**.
5. Select **Create policy**.
6. Select **JSON**.
7. Copy and paste in the following policy:

```json
{
   "Statement": [
      {
         "Action": [
            "elasticmapreduce:DescribeCluster",
            "elasticmapreduce:ListInstanceGroups"
         ],
         "Effect": "Allow",
         "Resource": [692
```
8. Select **Next: Tags**.

9. Select **Next: Review**.

10. Enter a Name, Description, and Select **Create policy**.
11. Next you will need to log into Studio. If this is your first time, then follow these instructions to Log into Studio.
Connect to an Amazon EMR Cluster from Studio

The next set of instructions will explain how to connect to an Amazon EMR Cluster from Studio.

1. Once connected to Studio, you can either open an existing Studio notebook instance or can select File and then New to create a new notebook instance.
2. After you have an open Studio notebook instance, choose a Kernel and Instance. Only a subset of Kernels support connecting to an Amazon EMR Cluster. The supported images are: Data Science and SparkMagic. The supported kernels are PySpark from SparkMagic image and Python3(IPython) from Data Science image. You will see a Cluster button appear in the top right corner of the notebook instance. Select Cluster.
3. **Connect to cluster** UI screen will appear. Choose a cluster and select **Connect**. Not all Amazon EMR clusters can be connected to Studio. For more information, see the following resources: [Studio/Amazon EMR integration](https://aws.amazon.com/blogs/aws/studio-amazon-emr-integration/) and [Studio Amazon EMR integration blog post](https://aws.amazon.com/blogs/aws/).

1. Connecting to a cluster will add a code block to an active cell to establish the connection.
Connect to an Amazon EMR Cluster from Studio
4. If the cluster you are connecting to does not use Kerberos or LDAP connection then you will be prompted to select credential type. You can choose HTTP basic authentication or No credential.
5. An active cell will be populated with all the connection information needed to connect to the Amazon EMR cluster you selected earlier.

1. If the authentication type is Kerberos and HTTP Basic Auth, a widget will be created in an active cell and you will need to provide your credentials to the cluster. Enter your **Username** and **Password**. The following is a screenshot showing a successful connection after entering these credentials to a cluster.
2. If the cluster you are connecting to does not use Kerberos or LDAP and you selected No credentials then you will automatically be connected to an Amazon EMR cluster. The following is a screenshot showing this.
You can change the Amazon EMR cluster that the Studio Notebook is connected to by selecting **Cluster** at the top of your notebook. Then simply browse to find the cluster you want to switch to and click to connect to it.

**Troubleshoot and Monitor Workloads in Amazon EMR**

The following outlines instructions on how to set up SSH tunneling for Spark UI access.

**Set up SSH Tunneling for Spark UI access**

If you would like to set up SSH tunneling to access the Spark UI then follow the steps below. The link under Spark UI and Driver log shown in 6b would not be enabled unless the steps for SSH tunneling for Spark UI is followed.

1. **Option 1:** Set up an SSH tunnel to the master node using local port forwarding
2. **Option 2, part 1:** Set up an SSH tunnel to the master node using dynamic port forwarding
3. **Option 2, part 2:** Configure proxy settings to view websites hosted on the master node

For information on how to view web interfaces hosted on Amazon EMR clusters, see [View web interfaces on Amazon EMR Clusters](#).

**Processing Spark data**

For more information on how to process data using Spark from within a SageMaker Studio notebook, see this blog [Perform interactive data processing using Spark in SageMaker Studio Notebooks](#).

**Bring your own image**

If you want to bring your own image, you need to install the following dependencies to your kernel. Run the following `pip` commands along with the library names:

1. `pip install sparkmagic`
2. `pip install sagemaker-studio-sparkmagic-lib`
3. `pip install sagemaker-studio-analytics-extension`

If you want to connect to a Kerberos protected Amazon EMR then you will also need to install the `kinit` client. Depending on your OS the command to install the `kinit` client will vary. Here is the command for a Ubuntu/Debian based image: `apt-get install -y -qq krb5-user`. 

Process Data

To analyze data and evaluate machine learning models on Amazon SageMaker, use Amazon SageMaker Processing. With Processing, you can use a simplified, managed experience on SageMaker to run your data processing workloads, such as feature engineering, data validation, model evaluation, and model interpretation. You can also use the Amazon SageMaker Processing APIs during the experimentation phase and after the code is deployed in production to evaluate performance.

The preceding diagram shows how Amazon SageMaker spins up a Processing job. Amazon SageMaker takes your script, copies your data from Amazon Simple Storage Service (Amazon S3), and then pulls a processing container. The processing container image can either be an Amazon SageMaker built-in image or a custom image that you provide. The underlying infrastructure for a Processing job is fully managed by Amazon SageMaker. Cluster resources are provisioned for the duration of your job, and cleaned up when a job completes. The output of the Processing job is stored in the Amazon S3 bucket you specified.

Note
Your data must be stored in an Amazon S3 bucket.

Use Amazon SageMaker Processing Sample Notebooks

We provide two sample Jupyter notebooks that show how to perform data preprocessing, model evaluation, or both.

For a sample notebook that shows how to run scikit-learn scripts to perform data preprocessing and model training and evaluation with the SageMaker Python SDK for Processing, see scikit-learn Processing. This notebook also shows how to use your own custom container to run processing workloads with your Python libraries and other specific dependencies.

For a sample notebook that shows how to use Amazon SageMaker Processing to perform distributed data preprocessing with Spark, see Distributed Processing (Spark). This notebook also shows how to train a regression model using XGBoost on the preprocessed dataset.

For instructions on how to create and access Jupyter notebook instances that you can use to run these samples in SageMaker, see Use Amazon SageMaker Notebook Instances (p. 139). After you have created a notebook instance and opened it, choose the SageMaker Examples tab to see a list of all the SageMaker samples. To open a notebook, choose its Use tab and choose Create copy.
Monitor Amazon SageMaker Processing Jobs with CloudWatch Logs and Metrics

Amazon SageMaker Processing provides Amazon CloudWatch logs and metrics to monitor processing jobs. CloudWatch provides CPU, GPU, memory, GPU memory, and disk metrics, and event logging. For more information, see Monitor Amazon SageMaker with Amazon CloudWatch (p. 2624) and Log Amazon SageMaker Events with Amazon CloudWatch (p. 2635).

Data Processing with Apache Spark

Apache Spark is a unified analytics engine for large-scale data processing. Amazon SageMaker provides prebuilt Docker images that include Apache Spark and other dependencies needed to run distributed data processing jobs. With the Amazon SageMaker Python SDK, you can easily apply data transformations and extract features (feature engineering) using the Spark framework. For information about using the SageMaker Python SDK to run Spark processing jobs, see Data Processing with Spark in the Amazon SageMaker Python SDK.

A code repository that contains the source code and Dockerfiles for the Spark images is available on GitHub.

Running a Spark Processing Job

You can use the `sagemaker.spark.PySparkProcessor` or `sagemaker.spark.SparkJarProcessor` class to run your Spark application inside of a processing job. Note you can set `MaxRuntimeInSeconds` to a maximum runtime limit of 5 days. With respect to execution time, and number of instances used, simple spark workloads see a near linear relationship between the number of instances vs. time to completion.

The following code example shows how to run a processing job that invokes your PySpark script `preprocess.py`.

```python
from sagemaker.spark.processing import PySparkProcessor

spark_processor = PySparkProcessor(
    base_job_name="spark-preprocessor",
    framework_version="2.4",
    role=role,
    instance_count=2,
    instance_type="ml.m5.xlarge",
    max_runtime_in_seconds=1200,
)

spark_processor.run(
    submit_app="preprocess.py",
    arguments=[
        's3_input_bucket', bucket,
        's3_input_key_prefix', input_prefix,
        's3_output_bucket', bucket,
        's3_output_key_prefix', output_prefix
    ]
)
```

For an in-depth look, see the Distributed Data Processing with Apache Spark and SageMaker Processing example notebook.

If you are not using the Amazon SageMaker Python SDK and one of its Processor classes to retrieve the pre-built images, you can retrieve these images yourself. The SageMaker prebuilt Docker images are
Data Processing with scikit-learn

For a sample notebook that shows how to run scikit-learn scripts using a Docker image provided and maintained by SageMaker to preprocess data and evaluate models, see scikit-learn Processing. To use this notebook, you need to install the SageMaker Python SDK for Processing.

This notebook runs a processing job using SKLearnProcessor class from the the SageMaker Python SDK to run a scikit-learn script that you provide. The script preprocesses data, trains a model using a SageMaker training job, and then runs a processing job to evaluate the trained model. The processing job estimates how the model is expected to perform in production.

To learn more about using the SageMaker Python SDK with Processing containers, see the SageMaker Python SDK.

The following code example shows how the notebook uses SKLearnProcessor to run your own scikit-learn script using a Docker image provided and maintained by SageMaker, instead of your own Docker image.

```python
from sagemaker.sklearn.processing import SKLearnProcessor
from sagemaker.processing import ProcessingInput, ProcessingOutput

sklearn_processor = SKLearnProcessor(framework_version='0.20.0',
                                       role=role,
                                       instance_type='ml.m5.xlarge',
                                       instance_count=1)

sklearn_processor.run(code='preprocessing.py',
                       inputs=[ProcessingInput(
                               source='s3://path/to/my/input-data.csv',
                               destination='/opt/ml/processing/input')],
                       outputs=[ProcessingOutput(source='/opt/ml/processing/output/train'),
                                ProcessingOutput(source='/opt/ml/processing/output/validation'),
                                ProcessingOutput(source='/opt/ml/processing/output/test')])
```

To process data in parallel using Scikit-Learn on Amazon SageMaker Processing, you can shard input objects by S3 key by setting s3_data_distribution_type='ShardedByS3Key' inside a ProcessingInput so that each instance receives about the same number of input objects.

Use Your Own Processing Code

You can install libraries to run your scripts in your own processing container or, in a more advanced scenario, you can build your own processing container that satisfies the contract to run in Amazon SageMaker. For a formal specification that defines the contract for an Amazon SageMaker Processing container, see Build Your Own Processing Container (Advanced Scenario) (p. 710).

Topics
- Run Scripts with Your Own Processing Container (p. 709)
• Build Your Own Processing Container (Advanced Scenario) (p. 710)

Run Scripts with Your Own Processing Container

You can use scikit-learn scripts to preprocess data and evaluate your models. To see how to run scikit-learn scripts to perform these tasks, see the scikit-learn Processing sample notebook. This notebook uses the ScriptProcessor class from the Amazon SageMaker Python SDK for Processing.

The following example shows a general workflow for using a ScriptProcessor class with your own processing container. The workflow shows how to create your own image, build your container, and use a ScriptProcessor class to run a Python preprocessing script with the container. The processing job processes your input data and saves the processed data in Amazon Simple Storage Service (Amazon S3).

Before using the following examples, you need to have your own input data and a Python script prepared to process your data. For an end-to-end, guided example of this process, refer back to the scikit-learn Processing sample notebook.

1. Create a Docker directory and add the Dockerfile used to create the processing container. Install pandas and scikit-learn into it. (You could also install your own dependencies with a similar RUN command.)

```bash
mkdir docker
%%writefile docker/Dockerfile
FROM python:3.7-slim-buster
RUN pip3 install pandas==0.25.3 scikit-learn==0.21.3
ENV PYTHONUNBUFFERED=TRUE
ENTRYPOINT ["python3"]
```

2. Build the container using the docker command, create an Amazon Elastic Container Registry (Amazon ECR) repository, and push the image to Amazon ECR.

```python
import boto3
account_id = boto3.client('sts').get_caller_identity().get('Account')
region = boto3.Session().region_name
ecr_repository = 'sagemaker-processing-container'
tag = ':latest'
processing_repository_uri = '{}/dkr.ecr.{}.amazonaws.com/{}'.format(account_id, region, ecr_repository + tag)

# Create ECR repository and push docker image
!docker build -t $ecr_repository docker
!aws ecr get-login-password --region {region} | docker login --username AWS --password-stdin {account_id}.dkr.ecr.{region}.amazonaws.com
!aws ecr create-repository --repository-name $ecr_repository
!docker tag {ecr_repository + tag} $processing_repository_uri
!docker push $processing_repository_uri
```

3. Set up the ScriptProcessor from the SageMaker Python SDK to run the script. Replace image_uri with the URI for the image you created, and replace role_arn with the ARN for an AWS Identity and Access Management role that has access to your target Amazon S3 bucket.

```python
from sagemaker.processing import ScriptProcessor, ProcessingInput, ProcessingOutput
script_processor = ScriptProcessor(command=['python3'],
image_uri='image_uri',
role_arn='role_arn')
```
4. Run the script. Replace `preprocessing.py` with the name of your own Python processing script, and replace `s3://path/to/my/input-data.csv` with the Amazon S3 path to your input data.

```python
script_processor.run(code='preprocessing.py',
    inputs=[ProcessingInput(
        source='s3://path/to/my/input-data.csv',
        destination='/opt/ml/processing/input')],
    outputs=[ProcessingOutput(source='/opt/ml/processing/output/train'),
             ProcessingOutput(source='/opt/ml/processing/output/validation'),
             ProcessingOutput(source='/opt/ml/processing/output/test')])
```

You can use the same procedure with any other library or system dependencies. You can also use existing Docker images. This includes images that you run on other platforms such as Kubernetes.

## Build Your Own Processing Container (Advanced Scenario)

You can provide Amazon SageMaker Processing with a Docker image that has your own code and dependencies to run your data processing, feature engineering, and model evaluation workloads.

The following example of a Dockerfile builds a container with the Python libraries scikit-learn and pandas, which you can run as a processing job.

```
FROM python:3.7-slim-buster

# Install scikit-learn and pandas
RUN pip3 install pandas==0.25.3 scikit-learn==0.21.3

# Add a Python script and configure Docker to run it
ADD processing_script.py /
ENTRYPOINT ["python3", "/processing_script.py"]
```

Build and push this Docker image to an Amazon Elastic Container Registry (Amazon ECR) repository and ensure that your SageMaker IAM role can pull the image from Amazon ECR. Then you can run this image on Amazon SageMaker Processing.

## How Amazon SageMaker Processing Runs Your Processing Container Image

Amazon SageMaker Processing runs your processing container image in a similar way as the following command, where `AppSpecification.ImageUri` is the Amazon ECR image URI that you specify in a `CreateProcessingJob` operation.

```
docker run [AppSpecification.ImageUri]
```

This command runs the `ENTRYPOINT` command configured in your Docker image.

You can also override the entrypoint command in the image or give command-line arguments to your entrypoint command using the `AppSpecification.ContainerEntrypoint` and
AppSpecification.ContainerArgument parameters in your CreateProcessingJob request. Specifying these parameters configures Amazon SageMaker Processing to run the container similar to the way that the following command does.

```
```

For example, if you specify the ContainerEntrypoint to be `[python3, -v, /processing_script.py]` in your CreateProcessingJob request, and ContainerArguments to be `[data-format, csv]`, Amazon SageMaker Processing runs your container with the following command.

```
python3 -v /processing_script.py data-format csv
```

When building your processing container, consider the following details:

- Amazon SageMaker Processing decides whether the job completes or fails depending on the exit code of the command run. A processing job completes if all of the processing containers exit successfully with an exit code of 0, and fails if any of the containers exit with a non-zero exit code.
- Amazon SageMaker Processing lets you override the processing container's entrypoint and set command-line arguments just like you can with the Docker API. Docker images can also configure the entrypoint and command-line arguments using the ENTRYPOINT and CMD instructions. The way CreateProcessingJob's ContainerEntrypoint and ContainerArgument parameters configure a Docker image's entrypoint and arguments mirrors how Docker overrides the entrypoint and arguments through the Docker API:
  - If neither ContainerEntrypoint nor ContainerArguments are provided, Processing uses the default ENTRYPOINT or CMD in the image.
  - If ContainerEntrypoint is provided, but not ContainerArguments, Processing runs the image with the given entrypoint, and ignores the ENTRYPOINT and CMD in the image.
  - If ContainerArguments is provided, but not ContainerEntrypoint, Processing runs the image with the default ENTRYPOINT in the image and with the provided arguments.
  - If both ContainerEntrypoint and ContainerArguments are provided, Processing runs the image with the given entrypoint and arguments, and ignores the ENTRYPOINT and CMD in the image.
  - You must use the exec form of the ENTRYPOINT instruction in your Dockerfile (ENTRYPOINT ["executable", "param1", "param2"]) instead of the shell form (ENTRYPOINT command param1 param2). This lets your processing container receive SIGINT and SIGKILL signals, which Processing uses to stop processing jobs with the StopProcessingJob API.
  - `/opt/ml` and all its subdirectories are reserved by SageMaker. When building your Processing Docker image, don't place any data required by your processing container in these directories.
  - If you plan to use GPU devices, make sure that your containers are nvidia-docker compatible. Include only the CUDA toolkit in containers. Don't bundle NVIDIA drivers with the image. For more information about nvidia-docker, see NVIDIA/nvidia-docker.

**How Amazon SageMaker Processing Configures Input and Output For Your Processing Container**

When you create a processing job using the CreateProcessingJob operation, you can specify multiple ProcessingInput and ProcessingOutput values.

You use the ProcessingInput parameter to specify an Amazon Simple Storage Service (Amazon S3) URI to download data from, and a path in your processing container to download the data to. The ProcessingOutput parameter configures a path in your processing container from which to
upload data, and where in Amazon S3 to upload that data to. For both ProcessingInput and ProcessingOutput, the path in the processing container must begin with `/opt/ml/processing/`.

For example, you might create a processing job with one ProcessingInput parameter that downloads data from `s3://your-data-bucket/path/to/input/csv/data` into `/opt/ml/processing/csv` in your processing container, and a ProcessingOutput parameter that uploads data from `/opt/ml/processing/processed_csv` to `s3://your-data-bucket/path/to/output/csv/data`. Your processing job would read the input data, and write output data to `/opt/ml/processing/processed_csv`. Then it uploads the data written to this path to the specified Amazon S3 output location.

**Important**

Symbolic links (symlinks) can not be used to upload output data to Amazon S3. Symlinks are not followed when uploading output data.

How Amazon SageMaker Processing Provides Logs and Metrics for Your Processing Container

When your processing container writes to `stdout` or `stderr`, Amazon SageMaker Processing saves the output from each processing container and puts it in Amazon CloudWatch logs. For information about logging, see [Log Amazon SageMaker Events with Amazon CloudWatch](p. 2635).

Amazon SageMaker Processing also provides CloudWatch metrics for each instance running your processing container. For information about metrics, see [Monitor Amazon SageMaker with Amazon CloudWatch](p. 2624).

How Amazon SageMaker Processing Configures Your Processing Container

Amazon SageMaker Processing provides configuration information to your processing container through environment variables and two JSON files—`/opt/ml/config/processingjobconfig.json` and `/opt/ml/config/resourceconfig.json`—at predefined locations in the container.

When a processing job starts, it uses the environment variables that you specified with the Environment map in the CreateProcessingJob request. The `/opt/ml/config/processingjobconfig.json` file contains information about the hostnames of your processing containers, and is also specified in the CreateProcessingJob request.

The following example shows the format of the `/opt/ml/config/processingjobconfig.json` file.

```json
{
    "ProcessingJobArn": "<processing_job_arn>",
    "ProcessingJobName": "<processing_job_name>",
    "AppSpecification": {
        "ImageUri": "<image_uri>",
        "ContainerEntrypoint": null,
        "ContainerArguments": null
    },
    "Environment": {
        "KEY": "VALUE"
    },
    "ProcessingInputs": [
        {
            "InputName": "input-1",
            "S3Input": {
                "LocalPath": "/opt/ml/processing/input/dataset",
                "S3Uri": "<s3_uri>",
                "S3DataDistributionType": "FullyReplicated"
            }
        }
    ]
}
```
Build Your Own Processing Container

The `/opt/ml/config/resourceconfig.json` file contains information about the hostnames of your processing containers. Use the following hostnames when creating or running distributed processing code.

```json
{
  "current_host": "algo-1",
  "hosts": ["algo-1","algo-2","algo-3"]
}
```

Don't use the information about hostnames contained in `/etc/hostname` or `/etc/hosts` because it might be inaccurate.

Hostname information might not be immediately available to the processing container. We recommend adding a retry policy on hostname resolution operations as nodes become available in the cluster.

### Save and Access Metadata Information About Your Processing Job

To save metadata from the processing container after exiting it, containers can write UTF-8 encoded text to the `/opt/ml/output/message` file. After the processing job enters any terminal status ("Completed", "Stopped", or "Failed"), the "ExitMessage" field in `DescribeProcessingJob` contains the first 1 KB of this file. Access that initial part of file with a call to `DescribeProcessingJob`, which returns it through the `ExitMessage` parameter. For failed processing jobs, you can use this field to communicate information about why the processing container failed.

**Important**

Don't write sensitive data to the `/opt/ml/output/message` file.
If the data in this file isn’t UTF-8 encoded, the job fails and returns a ClientError. If multiple containers exit with an ExitMessage, the content of the ExitMessage from each processing container is concatenated, then truncated to 1 KB.

Run Your Processing Container Using the SageMaker Python SDK

You can use the SageMaker Python SDK to run your own processing image by using the Processor class. The following example shows how to run your own processing container with one input from Amazon Simple Storage Service (Amazon S3) and one output to Amazon S3.

```python
from sagemaker.processing import Processor, ProcessingInput, ProcessingOutput

processor = Processor(image_uri='<your_ecr_image_uri>',
                      role=role,
                      instance_count=1,
                      instance_type="ml.m5.xlarge")

processor.run(inputs=[ProcessingInput(
                      source='<s3_uri or local path>',
                      destination='/opt/ml/processing/input_data'),
                      outputs=[ProcessingOutput(
                      source='/opt/ml/processing/processed_data',
                      destination='<s3_uri>')])
```

Instead of building your processing code into your processing image, you can provide a ScriptProcessor with your image and the command that you want to run, along with the code that you want to run inside that container. For an example, see Run Scripts with Your Own Processing Container (p. 709).

You can also use the scikit-learn image that Amazon SageMaker Processing provides through SKLearnProcessor to run scikit-learn scripts. For an example, see Data Processing with scikit-learn (p. 708).
Create, Store, and Share Features with Amazon SageMaker Feature Store

The machine learning (ML) development process often begins with extracting data signals also known as features from data to train ML models. Amazon SageMaker Feature Store makes it easy for data scientists, machine learning engineers, and general practitioners to create, share, and manage features for machine learning (ML) development. Feature Store accelerates this process by reducing repetitive data processing and curation work required to convert raw data into features for training an ML algorithm.

Further, the processing logic for your data is authored only once, and features generated are used for both training and inference, reducing the training-serving skew. Feature Store is a centralized store for features and associated metadata so features can be easily discovered and reused. You can create an online or an offline store. The online store is used for low latency real-time inference use cases, and the offline store is used for training and batch inference.

The following diagram shows how you can use Amazon SageMaker Feature Store as part of your machine learning pipeline. First, you read in your raw data and process it. You can ingest data via streaming to the online and offline store, or in batches directly to the offline store. You first create a FeatureGroup and configure it to an online or offline store, or both. Then, you can ingest data into your FeatureGroup and store it in your store. A FeatureGroup is a group of features that is defined via a schema in Feature Store to describe a record.

Online store is primarily designed for supporting real-time predictions that need low millisecond latency reads and high throughput writes. Offline store is primarily intended for batch predictions and model training. Offline store is an append only store and can be used to store and access historical feature data. The offline store can help you store and serve features for exploration and model training. The online store retains only the latest feature data. Feature group definitions are immutable after they are created.

How Feature Store Works

In Feature Store, features are stored in a collection called a feature group. You can visualize a feature group as a table in which each column is a feature, with a unique identifier for each row. In principle, a
A feature group is composed of features and values specific to each feature. A record is a collection of values for features that correspond to a unique RecordIdentifier. Altogether, a FeatureGroup is a group of features defined in your FeatureStore to describe a record.

You can use Feature Store in the following modes:

- **Online** – In online mode, features are read with low latency (milliseconds) reads and used for high throughput predictions. This mode requires a feature group to be stored in an online store.
- **Offline** – In offline mode, large streams of data are fed to an offline store, which can be used for training and batch inference. This mode requires a feature group to be stored in an offline store. The offline store uses your S3 bucket for storage and can also fetch data using Athena queries.
- **Online and Offline** – This includes both online and offline modes.

You can ingest data into feature groups in Feature Store in two ways: streaming or in batches. When you ingest data through streaming, a collection of records are pushed to Feature Store by calling a synchronous PutRecord API call. This API enables you to maintain the latest feature values in Feature Store and to push new feature values as soon an update is detected.

Alternatively, Feature Store can process and ingest data in batches. You can author features using Amazon SageMaker Data Wrangler, create feature groups in Feature Store and ingest features in batches using a SageMaker Processing job with a notebook exported from Data Wrangler. This mode allows for batch ingestion into the offline store. It also supports ingestion into the online store if the feature group is configured for both online and offline use.

## Create Feature Groups

To ingest features into Feature Store, you must first define the feature group and the feature definitions (feature name and data type) for all features that belong to the feature group. After they are created, feature groups are immutable. Feature group names are unique within an AWS Region and AWS account. When creating a feature group, you can also create the metadata for the feature group, such as a short description, storage configuration, features for identifying each record, and the event time, as well as tags to store information such as the author, data source, version, and more.

**Important**

FeatureGroup names or associated metadata such as description or tags should not contain any personal identifiable information (PII) or confidential information.

## Find, Discover, and Share Features

After you create a feature group in Feature Store, other authorized users of the feature store can share and discover it. Users can browse through a list of all feature groups in Feature Store or discover existing feature groups by searching by feature group name, description, record identifier name, creation date, and tags.

## Real-Time Inference for Features Stored in the Online Store

With Feature Store, you can enrich your features stored in the online store in real time with data from a streaming source (clean stream data from another application) and serve the features with low millisecond latency for real-time inference.
You can also perform joins across different FeatureGroups for real-time inference by querying two different FeatureGroups in the client application.

Offline Store for Model Training and Batch Inference

Feature Store provides offline storage for feature values in your S3 bucket. Your data is stored in your S3 bucket using a prefixing scheme based on event time. The offline store is an append-only store, enabling Feature Store to maintain a historical record of all feature values. Data is stored in the offline store in Parquet format for optimized storage and query access.

You can query, explore, and visualize features using Data Wrangler from Amazon SageMaker Studio. Feature Store supports combining data to produce, train, validate, and test data sets, and allows you to extract data at different points in time.

Feature Data Ingestion

Feature generation pipelines can be created to process large batches (1 million rows of data or more) or small batches, and to write feature data to the offline or online store. Streaming sources such as Amazon Managed Streaming for Apache Kafka or Amazon Kinesis can also be used as data sources from which features are extracted and directly fed to the online store for training, inference, or feature creation.

You can push records to Feature Store by calling the synchronous PutRecord API call. Since this is a synchronous API call, it allows small batches of updates to be pushed in a single API call. This enables you to maintain high freshness of the feature values and publish values as soon as an update is detected. These are also called streaming features.

When feature data is ingested and updated, Feature Store stores historical data for all features in the offline store. For batch ingest, you can pull feature values from your S3 bucket or use Athena to query. You can also use Data Wrangler to process and engineer new features that can then be exported to a chosen S3 bucket to be accessed by Feature Store. For batch ingestion, you can configure a processing job to batch ingest your data into Feature Store, or you can pull feature values from your S3 bucket using Athena.

Get started with Amazon SageMaker Feature Store

To get started using Amazon SageMaker Feature Store, review the basic concepts, learn how to ingest data for your feature store, and then walk through a Feature Store example. The following sections explain how to create feature groups, ingest data into the groups, and how to manage security for your feature store.

Topics
- Feature Store Concepts (p. 718)
- Create Feature Groups (p. 718)
- Adding required policies to your IAM role (p. 730)
- Use Amazon SageMaker Feature Store with Amazon SageMaker Studio (p. 735)
Feature Store Concepts

The following list of terms are key to understanding the capabilities of Amazon SageMaker Feature Store:

- **Feature store** – Serves as the single source of truth to store, retrieve, remove, track, share, discover, and control access to features.
- **Feature** – A measurable property or characteristic that encapsulates an observed phenomenon. In the Amazon SageMaker Feature Store API, a feature is an attribute of a record. You can define a name and type for every feature stored in Feature Store. Name uniquely identifies a feature within a feature group. Type identifies the datatype for the values of the feature. Supported datatypes are: String, Integral and Fractional.
- **Feature group** – A FeatureGroup is the main Feature Store resource that contains the metadata for all the data stored in Amazon SageMaker Feature Store. A feature group is a logical grouping of features, defined in the feature store, to describe records. A feature group's definition is composed of a list of feature definitions, a record identifier name, and configurations for its online and offline store.
- **Feature definition** – A FeatureDefinition consists of a name and one of the following data types: an Integral, String or Fractional. A FeatureGroup contains a list of feature definitions.
- **Record identifier name** – Each feature group is defined with a record identifier name. The record identifier name must refer to one of the names of a feature defined in the feature group's feature definitions.
- **Record** – A Record is a collection of values for features for a single record identifier value. A combination of record identifier name and a timestamp uniquely identify a record within a feature group.
- **Event time** – a point in time when a new event occurs that corresponds to the creation or update of a record in a feature group. All records in the feature group must have a corresponding Event time. It can be used to track changes to a record over time. The online store contains the record corresponding to the last Event time for a record identifier name, whereas the offline store contains all historic records. Event time values must be an ISO-8601 string in the format. The following formats are supported "yyyy-MM-dd'T'HH:mm:ssZ" and "yyyy-MM-dd'T'HH:mm:ss.SSSZ" where yyyy, MM, and dd represent the year, month, and day respectively and HH, mm, ss, and if applicable, SSS represent the hour, month, second and milliseconds respectively. T and Z are constants.
- **Online Store** – the low latency, high availability cache for a feature group that enables real-time lookup of records. The online store allows quick access to the latest value for a Record via the GetRecord API. A feature group contains an OnlineStoreConfig controlling where the data is stored.
- **Offline store** – the OfflineStore, stores historical data in your S3 bucket. It is used when low (sub-second) latency reads are not needed. For example, when you want to store and serve features for exploration, model training, and batch inference. A feature group contains an OfflineStoreConfig controlling where the data is stored.
- **Ingestion** – The act of populating feature groups in the feature store.

Create Feature Groups

A FeatureGroup is the main Feature Store resource that contains the metadata for all the data stored in Amazon SageMaker Feature Store. A feature group is a logical grouping of features, defined in the feature store, to describe records. A feature group's definition is composed of a list of feature definitions, a record identifier name, and configurations for its online and offline store. The example code in this topic uses the SageMaker Python SDK. The underlying APIs are available for developers using other languages.

Prior to using a feature store you typically load your dataset, run transformations, and set up your features for ingestion. This process has a lot of variation and is highly dependent on your data. The
example code in the following topics refer to the Introduction to Feature Store, Fraud Detection with Amazon SageMaker FeatureStore example notebooks respectively. We recommend that you run this notebook in Amazon SageMaker Studio because the code in this guide is conceptual and not fully functional if copied.

Feature Store supports the following data types: String, Fractional (IEEE 64-bit floating point value), and Integral (Int64 - 64 bit signed integral value). The default type is set to String. This means that, if a column in your dataset is not a float or long type, it defaults to String in your feature store.

You may use a schema to describe your data's columns and data types. You pass this schema into FeatureDefinitions, a required parameter for a FeatureGroup. You can use the SageMaker Python SDK, which has automatic data type detection when you use the load_feature_definitions function.

The default behavior when a new feature record is added with an already existing record ID is as follows. In the offline store, the new record will be appended. In the online store, if the event time of the new record is less than the existing event time than nothing will happen, however if the event time of the new record is greater than or equal to the existing event time, the record will be over written.

Introduction to Feature Store

The example code in this topic refers to the Introduction to Amazon SageMaker Feature Store example notebook. It is recommended that you run this notebook in Amazon SageMaker Studio because the code in this guide is conceptual and not fully functional if copied.

Step 1: Set Up

To start using Feature Store, create SageMaker, boto3 and a Feature Store sessions. Then set up the S3 bucket you want to use for your features. This is your offline store. The following code uses the SageMaker default bucket and adds a custom prefix to it.

Note
The role that you use must have the following managed policies attached to it: AmazonS3FullAccess and AmazonSageMakerFeatureStoreAccess.

```python
# SageMaker Python SDK version 2.x is required
import sagemaker
import sys
import boto3
import pandas as pd
import numpy as np
import io
from sagemaker.session import Session
from sagemaker import get_execution_role

prefix = 'sagemaker-featurestore-introduction'
role = get_execution_role()

sagemaker_session = sagemaker.Session()
region = sagemaker_session.boto_region_name
s3_bucket_name = sagemaker_session.default_bucket()
```

Step 2: Inspect your data

In this notebook example we ingest synthetic data from the Github repository that hosts the full notebook.
The following diagram illustrates the steps the data goes through before it is ingested into Feature Store. In this notebook, we illustrate the use-case where you have data from multiple sources and want to store them independently in a feature store. Our example considers data from a data warehouse (customer data), and data from a real-time streaming service (order data).
Step 3: Create feature groups

We first start by creating feature group names for customer_data and orders_data. Following this, we create two Feature Groups, one for customer_data and another for orders_data.

```
import time
from time import strftime, gmtime
customers_feature_group_name = 'customers-feature-group-' + strftime('%d-%H-%M-%S', gmtime())
orders_feature_group_name = 'orders-feature-group-' + strftime('%d-%H-%M-%S', gmtime())
```

Instantiate a FeatureGroup object for customers_data and orders_data.

```
from sagemaker.feature_store.feature_group import FeatureGroup

customers_feature_group = FeatureGroup(
    name=customers_feature_group_name, sagemaker_session=sagemaker_session)
orders_feature_group = FeatureGroup(
    name=orders_feature_group_name, sagemaker_session=sagemaker_session)
```

```
import time
current_time_sec = int(round(time.time()))
record_identifier_feature_name = "customer_id"
```

Append EventTime feature to your data frame. This parameter is required, and time stamps each data point.

```
customer_data["EventTime"] = pd.Series([current_time_sec]*len(customer_data),
                               dtype="float64")
orders_data["EventTime"] = pd.Series([current_time_sec]*len(orders_data), dtype="float64")
```

Load feature definitions to your feature group.

```
customers_feature_group.load_feature_definitions(data_frame=customer_data)
orders_feature_group.load_feature_definitions(data_frame=orders_data)
```

Below we call create to create two feature groups, customers_feature_group and orders_feature_group respectively.

```
customers_feature_group.create(
    s3_uri=f"s3://{s3_bucket_name}/{prefix}",
    record_identifier_name=record_identifier_feature_name,
    event_time_feature_name="EventTime",
    role_arn=role,
    enable_online_store=True)
```

```
orders_feature_group.create(
    s3_uri=f"s3://{s3_bucket_name}/{prefix}",
    record_identifier_name=record_identifier_feature_name,
    event_time_feature_name="EventTime",
    role_arn=role,
    enable_online_store=True)
```
To confirm that your FeatureGroup has been created we use DescribeFeatureGroup and ListFeatureGroups APIs to display the created feature group.

```
customers_feature_group.describe()

orders_feature_group.describe()
```

```
sagemaker_session.boto_session.client('sagemaker', region_name=region).list_feature_groups()  # We use the boto client to list FeatureGroups
```

**Step 4: Ingest data into a feature group**

After the FeatureGroups have been created, we can put data into the FeatureGroups. If you are using the SageMaker Python SDK, use the ingest API call. If you are using by using boto3 then use the PutRecord API. It will take less than 1 minute to ingest data both of these FeatureGroups. This example uses the SageMaker Python SDK, and so it uses the ingest API call.

```
def check_feature_group_status(feature_group):
    status = feature_group.describe().get("FeatureGroupStatus")
    while status == "Creating":
        print("Waiting for Feature Group to be Created")
        time.sleep(5)
        status = feature_group.describe().get("FeatureGroupStatus")
        print(f"FeatureGroup {feature_group.name} successfully created.")

check_feature_group_status(customers_feature_group)
check_feature_group_status(orders_feature_group)
```

```
customers_feature_group.ingest(
    data_frame=customer_data, max_workers=3, wait=True
)

orders_feature_group.ingest(
    data_frame=orders_data, max_workers=3, wait=True
)
```

Using an arbitrary customer record id, 573291 we use get_record to check that the data has been ingested into the feature group.

```
customer_id = 573291
sample_record = sagemaker_session.boto_session.client('sagemaker-featurestore-runtime', region_name=region).get_record(FeatureGroupName=customers_feature_group_name, RecordIdentifierValueAsString=str(customer_id))
print(sample_record)
```

Below demonstrates how to use the batch_get_record to get a batch of records.

```
all_records = sagemaker_session.boto_session.client(
    "sagemaker-featurestore-runtime", region_name=region
).batch_get_record(
    Identifiers=[
        {
            "FeatureGroupName": customers_feature_group_name,
            "RecordIdentifiersValueAsString": ["573291", "109382", "828400", "124013"],
```
Step 5: Clean up

Here we remove the Feature Groups we created.

```python
customers_feature_group.delete()
orders_feature_group.delete()
```

Step 6: Next steps

In this example notebook, you learned how to quickly get started with Feature Store, create feature groups, and ingest data into them.

For an advanced example on how to use Feature Store for a Fraud Detection use-case, see Fraud Detection with Feature Store.

Step 7: Programmers note

In this notebook we used a variety of different API calls. Most of them are accessible through the Python SDK, however some only exist within boto3. You can invoke the Python SDK API calls directly on your Feature Store objects, whereas to invoke API calls that exist within boto3, you must first access a boto client through your boto and sagemaker sessions: e.g., `sagemaker_session.boto_session.client()`.

Below we list API calls used in this notebook that exist within the Python SDK and ones that exist in boto3 for your reference.

Python SDK API Calls

```python
describe()
ingest()
delete()
create()
load_feature_definitions()
```

Boto3 API Calls

```python
list_feature_groups()
get_record()
```

Fraud Detection with Feature Store

Step 1: Set Up Feature Store

To start using Feature Store, create a SageMaker session, boto3 session, and a Feature Store session. Also, set up the S3 bucket you want to use for your features. This is your offline store. The following code uses the SageMaker default bucket and adds a custom prefix to it.
Note
The role that you use must have the following managed policies attached to it:
AmazonSageMakerFullAccess and AmazonSageMakerFeatureStoreAccess.

import boto3
import sagemaker
from sagemaker.session import Session

sagemaker_session = sagemaker.Session()
boto_session = boto3.Session(region_name=region)
role = sagemaker.get_execution_role()
default_bucket = sagemaker_session.default_bucket()
prefix = 'sagemaker-featurestore'
offline_feature_store_bucket = 's3://{}/{}'.format(default_bucket, prefix)

sagemaker_client = boto_session.client(service_name='sagemaker', region_name=region)
featurestore_runtime = boto_session.client(service_name='sagemaker-featurestore-runtime', region_name=region)

feature_store_session = Session(
boto_session=boto_session,
sagemaker_client=sagemaker_client,
sagemaker_featurestore_runtime_client=featurestore_runtime
)

Step 2: Load Datasets and Partition Data into Feature Groups

Load your data into data frames for each of your features. You use these data frames after you set up the feature group. In the fraud detection example, you can see these steps in the following code.

import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import io

fraud_detection_bucket_name = 'sagemaker-featurestore-fraud-detection'
identity_file_key = 'sampled_identity.csv'
transaction_file_key = 'sampled_transactions.csv'

identity_data_object = s3_client.get_object(Bucket=fraud_detection_bucket_name, Key=identity_file_key)
transaction_data_object = s3_client.get_object(Bucket=fraud_detection_bucket_name, Key=transaction_file_key)

identity_data = pd.read_csv(io.BytesIO(identity_data_object['Body'].read()))
transaction_data = pd.read_csv(io.BytesIO(transaction_data_object['Body'].read()))

identity_data = identity_data.round(5)
transaction_data = transaction_data.round(5)

identity_data = identity_data.fillna(0)
transaction_data = transaction_data.fillna(0)

# Feature transformations for this dataset are applied before ingestion into FeatureStore.
# One hot encode card4, card6
encoded_card_bank = pd.get_dummies(transaction_data['card4'], prefix = 'card_bank')
encoded_card_type = pd.get_dummies(transaction_data['card6'], prefix = 'card_type')

transformed_transaction_data = pd.concat([transaction_data, encoded_card_type, encoded_card_bank], axis=1)
transformed_transaction_data = transformed_transaction_data.rename(columns={"card_bank_american express": "card_bank_american_express"})

Step 3: Set Up Feature Groups

When you set up your feature groups, you need to customize the feature names with a unique name and set up each feature group with the `FeatureGroup` class.

```python
from sagemaker.feature_store.feature_group import FeatureGroup
feature_group_name = "some string for a name"
feature_group = FeatureGroup(name=feature_group_name,
sagemaker_session=feature_store_session)
```

For example, in the fraud detection example, the two feature groups are `identity` and `transaction`. In the following code you can see how the names are customized with a timestamp, and then each group is set up by passing in the name and the session.

```python
import time
from time import gmtime, strftime, sleep
from sagemaker.feature_store.feature_group import FeatureGroup

identity_feature_group_name = 'identity-feature-group-' + strftime('%d-%H-%M-%S', gmtime())
transaction_feature_group_name = 'transaction-feature-group-' + strftime('%d-%H-%M-%S', gmtime())

identity_feature_group = FeatureGroup(name=identity_feature_group_name,
sagemaker_session=feature_store_session)
transaction_feature_group = FeatureGroup(name=transaction_feature_group_name,
sagemaker_session=feature_store_session)
```

Step 4: Set Up Record Identifier and Event Time Features

In this step, you specify a record identifier name and an event time feature name. This name maps to the column of the corresponding features in your data. For example, in the fraud detection example, the column of interest is `TransactionID`. `EventTime` can be appended to your data when no timestamp is available. In the following code, you can see how these variables are set, and then `EventTime` is appended to both feature's data.

```python
record_identifier_name = "TransactionID"
event_time_feature_name = "EventTime"
current_time_sec = int(round(time.time()))

identity_data[event_time_feature_name] = pd.Series([current_time_sec]*len(identity_data),
dtype="float64")
transformed_transaction_data[event_time_feature_name] =
    pd.Series([current_time_sec]*len(transaction_data), dtype="float64")
```

Step 5: Load Feature Definitions

You can now load the feature definitions by passing a data frame containing the feature data. In the following code for the fraud detection example, the identity feature and transaction feature are each loaded by using `load_feature_definitions`, and this function automatically detects the data type of each column of data. For developers using a schema rather than automatic detection, see the Export Feature Groups from Data Wrangler example for code that shows how to load the schema, map it, and add it as a `FeatureDefinition` that you can use to create the `FeatureGroup`. This example also covers a boto3 implementation, which you can use instead of the SageMaker Python SDK.

```python
identity_feature_group.load_feature_definitions(data_frame=identity_data); # output is suppressed
```
Step 6: Create a Feature Group

In this step, you use the `create` function to create the feature group. The following code shows all of the available parameters. The online store is not created by default, so you must set this as `True` if you want to enable it. The `s3_uri` is the S3 bucket location of your offline store.

```python
# create a FeatureGroup
feature_group.create(
    description = "Some info about the feature group",
    feature_group_name = feature_group_name,
    record_identifier_name = record_identifier_name,
    event_time_feature_name = event_time_feature_name,
    feature_definitions = feature_definitions,
    role_arn = role,
    s3_uri = offline_feature_store_bucket,
    enable_online_store = True,
    online_store_kms_key_id = None,
    offline_store_kms_key_id = None,
    disable_glue_table_creation = False,
    data_catalog_config = None,
    tags = ["tag1","tag2"]
)
```

The following code from the fraud detection example shows a minimal `create` call for each of the two features groups being created.

```python
identity_feature_group.create(
    s3_uri=offline_feature_store_bucket,
    record_identifier_name=record_identifier_name,
    event_time_feature_name=event_time_feature_name,
    role_arn=role,
    enable_online_store=True
)

transaction_feature_group.create(
    s3_uri=offline_feature_store_bucket,
    record_identifier_name=record_identifier_name,
    event_time_feature_name=event_time_feature_name,
    role_arn=role,
    enable_online_store=True
)
```

When you create a feature group, it takes time to load the data, and you need to wait until the feature group is created before you can use it. You can check status using the following method.

```python
status = feature_group.describe().get("FeatureGroupStatus")
```

While the feature group is being created, you receive `Creating` as a response. When this step has finished successfully, the response is `Created`. Other possible statuses are `CreateFailed`, `Deleting`, or `DeleteFailed`.

Step 7: Work with Feature Groups

Now that you've set up your feature group, you can perform any of the following tasks:
Describe a Feature Group

You can retrieve information about your feature group with the `describe` function.

```python
feature_group.describe()
```

List Feature Groups

You can list all of your feature groups with the `list_feature_groups` function.

```python
sagemaker_client.list_feature_groups()
```

Put Records in a Feature Group

You can use the `ingest` function to load your feature data. You pass in a data frame of feature data, set the number of workers, and choose to wait for it to return or not. The following example demonstrates using the `ingest` function.

```python
feature_group.ingest(  
data_frame=feature_data, max_workers=3, wait=True
)
```

For each feature group you have, run the `ingest` function on the feature data you want to load.

Get Records from a Feature Group

You can use the `get_record` function to retrieve the data for a specific feature by its record identifier. The following example uses an example identifier to retrieve the record.

```python
record_identifier_value = str(2990130)
featurestore_runtime.get_record(FeatureGroupName=transaction_feature_group_name,  
RecordIdentifierValueAsString=record_identifier_value)
```

An example response from the fraud detection example:

```json
...  
'Record': [{'FeatureName': 'TransactionID', 'ValueAsString': '2990130'},  
{'FeatureName': 'isFraud', 'ValueAsString': '0'},  
{'FeatureName': 'TransactionID', 'ValueAsString': '152647'},  
{'FeatureName': 'TransactionAmt', 'ValueAsString': '75.0'},  
{'FeatureName': 'ProductCD', 'ValueAsString': 'H'},  
{'FeatureName': 'card1', 'ValueAsString': '4577'}],  
...
Generate Hive DDL Commands

The SageMaker Python SDK’s FeatureStore class also provides the functionality to generate Hive DDL commands. The schema of the table is generated based on the feature definitions. Columns are named after feature name and data-type are inferred based on feature type.

```python
print(feature_group.as_hive_ddl())
```

Example output:

```
CREATE EXTERNAL TABLE IF NOT EXISTS sagemaker_featurestore.identity-feature-group-27-19-33-00 (  
    TransactionID INT  
    id_01 FLOAT  
    id_02 FLOAT  
    id_03 FLOAT  
    id_04 FLOAT  
    ...  
)
```

Build a Training Dataset

Feature Store automatically builds an AWS Glue data catalog when you create feature groups and you can turn this off if you want. The following describes how to create a single training dataset with feature values from both identity and transaction feature groups created earlier in this topic. Also, the following describes how to run an Amazon Athena query to join data stored in the offline store from both identity and transaction feature groups.

To start, create an Athena query using `athena_query()` for both identity and transaction feature groups. The `table_name` is the AWS Glue table that is autogenerated by Feature Store.

```python
identity_query = identity_feature_group.athena_query()
transaction_query = transaction_feature_group.athena_query()
```

```python
identity_table = identity_query.table_name
transaction_table = transaction_query.table_name
```

Write and Execute an Athena Query

You write your query using SQL on these feature groups, and then execute the query with the `.run()` command and specify your S3 bucket location for the data set to be saved there.

```python
# Athena query
query_string = 'SELECT * FROM "'+transaction_table+'" LEFT JOIN "'+identity_table+'" ON "'+transaction_table+'".transactionid = "'+identity_table+'".transactionid'

# run Athena query. The output is loaded to a Pandas dataframe.
dataset = pd.DataFrame()
identity_query.run(query_string=query_string,
                   output_location='s3://'+default_s3_bucket_name+'/query_results/')
identity_query.wait()
dataset = identity_query.as_dataframe()
```

From here you can train a model using this data set and then perform inference.

Delete a Feature Group

You can delete a feature group with the `delete` function.
Adding required policies to your IAM role

To get started with Amazon SageMaker Feature Store you must add the required policy to your role, AmazonSageMakerFeatureStoreAccess. Below is a walkthrough on how to add it to your role through the console.

**Step 1: Access AWS Management Console**

Sign in to the AWS Management Console and open the IAM console.

**Step 2: Choose Roles**

In the navigation pane on the left, choose Roles. The navigation pane is illustrated below with Roles outlined in red.
Identity and Access Management (IAM)

Dashboard

- Access management
  - Groups
  - Users
    - Roles
  - Policies
    - Identity providers
    - Account settings

- Access reports
  - Access analyzer
    - Archive rules
  - Analyzers
  - Settings
  - Credential report
  - Organization activity
  - Service control policies (SCPs)
**Step 3: Find your role**

In the search bar, enter the role you are using for Amazon SageMaker Feature Store. Below illustrates with a red arrow where you enter your role.

**Roles**

**What are IAM roles?**

IAM roles are a secure way to grant permissions to entities that you trust. Examples of entities include:

- IAM user in another account
- Application code running on an EC2 instance that needs to perform actions on AWS resources
- An AWS service that needs to act on resources in your account to provide its features
- Users from a corporate directory who use identity federation with SAML

IAM roles issue keys that are valid for short durations, making them a more secure way to grant access.

**Additional resources:**

- IAM Roles FAQ
- IAM Roles Documentation
- Tutorial: Setting Up Cross Account Access
- Common Scenarios for Roles

**Step 4: Attach policy**

After you find your role, choose **Attach policies**. Below illustrates this with a red arrow.
Next you will enter in the search bar the required policy. Below illustrates the search bar you will use to enter the policy.

The policy you will need to add is `AmazonSageMakerFeatureStoreAccess`. After you enter the policy, select the check box and then choose Attach policy. Below illustrates this step.
After you have attached both policies to your role, the policy should appear under your IAM role. The following illustrates how it appears under your IAM role.
Use Amazon SageMaker Feature Store with Amazon SageMaker Studio

You can use Studio to create and view details about your feature groups.

Topics
- Create a Feature Group in Studio (p. 735)
- View Feature Group Details in Studio (p. 740)

Create a Feature Group in Studio

The create feature group process in Studio has four steps: enter details, definitions, required features, and tags.

Consider the following options before you start:

- If you plan to only use an online store, you just need the schema for your features. This is your columns and each column's data type.
- If you plan to use an offline store, you need an S3 bucket URI and a Role ARN.
- If you plan to use encryption, you need a KMS key. You can use the same one for both the online store and your offline store, or have a unique key for each.
- If you plan to use AWS Glue integration, be prepared to provide a data catalog name, database name, and table name.

To create a feature group in Studio

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Studio (p. 34).
2. In the left navigation pane, choose the Components and registries icon (اظهار). ( travellers )
3. In the file and resource browser, choose Feature Store.
The feature store is a centralized repository of features for machine learning. Use **Create feature group** to create a new collection of features, tags, and metadata for easy discovery and sharing.

4. The Feature Store tab lists your feature groups.
5. The **Feature Store** tab, choose **Create Feature Group**.
6. Enter the feature group details.

![Image of Feature Store and Feature Group creation](image)

7. *(Optional)* If you're using Glue, enter the data catalog details.

![Image of Data Catalog](image)

8. Enter feature definitions. You have two options for providing a schema for your features: a JSON editor, or a Table editor.
9. The table editor accepts a column name and a data type. In a minimal example, you will need at least two for the next step: one for a record identifier and one for a time event feature. You can have up to 2,500 feature definitions.

10. Set a record identifier and a time feature to use for this feature group.
11. (Optional) Enter tags as key value pairs.

12. Choose Create feature group.
13. In the **Actions** column, choose **Open feature store**.

14. When the feature group is finished being created, it appears in your feature groups list. Choose the refresh button to refresh the list.

**View Feature Group Details in Studio**

You can view details about your feature groups, and get sample queries to run against your data sources to gather the data for features you have defined.

**To view feature group details in Studio**

1. Double-click or right-click a feature group from your list, and then choose **Open feature group detail**.

2. In the details view, you can review your feature group summary, feature definitions, feature group tags, and sample query.
3. On the **Feature definitions** tab, you can search for features by name.

![Feature definitions tab](image)

4. On the **Feature group tags** tab, you can add and remove tags.

![Feature group tags tab](image)
5. On the **Sample query** tab, you can see a variety of sample queries: interactive exploration, time travel, remove tombstone, and remove duplicates.

**Data Sources and Ingestion**

There are multiple ways to bring your data into Amazon SageMaker Feature Store. Feature Store offers a single API call for data ingestion called `PutRecord` that enables you to ingest data in batches or from streaming sources. You can also use Amazon SageMaker Data Wrangler to engineer features and then ingest your features into your Feature Store.

**Topics**
- Stream Ingestion (p. 742)
- Data Wrangler with Feature Store (p. 743)

**Stream Ingestion**

You can use streaming sources such as Kafka or Kinesis as a data source where features are extracted from there and directly fed to the online feature store for training, inference or feature creation. Records can be pushed into the feature store by calling the synchronous `PutRecord` API call. Since this is a synchronous API call it allows small batches of updates to be pushed in a single API call. This enables you to maintain high freshness of the feature values and publish values as soon an update is detected. These are also called *streaming* features.
Data Wrangler with Feature Store

Data Wrangler is a feature of Studio that provides an end-to-end solution to import, prepare, transform, featurize, and analyze data. Data Wrangler enables you to engineer your features and ingest them into a feature store.

In Studio, after interacting with Data Wrangler, choose the Export tab, choose Export Step, and then choose Feature Store, as shown in the following screenshot. This exports a Jupyter notebook that has all the source code in it to create a Feature Store feature group that adds your features from Data Wrangler to an offline or online feature store.
After the feature group has been created, you can also select and join data across multiple feature groups to create new engineered features in Data Wrangler and then export your data set to an S3 bucket.
For more information on how to export to Feature Store, see Export to SageMaker Feature Store.

Query Feature Store with Athena and AWS Glue

After a Feature Store feature group has been created in an offline feature store, you can choose to run queries using Amazon Athena on an AWS Glue catalog. This requires data to be registered in a data catalog with other catalog details which is auto-registered for you in Feature Store. In other words, Feature Store automatically builds an AWS Glue data catalog when feature groups are created and you can turn them off. This is particularly useful when you want to build a dataset by executing SQL queries and then train a model for inference.

After your FeatureStore has been created and populated with your data in the offline store, you have the capability to write SQL queries to join data stored in the offline store from different FeatureGroups. To do this, you can use Amazon Athena to write and execute SQL queries. You can set up a AWS Glue crawler to run on a schedule to ensure your catalog is always up to date as well.

If you want to do this please define a role which can used by the AWS Glue crawler to access the offline store's S3 buckets. For more information, see Create an IAM role.

For more information on how to use AWS Glue and Athena to build a training dataset for model training and inference, see Build Training Dataset: Create Feature Groups.

Sample Athena Queries

Below we provide some sample queries that act as a template for you to quickly write queries using Athena.

**Interactive Exploration**

This query selects the first 1000 records.

```
SELECT *
FROM <FeatureGroup.DataCatalogConfig.DatabaseName>.<FeatureGroup.DataCatalogConfig.TableName>
LIMIT 1000
```

**Latest snapshot without duplicates**

This query selects the latest non-duplicate records.

```
SELECT *
FROM
  (SELECT *,
       row_number()
       OVER (PARTITION BY <RecordIdentifierFeatureName>
              ORDER BY <EventTimeFeatureName> desc, Api_Invocation_Time DESC, write_time DESC) AS row_num
  FROM
    <FeatureGroup.DataCatalogConfig.DatabaseName>.<FeatureGroup.DataCatalogConfig.TableName>)
WHERE row_num = 1;
```

**Latest snapshot without duplicates and deleted records in the offline store**

This query filters out any deleted records and selects non-duplicate records from the offline store.

```
SELECT *
FROM
  (SELECT *,
       row_number()
       OVER (PARTITION BY <RecordIdentifierFeatureName>
              ORDER BY <EventTimeFeatureName> desc, Api_Invocation_Time DESC, write_time DESC) AS row_num
  FROM
    <FeatureGroup.DataCatalogConfig.DatabaseName>.<FeatureGroup.DataCatalogConfig.TableName>)
WHERE row_num = 1;
```
Cross-Account Offline Store Access

Amazon SageMaker Feature Store allows users to create a feature group in one account (Account A) and configure it with an offline store using an Amazon S3 bucket in another account (Account B). This can be set up using the steps in the following section.

Topics

• Step 1: Set Up the Offline Store Access Role in Account A (p. 746)
• Step 2: Set up an Offline Store S3 Bucket in Account B (p. 747)
• Step 3: Set up an Offline Store KMS Encryption Key in Account A (p. 748)
• Step 4: Create a Feature Group in Account A (p. 749)

Step 1: Set Up the Offline Store Access Role in Account A

First, set up a role for Amazon SageMaker Feature Store to write the data into the offline store. The simplest way to accomplish this is to create a new role using the AmazonSageMakerFeatureStoreAccess policy or to use an existing role that already has the AmazonSageMakerFeatureStoreAccess policy attached. This document refers to this policy as Account-A-Offline-Feature-Store-Role-ARN.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
```
The preceding code snippet shows the AmazonSageMakerFeatureStoreAccess policy. The Resource section of the policy is scoped down by default to S3 buckets with names that contain SageMaker, Sagemaker, or sagemaker. This means the offline store S3 bucket being used must follow this naming convention. If this is not your case, or if you want to further scope down the resource, you can copy and paste the policy to your S3 bucket policy in the console, customize the Resource section to be arn:aws:s3:::your-offline-store-bucket-name, and then attach to the role.

Additionally, this role must have KMS permissions attached. At a minimum, it requires the kms:GenerateDataKey permission to be able to write to the offline store using your customer managed key. See Step 3 to learn about why a customer managed key is needed for the cross-account scenario and how to set it up. The following example shows an inline policy:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",
      "Action": [
        "kms:GenerateDataKey"
      ],
    }
  ]
}
```

The Resource section of this policy is scoped to any key in Account A. To further scope this down, after setting up the offline store KMS key in Step 3, return to this policy and replace it with the key ARN.

**Step 2: Set up an Offline Store S3 Bucket in Account B**

Create an S3 bucket in Account B. If you are using the default AmazonSageMakerFeatureStoreAccess policy, the bucket name must include SageMaker, Sagemaker, or sagemaker. Edit the bucket policy as shown in the following example to allow Account A to read and write objects.

This document refers to the following example bucket policy as Account-B-Offline-Feature-Store-Bucket.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "S3CrossAccountBucketAccess",
      "Effect": "Allow",
      "Action": [
        "s3:GetObject",
        "s3:ListBucket"
      ],
      "Resource": "arn:aws:s3:::your-offline-store-bucket-name/*"
    }
  ]
}
```
In the preceding policy, the principal is `Account-A-Offline-Feature-Store-Role-ARN`, which is the role created in Account A in Step 1 and provided to Amazon SageMaker Feature Store to write to the offline store. You can provide multiple ARN roles under `Principal`.

**Step 3: Set up an Offline Store KMS Encryption Key in Account A**

Amazon SageMaker Feature Store ensures that server-side encryption is always enabled for S3 objects in the offline store. For cross-account use cases, you must provide a customer managed key so that you are in control of who can write to the offline store (in this case, `Account-A-Offline-Feature-Store-Role-ARN` from Account A) and who can read from the offline store (in this case, identities from Account B).

This document refers to the following example key policy as `Account-A-Offline-Feature-Store-KMS-Key-ARN`.

```json
{
  "Version": "2012-10-17",
  "Id": "key-consolepolicy-3",
  "Statement": [
    {
      "Sid": "Enable IAM User Permissions",
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::Account-A-Account-Id:root"
      },
      "Action": "kms:*",
      "Resource": "*"
    },
    {
      "Sid": "Allow access for Key Administrators",
      "Effect": "Allow",
      "Principal": {
        "AWS": [
          "arn:aws:iam::Account-A-Account-Id:role/Administrator",
          "arn:aws:iam::Account-A-Account-Id:role/KeyAdministrator"
        ]
      },
      "Resource": "*"
    }
  ]
}
```
Step 4: Create a Feature Group in Account A

Next, create the feature group in Account A, with an offline store S3 bucket in Account B. To do this, provide the following parameters for RoleArn, OfflineStoreConfig.S3StorageConfig.KmsKeyId and OfflineStoreConfig.S3StorageConfig.S3Uri respectively:

- Provide Account-A-Offline-Feature-Store-Role-ARN as the RoleArn.
- Provide Account-A-Offline-Feature-Store-KMS-Key-ARN for OfflineStoreConfig.S3StorageConfig.KmsKeyId.
- Provide Account-B-Offline-Feature-Store-Bucket for OfflineStoreConfig.S3StorageConfig.S3Uri.
Security and Access Control

Amazon SageMaker Feature Store enables you to create two types of stores: an online store or offline store. The online store is used for low latency real-time inference use cases whereas the offline store is used for training and batch inference use cases. When you create a feature group for online or offline use you can provide a AWS Key Management Service customer managed key to encrypt all your data at rest. In case you do not provide a AWS KMS key then we ensure that your data is encrypted on the server side using an AWS owned AWS KMS key or AWS managed AWS KMS key. While creating a feature group, you can select storage type and optionally provide a AWS KMS key for encrypting data, then you can call various APIs for data management such as PutRecord, GetRecord, DeleteRecord.

Feature Store allows you to grant or deny access to individuals at the feature group-level and enables cross-account access to Feature Store. For example, you can set up developer accounts to access the offline store for model training and exploration that do not have write access to production accounts. You can set up production accounts to access both online and offline stores. Feature Store uses unique customer AWS KMS keys for offline and online store data at-rest encryption. Access control is enabled through both API and AWS KMS key access. You can also create feature group-level access control.

For more information about customer managed key, see customer managed keys. For more information about AWS KMS, see AWS KMS.

Using AWS KMS Permissions for Amazon SageMaker Feature Store

Encryption at rest protects Feature Store under an AWS KMS customer managed key. By default, it uses an AWS owned customer managed key for OnlineStore and AWS managed customer managed key for OfflineStore. Feature Store supports an option to encrypt your online or offline store under customer managed key. You can select the customer managed key for Feature Store when you create your online or offline store, and they can be different for each store.

Feature Store supports only symmetric customer managed keys. You cannot use an asymmetric customer managed key to encrypt your data in your online or offline store. For help determining whether a customer managed key is symmetric or asymmetric, see Identifying symmetric and asymmetric customer managed keys.

When you use a customer managed key, you can take advantage of the following features:

- You create and manage the customer managed key, including setting the key policies, IAM policies and grants to control access to the customer managed key. You can enable and disable the customer managed key, enable and disable automatic key rotation, and delete the customer managed key when it is no longer in use.
- You can use a customer managed key with imported key material or a customer managed key in a custom key store that you own and manage.
- You can audit the encryption and decryption of your online or offline store by examining the API calls to AWS KMS in AWS CloudTrail logs.

You do not pay a monthly fee for AWS owned customer managed keys. Customer managed keys will incur a charge for each API call and AWS Key Management Service quotas apply to each customer managed key.
Authorizing Use of a Customer Managed Key for Your Online Store

If you use a customer managed key to protect your online store, the policies on that customer managed key must give Feature Store permission to use it on your behalf. You have full control over the policies and grants on a customer managed key.

Feature Store does not need additional authorization to use the default AWS owned customer managed key to protect your online or offline stores in your AWS account.

Customer managed key policy

When you select a customer managed key to protect your Online Store, Feature Store must have permission to use the customer managed key on behalf of the principal who makes the selection. That principal, a user or role, must have the permissions on the customer managed key that Feature Store requires. You can provide these permissions in a key policy, an IAM policy, or a grant. At a minimum, Feature Store requires the following permissions on a customer managed key:

For example, the following example key policy provides only the required permissions. The policy has the following effects:

- Allows Feature Store to use the customer managed key in cryptographic operations and create grants, but only when it is acting on behalf of principals in the account who have permission to use your Feature Store. If the principals specified in the policy statement don't have permission to use your Feature Store, the call fails, even when it comes from the Feature Store service.
- The kms:ViaService condition key allows the permissions only when the request comes from FeatureStore on behalf of the principals listed in the policy statement. These principals can't call these operations directly. The value for kms:ViaService should be sagemaker.*.amazonaws.com.

Note
The kms:ViaService condition key can only be used for the online store customer managed AWS KMS key, and cannot be used for the offline store. If you add this special condition to your customer managed key, and use the same AWS KMS key for both the online and offline store, then it will fail the CreateFeatureGroup API operation.

- Gives the customer managed key administrators read-only access to the customer managed key and permission to revoke grants, including the grants that Feature Store uses to protect your data.
- Gives Feature Store read-only access to the customer managed key. In this case, Feature Store can call these operations directly. It does not have to act on behalf of an account principal.

Before using an example key policy, replace the example principals with actual principals from your AWS account.

```json
{ "Id": "key-policy-feature-store",  "Version": "2012-10-17",  "Statement": [   { "Sid" : "Allow access through Amazon SageMaker Feature Store for all principals in the account that are authorized to use Amazon SageMaker Feature Store", "Effect": "Allow", "Principal": { "AWS": "arn:aws:iam::111122223333:user/featurestore-user"}, "Action": [  ]  ] }
```
Using Grants to Authorize Feature Store

In addition to key policies, Feature Store uses grants to set permissions on the customer managed key. To view the grants on a customer managed key in your account, use the `ListGrants` operation. Feature Store does not need grants, or any additional permissions, to use the AWS owned customer managed key to protect your online store.

Feature Store uses the grant permissions when it performs background system maintenance and continuous data protection tasks.

Each grant is specific to an online store. If the account includes multiple stores encrypted under the same customer managed key, there will be unique grants per `FeatureGroup` using the same customer managed key.

The key policy can also allow the account to revoke the grant on the customer managed key. However, if you revoke the grant on an active encrypted online store, Feature Store won't be able to protect and maintain the store.

Monitoring Feature Store interaction with AWS KMS

If you use a customer managed key to protect your online or offline store, you can use AWS CloudTrail logs to track the requests that Feature Store sends to AWS KMS on your behalf.
Accessing Data in Your Online Store

The caller (either IAM user or IAM role) to ALL DataPlane operations (Put, Get, DeleteRecord) must have below permissions on the customer managed key:

"kms:Decrypt"

Authorizing Use of a Customer Managed Key for your Offline Store

The roleArn that is passed as a parameter to createFeatureGroup must have below permissions to the OfflineStore KmsKeyId:

"kms:GenerateDataKey"

**Note**
The key policy for the online store also works for the offline store, only when the kms:ViaService condition is not specified.

**Important**
You can specify a AWS KMS encryption key to encrypt the Amazon S3 location used for your offline feature store when you create a feature group. If AWS KMS encryption key is not specified, by default we encrypt all data at rest using AWS KMS key. By defining your bucket-level key for SSE, you can reduce AWS KMS requests costs by up to 99 percent.

Quotas, Naming Rules and Data Types

**Limits and Quotas**

**Note**
Soft limits can be increased based on your needs.

- **Maximum number of feature groups per AWS account**: Soft limit of 100.
- **Maximum number of feature definitions per feature group**: 2500.
- **Maximum Transactions per second (TPS) per API per AWS account**: Soft limit of 10000 TPS per API.
- **Maximum size of a record**: 350KB.
- **Maximum size of a feature value**: 350KB.
- **Maximum number of concurrent feature group creation workflows**: 4.
- **BatchGetRecord API**: Can contain as many as 100 records and can query up to 10 feature groups.

**Naming Rules**

- **Reserved Words**: The following are reserved words and cannot be used as feature names in feature definitions: is_deleted, write_time, and api_invocation_time.

**Data Types**

- **String Feature Type**: Strings are Unicode with UTF-8 binary encoding. The minimum length of a string can be zero, the maximum length is constrained by the maximum size of a record.
Amazon SageMaker Feature Store Offline Store Data Format

Amazon SageMaker Feature Store offline store data is stored in an Amazon S3 bucket within your account. When you call `PutRecord`, your data is buffered, batched, and written into Amazon S3 within 15 minutes. Feature Store only supports the Parquet file format. Specifically, when your data is written to your offline store, the data can only be retrieved from your Amazon S3 bucket in Parquet format. Each file can contain multiple `Records`.

Files are organized with the following naming convention:

```
```

Records in the offline store are partitioned by event time. All `Records` in your store will have an event time within that day your data was ingested.

For example:

```
s3://my-bucket/my-prefix/123456789012/sagemaker/us-east-1/offline-store/customer-purchase-history-patterns-1593511200/data/year=2020/month=06/day=31/hour=00/20200631T064401Z_108934320012Az11.parquet
```

Feature Store also exposes the `OfflineStoreConfig.S3StorageConfig.ResolvedOutputS3Uri` field, which can be found from in the `DescribeFeatureGroup` API call. This is the S3 path under which the files for the specific feature group are written.

Example value of `ResolvedOutputS3Uri`:

```
```

The following additional fields are added by Feature Store to each Record when they persist in the offline store:

- **api_invocation_time** – The timestamp when the service receives the `PutRecord` or `DeleteRecord` call. If using managed ingestion (e.g. Data Wrangler), this is the timestamp when data was written into the offline store.
- **write_time** – The timestamp when data was written into the offline store. Can be used for constructing time-travel related queries.
- **is_deleted** – False by default. If `DeleteRecord` is called, a new `Record` is inserted into `RecordIdentifierValue` and set to True in the offline store.
Amazon SageMaker Feature Store Notebook Examples

To get started using Amazon SageMaker Feature Store, you can choose from a variety of example Jupyter notebooks in the table below. If this is your first time using Feature Store, try out the Introduction to Feature Store notebook. To run any these notebooks, you must attach this policy to your IAM execution role: AmazonSageMakerFeatureStoreAccess.

See IAM Roles to access your role and attach this policy. For a walkthrough see Adding policies to your IAM role. The following screenshot illustrates how the policy appears under your IAM role after it has been attached.

### Feature Store sample notebooks

The following table outlines a variety of sample notebooks that address different use cases of Amazon SageMaker Feature Store.

<table>
<thead>
<tr>
<th>Notebook Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Introduction to Feature Store</td>
<td>An introduction to key Feature Store capabilities such as how to create, configure a feature group, and how to ingest data into an online or offline feature store.</td>
</tr>
<tr>
<td>Fraud Detection with Feature Store</td>
<td>An advanced example on how to train a fraud detection model by ingesting data into a Feature Store, querying it to form a training dataset, and how to train a simple model for inference.</td>
</tr>
<tr>
<td>Encrypt Data in your Online or Offline Feature Store using KMS key</td>
<td>An advanced example on how to encrypt and decrypt data in an Online or Offline Feature Store using KMS key and how to verify that your data is encrypted. Note that this notebook tackles encryption at rest.</td>
</tr>
<tr>
<td>Client-side Encryption with Feature Store using AWS Encryption SDK</td>
<td>An advanced example how to do client-side encryption with Feature Store using the AWS Encryption SDK library which encrypts your data prior to ingesting it into your Online or Offline Feature Store.</td>
</tr>
<tr>
<td>Notebook Title</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>How to securely store an image dataset in Feature Store with KMS key?</td>
<td>An advanced example that demonstrates how to securely store a dataset of images into your Feature Store using KMS key for server-side encryption.</td>
</tr>
<tr>
<td>Create a machine learning workflow from a Ground Truth classification labelling job to Feature Store</td>
<td>A machine learning (ML) workflow that demonstrates how to feed the output of an image or text classification labelling job from AWS Ground Truth to Feature Store.</td>
</tr>
</tbody>

Train Models

For an overview on training models with Amazon SageMaker, see Train a Model with Amazon SageMaker (p. 8).

SageMaker provides features to monitor and manage the training and validation of machine learning models. For guidance on metrics available, incremental training, automatic model tuning, and the use of augmented manifest files to label training data, see the following topics.

- For guidance on choosing a machine learning algorithm and its implementation for your task or problem, see Choose an Algorithm (p. 757).
- For guidance on debugging the training of machine learning models, see Amazon SageMaker Debugger (p. 1630).
- For guidance on metrics used to monitor and train models, see Monitor and Analyze Training Jobs Using Amazon CloudWatch Metrics (p. 1923).
- For guidance on metrics used to detect model post-processing bias, see Detect Posttraining Data and Model Bias (p. 1875).
- For guidance on model explainability, see Model Explainability (p. 1907).
- For guidance on incremental training in SageMaker, see Incremental Training in Amazon SageMaker (p. 1909).
- For guidance on using managed spot training in SageMaker, see Managed Spot Training in Amazon SageMaker (p. 1914).
- For guidance on using training checkpoints in SageMaker, see Use Checkpoints in Amazon SageMaker (p. 1915).
- For guidance on automatic model tuning, also known as hyperparameter tuning, see Perform Automatic Model Tuning with SageMaker (p. 1797).
- For guidance on using an augmented manifest file to label training data, see Provide Dataset Metadata to Training Jobs with an Augmented Manifest File (p. 1919).

- Model Explainability (p. 1907)
- Incremental Training in Amazon SageMaker (p. 1909)
- Managed Spot Training in Amazon SageMaker (p. 1914)
- Use Checkpoints in Amazon SageMaker (p. 1915)
- Provide Dataset Metadata to Training Jobs with an Augmented Manifest File (p. 1919)
- Monitor and Analyze Training Jobs Using Amazon CloudWatch Metrics (p. 1923)

Choose an Algorithm

Machine learning can help you accomplish empirical tasks that require some sort of inductive inference. This task involves induction as it uses data to train algorithms to make generalizable inferences. This
means that the algorithms can make statistically reliable predictions or decisions, or complete other tasks when applied to new data that was not used to train them.

To help you select the best algorithm for your task, we classify these tasks on various levels of abstraction. At the highest level of abstraction, machine learning attempts to find patterns or relationships between features or less structured items, such as text in a data set. Pattern recognition techniques can be classified into distinct machine learning paradigms, each of which address specific problem types. There are currently three basic paradigms for machine learning used to address various problem types:

- Supervised learning (p. 760)
- Unsupervised learning (p. 761)
- Reinforcement learning (p. 761)

The types of problems that each learning paradigm can address are identified by considering the inferences (or predictions, decisions, or other tasks) you want to make from the type of data that you have or could collect. Machine learning paradigms use algorithmic methods to address their various problem types. The algorithms provide recipes for solving these problems.

However, many algorithms, such as neural networks, can be deployed with different learning paradigms and on different types of problems. Multiple algorithms can also address a specific problem type. Some algorithms are more generally applicable and others are quite specific for certain kinds of objectives and data. So the mapping between machine learning algorithms and problem types is many-to-many. Also, there are various implementation options available for algorithms.

The following sections provide guidance concerning implementation options, machine learning paradigms, and algorithms appropriate for different problem types.

**Topics**

- Choose an algorithm implementation (p. 758)
- Problem types for the basic machine learning paradigms (p. 760)
- Use Amazon SageMaker Built-in Algorithms (p. 762)
- Use Reinforcement Learning with Amazon SageMaker (p. 1596)

## Choose an algorithm implementation

After choosing an algorithm, you must decide which implementation of it you want to use. Amazon SageMaker supports three implementation options that require increasing levels of effort.

- **Built-in algorithms** require the least effort and scale if the data set is large and significant resources are needed to train and deploy the model.
- If there is no built-in solution that works, try to develop one that uses **pre-made images for machine and deep learning frameworks** for supported frameworks such as Scikit-Learn, TensorFlow, PyTorch, MXNet, or Chainer. If you need to run custom packages or use any code which isn’t a part of a supported framework or available via PyPi, then you need to build your own custom Docker image that is configured to install the necessary packages or software. The custom image must also be pushed to an online repository like the Amazon Elastic Container Registry.

**Topics**

- Use a built-in algorithm (p. 759)
- Use script mode in a supported framework (p. 759)
- Use a custom Docker image (p. 760)

Use a built-in algorithm

When choosing an algorithm for your type of problem and data, the easiest option is to use one of Amazon SageMaker’s built-in algorithms. These built-in algorithms come with two major benefits.

- The built-in algorithms require no coding to start running experiments. The only inputs you need to provide are the data, hyperparameters, and compute resources. This allows you to run experiments more quickly, with less overhead for tracking results and code changes.
- The built-in algorithms come with parallelization across multiple compute instances and GPU support right out of the box for all applicable algorithms (some algorithms may not be included due to inherent limitations). If you have a lot of data with which to train your model, most built-in algorithms can easily scale to meet the demand. Even if you already have a pre-trained model, it may still be easier to use its corollary in SageMaker and input the hyper-parameters you already know than to port it over, using script mode on a supported framework.

For more information on the built-in algorithms provided by SageMaker, see Use Amazon SageMaker Built-in Algorithms (p. 762).

For important information about docker registry paths, data formats, recommended EC2 instance types, and CloudWatch logs common to all of the built-in algorithms provided by SageMaker, see Common Information About Built-in Algorithms (p. 767).

Use script mode in a supported framework

If the algorithm you want to use for your model is not supported by a built-in choice and you are comfortable coding your own solution, then you should consider using an Amazon SageMaker supported framework. This is referred to as "script mode" because you write your custom code (script) in a text file with a .py extension. As the table above indicates, SageMaker supports most of the popular machine learning frameworks. These frameworks come preloaded with the corresponding framework and some additional Python packages, such as Pandas and NumPy, so you can write your own code for training an algorithm. These frameworks also allow you to install any Python package hosted on PyPi by including a
requirements.txt file with your training code or to include your own code directories. R is also supported natively in SageMaker notebook kernels. Some frameworks, like scikit-learn and Spark ML, have pre-coded algorithms you can use easily, while other frameworks like TensorFlow and PyTorch may require you to implement the algorithm yourself. The only limitation when using a supported framework image is that you cannot import any software packages that are not hosted on PyPi or that are not already included with the framework's image.

For more information on the frameworks supported by SageMaker, see Use Machine Learning Frameworks, Python, and R with Amazon SageMaker (p. 14).

Use a custom Docker image

Amazon SageMaker's built-in algorithms and supported frameworks should cover most use cases, but there are times when you may need to use an algorithm from a package not included in any of the supported frameworks. You might also have a pre-trained model picked or persisted somewhere which you need to deploy. SageMaker uses Docker images to host the training and serving of all models, so you can supply your own custom Docker image if the package or software you need is not included in a supported framework. This may be your own Python package or an algorithm coded in a language like Stan or Julia. For these images you must also configure the training of the algorithm and serving of the model properly in your Dockerfile. This requires intermediate knowledge of Docker and is not recommended unless you are comfortable writing your own machine learning algorithm. Your Docker image must be uploaded to an online repository, such as the Amazon Elastic Container Registry (ECR) before you can train and serve your model properly.

For more information on custom Docker images in SageMaker, see Using Docker containers with SageMaker (p. 2208).

Problem types for the basic machine learning paradigms

The following three sections describe the main problem types addressed by the three basic paradigms for machine learning. For a list of the built-in algorithms that SageMaker provides to address these problem types, see Use Amazon SageMaker Built-in Algorithms (p. 762).

Topics
- Supervised learning (p. 760)
- Unsupervised learning (p. 761)
- Reinforcement learning (p. 761)

Supervised learning

If your data set consists of features or attributes (inputs) that contain target values (outputs), then you have a supervised learning problem. If your target values are categorical (mathematically discrete), then you have a classification problem. It is a standard practice to distinguish binary from multiclass classification.

- **Binary classification** is a type of supervised learning that assigns an individual to one of two predefined and mutually exclusive classes based on the individual's attributes. It is supervised because the models are trained using examples in which the attributes are provided with correctly labeled objects. A medical diagnosis for whether an individual has a disease or not based on the results of diagnostic tests is an example of binary classification.

- **Multiclass classification** is a type of supervised learning that assigns an individual to one of several classes based on the individual's attributes. It is supervised because the models are trained using examples in which the attributes are provided with correctly labeled objects. An example is the
prediction of the topic most relevant to a text document. A document may be classified as being about religion, politics, or finance, or as about one of several other predefined topic classes.

If the target values you are trying to predict are mathematically continuous, then you have a regression problem. Regression estimates the values of a dependent target variable based on one or more other variables or attributes that are correlated with it. An example is the prediction of house prices using features like the number of bathrooms and bedrooms and the square footage of the house and garden. Regression analysis can create a model that takes one or more of these features as an input and predicts the price of a house.

For more information on the built-in supervised learning algorithms provided by SageMaker, see Supervised Learning (p. 765).

Unsupervised learning

If your data set consists of features or attributes (inputs) that do not contain labels or target values (outputs), then you have an unsupervised learning problem. In this type of problem, the output must be predicted based on the pattern discovered in the input data. The goal in unsupervised learning problems is to discover patterns such groupings within the data. There are a large variety of tasks or problem types to which unsupervised learning can be applied. Principal component and cluster analyses are two of the main methods commonly deployed for preprocessing data. Here is a short list of problem types that can be addressed by unsupervised learning:

- **Dimension reduction** is typically part of a data exploration step used to determine the most relevant features to use for model construction. The idea is to transform data from a high-dimensional, sparsely populated space into a low-dimensional space that retains most significant properties of the original data. This provides relief for the curse of dimensionality that can arise with sparsely populated, high-dimensional data on which statistical analysis becomes problematic. It can also be used to help understand data, reducing high-dimensional data to a lower dimensionality that can be visualized.

- **Cluster analysis** is a class of techniques that are used to classify objects or cases into groups called clusters. It attempts to find discrete groupings within data, where members of a group are as similar as possible to one another and as different as possible from members of other groups. You define the features or attributes that you want the algorithm to use to determine similarity, select a distance function to measure similarity, and specify the number of clusters to use in the analysis.

- **Anomaly detection** is the identification of rare items, events, or observations in a data set which raise suspicions because they differ significantly from the rest of the data. The identification of anomalous items can be used, for example, to detect bank fraud or medical errors. Anomalies are also referred to as outliers, novelties, noise, deviations, and exceptions.

- **Density estimation** is the construction of estimates of unobservable underlying probability density functions based on observed data. A natural use of density estimates is for data exploration. Density estimates can discover features such as skewness and multimodality in the data. The most basic form of density estimation is a rescaled histogram.

SageMaker provides several built-in machine learning algorithms that you can use for these unsupervised learning tasks. For more information on the built-in unsupervised algorithms provided by SageMaker, see Unsupervised Learning (p. 765).

Reinforcement learning

Reinforcement learning is a type of learning that is based on interaction with the environment. This type of learning is used by an agent that must learn behavior through trial-and-error interactions with a dynamic environment in which the goal is to maximize the long-term rewards that the agent receives as a result of its actions. Rewards are maximized by trading off exploring actions that have uncertain rewards with exploiting actions that have known rewards.
For more information on SageMaker’s frameworks, toolkits, and environments for reinforcement learning, see Use Reinforcement Learning with Amazon SageMaker (p. 1596).

Use Amazon SageMaker Built-in Algorithms

Amazon SageMaker provides a suite of built-in algorithms to help data scientists and machine learning practitioners get started on training and deploying machine learning models quickly. For someone that is new to SageMaker, choosing the right algorithm for your particular use case can be a challenging task. The following table provides a quick cheat sheet that shows how you can start with an example problem or use case and find an appropriate built-in algorithm offered by SageMaker that is valid for that problem type. Additional guidance organized by learning paradigms (supervised and unsupervised) and important data domains (text and images) is provided in the sections following the table.

Table: Mapping use cases to built-in algorithms

For important information about Docker registry paths, data formats, recommenced Amazon EC2 instance types, and CloudWatch logs common to all of the built-in algorithms provided by SageMaker, see Common Information About Built-in Algorithms (p. 767).
The following sections provide additional guidance for the Amazon SageMaker built-in algorithms grouped by the supervised and unsupervised learning paradigms to which they belong. For descriptions of these learning paradigms and their associated problem types, see Choose an Algorithm (p. 757). Sections are also provided for the SageMaker built-in algorithms available to address two important machine learning domains: textual analysis and image processing.

- Supervised Learning (p. 765)
- Unsupervised Learning (p. 765)
- Textual Analysis (p. 766)
- Image Processing (p. 766)

**Supervised Learning**

Amazon SageMaker provides several built-in general purpose algorithms that can be used for either classification or regression problems.

- **Linear Learner Algorithm** (p. 1486)—learns a linear function for regression or a linear threshold function for classification.
- **Factorization Machines Algorithm** (p. 1433)—an extension of a linear model that is designed to economically capture interactions between features within high-dimensional sparse datasets.
- **XGBoost Algorithm** (p. 1568)—implementation of the gradient-boosted trees algorithm that combines an ensemble of estimates from a set of simpler and weaker models.
- **K-Nearest Neighbors (k-NN) Algorithm** (p. 1472)—a non-parametric method that uses the k nearest labeled points to assign a label to a new data point for classification or a predicted target value from the average of the k nearest points for regression.

Amazon SageMaker also provides several built-in supervised learning algorithms that are used for more specialized tasks during feature engineering and forecasting from time series data.

- **Object2Vec Algorithm** (p. 1507)—a new highly customizable multi-purpose algorithm used for feature engineering. It can learn low-dimensional dense embeddings of high-dimensional objects to produce features that improve training efficiencies for downstream models. While this is a supervised algorithm, as it requires labeled data for training, there are many scenarios in which the relationship labels can be obtained purely from natural clusterings in data, without any explicit human annotation.
- **DeepAR Forecasting Algorithm** (p. 1418)—a supervised learning algorithm for forecasting scalar (one-dimensional) time series using recurrent neural networks (RNN).

**Unsupervised Learning**

Amazon SageMaker provides several built-in algorithms that can be used for a variety of unsupervised learning tasks such as clustering, dimension reduction, pattern recognition, and anomaly detection.

- **Principal Component Analysis (PCA) Algorithm** (p. 1534)—reduces the dimensionality (number of features) within a dataset by projecting data points onto the first few principal components. The objective is to retain as much information or variation as possible. For mathematicians, principal components are eigenvectors of the data's covariance matrix.
- **K-Means Algorithm** (p. 1464)—finds discrete groupings within data, where members of a group are as similar as possible to one another and as different as possible from members of other groups.
- **IP Insights** (p. 1454)—learns the usage patterns for IPv4 addresses. It is designed to capture associations between IPv4 addresses and various entities, such as user IDs or account numbers.
- **Random Cut Forest (RCF) Algorithm** (p. 1538)—detects anomalous data points within a data set that diverge from otherwise well-structured or patterned data.
Textual Analysis

SageMaker provides algorithms that are tailored to the analysis of textual documents used in natural language processing, document classification or summarization, topic modeling or classification, and language transcription or translation.

- BlazingText algorithm (p. 1408)—a highly optimized implementation of the Word2vec and text classification algorithms that scale to large datasets easily. It is useful for many downstream natural language processing (NLP) tasks.
- Sequence-to-Sequence Algorithm (p. 1556)—a supervised algorithm commonly used for neural machine translation.
- Latent Dirichlet Allocation (LDA) Algorithm (p. 1480)—an algorithm suitable for determining topics in a set of documents. It is an unsupervised algorithm, which means that it doesn’t use example data with answers during training.
- Neural Topic Model (NTM) Algorithm (p. 1501)—another unsupervised technique for determining topics in a set of documents, using a neural network approach.

Image Processing

SageMaker also provides image processing algorithms that are used for image classification, object detection, and computer vision.

- Image Classification Algorithm (p. 1443)—uses example data with answers (referred to as a supervised algorithm). Use this algorithm to classify images.
- Semantic Segmentation Algorithm (p. 1546)—provides a fine-grained, pixel-level approach to developing computer vision applications.
- Object Detection Algorithm (p. 1523)—detects and classifies objects in images using a single deep neural network. It is a supervised learning algorithm that takes images as input and identifies all instances of objects within the image scene.

</tbody>
</table>

Algorithms that are *parallelizable* can be deployed on multiple compute instances for distributed training.

The following topics provide information about Docker registry paths, data formats, recommended Amazon EC2 instance types, and CloudWatch logs common to all of the built-in algorithms provided by Amazon SageMaker.

**Topics**
- Docker Registry Paths and Example Code (p. 769)
- Common Data Formats for Built-in Algorithms (p. 1398)
Docker Registry Paths and Example Code

The following topics list the Docker registry path and other parameters for each of the Amazon SageMaker provided algorithms and Deep Learning Containers (DLC).

Use the path as follows:

- To create a training job (create_training_job), specify the Docker registry path (TrainingImage) and the training input mode (TrainingInputMode) for the training image. You create a training job to train a model using a specific dataset.
- To create a model (create_model), specify the Docker registry path (Image) for the inference image (PrimaryContainer Image). SageMaker launches machine learning compute instances that are based on the endpoint configuration and deploys the model, which includes the artifacts (the result of model training).

**Note**
For the registry path, use the :1 version tag to ensure that you are using a stable version of the algorithm/DLC. You can reliably host a model trained using an image with the :1 tag on an inference image that has the :1 tag. Using the :latest tag in the registry path provides you with the most up-to-date version of the algorithm/DLC, but might cause problems with backward compatibility. Avoid using the :latest tag for production purposes.
For XGBoost, do not use :latest or :1. Use the specific version you require, such as :0.90-1-cpu-py3, :0.90-2-cpu-py3, :1.0-1-cpu-py3, or :1.2-1.

To find the registry path, choose the AWS Region, then choose the algorithm or DLC.

**Docker Registry Paths and Example Code for US East (N. Virginia) (us-east-1)**

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.

**Topics**
- BlazingText (algorithm) (p. 798)
- Chainer (DLC) (p. 799)
- Clarify (algorithm) (p. 799)
- Data Wrangler (algorithm) (p. 799)
- Debugger (algorithm) (p. 800)
- DeepAR Forecasting (algorithm) (p. 800)
- Factorization Machines (algorithm) (p. 800)
- Hugging Face (algorithm) (p. 801)
- IP Insights (algorithm) (p. 801)
- Image classification (algorithm) (p. 802)
- Inferentia MXNet (DLC) (p. 802)
- Inferentia PyTorch (DLC) (p. 802)
- K-Means (algorithm) (p. 803)
BlazingText (algorithm)

Amazon SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='blazingtext',region='us-east-1')
# Output path
'811284229777.dkr.ecr.us-east-1.amazonaws.com/blazingtext:1'
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>811284229777.dkr.ecr.us-east-1.amazonaws.com/blazingtext:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>
Chainer (DLC)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='chainer', region='us-east-1', version='5.0.0', py_version='py3', image_scope='inference', instance_type='ml.c5.4xlarge')
# Output path
'520713654638.dkr.ecr.us-east-1.amazonaws.com/sagemaker-chainer:5.0.0-cpu-py3'
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
<th>Processor types</th>
<th>Python versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>520713654638.dkr.ecr.us-east-1.amazonaws.com/sagemaker-chainer:&lt;tag&gt;</td>
<td>inference, training</td>
<td>CPU, GPU</td>
<td>py2, py3</td>
<td></td>
</tr>
<tr>
<td>520713654638.dkr.ecr.us-east-1.amazonaws.com/sagemaker-chainer:&lt;tag&gt;</td>

<td>CPU, GPU</td>
<td>py2, py3</td>
<td></td>
</tr>
<tr>
<td>520713654638.dkr.ecr.us-east-1.amazonaws.com/sagemaker-chainer:&lt;tag&gt;</td>
<td>inference, training</td>
<td>CPU, GPU</td>
<td>py2, py3</td>
<td></td>
</tr>
</tbody>
</table>

Clarify (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='clarify', region='us-east-1', version='1.0', image_scope='processing')
# Output path
'205585389593.dkr.ecr.us-east-1.amazonaws.com/sagemaker-clarify-processing:1.0'
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>205585389593.dkr.ecr.us-east-1.amazonaws.com/sagemaker-clarify-processing:&lt;tag&gt;</td>
<td>processing</td>
<td></td>
</tr>
</tbody>
</table>

Data Wrangler (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='data-wrangler', region='us-east-1')
```
# Output path
'663277389841.dkr.ecr.us-east-1.amazonaws.com/sagemaker-data-wrangler-container:1.x'

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>663277389841.dkr.ecr.us-east-1.amazonaws.com/sagemaker-data-wrangler-container:&lt;tag&gt;</td>
<td>1.x</td>
<td>processing</td>
</tr>
</tbody>
</table>

**Debugger (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='debugger', region='us-east-1')
# Output path
'503895931360.dkr.ecr.us-east-1.amazonaws.com/sagemaker-debugger-rules:latest'
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>503895931360.dkr.ecr.us-east-1.amazonaws.com/sagemaker-debugger-rules:&lt;tag&gt;</td>
<td>latest</td>
<td>debugger</td>
</tr>
</tbody>
</table>

**DeepAR Forecasting (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='forecasting-deepar', region='us-east-1')
# Output path
'522234722520.dkr.ecr.us-east-1.amazonaws.com/forecasting-deepar:1'
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>522234722520.dkr.ecr.us-east-1.amazonaws.com/forecasting-deepar:&lt;tag&gt;</td>
<td>1</td>
<td>inference, training</td>
</tr>
</tbody>
</table>

**Factorization Machines (algorithm)**

SageMaker Python SDK example to retrieve registry path.
from sagemaker import image_uris
image_uris.retrieve(framework='factorization-machines',region='us-east-1')

# Output path
'38241673822.dkr.ecr.us-east-1.amazonaws.com/factorization-machines:1'

<table>
<thead>
<tr>
<th>Registry path</th>

</thead>
<tbody>
<tr>
<td>38241673822.dkr.ecr.us-east-1.amazonaws.com/factorization-machines:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

**Hugging Face (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='huggingface',region='us-east-1',version='4.4.2',image_scope='training',base_framework_version='tensorflow2.4.1')

# Output path
'763104351884.dkr.ecr.us-east-1.amazonaws.com/huggingface-tensorflow-training:2.4.1-transformers4.4.2-gpu-py37'
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>

</tr>
</thead>
<tbody>
<tr>
<td>763104351884.dkr.ecr.us-east-1.amazonaws.com/huggingface-pytorch-training:&lt;tag&gt;</td>
<td>4.4.2</td>
<td>training</td>
</tr>
<tr>
<td>763104351884.dkr.ecr.us-east-1.amazonaws.com/huggingface-pytorch-training:&lt;tag&gt;</td>
<td>4.5.0</td>
<td>training</td>
</tr>
<tr>
<td>763104351884.dkr.ecr.us-east-1.amazonaws.com/huggingface-tensorflow-training:&lt;tag&gt;</td>
<td>4.4.2</td>
<td>training</td>
</tr>
<tr>
<td>763104351884.dkr.ecr.us-east-1.amazonaws.com/huggingface-tensorflow-training:&lt;tag&gt;</td>
<td>4.5.0</td>
<td>training</td>
</tr>
</tbody>
</table>

**IP Insights (algorithm)**

SageMaker Python SDK example to retrieve registry path.
from sagemaker import image_uris
image_uris.retrieve(framework='ipinsights', region='us-east-1')

# Output path
'382416733822.dkr.ecr.us-east-1.amazonaws.com/ipinsights:1'

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>382416733822.dkr.ecr.us-east-1.amazonaws.com/ipinsights:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

### Image classification (algorithm)

SageMaker Python SDK example to retrieve registry path.

from sagemaker import image_uris
image_uris.retrieve(framework='image-classification', region='us-east-1')

# Output path
'811284229777.dkr.ecr.us-east-1.amazonaws.com/image-classification:1'

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>811284229777.dkr.ecr.us-east-1.amazonaws.com/image-classification:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

### Inferentia MXNet (DLC)

SageMaker Python SDK example to retrieve registry path.

from sagemaker import image_uris
image_uris.retrieve(framework='inferentia-mxnet', region='us-east-1', version='1.5.1', instance_type='ml.inf1.6xlarge')

# Output path
'78557368785.dkr.ecr.us-east-1.amazonaws.com/sagemaker-neo-mxnet:1.5.1-inf-py3'

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
<th>Processor types</th>
<th>Python versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>78557368785.dkr.ecr.us-east-1.amazonaws.com/sagemaker-neo-mxnet:&lt;tag&gt;</td>
<td></td>
<td>inference</td>
<td>inf</td>
<td>py3</td>
</tr>
</tbody>
</table>

### Inferentia PyTorch (DLC)

SageMaker Python SDK example to retrieve registry path.
Use built-in algorithms

```python
from sagemaker import image_uris
image_uris.retrieve(framework='inferentia-pytorch', region='us-east-1', version='1.5.1', py_version='py3')

# Output path
'785573368785.dkr.ecr.us-east-1.amazonaws.com/sagemaker-neo-pytorch:1.5.1-inf-py3'
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
<th>Processor types</th>
<th>Python versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>785573368785.dkr.ecr.us-east-1.amazonaws.com/sagemaker-neo-pytorch:&lt;tag&gt;</td>
<td></td>
<td>inference</td>
<td>inf</td>
<td>py3</td>
</tr>
</tbody>
</table>

**K-Means (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='kmeans', region='us-east-1')

# Output path
'382416733822.dkr.ecr.us-east-1.amazonaws.com/kmeans:1'
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>382416733822.dkr.ecr.us-east-1.amazonaws.com/kmeans:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
<td></td>
</tr>
</tbody>
</table>

**KNN (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='knn', region='us-east-1')

# Output path
'382416733822.dkr.ecr.us-east-1.amazonaws.com/knn:1'
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>382416733822.dkr.ecr.us-east-1.amazonaws.com/knn:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
<td></td>
</tr>
</tbody>
</table>

**LDA (algorithm)**

SageMaker Python SDK example to retrieve registry path.
from sagemaker import image_uris
image_uris.retrieve(framework='lda', region='us-east-1')

# Output path
'766337827248.dkr.ecr.us-east-1.amazonaws.com/lda:<tag>'

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>

</table>

**Model Monitor (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='model-monitor', region='us-east-1')

# Output path
'156813124566.dkr.ecr.us-east-1.amazonaws.com/sagemaker-model-monitor-analyzer'
```
### NTM (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='ntm', region='us-east-1')

# Output path
'382416733822.dkr.ecr.us-east-1.amazonaws.com/ntm:1'
```

### Neo Image Classification (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='image-classification-neo', region='us-east-1')

# Output path
'78557368785.dkr.ecr.us-east-1.amazonaws.com/image-classification-neo:latest'
```

### Neo MXNet (DLC)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='neo-mxnet', region='us-east-1', version='1.8', py_version='py3', image_scope='inference', instance_type='ml.c5.4xlarge')
```
# Output path
'785573368785.dkr.ecr.us-east-1.amazonaws.com/sagemaker-inference-mxnet:1.8-cpu-py3'

### Neo Tensorflow (DLC)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='neo-tensorflow',region='us-east-1',version='1.15.3',py_version='py3',instance_type='ml.c5.4xlarge')

# Output path
'785573368785.dkr.ecr.us-east-1.amazonaws.com/sagemaker-inference-tensorflow:1.15.3-cpu-py3'
```
### Registry path | Version | Job types (image scope) | Processor types | Python versions
---|---|---|---|---
785573368785.dkr.ecr.us-east-1.amazonaws.com/sagemaker-inference-tensorflow:tag | inference | CPU, GPU | py3

**Neo XGBoost (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='xgboost-neo', region='us-east-1')
# Output path
'785573368785.dkr.ecr.us-east-1.amazonaws.com/xgboost-neo:latest'
```

<table>

### Docker Registry Paths and Example Code for US West (N. California) (us-west-1)

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.

#### Topics
- BlazingText (algorithm) (p. 828)
- Chainer (DLC) (p. 828)
- Clarify (algorithm) (p. 829)
- Data Wrangler (algorithm) (p. 829)
- Debugger (algorithm) (p. 829)
- DeepAR Forecasting (algorithm) (p. 830)
- Factorization Machines (algorithm) (p. 830)
- Hugging Face (algorithm) (p. 830)
- IP Insights (algorithm) (p. 831)
- Image classification (algorithm) (p. 831)
- Inferentia MXNet (DLC) (p. 831)
- Inferentia PyTorch (DLC) (p. 832)
- K-Means (algorithm) (p. 832)
- KNN (algorithm) (p. 832)
- LDA (algorithm) (p. 833)
- Linear Learner (algorithm) (p. 833)
- MXNet (DLC) (p. 833)
- MXNet Coach (DLC) (p. 836)
- Model Monitor (algorithm) (p. 836)
- NTM (algorithm) (p. 837)
- Neo Image Classification (algorithm) (p. 837)
- Neo MXNet (DLC) (p. 837)
- Neo PyTorch (DLC) (p. 837)
- Neo Tensorflow (DLC) (p. 838)
- Neo XGBoost (algorithm) (p. 838)
- Object Detection (algorithm) (p. 839)
- Object2Vec (algorithm) (p. 839)
- PCA (algorithm) (p. 839)
- PyTorch (DLC) (p. 840)
- Random Cut Forest (algorithm) (p. 842)
- Ray PyTorch (DLC) (p. 842)
- Scikit-learn (algorithm) (p. 842)
- Semantic Segmentation (algorithm) (p. 843)
- Seq2Seq (algorithm) (p. 843)
- Spark (algorithm) (p. 843)
- SparkML Serving (algorithm) (p. 844)
- Tensorflow (DLC) (p. 844)
- Tensorflow Coach (DLC) (p. 851)
- Tensorflow Inferentia (DLC) (p. 852)
- Tensorflow Ray (DLC) (p. 853)
- VW (algorithm) (p. 853)
- XGBoost (algorithm) (p. 854)

**BlazingText (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='blazingtext',region='us-west-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>

<td>1.x</td>
<td>processing</td>
</tr>
</tbody>
</table>

#### Debugger (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='debugger',region='us-west-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>685455198987.dkr.ecr.us-west-1.amazonaws.com/sagemaker-debugger-rules:&lt;tag&gt;</td>
<td>latest</td>
<td>debugger</td>
</tr>
</tbody>
</table>
**DeepAR Forecasting (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='forecasting-deepar', region='us-west-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>632365934929.dkr.ecr.us-west-1.amazonaws.com/forecasting-deepar:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

**Factorization Machines (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='factorization-machines', region='us-west-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>632365934929.dkr.ecr.us-west-1.amazonaws.com/factorization-machines:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

**Hugging Face (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='huggingface', region='us-west-1', version='4.4.2', image_scope='training', base_framework_version='tensorflow2.4.1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>

<td>py2, py3</td>
</tr>
</tbody>
</table>

Clarify (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='clarify', region='us-west-2', version='1.0', image_scope='processing')
```
### Registry path | Version | Job types (image scope)
--- | --- | ---
306415355426.dkr.ecr.us-west-2.amazonaws.com/sagemaker-clarify-processing:<tag> | 1.0 | processing

#### Data Wrangler (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='data-wrangler', region='us-west-2')
```

### Registry path | Version | Job types (image scope)
--- | --- | ---
174368400705.dkr.ecr.us-west-2.amazonaws.com/sagemaker-data-wrangler-container:<tag> | 1.x | processing

#### Debugger (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='debugger', region='us-west-2')
```

### Registry path | Version | Job types (image scope)
--- | --- | ---
895741380848.dkr.ecr.us-west-2.amazonaws.com/sagemaker-debugger-rules:<tag> | latest | debugger

#### DeepAR Forecasting (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='forecasting-deepar', region='us-west-2')
```

### Registry path | Version | Job types (image scope)
--- | --- | ---
156387875391.dkr.ecr.us-west-2.amazonaws.com/ | 1 | inference, training
### Use built-in algorithms

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='sklearn',region='us-west-2',version='0.23-1',image_scope='inference')
```

**Registry path** | **Version** | **Job types (image scope)**
--- | --- | ---
246618743249.dkr.ecr.us-west-2.amazonaws.com/sagemaker-scikit-learn:<tag> | 0.20.0 | inference, training

**Semantic Segmentation (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
```
Use built-in algorithms

```python
image_uris.retrieve(framework='semantic-segmentation', region='us-west-2')
```

### Docker Registry Paths and Example Code for Africa (Cape Town) (af-south-1)

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.

**Topics**

- BlazingText (algorithm) (p. 883)
- Chainer (DLC) (p. 883)
- Clarify (algorithm) (p. 884)
- Data Wrangler (algorithm) (p. 884)
- Debugger (algorithm) (p. 885)
- DeepAR Forecasting (algorithm) (p. 885)
- Factorization Machines (algorithm) (p. 885)
- Hugging Face (algorithm) (p. 885)
- IP Insights (algorithm) (p. 886)
- Image classification (algorithm) (p. 886)
- Inferentia MXNet (DLC) (p. 887)
- Inferentia PyTorch (DLC) (p. 887)
- K-Means (algorithm) (p. 887)
• KNN (algorithm) (p. 887)
• Linear Learner (algorithm) (p. 888)
• MXNet (DLC) (p. 888)
• MXNet Coach (DLC) (p. 891)
• Model Monitor (algorithm) (p. 891)
• NTM (algorithm) (p. 891)
• Neo Image Classification (algorithm) (p. 892)
• Neo MXNet (DLC) (p. 892)
• Neo PyTorch (DLC) (p. 892)
• Neo Tensorflow (DLC) (p. 893)
• Neo XGBoost (algorithm) (p. 893)
• Object Detection (algorithm) (p. 894)
• Object2Vec (algorithm) (p. 894)
• PCA (algorithm) (p. 894)
• PyTorch (DLC) (p. 894)
• Random Cut Forest (algorithm) (p. 897)
• Scikit-learn (algorithm) (p. 897)
• Semantic Segmentation (algorithm) (p. 897)
• Seq2Seq (algorithm) (p. 898)
• Spark (algorithm) (p. 898)
• SparkML Serving (algorithm) (p. 898)
• Tensorflow (DLC) (p. 899)
• Tensorflow Coach (DLC) (p. 906)
• Tensorflow Inferentia (DLC) (p. 907)
• Tensorflow Ray (DLC) (p. 907)
• XGBoost (algorithm) (p. 908)

BlazingText (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='blazingtext', region='af-south-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>455444449433.dkr.ecr.af-south-1.amazonaws.com/blazingtext:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

Chainer (DLC)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
```
Use built-in algorithms

```python
image_uris.retrieve(framework='chainer',region='af-south-1',version='5.0.0',py_version='py3',image_scope='inference',instance_type='ml.c5.4xlarge')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
<th>Processor types</th>
<th>Python versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>313743910680.dkr.ecr.af-south-1.amazonaws.com/sagemaker-chainer:&lt;tag&gt;</td>
<td>inference, training</td>
<td>CPU, GPU</td>
<td>py2, py3</td>
<td></td>
</tr>
<tr>
<td>313743910680.dkr.ecr.af-south-1.amazonaws.com/sagemaker-chainer:&lt;tag&gt;</td>
<td>inference, training</td>
<td>CPU, GPU</td>
<td>py2, py3</td>
<td></td>
</tr>
<tr>
<td>313743910680.dkr.ecr.af-south-1.amazonaws.com/sagemaker-chainer:&lt;tag&gt;</td>
<td>inference, training</td>
<td>CPU, GPU</td>
<td>py2, py3</td>
<td></td>
</tr>
</tbody>
</table>

**Clarify (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='clarify',region='af-south-1',version='1.0',image_scope='processing')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>811711786498.dkr.ecr.af-1.0.south-1.amazonaws.com/sagemaker-clarify-processing:&lt;tag&gt;</td>
<td>processing</td>
<td></td>
</tr>
</tbody>
</table>

**Data Wrangler (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='data-wrangler',region='af-south-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>143210264188.dkr.ecr.af-1.x.south-1.amazonaws.com/sagemaker-data-wrangler-container:&lt;tag&gt;</td>
<td>processing</td>
<td></td>
</tr>
</tbody>
</table>

884
Debugger (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='debugger', region='af-south-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>314341159256.dkr.ecr.af-south-1.amazonaws.com/sagemaker-debugger-rules:&lt;tag&gt;</td>
<td></td>
<td>debugger</td>
</tr>
</tbody>
</table>

DeepAR Forecasting (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='forecasting-deepar', region='af-south-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>455444449433.dkr.ecr.af-1south-1.amazonaws.com/forecasting-deepar:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

Factorization Machines (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='factorization-machines', region='af-south-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>455444449433.dkr.ecr.af-1south-1.amazonaws.com/factorization-machines:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

Hugging Face (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='huggingface', region='af-south-1', version='4.4.2', image_scope='training', base_framework_version='tensorflow2.4.1')
```
### IP Insights (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='ipinsights', region='af-south-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>626614931356.dkr.ecr.af-south-1.amazonaws.com/huggingface-pytorch-training:&lt;tag&gt;</td>
<td>4.4.2</td>
<td>training</td>
</tr>
<tr>
<td>626614931356.dkr.ecr.af-south-1.amazonaws.com/huggingface-pytorch-training:&lt;tag&gt;</td>
<td>4.5.0</td>
<td>training</td>
</tr>
<tr>
<td>626614931356.dkr.ecr.af-south-1.amazonaws.com/huggingface-tensorflow-training:&lt;tag&gt;</td>
<td>4.4.2</td>
<td>training</td>
</tr>
<tr>
<td>626614931356.dkr.ecr.af-south-1.amazonaws.com/huggingface-tensorflow-training:&lt;tag&gt;</td>
<td>4.5.0</td>
<td>training</td>
</tr>
</tbody>
</table>

### Image classification (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='image-classification', region='af-south-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>455444494933.dkr.ecr.af-south-1.amazonaws.com/ipinsights:&lt;tag&gt;</td>
<td>1</td>
<td>inference, training</td>
</tr>
<tr>
<td>455444494933.dkr.ecr.af-south-1.amazonaws.com/image-classification:&lt;tag&gt;</td>
<td>1</td>
<td>inference, training</td>
</tr>
</tbody>
</table>
**Inferentia MXNet (DLC)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
text = image_uris.retrieve(framework='inferentia-mxnet', region='af-south-1', version='1.5.1', instance_type='ml.inf1.6xlarge')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
<th>Processor types</th>
<th>Python versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>774647643957.dkr.ecr.af-south-1.amazonaws.com/sagemaker-neo-mxnet:&lt;tag&gt;</td>
<td>inference</td>
<td>inf</td>
<td>py3</td>
<td></td>
</tr>
</tbody>
</table>

**Inferentia PyTorch (DLC)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
text = image_uris.retrieve(framework='inferentia-pytorch', region='af-south-1', version='1.5.1', py_version='py3')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
<th>Processor types</th>
<th>Python versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>774647643957.dkr.ecr.af-south-1.amazonaws.com/sagemaker-neo-pytorch:&lt;tag&gt;</td>
<td>inference</td>
<td>inf</td>
<td>py3</td>
<td></td>
</tr>
</tbody>
</table>

**K-Means (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
text = image_uris.retrieve(framework='kmeans', region='af-south-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>455444449433.dkr.ecr.af-1-south-1.amazonaws.com/kmeans:&lt;tag&gt;</td>
<td>inference, training</td>
<td></td>
</tr>
</tbody>
</table>

**KNN (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
text = image_uris.retrieve(framework='knn', region='af-south-1')
```
<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>455444449433.dkr.ecr.af-south-1.amazonaws.com/knn:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

Linear Learner (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='linear-learner',region='af-south-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>455444449433.dkr.ecr.af-south-1.amazonaws.com/linear-learner:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

MXNet (DLC)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='mxnet',region='af-south-1',version='1.4.1',py_version='py3',image_scope='inference',instance_type='ml.c5.4xlarge')
```

<table>

<td></td>
<td>monitoring</td>
</tr>
</tbody>
</table>

### NTM (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
```
Use built-in algorithms

```python
image_uris.retrieve(framework='ntm', region='af-south-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>455444449433.dkr.ecr.af-south-1.amazonaws.com/ntm:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

**Neo Image Classification (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='image-classification-neo', region='af-south-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>774647643957.dkr.ecr.af-latest.south-1.amazonaws.com/image-classification-neo:&lt;tag&gt;</td>
<td>latest</td>
<td>inference</td>
</tr>
</tbody>
</table>

**Neo MXNet (DLC)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='neo-mxnet', region='af-south-1', version='1.8', py_version='py3', image_scope='inference', instance_type='ml.c5.4xlarge')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
<th>Processor types</th>
<th>Python versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>774647643957.dkr.ecr.af-south-1.amazonaws.com/sagemaker-inference-mxnet:&lt;tag&gt;</td>
<td></td>
<td>inference</td>
<td>CPU, GPU</td>
<td>py3</td>
</tr>
</tbody>
</table>

**Neo PyTorch (DLC)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='neo-pytorch', region='af-south-1', version='1.6', image_scope='inference', instance_type='ml.c5.4xlarge')
```
Use built-in algorithms

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
<th>Processor types</th>
<th>Python versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>774647643957.dkr.ecr.af-south-1.amazonaws.com/sagemaker-inference-pytorch:</td>

Use built-in algorithms

XGBoost (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='xgboost',region='af-south-1',version='1.2-1')
```

Docker Registry Paths and Example Code for Asia Pacific (Hong Kong) (ap-east-1)

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.

Topics
Use built-in algorithms

- BlazingText (algorithm) (p. 909)

**Docker Registry Paths and Example Code for Asia Pacific (Mumbai) (ap-south-1)**

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.

**Topics**
- BlazingText (algorithm) (p. 936)
- Chainer (DLC) (p. 936)
- Clarify (algorithm) (p. 937)
- Data Wrangler (algorithm) (p. 937)
- Debugger (algorithm) (p. 937)
- DeepAR Forecasting (algorithm) (p. 938)
- Factorization Machines (algorithm) (p. 938)
- Hugging Face (algorithm) (p. 938)
- IP Insights (algorithm) (p. 939)
- Image classification (algorithm) (p. 939)
- Inferentia MXNet (DLC) (p. 940)
- Inferentia PyTorch (DLC) (p. 940)
- K-Means (algorithm) (p. 940)
- KNN (algorithm) (p. 940)
- LDA (algorithm) (p. 941)
- Linear Learner (algorithm) (p. 941)
- MXNet (DLC) (p. 941)
- MXNet Coach (DLC) (p. 944)
- Model Monitor (algorithm) (p. 944)
- NTM (algorithm) (p. 945)
- Neo Image Classification (algorithm) (p. 945)
- Neo MXNet (DLC) (p. 945)
- Neo PyTorch (DLC) (p. 946)
- Neo Tensorflow (DLC) (p. 946)
- Neo XGBoost (algorithm) (p. 947)
• Object Detection (algorithm) (p. 947)
• Object2Vec (algorithm) (p. 947)
• PCA (algorithm) (p. 947)
• PyTorch (DLC) (p. 948)
• Random Cut Forest (algorithm) (p. 950)
• Ray PyTorch (DLC) (p. 950)
• Scikit-learn (algorithm) (p. 951)
• Semantic Segmentation (algorithm) (p. 951)
• Seq2Seq (algorithm) (p. 951)
• Spark (algorithm) (p. 952)
• SparkML Serving (algorithm) (p. 952)
• Tensorflow (DLC) (p. 952)
• Tensorflow Coach (DLC) (p. 960)
• Tensorflow Inferentia (DLC) (p. 960)
• Tensorflow Ray (DLC) (p. 961)
• VW (algorithm) (p. 962)
• XGBoost (algorithm) (p. 962)

BlazingText (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='blazingtext', region='ap-south-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>

<td>processing</td>
<td></td>
</tr>
</tbody>
</table>

### Data Wrangler (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='data-wrangler', region='ap-south-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>089933028263.dkr.ecr.ap-south-1.amazonaws.com/sagemaker-data-wrangler-container:1.x</td>
<td>processing</td>
<td></td>
</tr>
</tbody>
</table>

### Debugger (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='debugger', region='ap-south-1')
```
### Use built-in algorithms

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>

<td>4.4.2</td>
<td>training</td>
</tr>
</tbody>
</table>

**DeepAR Forecasting (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='forecasting-deepar', region='ap-south-1')
```

**Factorization Machines (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='factorization-machines', region='ap-south-1')
```

**Hugging Face (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='huggingface',region='ap-south-1',version='4.4.2',image_scope='training',base_framework_version='tensorflow2.4.1')
```
## Use built-in algorithms

<table>

Docker Registry Paths and Example Code for Asia Pacific (Seoul) (ap-northeast-2)

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.

Topics
- BlazingText (algorithm) (p. 964)
- Chainer (DLC) (p. 964)
- Clarify (algorithm) (p. 964)
- Data Wrangler (algorithm) (p. 965)
- Debugger (algorithm) (p. 965)
- DeepAR Forecasting (algorithm) (p. 965)
- Factorization Machines (algorithm) (p. 966)
- Hugging Face (algorithm) (p. 966)
- IP Insights (algorithm) (p. 967)
- Image classification (algorithm) (p. 967)
- Inferentia MXNet (DLC) (p. 967)
- Inferentia PyTorch (DLC) (p. 968)
- K-Means (algorithm) (p. 968)
- KNN (algorithm) (p. 968)
- LDA (algorithm) (p. 968)
- Linear Learner (algorithm) (p. 969)
- MXNet (DLC) (p. 969)
- MXNet Coach (DLC) (p. 972)
- Model Monitor (algorithm) (p. 972)
- NTM (algorithm) (p. 972)
- Neo Image Classification (algorithm) (p. 973)
- Neo MXNet (DLC) (p. 973)
- Neo PyTorch (DLC) (p. 973)
- Neo Tensorflow (DLC) (p. 974)
- Neo XGBoost (algorithm) (p. 974)
- Object Detection (algorithm) (p. 975)
- Object2Vec (algorithm) (p. 975)
- PCA (algorithm) (p. 975)
- PyTorch (DLC) (p. 975)
- Random Cut Forest (algorithm) (p. 978)
- Ray PyTorch (DLC) (p. 978)
- Scikit-learn (algorithm) (p. 978)
- Semantic Segmentation (algorithm) (p. 979)
- Seq2Seq (algorithm) (p. 979)
Use built-in algorithms

- Spark (algorithm) (p. 979)
- SparkML Serving (algorithm) (p. 980)
- Tensorflow (DLC) (p. 980)
- Tensorflow Coach (DLC) (p. 987)
- Tensorflow Inferentia (DLC) (p. 988)
- Tensorflow Ray (DLC) (p. 988)
- VW (algorithm) (p. 989)
- XGBoost (algorithm) (p. 990)

BlazingText (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='blazingtext', region='ap-northeast-2')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>306986355934.dkr.ecr.ap-northeast-2.amazonaws.com/blazingtext:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

Chainer (DLC)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='chainer', region='ap-northeast-2', version='5.0.0', py_version='py3', image_scope='inference', instance_type='ml.c5.4xlarge')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
<th>Processor types</th>
<th>Python versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>520713654638.dkr.ecr.ap-northeast-2.amazonaws.com/sagemaker-chainer:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
<td>CPU, GPU</td>
<td>py2, py3</td>
</tr>
<tr>
<td>520713654638.dkr.ecr.ap-northeast-2.amazonaws.com/sagemaker-chainer:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
<td>CPU, GPU</td>
<td>py2, py3</td>
</tr>
<tr>
<td>520713654638.dkr.ecr.ap-northeast-2.amazonaws.com/sagemaker-chainer:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
<td>CPU, GPU</td>
<td>py2, py3</td>
</tr>
</tbody>
</table>

Clarify (algorithm)

SageMaker Python SDK example to retrieve registry path.
Use built-in algorithms

```python
from sagemaker import image_uris
image_uris.retrieve(framework='clarify',region='ap-northeast-2',version='1.0',image_scope='processing')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>263625296855.dkr.ecr.ap-northeast-2.amazonaws.com/sagemaker-clarify-</td>
<td></td>
<td>processing</td>
</tr>
<tr>
<td>processing:&lt;tag&gt;</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Data Wrangler (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='data-wrangler',region='ap-northeast-2')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>131546521161.dkr.ecr.ap-1.x</td>
<td></td>
<td>processing</td>
</tr>
<tr>
<td>northeast-2.amazonaws.com/sagemaker-data-wrangler-container:&lt;tag&gt;</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Debugger (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='debugger',region='ap-northeast-2')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>578805364391.dkr.ecr.ap-latest</td>
<td></td>
<td>debugger</td>
</tr>
<tr>
<td>northeast-2.amazonaws.com/sagemaker-debugger-rules:&lt;tag&gt;</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**DeepAR Forecasting (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='forecasting-deepar',region='ap-northeast-2')
```
Use built-in algorithms

Registry path | Version | Job types (image scope)
--- | --- | ---
204372634319.dkr.ecr.ap-northeast-2.amazonaws.com/forecasting-deepar:1 |  | inference, training

Factorization Machines (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='factorization-machines',region='ap-northeast-2')
```

Registry path | Version | Job types (image scope)
--- | --- | ---
835164637446.dkr.ecr.ap-northeast-2.amazonaws.com/factorization-machines:1 |  | inference, training

Hugging Face (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='huggingface',region='ap-northeast-2',version='4.4.2',image_scope='training',base_framework_version='tensorflow2.4.1')
```

Registry path | Version | Job types (image scope)
--- | --- | ---
763104351884.dkr.ecr.ap-northeast-2.amazonaws.com/huggingface-pytorch-training:4.4.2 |  | training

763104351884.dkr.ecr.ap-northeast-2.amazonaws.com/huggingface-tensorflow-training:4.4.2 |  | training

763104351884.dkr.ecr.ap-northeast-2.amazonaws.com/huggingface-tensorflow-training:4.5.0 |  | training

763104351884.dkr.ecr.ap-northeast-2.amazonaws.com/huggingface-pytorch-training:4.5.0 |  | training
Use built-in algorithms

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>tensorflow-training:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

IP Insights (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='ipinsights', region='ap-northeast-2')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>835164637446.dkr.ecr.ap-northeast-2.amazonaws.com/ipinsights:</td>
<td>1</td>
<td>inference, training</td>
</tr>
</tbody>
</table>

Image classification (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='image-classification', region='ap-northeast-2')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>306986355934.dkr.ecr.ap-northeast-2.amazonaws.com/image-classification:</td>
<td>1</td>
<td>inference, training</td>
</tr>
</tbody>
</table>

Inferentia MXNet (DLC)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='inferentia-mxnet', region='ap-northeast-2', version='1.5.1', instance_type='ml.inf1.6xlarge')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
<th>Processor types</th>
<th>Python versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>151534178276.dkr.ecr.ap-northeast-2.amazonaws.com/sagemaker-neo-mxnet:</td>
<td></td>
<td>inference</td>
<td>inf</td>
<td>py3</td>
</tr>
</tbody>
</table>
Inferentia PyTorch (DLC)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='inferentia-pytorch', region='ap-northeast-2', version='1.5.1', py_version='py3')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
<th>Processor types</th>
<th>Python versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>151534178276.dkr.ecr.ap-northeast-2.amazonaws.com/sagemaker-neo-pytorch:&lt;tag&gt;</td>
<td>inference</td>
<td>inf</td>
<td>py3</td>
<td></td>
</tr>
</tbody>
</table>

K-Means (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='kmeans', region='ap-northeast-2')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>835164637446.dkr.ecr.ap-northeast-2.amazonaws.com/kmeans:&lt;tag&gt;</td>
<td>inference, training</td>
<td></td>
</tr>
</tbody>
</table>

KNN (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='knn', region='ap-northeast-2')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>835164637446.dkr.ecr.ap-northeast-2.amazonaws.com/knn:&lt;tag&gt;</td>
<td>inference, training</td>
<td></td>
</tr>
</tbody>
</table>

LDA (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='lda', region='ap-northeast-2')
```
### Use built-in algorithms

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>293181348795.dkr.ecr.ap-northeast-2.amazonaws.com/lda:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

**Linear Learner (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='linear-learner',region='ap-northeast-2')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>

**Docker Registry Paths and Example Code for Asia Pacific (Singapore) (ap-southeast-1)**

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.
Use built-in algorithms

Topics
- BlazingText (algorithm) (p. 992)
- Chainer (DLC) (p. 992)
- Clarify (algorithm) (p. 992)
- Data Wrangler (algorithm) (p. 993)
- Debugger (algorithm) (p. 993)
- DeepAR Forecasting (algorithm) (p. 993)
- Factorization Machines (algorithm) (p. 994)
- Hugging Face (algorithm) (p. 994)
- IP Insights (algorithm) (p. 995)
- Image classification (algorithm) (p. 995)
- Inferentia MXNet (DLC) (p. 995)
- Inferentia PyTorch (DLC) (p. 995)
- K-Means (algorithm) (p. 996)
- KNN (algorithm) (p. 996)
- LDA (algorithm) (p. 996)
- Linear Learner (algorithm) (p. 997)
- MXNet (DLC) (p. 997)
- MXNet Coach (DLC) (p. 999)
- Model Monitor (algorithm) (p. 1000)
- NTM (algorithm) (p. 1000)
- Neo Image Classification (algorithm) (p. 1000)
- Neo MXNet (DLC) (p. 1001)
- Neo PyTorch (DLC) (p. 1001)
- Neo Tensorflow (DLC) (p. 1002)
- Neo XGBoost (algorithm) (p. 1002)
- Object Detection (algorithm) (p. 1002)
- Object2Vec (algorithm) (p. 1003)
- PCA (algorithm) (p. 1003)
- PyTorch (DLC) (p. 1003)
- Random Cut Forest (algorithm) (p. 1005)
- Ray PyTorch (DLC) (p. 1006)
- Scikit-learn (algorithm) (p. 1006)
- Semantic Segmentation (algorithm) (p. 1006)
- Seq2Seq (algorithm) (p. 1007)
- Spark (algorithm) (p. 1007)
- SparkML Serving (algorithm) (p. 1007)
- Tensorflow (DLC) (p. 1008)
- Tensorflow Coach (DLC) (p. 1015)
- Tensorflow Inferentia (DLC) (p. 1016)
- Tensorflow Ray (DLC) (p. 1016)
- VW (algorithm) (p. 1017)
- XGBoost (algorithm) (p. 1017)
**BlazingText (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='blazingtext', region='ap-southeast-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>

### Docker Registry Paths and Example Code for Asia Pacific (Sydney) (ap-southeast-2)

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.

#### Topics

- BlazingText (algorithm) (p. 1019)
- Chainer (DLC) (p. 1019)
- Clarify (algorithm) (p. 1020)
- Data Wrangler (algorithm) (p. 1020)
- Debugger (algorithm) (p. 1021)
- DeepAR Forecasting (algorithm) (p. 1021)
- Factorization Machines (algorithm) (p. 1021)
- Hugging Face (algorithm) (p. 1021)
- IP Insights (algorithm) (p. 1022)
- Image classification (algorithm) (p. 1022)
- Inferentia MXNet (DLC) (p. 1023)
- Inferentia PyTorch (DLC) (p. 1023)
- K-Means (algorithm) (p. 1023)
Use built-in algorithms

- KNN (algorithm) (p. 1024)
- LDA (algorithm) (p. 1024)
- Linear Learner (algorithm) (p. 1024)
- MXNet (DLC) (p. 1024)
- MXNet Coach (DLC) (p. 1027)
- Model Monitor (algorithm) (p. 1027)
- NTM (algorithm) (p. 1028)
- Neo Image Classification (algorithm) (p. 1028)
- Neo MXNet (DLC) (p. 1028)
- Neo PyTorch (DLC) (p. 1029)
- Neo Tensorflow (DLC) (p. 1029)
- Neo XGBoost (algorithm) (p. 1030)
- Object Detection (algorithm) (p. 1030)
- Object2Vec (algorithm) (p. 1030)
- PCA (algorithm) (p. 1030)
- PyTorch (DLC) (p. 1031)
- Random Cut Forest (algorithm) (p. 1033)
- Ray PyTorch (DLC) (p. 1033)
- Scikit-learn (algorithm) (p. 1034)
- Semantic Segmentation (algorithm) (p. 1034)
- Seq2Seq (algorithm) (p. 1034)
- Spark (algorithm) (p. 1035)
- SparkML Serving (algorithm) (p. 1035)
- Tensorflow (DLC) (p. 1035)
- Tensorflow Coach (DLC) (p. 1043)
- Tensorflow Inferentia (DLC) (p. 1043)
- Tensorflow Ray (DLC) (p. 1044)
- VW (algorithm) (p. 1045)
- XGBoost (algorithm) (p. 1045)

**BlazingText (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='blazingtext',region='ap-southeast-2')
```

<table>
<thead>
<tr>
<th>Registry path</th>

Use built-in algorithms

### Spark (algorithm)
SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='spark',region='ap-southeast-2',version='3.0',image_scope='processing')
```

### SparkML Serving (algorithm)
SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='sparkml-serving',region='ap-southeast-2',version='2.4')
```

### Tensorflow (DLC)
SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
```
Use built-in algorithms

```python
image_uris.retrieve(framework='tensorflow',region='ap-southeast-2',version='1.12.0',image_scope='inference',instance_type='ml.c5.4xlarge')
```

1045
Docker Registry Paths and Example Code for Asia Pacific (Tokyo) (ap-northeast-1)

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.

Topics

- BlazingText (algorithm) (p. 1047)
- Chainer (DLC) (p. 1047)
- Clarify (algorithm) (p. 1047)
- Data Wrangler (algorithm) (p. 1048)
- Debugger (algorithm) (p. 1048)
- DeepAR Forecasting (algorithm) (p. 1048)
- Factorization Machines (algorithm) (p. 1049)
- Hugging Face (algorithm) (p. 1049)
- IP Insights (algorithm) (p. 1050)
- Image classification (algorithm) (p. 1050)
- Inferentia MXNet (DLC) (p. 1050)
- Inferentia PyTorch (DLC) (p. 1051)
- K-Means (algorithm) (p. 1051)
- KNN (algorithm) (p. 1051)
- LDA (algorithm) (p. 1051)
- Linear Learner (algorithm) (p. 1052)
- MXNet (DLC) (p. 1052)
- MXNet Coach (DLC) (p. 1055)
- Model Monitor (algorithm) (p. 1055)
- NTM (algorithm) (p. 1055)
- Neo Image Classification (algorithm) (p. 1056)
- Neo MXNet (DLC) (p. 1056)
- Neo PyTorch (DLC) (p. 1056)
- Neo Tensorflow (DLC) (p. 1057)
- Neo XGBoost (algorithm) (p. 1057)
- Object Detection (algorithm) (p. 1058)
- Object2Vec (algorithm) (p. 1058)
- PCA (algorithm) (p. 1058)
- PyTorch (DLC) (p. 1058)
- Random Cut Forest (algorithm) (p. 1061)
- Ray PyTorch (DLC) (p. 1061)
- Scikit-learn (algorithm) (p. 1061)
- Semantic Segmentation (algorithm) (p. 1062)
- Seq2Seq (algorithm) (p. 1062)
• Spark (algorithm) (p. 1062)
• SparkML Serving (algorithm) (p. 1063)
• Tensorflow (DLC) (p. 1063)
• Tensorflow Coach (DLC) (p. 1070)
• Tensorflow Inferentia (DLC) (p. 1071)
• Tensorflow Ray (DLC) (p. 1071)
• VW (algorithm) (p. 1072)
• XGBoost (algorithm) (p. 1073)

BlazingText (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='blazingtext', region='ap-northeast-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>501404015308.dkr.ecr.ap-northeast-1.amazonaws.com/blazingtext:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

Chainer (DLC)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='chainer', region='ap-northeast-1', version='5.0.0', py_version='py3', image_scope='inference', instance_type='ml.c5.4xlarge')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
<th>Processor types</th>
<th>Python versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>520713654638.dkr.ecr.ap-northeast-1.amazonaws.com/sagemaker-chainer:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
<td>CPU, GPU</td>
<td>py2, py3</td>
</tr>
<tr>
<td>520713654638.dkr.ecr.ap-northeast-1.amazonaws.com/sagemaker-chainer:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
<td>CPU, GPU</td>
<td>py2, py3</td>
</tr>
<tr>
<td>520713654638.dkr.ecr.ap-northeast-1.amazonaws.com/sagemaker-chainer:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
<td>CPU, GPU</td>
<td>py2, py3</td>
</tr>
</tbody>
</table>

Clarify (algorithm)

SageMaker Python SDK example to retrieve registry path.
Use built-in algorithms

```python
from sagemaker import image_uris
image_uris.retrieve(framework='clarify',region='ap-northeast-1',version='1.0',image_scope='processing')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>377024640650.dkr.ecr.ap-northeast-1.amazonaws.com/sagemaker-clarify-processing:&lt;tag&gt;</td>
<td></td>
<td>processing</td>
</tr>
</tbody>
</table>

**Data Wrangler (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='data-wrangler',region='ap-northeast-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>649008135260.dkr.ecr.ap-northeast-1.amazonaws.com/sagemaker-data-wrangler-container:&lt;tag&gt;</td>
<td></td>
<td>processing</td>
</tr>
</tbody>
</table>

**Debugger (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='debugger',region='ap-northeast-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>430734990657.dkr.ecr.ap-latest-northeast-1.amazonaws.com/sagemaker-debugger-rules:&lt;tag&gt;</td>
<td></td>
<td>debugger</td>
</tr>
</tbody>
</table>

**DeepAR Forecasting (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='forecasting-deepar',region='ap-northeast-1')
```
### Factorization Machines (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='factorization-machines', region='ap-northeast-1')
```

### Hugging Face (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='huggingface', region='ap-northeast-1', version='4.4.2', image_scope='training', base_framework_version='tensorflow2.4.1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>633353088612.dkr.ecr.ap-northeast-1.amazonaws.com/forecasting-deepar:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
<tr>
<td>351501993468.dkr.ecr.ap-northeast-1.amazonaws.com/factorization-machines:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>

<td>Job types (image scope)</td>
</tr>
<tr>
<td>---------------</td>
<td>---------</td>
<td>-------------------------</td>
</tr>
<tr>
<td>tensorflow-training:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**IP Insights (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='ipinsights', region='ap-northeast-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>351501993468.dkr.ecr.ap-northeast-1.amazonaws.com/ipinsights:</td>
<td>1.0.0</td>
<td>inference, training</td>
</tr>
</tbody>
</table>

**Image classification (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='image-classification', region='ap-northeast-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>501404015308.dkr.ecr.ap-northeast-1.amazonaws.com/image-classification:</td>
<td>1.0.0</td>
<td>inference, training</td>
</tr>
</tbody>
</table>

**Inferentia MXNet (DLC)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='inferentia-mxnet', region='ap-northeast-1', version='1.5.1', instance_type='ml.inf1.6xlarge')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
<th>Processor types</th>
<th>Python versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>941853720454.dkr.ecr.ap-northeast-1.amazonaws.com/sagemaker-neo-mxnet:</td>
<td>1.5.1</td>
<td>inference</td>
<td>inf</td>
<td>py3</td>
</tr>
</tbody>
</table>
Inferentia PyTorch (DLC)
SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='inferentia-pytorch', region='ap-northeast-1', version='1.5.1', py_version='py3')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
<th>Processor types</th>
<th>Python versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>941853720454.dkr.ecr.ap-northeast-1.amazonaws.com/sagemaker-neo-pytorch:&lt;tag&gt;</td>
<td></td>
<td>inference</td>
<td>inf</td>
<td>py3</td>
</tr>
</tbody>
</table>

K-Means (algorithm)
SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='kmeans', region='ap-northeast-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>351501993468.dkr.ecr.ap-northeast-1.amazonaws.com/kmeans:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

KNN (algorithm)
SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='knn', region='ap-northeast-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>351501993468.dkr.ecr.ap-northeast-1.amazonaws.com/knn:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

LDA (algorithm)
SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='lda', region='ap-northeast-1')
```
Use built-in algorithms

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>258307448986.dkr.ecr.ap-northeast-1.amazonaws.com/ld: &lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

**Linear Learner (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='linear-learner', region='ap-northeast-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>351501993468.dkr.ecr.ap-northeast-1.amazonaws.com/linear-learner: &lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

**MXNet (DLC)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='mxnet', region='ap-northeast-1', version='1.4.1', py_version='py3', image_scope='inference', instance_type='ml.c5.4xlarge')
```
