Welcome

AWS Step Functions is a service that lets you coordinate the components of distributed applications and microservices using visual workflows.

You can use Step Functions to build applications from individual components, each of which performs a discrete function, or *task*, allowing you to scale and change applications quickly. Step Functions provides a console that helps visualize the components of your application as a series of steps. Step Functions automatically triggers and tracks each step, and retries steps when there are errors, so your application executes predictably and in the right order every time. Step Functions logs the state of each step, so you can quickly diagnose and debug any issues.

Step Functions manages operations and underlying infrastructure to ensure your application is available at any scale. You can run tasks on AWS, your own servers, or any system that has access to AWS. You can access and use Step Functions using the console, the AWS SDKs, or an HTTP API. For more information about Step Functions, see the [AWS Step Functions Developer Guide](#).

This document was last published on February 19, 2018.

Actions

The following actions are supported:

- [CreateActivity](#) (p. 3)
- [CreateStateMachine](#) (p. 5)
- [DeleteActivity](#) (p. 8)
- [DeleteStateMachine](#) (p. 10)
- [DescribeActivity](#) (p. 12)
- [DescribeExecution](#) (p. 15)
- [DescribeStateMachine](#) (p. 18)
- [DescribeStateMachineForExecution](#) (p. 21)
- [GetActivityTask](#) (p. 23)
- [GetExecutionHistory](#) (p. 26)
- [ListActivities](#) (p. 30)
- [ListExecutions](#) (p. 33)
- [ListStateMachines](#) (p. 36)
- [SendTaskFailure](#) (p. 38)
- [SendTaskHeartbeat](#) (p. 40)
- [SendTaskSuccess](#) (p. 42)
- [StartExecution](#) (p. 44)
- [StopExecution](#) (p. 47)
- [UpdateStateMachine](#) (p. 49)

CreateActivity

Creates an activity. An activity is a task which you write in any programming language and host on any machine which has access to AWS Step Functions. Activities must poll Step Functions using the `GetActivityTask` API action and respond using `SendTask*` API actions. This function lets Step Functions know the existence of your activity and returns an identifier for use in a state machine and when polling from the activity.

Request Syntax

```
{  
  "name": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

name (p. 3)

The name of the activity to create. This name must be unique for your AWS account and region for 90 days. For more information, see [Limits Related to State Machine Executions](#) in the *AWS Step Functions Developer Guide*.

Important

When you make multiple `StartExecution` calls with the same name, the new execution does not run, and the following rules apply:

- When the original execution is open and the execution input from the new call is *different*, the `ExecutionAlreadyExists` message is returned.
- When the original execution is open and the execution input from the new call is *identical*, the `Success` message is returned.
- When the original execution has been closed within 90 days, the `ExecutionAlreadyExists` message is returned regardless of input.

A name must *not* contain:

- whitespace
- brackets `<` `>` `{` `}` `[` `]`
- wildcard characters `?` `*`
- special characters `"` `#` `%` `\` `^` `|` `~` ``` `$` `&` `,` `;` `:` `/`
- control characters (U+0000-001F, U+007F-009F)

Type: String

Length Constraints: Minimum length of 1. Maximum length of 80.

Required: Yes

Response Syntax

```
{
```

```
"activityArn": "string",  
"creationDate": number  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

activityArn (p. 3)

The Amazon Resource Name (ARN) that identifies the created activity.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

creationDate (p. 3)

The date the activity is created.

Type: Timestamp

Errors

For information about the errors that are common to all actions, see [Common Errors](#) (p. 83).

ActivityLimitExceeded

The maximum number of activities has been reached. Existing activities must be deleted before a new activity can be created.

HTTP Status Code: 400

InvalidName

The provided name is invalid.

HTTP Status Code: 400

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS Command Line Interface](#)
- [AWS SDK for .NET](#)
- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for JavaScript](#)
- [AWS SDK for PHP V3](#)
- [AWS SDK for Python](#)
- [AWS SDK for Ruby V2](#)

CreateStateMachine

Creates a state machine. A state machine consists of a collection of states that can do work (`Task` states), determine to which states to transition next (`Choice` states), stop an execution with an error (`Fail` states), and so on. State machines are specified using a JSON-based, structured language.

Request Syntax

```
{  
  "definition": "string",  
  "name": "string",  
  "roleArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

definition (p. 5)

The Amazon States Language definition of the state machine. See [Amazon States Language](#).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1048576.

Required: Yes

name (p. 5)

The name of the state machine. This name must be unique for your AWS account and region for 90 days. For more information, see [Limits Related to State Machine Executions](#) in the *AWS Step Functions Developer Guide*.

Important

When you make multiple `StartExecution` calls with the same name, the new execution does not run, and the following rules apply:

- When the original execution is open and the execution input from the new call is *different*, the `ExecutionAlreadyExists` message is returned.
- When the original execution is open and the execution input from the new call is *identical*, the `Success` message is returned.
- When the original execution has been closed within 90 days, the `ExecutionAlreadyExists` message is returned regardless of input.

A name must *not* contain:

- whitespace
- brackets `<` `>` `{` `}` `[` `]`
- wildcard characters `?` `*`
- special characters `"` `#` `%` `\` `^` `|` `~` ``` `$` `&` `,` `;` `:` `/`
- control characters (U+0000-001F, U+007F-009F)

Type: String

Length Constraints: Minimum length of 1. Maximum length of 80.

Required: Yes

[roleArn \(p. 5\)](#)

The Amazon Resource Name (ARN) of the IAM role to use for this state machine.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

Response Syntax

```
{  
  "creationDate": number,  
  "stateMachineArn": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[creationDate \(p. 6\)](#)

The date the state machine is created.

Type: Timestamp

[stateMachineArn \(p. 6\)](#)

The Amazon Resource Name (ARN) that identifies the created state machine.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Errors

For information about the errors that are common to all actions, see [Common Errors \(p. 83\)](#).

InvalidArn

The provided Amazon Resource Name (ARN) is invalid.

HTTP Status Code: 400

InvalidDefinition

The provided Amazon States Language definition is invalid.

HTTP Status Code: 400

InvalidName

The provided name is invalid.

HTTP Status Code: 400

StateMachineAlreadyExists

A state machine with the same name but a different definition or role ARN already exists.

HTTP Status Code: 400

StateMachineDeleting

The specified state machine is being deleted.

HTTP Status Code: 400

StateMachineLimitExceeded

The maximum number of state machines has been reached. Existing state machines must be deleted before a new state machine can be created.

HTTP Status Code: 400

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS Command Line Interface](#)
- [AWS SDK for .NET](#)
- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for JavaScript](#)
- [AWS SDK for PHP V3](#)
- [AWS SDK for Python](#)
- [AWS SDK for Ruby V2](#)

DeleteActivity

Deletes an activity.

Request Syntax

```
{  
  "activityArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

activityArn (p. 8)

The Amazon Resource Name (ARN) of the activity to delete.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors \(p. 83\)](#).

InvalidArn

The provided Amazon Resource Name (ARN) is invalid.

HTTP Status Code: 400

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS Command Line Interface](#)
- [AWS SDK for .NET](#)
- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for JavaScript](#)

- [AWS SDK for PHP V3](#)
- [AWS SDK for Python](#)
- [AWS SDK for Ruby V2](#)

DeleteStateMachine

Deletes a state machine. This is an asynchronous operation: It sets the state machine's status to `DELETING` and begins the deletion process. Each state machine execution is deleted the next time it makes a state transition.

Note

The state machine itself is deleted after all executions are completed or deleted.

Request Syntax

```
{  
  "stateMachineArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

stateMachineArn (p. 10)

The Amazon Resource Name (ARN) of the state machine to delete.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors \(p. 83\)](#).

InvalidArn

The provided Amazon Resource Name (ARN) is invalid.

HTTP Status Code: 400

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS Command Line Interface](#)
- [AWS SDK for .NET](#)
- [AWS SDK for C++](#)

- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for JavaScript](#)
- [AWS SDK for PHP V3](#)
- [AWS SDK for Python](#)
- [AWS SDK for Ruby V2](#)

DescribeActivity

Describes an activity.

Request Syntax

```
{  
  "activityArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

activityArn (p. 12)

The Amazon Resource Name (ARN) of the activity to describe.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

Response Syntax

```
{  
  "activityArn": "string",  
  "creationDate": number,  
  "name": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

activityArn (p. 12)

The Amazon Resource Name (ARN) that identifies the activity.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

creationDate (p. 12)

The date the activity is created.

Type: Timestamp

name (p. 12)

The name of the activity.

Important

When you make multiple `StartExecution` calls with the same name, the new execution does not run, and the following rules apply:

- When the original execution is open and the execution input from the new call is *different*, the `ExecutionAlreadyExists` message is returned.
- When the original execution is open and the execution input from the new call is *identical*, the `Success` message is returned.
- When the original execution has been closed within 90 days, the `ExecutionAlreadyExists` message is returned regardless of input.

A name must *not* contain:

- whitespace
- brackets `< > { } []`
- wildcard characters `? *`
- special characters `" # % \ ^ | ~ ` $ & , ; : /`
- control characters (U+0000-001F, U+007F-009F)

Type: String

Length Constraints: Minimum length of 1. Maximum length of 80.

Errors

For information about the errors that are common to all actions, see [Common Errors \(p. 83\)](#).

ActivityDoesNotExist

The specified activity does not exist.

HTTP Status Code: 400

InvalidArn

The provided Amazon Resource Name (ARN) is invalid.

HTTP Status Code: 400

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS Command Line Interface](#)
- [AWS SDK for .NET](#)
- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for JavaScript](#)
- [AWS SDK for PHP V3](#)
- [AWS SDK for Python](#)

- [AWS SDK for Ruby V2](#)

DescribeExecution

Describes an execution.

Request Syntax

```
{  
  "executionArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

executionArn (p. 15)

The Amazon Resource Name (ARN) of the execution to describe.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

Response Syntax

```
{  
  "executionArn": "string",  
  "input": "string",  
  "name": "string",  
  "output": "string",  
  "startDate": number,  
  "stateMachineArn": "string",  
  "status": "string",  
  "stopDate": number  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

executionArn (p. 15)

The Amazon Resource Name (ARN) that identifies the execution.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

input (p. 15)

The string that contains the JSON input data of the execution.

Type: String

Length Constraints: Maximum length of 32768.

name (p. 15)

The name of the execution.

Important

When you make multiple `StartExecution` calls with the same name, the new execution does not run, and the following rules apply:

- When the original execution is open and the execution input from the new call is *different*, the `ExecutionAlreadyExists` message is returned.
- When the original execution is open and the execution input from the new call is *identical*, the `Success` message is returned.
- When the original execution has been closed within 90 days, the `ExecutionAlreadyExists` message is returned regardless of input.

A name must *not* contain:

- whitespace
- brackets `< > { } []`
- wildcard characters `? *`
- special characters `" # % \ ^ | ~ ` $ & , ; : /`
- control characters (U+0000-001F, U+007F-009F)

Type: String

Length Constraints: Minimum length of 1. Maximum length of 80.

output (p. 15)

The JSON output data of the execution.

Note

This field is set only if the execution succeeds. If the execution fails, this field is null.

Type: String

Length Constraints: Maximum length of 32768.

startDate (p. 15)

The date the execution is started.

Type: Timestamp

stateMachineArn (p. 15)

The Amazon Resource Name (ARN) of the executed state machine.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

status (p. 15)

The current status of the execution.

Type: String

Valid Values: `RUNNING` | `SUCCEEDED` | `FAILED` | `TIMED_OUT` | `ABORTED`

stopDate (p. 15)

If the execution has already ended, the date the execution stopped.

Type: Timestamp

Errors

For information about the errors that are common to all actions, see [Common Errors \(p. 83\)](#).

ExecutionDoesNotExist

The specified execution does not exist.

HTTP Status Code: 400

InvalidArn

The provided Amazon Resource Name (ARN) is invalid.

HTTP Status Code: 400

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS Command Line Interface](#)
- [AWS SDK for .NET](#)
- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for JavaScript](#)
- [AWS SDK for PHP V3](#)
- [AWS SDK for Python](#)
- [AWS SDK for Ruby V2](#)

DescribeStateMachine

Describes a state machine.

Request Syntax

```
{  
  "stateMachineArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

stateMachineArn (p. 18)

The Amazon Resource Name (ARN) of the state machine to describe.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

Response Syntax

```
{  
  "creationDate": number,  
  "definition": "string",  
  "name": "string",  
  "roleArn": "string",  
  "stateMachineArn": "string",  
  "status": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

creationDate (p. 18)

The date the state machine is created.

Type: Timestamp

definition (p. 18)

The Amazon States Language definition of the state machine. See [Amazon States Language](#).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1048576.

name (p. 18)

The name of the state machine.

Important

When you make multiple `StartExecution` calls with the same name, the new execution does not run, and the following rules apply:

- When the original execution is open and the execution input from the new call is *different*, the `ExecutionAlreadyExists` message is returned.
- When the original execution is open and the execution input from the new call is *identical*, the `Success` message is returned.
- When the original execution has been closed within 90 days, the `ExecutionAlreadyExists` message is returned regardless of input.

A name must *not* contain:

- whitespace
- brackets `<` `>` `{` `}` `[` `]`
- wildcard characters `?` `*`
- special characters `"` `#` `%` `\` `^` `|` `~` ``` `$` `&` `,` `;` `:` `/`
- control characters (U+0000–001F, U+007F–009F)

Type: String

Length Constraints: Minimum length of 1. Maximum length of 80.

roleArn (p. 18)

The Amazon Resource Name (ARN) of the IAM role used when creating this state machine. (The IAM role maintains security by granting Step Functions access to AWS resources.)

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

stateMachineArn (p. 18)

The Amazon Resource Name (ARN) that identifies the state machine.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

status (p. 18)

The current status of the state machine.

Type: String

Valid Values: `ACTIVE` | `DELETING`

Errors

For information about the errors that are common to all actions, see [Common Errors](#) (p. 83).

InvalidArn

The provided Amazon Resource Name (ARN) is invalid.

HTTP Status Code: 400

StateMachineDoesNotExist

The specified state machine does not exist.

HTTP Status Code: 400

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS Command Line Interface](#)
- [AWS SDK for .NET](#)
- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for JavaScript](#)
- [AWS SDK for PHP V3](#)
- [AWS SDK for Python](#)
- [AWS SDK for Ruby V2](#)

DescribeStateMachineForExecution

Describes the state machine associated with a specific execution.

Request Syntax

```
{  
  "executionArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

[executionArn \(p. 21\)](#)

The Amazon Resource Name (ARN) of the execution you want state machine information for.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

Response Syntax

```
{  
  "definition": "string",  
  "name": "string",  
  "roleArn": "string",  
  "stateMachineArn": "string",  
  "updateDate": number  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[definition \(p. 21\)](#)

The Amazon States Language definition of the state machine. See [Amazon States Language](#).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1048576.

[name \(p. 21\)](#)

The name of the state machine associated with the execution.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 80.

[roleArn \(p. 21\)](#)

The Amazon Resource Name (ARN) of the IAM role of the State Machine for the execution.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

[stateMachineArn \(p. 21\)](#)

The Amazon Resource Name (ARN) of the state machine associated with the execution.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

[updateDate \(p. 21\)](#)

The date and time the state machine associated with an execution was updated. For a newly created state machine, this is the creation date.

Type: Timestamp

Errors

For information about the errors that are common to all actions, see [Common Errors \(p. 83\)](#).

ExecutionDoesNotExist

The specified execution does not exist.

HTTP Status Code: 400

InvalidArn

The provided Amazon Resource Name (ARN) is invalid.

HTTP Status Code: 400

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for Python](#)
- [AWS SDK for Ruby V2](#)

GetActivityTask

Used by workers to retrieve a task (with the specified activity ARN) which has been scheduled for execution by a running state machine. This initiates a long poll, where the service holds the HTTP connection open and responds as soon as a task becomes available (i.e. an execution of a task of this type is needed.) The maximum time the service holds on to the request before responding is 60 seconds. If no task is available within 60 seconds, the poll returns a `taskToken` with a null string.

Important

Workers should set their client side socket timeout to at least 65 seconds (5 seconds higher than the maximum time the service may hold the poll request).

Request Syntax

```
{  
  "activityArn": "string",  
  "workerName": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

activityArn (p. 23)

The Amazon Resource Name (ARN) of the activity to retrieve tasks from (assigned when you create the task using [CreateActivity \(p. 3\)](#).)

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

workerName (p. 23)

You can provide an arbitrary name in order to identify the worker that the task is assigned to. This name is used when it is logged in the execution history.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 80.

Required: No

Response Syntax

```
{  
  "input": "string",  
  "taskToken": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

input (p. 23)

The string that contains the JSON input data for the task.

Type: String

Length Constraints: Maximum length of 32768.

taskToken (p. 23)

A token that identifies the scheduled task. This token must be copied and included in subsequent calls to [SendTaskHeartbeat](#) (p. 40), [SendTaskSuccess](#) (p. 42) or [SendTaskFailure](#) (p. 38) in order to report the progress or completion of the task.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Errors

For information about the errors that are common to all actions, see [Common Errors](#) (p. 83).

ActivityDoesNotExist

The specified activity does not exist.

HTTP Status Code: 400

ActivityWorkerLimitExceeded

The maximum number of workers concurrently polling for activity tasks has been reached.

HTTP Status Code: 400

InvalidArn

The provided Amazon Resource Name (ARN) is invalid.

HTTP Status Code: 400

- [AWS SDK for Java](#)
- [AWS SDK for JavaScript](#)
- [AWS SDK for PHP V3](#)

- [AWS SDK for Python](#)
- [AWS SDK for Ruby V2](#)

GetExecutionHistory

Returns the history of the specified execution as a list of events. By default, the results are returned in ascending order of the `timestamp` of the events. Use the `reverseOrder` parameter to get the latest events first.

If a `nextToken` is returned by a previous call, there are more results available. To retrieve the next page of results, make the call again using the returned token in `nextToken`. Keep all other arguments unchanged.

Request Syntax

```
{
  "executionArn": "string",
  "maxResults": number,
  "nextToken": "string",
  "reverseOrder": boolean
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

[executionArn \(p. 26\)](#)

The Amazon Resource Name (ARN) of the execution.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

[maxResults \(p. 26\)](#)

The maximum number of results that are returned per call. You can use `nextToken` to obtain further pages of results. The default is 100 and the maximum allowed page size is 1000. A value of 0 uses the default.

This is only an upper limit. The actual number of results returned per call might be fewer than the specified maximum.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 1000.

Required: No

[nextToken \(p. 26\)](#)

If a `nextToken` is returned by a previous call, there are more results available. To retrieve the next page of results, make the call again using the returned token in `nextToken`. Keep all other arguments unchanged.

The configured `maxResults` determines how many results can be returned in a single call.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Required: No

[reverseOrder \(p. 26\)](#)

Lists events in descending order of their `timeStamp`.

Type: Boolean

Required: No

Response Syntax

```
{
  "events": [
    {
      "activityFailedEventDetails": {
        "cause": "string",
        "error": "string"
      },
      "activityScheduledEventDetails": {
        "heartbeatInSeconds": number,
        "input": "string",
        "resource": "string",
        "timeoutInSeconds": number
      },
      "activityScheduleFailedEventDetails": {
        "cause": "string",
        "error": "string"
      },
      "activityStartedEventDetails": {
        "workerName": "string"
      },
      "activitySucceededEventDetails": {
        "output": "string"
      },
      "activityTimedOutEventDetails": {
        "cause": "string",
        "error": "string"
      },
      "executionAbortedEventDetails": {
        "cause": "string",
        "error": "string"
      },
      "executionFailedEventDetails": {
        "cause": "string",
        "error": "string"
      },
      "executionStartedEventDetails": {
        "input": "string",
        "roleArn": "string"
      },
      "executionSucceededEventDetails": {
        "output": "string"
      },
      "executionTimedOutEventDetails": {
        "cause": "string",
        "error": "string"
      },
      "id": number,
    }
  ]
}
```

```

    "lambdaFunctionFailedEventDetails": {
      "cause": "string",
      "error": "string"
    },
    "lambdaFunctionScheduledEventDetails": {
      "input": "string",
      "resource": "string",
      "timeoutInSeconds": number
    },
    "lambdaFunctionScheduleFailedEventDetails": {
      "cause": "string",
      "error": "string"
    },
    "lambdaFunctionStartFailedEventDetails": {
      "cause": "string",
      "error": "string"
    },
    "lambdaFunctionSucceededEventDetails": {
      "output": "string"
    },
    "lambdaFunctionTimedOutEventDetails": {
      "cause": "string",
      "error": "string"
    },
    "previousEventId": number,
    "stateEnteredEventDetails": {
      "input": "string",
      "name": "string"
    },
    "stateExitedEventDetails": {
      "name": "string",
      "output": "string"
    },
    "timestamp": number,
    "type": "string"
  }
],
"nextToken": "string"
}

```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

events (p. 27)

The list of events that occurred in the execution.

Type: Array of [HistoryEvent \(p. 68\)](#) objects

nextToken (p. 27)

If a `nextToken` is returned by a previous call, there are more results available. To retrieve the next page of results, make the call again using the returned token in `nextToken`. Keep all other arguments unchanged.

The configured `maxResults` determines how many results can be returned in a single call.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Errors

For information about the errors that are common to all actions, see [Common Errors \(p. 83\)](#).

ExecutionDoesNotExist

The specified execution does not exist.

HTTP Status Code: 400

InvalidArn

The provided Amazon Resource Name (ARN) is invalid.

HTTP Status Code: 400

InvalidToken

The provided token is invalid.

HTTP Status Code: 400

- [AWS SDK for Ruby V2](#)

ListActivities

Lists the existing activities.

If a `nextToken` is returned by a previous call, there are more results available. To retrieve the next page of results, make the call again using the returned token in `nextToken`. Keep all other arguments unchanged.

Request Syntax

```
{  
  "maxResults": number,  
  "nextToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

maxResults (p. 30)

The maximum number of results that are returned per call. You can use `nextToken` to obtain further pages of results. The default is 100 and the maximum allowed page size is 1000. A value of 0 uses the default.

This is only an upper limit. The actual number of results returned per call might be fewer than the specified maximum.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 1000.

Required: No

nextToken (p. 30)

If a `nextToken` is returned by a previous call, there are more results available. To retrieve the next page of results, make the call again using the returned token in `nextToken`. Keep all other arguments unchanged.

The configured `maxResults` determines how many results can be returned in a single call.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Required: No

Response Syntax

```
{  
  "activities": [  
    {  
      ...  
    }  
  ]  
}
```

```
    "activityArn": "string",  
    "creationDate": number,  
    "name": "string"  
  }  
],  
"nextToken": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

activities (p. 30)

The list of activities.

Type: Array of [ActivityListItem \(p. 54\)](#) objects

nextToken (p. 30)

If a `nextToken` is returned by a previous call, there are more results available. To retrieve the next page of results, make the call again using the returned token in `nextToken`. Keep all other arguments unchanged.

The configured `maxResults` determines how many results can be returned in a single call.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Errors

For information about the errors that are common to all actions, see [Common Errors \(p. 83\)](#).

InvalidToken

The provided token is invalid.

HTTP Status Code: 400

See Also

- [AWS SDK for Java](#)
- [AWS SDK for JavaScript](#)
- [AWS SDK for PHP V3](#)
- [AWS SDK for Python](#)
- [AWS SDK for Ruby V2](#)

ListExecutions

Lists the executions of a state machine that meet the filtering criteria. Results are sorted by time, with the most recent execution first.

If a `nextToken` is returned by a previous call, there are more results available. To retrieve the next page of results, make the call again using the returned token in `nextToken`. Keep all other arguments unchanged.

Request Syntax

```
{
  "maxResults": number,
  "nextToken": "string",
  "stateMachineArn": "string",
  "statusFilter": "string"
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

[maxResults \(p. 33\)](#)

The maximum number of results that are returned per call. You can use `nextToken` to obtain further pages of results. The default is 100 and the maximum allowed page size is 1000. A value of 0 uses the default.

This is only an upper limit. The actual number of results returned per call might be fewer than the specified maximum.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 1000.

Required: No

[nextToken \(p. 33\)](#)

If a `nextToken` is returned by a previous call, there are more results available. To retrieve the next page of results, make the call again using the returned token in `nextToken`. Keep all other arguments unchanged.

The configured `maxResults` determines how many results can be returned in a single call.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Required: No

[stateMachineArn \(p. 33\)](#)

The Amazon Resource Name (ARN) of the state machine whose executions is listed.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

[statusFilter \(p. 33\)](#)

If specified, only list the executions whose current execution status matches the given filter.

Type: String

Valid Values: RUNNING | SUCCEEDED | FAILED | TIMED_OUT | ABORTED

Required: No

Response Syntax

```
{
  "executions": [
    {
      "executionArn": "string",
      "name": "string",
      "startDate": number,
      "stateMachineArn": "string",
      "status": "string",
      "stopDate": number
    }
  ],
  "nextToken": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[executions \(p. 34\)](#)

The list of matching executions.

Type: Array of [ExecutionListItem \(p. 63\)](#) objects

[nextToken \(p. 34\)](#)

If a `nextToken` is returned by a previous call, there are more results available. To retrieve the next page of results, make the call again using the returned token in `nextToken`. Keep all other arguments unchanged.

The configured `maxResults` determines how many results can be returned in a single call.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Errors

For information about the errors that are common to all actions, see [Common Errors \(p. 83\)](#).

InvalidArn

The provided Amazon Resource Name (ARN) is invalid.

HTTP Status Code: 400

InvalidToken

The provided token is invalid.

HTTP Status Code: 400

StateMachineDoesNotExist

The specified state machine does not exist.

HTTP Status Code: 400

See Also

ListStateMachines

Lists the existing state machines.

If a `nextToken` is returned by a previous call, there are more results available. To retrieve the next page of results, make the call again using the returned token in `nextToken`. Keep all other arguments unchanged.

Request Syntax

```
{  
  "maxResults": number,  
  "nextToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

maxResults (p. 36)

The maximum number of results that are returned per call. You can use `nextToken` to obtain further pages of results. The default is 100 and the maximum allowed page size is 1000. A value of 0 uses the default.

This is only an upper limit. The actual number of results returned per call might be fewer than the specified maximum.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 1000.

Required: No

nextToken (p. 36)

If a `nextToken` is returned by a previous call, there are more results available. To retrieve the next page of results, make the call again using the returned token in `nextToken`. Keep all other arguments unchanged.

The configured `maxResults` determines how many results can be returned in a single call.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Required: No

Response Syntax

```
{  
  "nextToken": "string",  
  "stateMachines": [  
    ...  
  ]  
}
```

```
{
  {
    "creationDate": number,
    "name": "string",
    "stateMachineArn": "string"
  }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

nextToken (p. 36)

If a `nextToken` is returned by a previous call, there are more results available. To retrieve the next page of results, make the call again using the returned token in `nextToken`. Keep all other arguments unchanged.

The configured `maxResults` determines how many results can be returned in a single call.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

stateMachines (p. 36)

Type: Array of [StateMachineListItem](#) (p. 79) objects

Errors

For information about the errors that are common to all actions, see [Common Errors](#) (p. 83).

InvalidToken

The provided token is invalid.

HTTP Status Code: 400

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS Command Line Interface](#)
- [AWS SDK for .NET](#)

SendTaskFailure

Used by workers to report that the task identified by the `taskToken` failed.

Request Syntax

```
{  
  "cause": "string",  
  "error": "string",  
  "taskToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

cause (p. 38)

A more detailed explanation of the cause of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 32768.

Required: No

error (p. 38)

An arbitrary error code that identifies the cause of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Required: No

taskToken (p. 38)

The token that represents this task. Task tokens are generated by the service when the tasks are assigned to a worker (see `GetActivityTask::taskToken`).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors \(p. 83\)](#).

InvalidToken

The provided token is invalid.

HTTP Status Code: 400

TaskDoesNotExist

HTTP Status Code: 400

TaskTimedOut

HTTP Status Code: 400

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for Java](#)
- [AWS SDK for JavaScript](#)
- [AWS SDK for PHP V3](#)
- [AWS SDK for Python](#)
- [AWS SDK for Ruby V2](#)

SendTaskHeartbeat

Used by workers to report to the service that the task represented by the specified `taskToken` is still making progress. This action resets the `Heartbeat` clock. The `Heartbeat` threshold is specified in the state machine's Amazon States Language definition. This action does not in itself create an event in the execution history. However, if the task times out, the execution history contains an `ActivityTimedOut` event.

Note

The `Timeout` of a task, defined in the state machine's Amazon States Language definition, is its maximum allowed duration, regardless of the number of [SendTaskHeartbeat \(p. 40\)](#) requests received.

Note

This operation is only useful for long-lived tasks to report the liveliness of the task.

Request Syntax

```
{  
  "taskToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

`taskToken` (p. 40)

The token that represents this task. Task tokens are generated by the service when the tasks are assigned to a worker (see [GetActivityTask:taskToken \(p. 24\)](#)).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors \(p. 83\)](#).

`InvalidToken`

The provided token is invalid.

HTTP Status Code: 400

`TaskDoesNotExist`

HTTP Status Code: 400

TaskTimedOut

HTTP Status Code: 400

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for Java](#)
- [AWS SDK for JavaScript](#)
- [AWS SDK for PHP V3](#)
- [AWS SDK for Python](#)
- [AWS SDK for Ruby V2](#)

SendTaskSuccess

Used by workers to report that the task identified by the `taskToken` completed successfully.

Request Syntax

```
{  
  "output": "string",  
  "taskToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

output (p. 42)

The JSON output of the task.

Type: String

Length Constraints: Maximum length of 32768.

Required: Yes

taskToken (p. 42)

The token that represents this task. Task tokens are generated by the service when the tasks are assigned to a worker (see [GetActivityTask:taskToken \(p. 24\)](#)).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors \(p. 83\)](#).

InvalidOutput

The provided JSON output data is invalid.

HTTP Status Code: 400

InvalidToken

The provided token is invalid.

HTTP Status Code: 400

TaskDoesNotExist

HTTP Status Code: 400

TaskTimedOut

HTTP Status Code: 400

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS Command Line Interface](#)
- [AWS SDK for .NET](#)
- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for JavaScript](#)
- [AWS SDK for PHP V3](#)
- [AWS SDK for Python](#)
- [AWS SDK for Ruby V2](#)

StartExecution

Starts a state machine execution.

Request Syntax

```
{  
  "input": "string",  
  "name": "string",  
  "stateMachineArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

input (p. 44)

The string that contains the JSON input data for the execution, for example:

```
"input": "{\"first_name\" : \"test\"}"
```

Note

If you don't include any JSON input data, you still must include the two braces, for example:
"input": "{}"

Type: String

Length Constraints: Maximum length of 32768.

Required: No

name (p. 44)

The name of the execution. This name must be unique for your AWS account and region for 90 days. For more information, see [Limits Related to State Machine Executions](#) in the *AWS Step Functions Developer Guide*.

Important

When you make multiple `StartExecution` calls with the same name, the new execution does not run, and the following rules apply:

- When the original execution is open and the execution input from the new call is *different*, the `ExecutionAlreadyExists` message is returned.
- When the original execution is open and the execution input from the new call is *identical*, the `Success` message is returned.
- When the original execution has been closed within 90 days, the `ExecutionAlreadyExists` message is returned regardless of input.

A name must *not* contain:

- whitespace
- brackets < > { } []
- wildcard characters ? *
- special characters " # % \ ^ | ~ ` \$ & , ; : /

- control characters (U+0000–001F, U+007F–009F)

Type: String

Length Constraints: Minimum length of 1. Maximum length of 80.

Required: No

[stateMachineArn \(p. 44\)](#)

The Amazon Resource Name (ARN) of the state machine to execute.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

Response Syntax

```
{  
  "executionArn": "string",  
  "startDate": number  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[executionArn \(p. 45\)](#)

The Amazon Resource Name (ARN) that identifies the execution.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

[startDate \(p. 45\)](#)

The date the execution is started.

Type: Timestamp

Errors

For information about the errors that are common to all actions, see [Common Errors \(p. 83\)](#).

ExecutionAlreadyExists

The execution has the same name as another execution (but a different `input`).

Note

Executions with the same name and `input` are considered idempotent.

HTTP Status Code: 400

ExecutionLimitExceeded

The maximum number of running executions has been reached. Running executions must end or be stopped before a new execution can be started.

HTTP Status Code: 400

InvalidArn

The provided Amazon Resource Name (ARN) is invalid.

HTTP Status Code: 400

InvalidExecutionInput

The provided JSON input data is invalid.

HTTP Status Code: 400

InvalidName

The provided name is invalid.

HTTP Status Code: 400

StateMachineDeleting

The specified state machine is being deleted.

HTTP Status Code: 400

StateMachineDoesNotExist

The specified state machine does not exist.

HTTP Status Code: 400

StopExecution

Stops an execution.

Request Syntax

```
{  
  "cause": "string",  
  "error": "string",  
  "executionArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

cause (p. 47)

A more detailed explanation of the cause of the termination.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 32768.

Required: No

error (p. 47)

An arbitrary error code that identifies the cause of the termination.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Required: No

executionArn (p. 47)

The Amazon Resource Name (ARN) of the execution to stop.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

Response Syntax

```
{  
  "stopDate": number  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

stopDate (p. 47)

The date the execution is stopped.

Type: Timestamp

Errors

For information about the errors that are common to all actions, see [Common Errors](#) (p. 83).

ExecutionDoesNotExist

The specified execution does not exist.

HTTP Status Code: 400

InvalidArn

The provided Amazon Resource Name (ARN) is invalid.

HTTP Status Code: 400

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS Command Line Interface](#)
- [AWS SDK for .NET](#)
- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for JavaScript](#)
- [AWS SDK for PHP V3](#)
- [AWS SDK for Python](#)
- [AWS SDK for Ruby V2](#)

UpdateStateMachine

Updates an existing state machine by modifying its `definition` and/or `roleArn`. Running executions will continue to use the previous `definition` and `roleArn`. You must include at least one of `definition` or `roleArn` or you will receive a `MissingRequiredParameter` error.

Note

All `StartExecution` calls within a few seconds will use the updated `definition` and `roleArn`. Executions started immediately after calling `UpdateStateMachine` may use the previous state machine `definition` and `roleArn`.

Request Syntax

```
{  
  "definition": "string",  
  "roleArn": "string",  
  "stateMachineArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters \(p. 81\)](#).

The request accepts the following data in JSON format.

[definition \(p. 49\)](#)

The Amazon States Language definition of the state machine. See [Amazon States Language](#).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1048576.

Required: No

[roleArn \(p. 49\)](#)

The Amazon Resource Name (ARN) of the IAM role of the state machine.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: No

[stateMachineArn \(p. 49\)](#)

The Amazon Resource Name (ARN) of the state machine.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

Response Syntax

```
{
```

```
"updateDate": number
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

updateDate (p. 49)

The date and time the state machine was updated.

Type: Timestamp

Errors

For information about the errors that are common to all actions, see [Common Errors](#) (p. 83).

InvalidArn

The provided Amazon Resource Name (ARN) is invalid.

HTTP Status Code: 400

InvalidDefinition

The provided Amazon States Language definition is invalid.

HTTP Status Code: 400

MissingRequiredParameter

Request is missing a required parameter. This error occurs if both `definition` and `roleArn` are not specified.

HTTP Status Code: 400

StateMachineDeleting

The specified state machine is being deleted.

HTTP Status Code: 400

StateMachineDoesNotExist

The specified state machine does not exist.

HTTP Status Code: 400

Data Types

The AWS Step Functions API contains several data types that various actions use. This section describes each data type in detail.

Note

The order of each element in a data type structure is not guaranteed. Applications should not assume a particular order.

The following data types are supported:

- [ActivityFailedEventDetails](#) (p. 53)
- [ActivityListItem](#) (p. 54)
- [ActivityScheduledEventDetails](#) (p. 56)
- [ActivityScheduleFailedEventDetails](#) (p. 57)
- [ActivityStartedEventDetails](#) (p. 58)
- [ActivitySucceededEventDetails](#) (p. 59)
- [ActivityTimedOutEventDetails](#) (p. 60)
- [ExecutionAbortedEventDetails](#) (p. 61)
- [ExecutionFailedEventDetails](#) (p. 62)
- [ExecutionListItem](#) (p. 63)
- [ExecutionStartedEventDetails](#) (p. 65)
- [ExecutionSucceededEventDetails](#) (p. 66)
- [ExecutionTimedOutEventDetails](#) (p. 67)
- [HistoryEvent](#) (p. 68)
- [LambdaFunctionFailedEventDetails](#) (p. 71)
- [LambdaFunctionScheduledEventDetails](#) (p. 72)
- [LambdaFunctionScheduleFailedEventDetails](#) (p. 73)
- [LambdaFunctionStartFailedEventDetails](#) (p. 74)
- [LambdaFunctionSucceededEventDetails](#) (p. 75)
- [LambdaFunctionTimedOutEventDetails](#) (p. 76)
- [StateEnteredEventDetails](#) (p. 77)
- [StateExitedEventDetails](#) (p. 78)
- [StateMachineListItem](#) (p. 79)

ActivityFailedEventDetails

Contains details about an activity which failed during an execution.

Contents

cause

A more detailed explanation of the cause of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 32768.

Required: No

error

The error code of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

ActivityListItem

Contains details about an activity.

Contents

activityArn

The Amazon Resource Name (ARN) that identifies the activity.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

creationDate

The date the activity is created.

Type: Timestamp

Required: Yes

name

The name of the activity.

Important

When you make multiple `StartExecution` calls with the same name, the new execution does not run, and the following rules apply:

- When the original execution is open and the execution input from the new call is *different*, the `ExecutionAlreadyExists` message is returned.
- When the original execution is open and the execution input from the new call is *identical*, the `Success` message is returned.
- When the original execution has been closed within 90 days, the `ExecutionAlreadyExists` message is returned regardless of input.

A name must *not* contain:

- whitespace
- brackets `< > { } []`
- wildcard characters `? *`
- special characters `" # % \ ^ | ~ ` $ & , ; : /`
- control characters (U+0000-001F, U+007F-009F)

Type: String

Length Constraints: Minimum length of 1. Maximum length of 80.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)

- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

ActivityScheduledEventDetails

Contains details about an activity scheduled during an execution.

Contents

heartbeatInSeconds

The maximum allowed duration between two heartbeats for the activity task.

Type: Long

Required: No

input

The JSON data input to the activity task.

Type: String

Length Constraints: Maximum length of 32768.

Required: No

resource

The Amazon Resource Name (ARN) of the scheduled activity.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

timeoutInSeconds

The maximum allowed duration of the activity task.

Type: Long

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

ActivityScheduleFailedEventDetails

Contains details about an activity schedule failure which occurred during an execution.

Contents

cause

A more detailed explanation of the cause of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 32768.

Required: No

error

The error code of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

ActivityStartedEventDetails

Contains details about the start of an activity during an execution.

Contents

workerName

The name of the worker that the task is assigned to. These names are provided by the workers when calling [GetActivityTask](#) (p. 23).

Type: String

Length Constraints: Maximum length of 256.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

ActivitySucceededEventDetails

Contains details about an activity which successfully terminated during an execution.

Contents

output

The JSON data output by the activity task.

Type: String

Length Constraints: Maximum length of 32768.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

ActivityTimedOutEventDetails

Contains details about an activity timeout which occurred during an execution.

Contents

cause

A more detailed explanation of the cause of the timeout.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 32768.

Required: No

error

The error code of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

ExecutionAbortedEventDetails

Contains details about an abort of an execution.

Contents

cause

A more detailed explanation of the cause of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 32768.

Required: No

error

The error code of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

ExecutionFailedEventDetails

Contains details about an execution failure event.

Contents

cause

A more detailed explanation of the cause of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 32768.

Required: No

error

The error code of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

ExecutionListItem

Contains details about an execution.

Contents

executionArn

The Amazon Resource Name (ARN) that identifies the execution.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

name

The name of the execution.

Important

When you make multiple `StartExecution` calls with the same name, the new execution does not run, and the following rules apply:

- When the original execution is open and the execution input from the new call is *different*, the `ExecutionAlreadyExists` message is returned.
- When the original execution is open and the execution input from the new call is *identical*, the `Success` message is returned.
- When the original execution has been closed within 90 days, the `ExecutionAlreadyExists` message is returned regardless of input.

A name must *not* contain:

- whitespace
- brackets `< > { } []`
- wildcard characters `? *`
- special characters `" # % \ ^ | ~ ` $ & , ; : /`
- control characters (U+0000-001F, U+007F-009F)

Type: String

Length Constraints: Minimum length of 1. Maximum length of 80.

Required: Yes

startDate

The date the execution started.

Type: Timestamp

Required: Yes

stateMachineArn

The Amazon Resource Name (ARN) of the executed state machine.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

status

The current status of the execution.

Type: String

Valid Values: `RUNNING` | `SUCCEEDED` | `FAILED` | `TIMED_OUT` | `ABORTED`

Required: Yes

stopDate

If the execution already ended, the date the execution stopped.

Type: Timestamp

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

ExecutionStartedEventDetails

Contains details about the start of the execution.

Contents

input

The JSON data input to the execution.

Type: String

Length Constraints: Maximum length of 32768.

Required: No

roleArn

The Amazon Resource Name (ARN) of the IAM role used for executing AWS Lambda tasks.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

ExecutionSucceededEventDetails

Contains details about the successful termination of the execution.

Contents

output

The JSON data output by the execution.

Type: String

Length Constraints: Maximum length of 32768.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

ExecutionTimedOutEventDetails

Contains details about the execution timeout which occurred during the execution.

Contents

cause

A more detailed explanation of the cause of the timeout.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 32768.

Required: No

error

The error code of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

HistoryEvent

Contains details about the events of an execution.

Contents

activityFailedEventDetails

Type: [ActivityFailedEventDetails \(p. 53\)](#) object

Required: No

activityScheduledEventDetails

Type: [ActivityScheduledEventDetails \(p. 56\)](#) object

Required: No

activityScheduleFailedEventDetails

Contains details about an activity schedule event which failed during an execution.

Type: [ActivityScheduleFailedEventDetails \(p. 57\)](#) object

Required: No

activityStartedEventDetails

Type: [ActivityStartedEventDetails \(p. 58\)](#) object

Required: No

activitySucceededEventDetails

Type: [ActivitySucceededEventDetails \(p. 59\)](#) object

Required: No

activityTimedOutEventDetails

Type: [ActivityTimedOutEventDetails \(p. 60\)](#) object

Required: No

executionAbortedEventDetails

Type: [ExecutionAbortedEventDetails \(p. 61\)](#) object

Required: No

executionFailedEventDetails

Type: [ExecutionFailedEventDetails \(p. 62\)](#) object

Required: No

executionStartedEventDetails

Type: [ExecutionStartedEventDetails \(p. 65\)](#) object

Required: No

executionSucceededEventDetails

Type: [ExecutionSucceededEventDetails \(p. 66\)](#) object

Required: No

executionTimedOutEventDetails

Type: [ExecutionTimedOutEventDetails \(p. 67\)](#) object

Required: No

id

The id of the event. Events are numbered sequentially, starting at one.

Type: Long

Required: Yes

lambdaFunctionFailedEventDetails

Type: [LambdaFunctionFailedEventDetails \(p. 71\)](#) object

Required: No

lambdaFunctionScheduledEventDetails

Type: [LambdaFunctionScheduledEventDetails \(p. 72\)](#) object

Required: No

lambdaFunctionScheduleFailedEventDetails

Type: [LambdaFunctionScheduleFailedEventDetails \(p. 73\)](#) object

Required: No

lambdaFunctionStartFailedEventDetails

Contains details about a lambda function which failed to start during an execution.

Type: [LambdaFunctionStartFailedEventDetails \(p. 74\)](#) object

Required: No

lambdaFunctionSucceededEventDetails

Contains details about a lambda function which terminated successfully during an execution.

Type: [LambdaFunctionSucceededEventDetails \(p. 75\)](#) object

Required: No

lambdaFunctionTimedOutEventDetails

Type: [LambdaFunctionTimedOutEventDetails \(p. 76\)](#) object

Required: No

previousEventId

The id of the previous event.

Type: Long

Required: No

stateEnteredEventDetails

Type: [StateEnteredEventDetails \(p. 77\)](#) object

Required: No

stateExitedEventDetails

Type: [StateExitedEventDetails \(p. 78\)](#) object

Required: No

timestamp

The date the event occurred.

Type: Timestamp

Required: Yes

type

The type of the event.

Type: String

Valid Values: ActivityFailed | ActivityScheduleFailed | ActivityScheduled
| ActivityStarted | ActivitySucceeded | ActivityTimedOut |
ChoiceStateEntered | ChoiceStateExited | ExecutionFailed | ExecutionStarted
| ExecutionSucceeded | ExecutionAborted | ExecutionTimedOut |
FailStateEntered | LambdaFunctionFailed | LambdaFunctionScheduleFailed |
LambdaFunctionScheduled | LambdaFunctionStartFailed | LambdaFunctionStarted
| LambdaFunctionSucceeded | LambdaFunctionTimedOut | SucceedStateEntered |
SucceedStateExited | TaskStateAborted | TaskStateEntered | TaskStateExited
| PassStateEntered | PassStateExited | ParallelStateAborted |
ParallelStateEntered | ParallelStateExited | ParallelStateFailed |
ParallelStateStarted | ParallelStateSucceeded | WaitStateAborted |
WaitStateEntered | WaitStateExited

Required: Yes

See Also

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

LambdaFunctionFailedEventDetails

Contains details about a lambda function which failed during an execution.

Contents

cause

A more detailed explanation of the cause of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 32768.

Required: No

error

The error code of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

LambdaFunctionScheduledEventDetails

Contains details about a lambda function scheduled during an execution.

Contents

input

The JSON data input to the lambda function.

Type: String

Length Constraints: Maximum length of 32768.

Required: No

resource

The Amazon Resource Name (ARN) of the scheduled lambda function.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

timeoutInSeconds

The maximum allowed duration of the lambda function.

Type: Long

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

LambdaFunctionScheduleFailedEventDetails

Contains details about a failed lambda function schedule event which occurred during an execution.

Contents

cause

A more detailed explanation of the cause of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 32768.

Required: No

error

The error code of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

LambdaFunctionStartFailedEventDetails

Contains details about a lambda function which failed to start during an execution.

Contents

cause

A more detailed explanation of the cause of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 32768.

Required: No

error

The error code of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

LambdaFunctionSucceededEventDetails

Contains details about a lambda function which successfully terminated during an execution.

Contents

output

The JSON data output by the lambda function.

Type: String

Length Constraints: Maximum length of 32768.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

LambdaFunctionTimedOutEventDetails

Contains details about a lambda function timeout which occurred during an execution.

Contents

cause

A more detailed explanation of the cause of the timeout.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 32768.

Required: No

error

The error code of the failure.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

StateEnteredEventDetails

Contains details about a state entered during an execution.

Contents

input

The string that contains the JSON input data for the state.

Type: String

Length Constraints: Maximum length of 32768.

Required: No

name

The name of the state.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 80.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

StateExitedEventDetails

Contains details about an exit from a state during an execution.

Contents

name

The name of the state.

Important

When you make multiple `StartExecution` calls with the same name, the new execution does not run, and the following rules apply:

- When the original execution is open and the execution input from the new call is *different*, the `ExecutionAlreadyExists` message is returned.
- When the original execution is open and the execution input from the new call is *identical*, the `Success` message is returned.
- When the original execution has been closed within 90 days, the `ExecutionAlreadyExists` message is returned regardless of input.

A name must *not* contain:

- whitespace
- brackets `< > { } []`
- wildcard characters `? *`
- special characters `" # % \ ^ | ~ ` $ & , ; : /`
- control characters (U+0000-001F, U+007F-009F)

Type: String

Length Constraints: Minimum length of 1. Maximum length of 80.

Required: Yes

output

The JSON output data of the state.

Type: String

Length Constraints: Maximum length of 32768.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

StateMachineListItem

Contains details about the state machine.

Contents

creationDate

The date the state machine is created.

Type: Timestamp

Required: Yes

name

The name of the state machine.

Important

When you make multiple `StartExecution` calls with the same name, the new execution does not run, and the following rules apply:

- When the original execution is open and the execution input from the new call is *different*, the `ExecutionAlreadyExists` message is returned.
- When the original execution is open and the execution input from the new call is *identical*, the `Success` message is returned.
- When the original execution has been closed within 90 days, the `ExecutionAlreadyExists` message is returned regardless of input.

A name must *not* contain:

- whitespace
- brackets `< > { } []`
- wildcard characters `? *`
- special characters `" # % \ ^ | ~ ` $ & , ; : /`
- control characters (U+0000-001F, U+007F-009F)

Type: String

Length Constraints: Minimum length of 1. Maximum length of 80.

Required: Yes

stateMachineArn

The Amazon Resource Name (ARN) that identifies the state machine.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)

- [AWS SDK for Go](#)
- [AWS SDK for Java](#)
- [AWS SDK for Ruby V2](#)

Common Parameters

The following list contains the parameters that all actions use for signing Signature Version 4 requests with a query string. Any action-specific parameters are listed in the topic for that action. For more information about Signature Version 4, see [Signature Version 4 Signing Process](#) in the *Amazon Web Services General Reference*.

Action

The action to be performed.

Type: string

Required: Yes

Version

The API version that the request is written for, expressed in the format YYYY-MM-DD.

Type: string

Required: Yes

X-Amz-Algorithm

The hash algorithm that you used to create the request signature.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Valid Values: `AWS4-HMAC-SHA256`

Required: Conditional

X-Amz-Credential

The credential scope value, which is a string that includes your access key, the date, the region you are targeting, the service you are requesting, and a termination string ("aws4_request"). The value is expressed in the following format: `access_key/YYYYMMDD/region/service/aws4_request`.

For more information, see [Task 2: Create a String to Sign for Signature Version 4](#) in the *Amazon Web Services General Reference*.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

X-Amz-Date

The date that is used to create the signature. The format must be ISO 8601 basic format (YYYYMMDD'THHMMSS'Z'). For example, the following date time is a valid X-Amz-Date value: `20120325T120000Z`.

Condition: X-Amz-Date is optional for all requests; it can be used to override the date used for signing requests. If the Date header is specified in the ISO 8601 basic format, X-Amz-Date is

not required. When X-Amz-Date is used, it always overrides the value of the Date header. For more information, see [Handling Dates in Signature Version 4](#) in the *Amazon Web Services General Reference*.

Type: string

Required: Conditional

X-Amz-Security-Token

The temporary security token that was obtained through a call to AWS Security Token Service (AWS STS). For a list of services that support temporary security credentials from AWS Security Token Service, go to [AWS Services That Work with IAM](#) in the *IAM User Guide*.

Condition: If you're using temporary security credentials from the AWS Security Token Service, you must include the security token.

Type: string

Required: Conditional

X-Amz-Signature

Specifies the hex-encoded signature that was calculated from the string to sign and the derived signing key.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

X-Amz-SignedHeaders

Specifies all the HTTP headers that were included as part of the canonical request. For more information about specifying signed headers, see [Task 1: Create a Canonical Request For Signature Version 4](#) in the *Amazon Web Services General Reference*.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

Common Errors

This section lists the errors common to the API actions of all AWS services. For errors specific to an API action for this service, see the topic for that API action.

AccessDeniedException

You do not have sufficient access to perform this action.

HTTP Status Code: 400

IncompleteSignature

The request signature does not conform to AWS standards.

HTTP Status Code: 400

InternalFailure

The request processing has failed because of an unknown error, exception or failure.

HTTP Status Code: 500

InvalidAction

The action or operation requested is invalid. Verify that the action is typed correctly.

HTTP Status Code: 400

InvalidClientTokenId

The X.509 certificate or AWS access key ID provided does not exist in our records.

HTTP Status Code: 403

InvalidParameterCombination

Parameters that must not be used together were used together.

HTTP Status Code: 400

InvalidParameterValue

An invalid or out-of-range value was supplied for the input parameter.

HTTP Status Code: 400

InvalidQueryParameter

The AWS query string is malformed or does not adhere to AWS standards.

HTTP Status Code: 400

MalformedQueryString

The query string contains a syntax error.

HTTP Status Code: 404

MissingAction

The request is missing an action or a required parameter.

HTTP Status Code: 400

MissingAuthenticationToken

The request must contain either a valid (registered) AWS access key ID or X.509 certificate.

HTTP Status Code: 403

MissingParameter

A required parameter for the specified action is not supplied.

HTTP Status Code: 400

OptInRequired

The AWS access key ID needs a subscription for the service.

HTTP Status Code: 403

RequestExpired

The request reached the service more than 15 minutes after the date stamp on the request or more than 15 minutes after the request expiration date (such as for pre-signed URLs), or the date stamp on the request is more than 15 minutes in the future.

HTTP Status Code: 400

ServiceUnavailable

The request has failed due to a temporary failure of the server.

HTTP Status Code: 503

ThrottlingException

The request was denied due to request throttling.

HTTP Status Code: 400

ValidationError

The input fails to satisfy the constraints specified by an AWS service.

HTTP Status Code: 400
