Welcome

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

Welcome to the AWS Site-to-Site VPN Network Administrator Guide. This guide is for customers who plan to use an AWS Site-to-Site VPN connection with their virtual private cloud (VPC). The topics in this guide help you configure your customer gateway device, which is the device on your side of the VPN connection.

Although the term VPN connection is a general term, in this documentation, a VPN connection refers to the connection between your VPC and your own on-premises network. Site-to-Site VPN supports Internet Protocol security (IPsec) VPN connections. For a list of customer gateway devices that we have tested with, see the section called “Customer Gateway Devices We've Tested” (p. 7).

The VPN connection lets you bridge your VPC and IT infrastructure. You extend your existing security and management policies to EC2 instances in your VPC as if they were running within your own infrastructure.

For more information, see the following topics:

- Your Customer Gateway Device (p. 2)
- Example: Check Point Device with Border Gateway Protocol (p. 13)
- Example: Check Point Device without Border Gateway Protocol (p. 24)
- Example: Cisco ASA Device (p. 36)
- Example: Cisco IOS Device (p. 60)
- Example: Cisco IOS Device without Border Gateway Protocol (p. 71)
- Example: Cisco ASA Device with a Virtual Tunnel Interface and Border Gateway Protocol (p. 43)
- Example: Cisco ASA Device with a Virtual Tunnel Interface (without Border Gateway Protocol) (p. 52)
- Example: SonicWALL SonicOS Device Without Border Gateway Protocol (p. 87)
- Example: SonicWALL Device (p. 80)
- Example: Juniper J-Series JunOS Device (p. 106)
- Example: Juniper SRX JunOS Device (p. 116)
- Example: Juniper ScreenOS Device (p. 126)
- Example: Netgate PfSense Device without Border Gateway Protocol (p. 136)
- Example: Palo Alto Networks Device (p. 142)
- Example: Yamaha Device (p. 152)
- Example: Generic Customer Gateway Device Using Border Gateway Protocol (p. 161)
- Example: Generic Customer Gateway Device without Border Gateway Protocol (p. 169)
- Configuring Windows Server 2008 R2 as a Customer Gateway Device (p. 204)
- Configuring Windows Server 2012 R2 as a Customer Gateway Device (p. 218)
What Is a Customer Gateway Device?

An Amazon VPC VPN connection links your data center (or network) to your Amazon Virtual Private Cloud (VPC). A customer gateway device is the anchor on your side of that connection. It can be a physical or software appliance. The anchor on the AWS side of the VPN connection is called a virtual private gateway.

The following diagram shows your network, the customer gateway, the VPN connection that goes to the virtual private gateway, and the VPC. There are two lines between the customer gateway device and virtual private gateway because the VPN connection consists of two tunnels to provide increased availability for the Amazon VPC service. If there's a device failure within AWS, your VPN connection automatically fails over to the second tunnel so that your access isn't interrupted. From time to time, AWS also performs routine maintenance on the virtual private gateway, which may briefly disable one of the two tunnels of your VPN connection. Your VPN connection automatically fails over to the second tunnel while this maintenance is performed. When you configure your customer gateway, it's therefore important that you configure both tunnels.
What Is a Customer Gateway Device?

You can create additional VPN connections to other VPCs using the same customer gateway device. You can reuse the same customer gateway IP address for each of those VPN connections.

When you create a VPN connection, the VPN tunnel comes up when traffic is generated from your side of the VPN connection. The virtual private gateway is not the initiator; your customer gateway device must initiate the tunnels. AWS VPN endpoints support rekey and can start renegotiations when phase 1 is about to expire if the customer gateway device hasn't sent any renegotiation traffic.

For more information about the components of a VPN connection, see VPN Connections in the AWS Site-to-Site VPN User Guide.

To protect against a loss of connectivity if your customer gateway device becomes unavailable, you can set up a second VPN connection. For more information about redundant connections, see Using Redundant VPN Connections to Provide Failover in the AWS Site-to-Site VPN User Guide.
Your Role

Throughout this guide, we refer to your company’s *integration team*, which is the person (or persons) at your company working to integrate your infrastructure with Amazon VPC. This team (which may or may not consist of you) must use the AWS Management Console to create a VPN connection and get the information that you need for configuring your customer gateway. Your company might have a separate team for each task (an integration team that uses the AWS Management Console). They might have a separate network engineering group that has access to network devices and configures the customer gateway. This guide assumes that you’re someone in the network engineering group who receives information from your company’s integration team so you can then configure the customer gateway device.

Overview of Setting Up a VPN Connection

The process of setting up the VPN connection in AWS is covered in the *AWS Site-to-Site VPN User Guide*. One task in the overall process is to configure the customer gateway. To create the VPN connection, AWS needs information about the customer gateway, and you must configure the customer gateway device itself.

To set up a VPN connection, follow these general steps:

1. Designate an appliance to act as your customer gateway device. For more information, see Customer Gateway Devices We’ve Tested (p. 7) and Requirements for Your Customer Gateway Device (p. 8).
2. Get the necessary Network Information (p. 4), and provide this information to the team to create the VPN connection in AWS.
3. Create the VPN connection in AWS and get the configuration file for your customer gateway. For more information about how to configure an AWS VPN connection, see Setting Up an AWS VPN Connection in the *AWS Site-to-Site VPN User Guide*.
4. Configure your customer gateway device using the information from the configuration file. Examples are provided in this guide.
5. Generate traffic from your side of the VPN connection to bring up the VPN tunnel.

Network Information

To create a VPN connection in AWS, you need the following information.

<table>
<thead>
<tr>
<th>Item</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Customer gateway vendor (for example, Cisco), platform (for example, ISR Series Routers), and software version (for example, IOS 12.4)</td>
<td>This information is used to generate a configuration file for the customer gateway device.</td>
</tr>
<tr>
<td>The internet-routable IP address for the customer gateway device’s external interface.</td>
<td>The value must be static. If your customer gateway device resides behind a device performing network address translation (NAT), use the public IP address of the NAT device. For source NAT, do not use the public IP address of the customer gateway as the source IP address for packets that are sent through a VPN tunnel.</td>
</tr>
<tr>
<td>Item</td>
<td>Comments</td>
</tr>
<tr>
<td>----------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>(Optional) Border Gateway Protocol (BGP) Autonomous System Number (ASN) of the customer gateway.</td>
<td>Instead, use a different IP address that is not in use. You can use an existing ASN assigned to your network. If you don't have one, you can use a private ASN in the 64512–65534 range. Otherwise, we assume that the BGP ASN for the customer gateway is 65000.</td>
</tr>
<tr>
<td>(Optional) The ASN for the Amazon side of the BGP session.</td>
<td>Specified when creating a virtual private gateway. If you do not specify a value, the default ASN applies. For more information, see Virtual Private Gateway.</td>
</tr>
<tr>
<td>(Optional) Tunnel information for each VPN tunnel</td>
<td>You can configure some of the tunnel options for the VPN connection. For more information, see Site-to-Site VPN Tunnel Options for Your Site-to-Site VPN Connection in the AWS Site-to-Site VPN User Guide.</td>
</tr>
<tr>
<td>(Optional) Private certificate from AWS Certificate Manager Private Certificate Authority to authenticate your VPN</td>
<td>You must create a private certificate using AWS Certificate Manager Private Certificate Authority. For information about creating a private certificate, see Creating and Managing a Private CA in the AWS Certificate Manager Private Certificate Authority User Guide.</td>
</tr>
</tbody>
</table>

The configuration file for your customer gateway device includes the values that you specify for the above items. It also contains any additional values required for setting up the VPN tunnels, including the outside IP address for the virtual private gateway. This value is static unless you recreate the VPN connection in AWS.

Routing Information

AWS recommends advertising more specific BGP routes to influence routing decisions in the virtual private gateway. Check your vendor documentation for the commands that are specific to your device.

For more information about route priority, see Route Tables and VPN Route Priority in the AWS Site-to-Site VPN User Guide.

AWS VPN CloudHub and Redundant Customer Gateways

You can establish multiple VPN connections to a single virtual private gateway from multiple customer gateway devices. This configuration can be used in different ways. You can have redundant customer gateway devices between your data center and your VPC, or you can have multiple locations connected to the AWS VPN CloudHub.

If you have redundant customer gateway devices, each device advertises the same prefix (for example, 0.0.0.0/0) to the virtual private gateway. We use BGP routing to determine the path for traffic. If one customer gateway device fails, the virtual private gateway directs all traffic to the working customer gateway device.
If you use the AWS VPN CloudHub configuration, multiple sites can access your VPC or securely access each other using a simple hub-and-spoke model. You configure each customer gateway device to advertise a site-specific prefix (such as 10.0.0.0/24, 10.0.1.0/24) to the virtual private gateway. The virtual private gateway routes traffic to the appropriate site and advertises the reachability of one site to all other sites.

To configure the AWS VPN CloudHub, use the Amazon VPC console to create multiple customer gateways, each with the public IP address of the gateway. You must use a unique Border Gateway Protocol (BGP) Autonomous System Number (ASN) for each. Then create a VPN connection from each customer gateway to a common virtual private gateway. Use the instructions that follow to configure each customer gateway device to connect to the virtual private gateway.

To enable instances in your VPC to reach the virtual private gateway (and then your customer gateway devices), you must configure routes in your VPC routing tables. For complete instructions, see VPN Connections in the AWS Site-to-Site VPN User Guide. For AWS VPN CloudHub, you can configure an aggregate route in your VPC routing table (for example, 10.0.0.0/16). Use more specific prefixes between customer gateways devices and the virtual private gateway.

Configuring Multiple VPN Connections to Your VPC

You can create up to ten VPN connections for your VPC. You can use multiple VPN connections to link your remote offices to the same VPC. For example, if you have offices in Los Angeles, Chicago, New York, and Miami, you can link each of these offices to your VPC. You can also use multiple VPN connections to establish redundant customer gateway devices from a single location.

Note
If you need more than ten VPN connections, submit a request to increase your quota.

When you create multiple VPN connections, the virtual private gateway sends network traffic to the appropriate VPN connection using statically assigned routes or BGP route advertisements. Which one depends on how the VPN connection was configured. Statically assigned routes are preferred over BGP advertised routes in cases where identical routes exist in the virtual private gateway. If you select the option to use BGP advertisement, then you cannot specify static routes.

When you have customer gateway devices at multiple geographic locations, each device should advertise a unique set of IP ranges specific to the location. When you establish redundant customer gateway devices at a single location, both devices should advertise the same IP ranges.

When a virtual private gateway receives routing information, it uses path selection to determine how to route traffic. For more information, see Route Tables and VPN Route Priority in the AWS Site-to-Site VPN User Guide.

The following diagram shows the configuration of multiple VPNs.
Your customer gateway device can be a physical or software appliance.

This guide presents information about how to configure the following devices that we have tested with:

- Check Point Security Gateway running R77.10 (or later) software
- Cisco ASA running Cisco ASA 8.2 (or later) software
- Cisco IOS running Cisco IOS 12.4 (or later) software
- SonicWALL running SonicOS 5.9 (or later) software
- Fortinet Fortigate 40+ Series running FortiOS 4.0 (or later) software
- Juniper J-Series running JunOS 9.5 (or later) software
- Juniper SRX running JunOS 11.0 (or later) software
- Juniper SSG running ScreenOS 6.1, or 6.2 (or later) software
- Juniper ISG running ScreenOS 6.1, or 6.2 (or later) software
- Netgate pfSense running OS 2.2.5 (or later) software.
- Palo Alto Networks PANOS 4.1.2 (or later) software
- Yamaha RT107e, RTX1200, RTX1210, RTX1500, RTX3000 and SRT100 routers
- Microsoft Windows Server 2008 R2 (or later) software
- Microsoft Windows Server 2012 R2 (or later) software
• Zyxel Zywall Series 4.20 (or later) software for statically routed VPN connections, or 4.30 (or later) software for dynamically routed VPN connections

If you have one of these devices, but configure it for IPsec in a different way than presented in this guide, feel free to alter our suggested configuration to match your particular needs.

Requirements for Your Customer Gateway Device

There are four main parts to the configuration of your customer gateway device. Throughout this guide, we use a symbol for each of these parts to help you understand what you need to do. The following table shows the four parts and the corresponding symbols.

<table>
<thead>
<tr>
<th>Requirement</th>
<th>RFC</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>IKE Security Association (required to exchange keys used to establish the IPsec security association)</td>
<td>RFC 2409</td>
<td>The IKE Security Association is established first between the virtual private gateway and customer gateway device using the pre-shared key or a private certificate using AWS Certificate Manager Private Certificate Authority as the authenticator. Upon establishment, IKE negotiates an ephemeral key to secure future IKE messages. Proper establishment of an IKE Security Association requires...</td>
</tr>
</tbody>
</table>
### Requirements for Your Customer Gateway Device

<table>
<thead>
<tr>
<th>Requirement</th>
<th>RFC</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Establish IPsec Security Associations in Tunnel mode</strong></td>
<td>RFC 4301</td>
<td>Using the IKE ephemeral key, keys are established between the virtual private gateway and customer gateway device to form an IPsec Security Association (SA). Traffic between gateways is encrypted and decrypted using this SA. The ephemeral keys used to encrypt traffic within the IPsec SA are automatically rotated by IKE on a regular basis to ensure confidentiality of communications.</td>
</tr>
<tr>
<td><strong>Use the AES 128-bit encryption or AES 256-bit encryption function</strong></td>
<td>RFC 3602</td>
<td>The encryption function is used to ensure privacy among both IKE and IPsec Security Associations.</td>
</tr>
<tr>
<td><strong>Use the SHA-1 or SHA-256 hashing function</strong></td>
<td>RFC 2404</td>
<td>This hashing function is used to authenticate both IKE and IPsec Security Associations.</td>
</tr>
<tr>
<td><strong>Use Diffie-Hellman Perfect Forward Secrecy. The following groups are supported:</strong></td>
<td>RFC 2409</td>
<td>IKE uses Diffie-Hellman to establish ephemeral keys to secure all communication between customer gateway devices and virtual private gateways.</td>
</tr>
<tr>
<td>• Phase 1 groups: 2, 14-18, 22, 23, and 24</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Phase 2 groups: 2, 5, 14-18, 22, 23, and 24</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Use IPsec Dead Peer Detection</strong></td>
<td>RFC 3706</td>
<td>The use of Dead Peer Detection enables the VPN devices to rapidly identify when a network condition prevents delivery of packets across the internet. When this occurs, the gateways delete the Security Associations and attempt to create new associations. During this process, the alternate IPsec tunnel is used if possible.</td>
</tr>
<tr>
<td><strong>Bind tunnel to logical interface (route-based VPN)</strong></td>
<td>None</td>
<td>Your gateway must support the ability to bind the IPsec tunnel to a logical interface. The logical interface contains an IP address used to establish BGP peering to the virtual private gateway. This logical interface should perform no additional encapsulation (for example, GRE, IP in IP). Your interface should be set to a 1399 byte Maximum Transmission Unit (MTU).</td>
</tr>
</tbody>
</table>

When you create a VPN connection in AWS, you can specify your own pre-shared key for each tunnel, or you can let AWS generate one for you. Alternatively, you can specify the private certificate using AWS Certificate Manager Private Certificate Authority to use for your customer gateway device. For more information, about configuring VPN tunnels see Configuring the VPN Tunnels for Your VPN Connection in the AWS Site-to-Site VPN User Guide.

The following versions are supported: IKEv1 and IKEv2. We support Main mode only with IKEv1.
### Requirements for Your Customer Gateway Device

<table>
<thead>
<tr>
<th>Requirement</th>
<th>RFC</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fragment IP packets before</td>
<td>RFC 4459</td>
<td>When packets are too large to be transmitted, they must be fragmented. We do not reassemble fragmented encrypted packets. Therefore, your VPN device must fragment packets before encapsulating with the VPN headers. The fragments are individually transmitted to the remote host, which reassembles them. For more information about fragmentation, see the IP fragmentation Wikipedia article.</td>
</tr>
<tr>
<td>encryption</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(Optional) Establish BGP peerings</td>
<td>RFC 4271</td>
<td>BGP is used to exchange routes between the customer gateway device and virtual private gateway for devices that use BGP. All BGP traffic is encrypted and transmitted via the IPsec Security Association. BGP is required for both gateways to exchange the IP prefixes reachable through the IPsec SA.</td>
</tr>
</tbody>
</table>

We recommend that you use the techniques listed in the following table. That helps you minimize problems related to the amount of data that can be transmitted through the IPsec tunnel. Because the connection encapsulates packets with additional network headers (including IPsec), the amount of data that can be transmitted in a single packet is reduced.

<table>
<thead>
<tr>
<th>Technique</th>
<th>RFC</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adjust the maximum segment size of TCP packets</td>
<td>RFC 4459</td>
<td>TCP packets are often the most prevalent type of packet across IPsec tunnels. Some gateways can change the TCP Maximum Segment Size parameter. This causes the TCP endpoints (clients, servers) to reduce the amount of data sent with each packet. This is an ideal approach, as the packets arriving at the VPN devices are small enough to be encapsulated and transmitted.</td>
</tr>
<tr>
<td>entering the VPN tunnel</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Reset the &quot;Don't Fragment&quot; flag on packets</td>
<td>RFC 791</td>
<td>Some packets carry a flag, known as the Don't Fragment (DF) flag, that indicates that the packet should not be fragmented. If the packets carry the flag, the gateways generate an ICMP Path MTU Exceeded message. In some cases, applications do not contain adequate mechanisms for processing these ICMP messages and reducing the amount of data transmitted in each packet. Some VPN devices can override the DF flag and fragment packets unconditionally as required. If your customer gateway device has this ability, we recommend that you use it as appropriate.</td>
</tr>
</tbody>
</table>

An AWS VPN connection does not support Path MTU Discovery (RFC 1191).

If you have a firewall between your customer gateway device and the internet, see Configuring a Firewall Between the Internet and Your Customer Gateway Device (p. 11).
Configuring a Firewall Between the Internet and Your Customer Gateway Device

To use this service, you must have an internet-routable IP address to use as the endpoint for the IPsec tunnels connecting your customer gateway device to the virtual private gateway. If a firewall is in place between the internet and your gateway, the rules in the following tables must be in place to establish the IPsec tunnels. The virtual private gateway addresses are in the configuration information that you get from the integration team.

**Inbound (from the Internet)**

<table>
<thead>
<tr>
<th>Input Rule I1</th>
<th>Source IP</th>
<th>Virtual Private Gateway 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dest IP</td>
<td>Customer Gateway</td>
<td></td>
</tr>
<tr>
<td>Protocol</td>
<td>UDP</td>
<td></td>
</tr>
<tr>
<td>Source Port</td>
<td>500</td>
<td></td>
</tr>
<tr>
<td>Destination Port</td>
<td>500</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Input Rule I2</th>
<th>Source IP</th>
<th>Virtual Private Gateway 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dest IP</td>
<td>Customer Gateway</td>
<td></td>
</tr>
<tr>
<td>Protocol</td>
<td>UDP</td>
<td></td>
</tr>
<tr>
<td>Source Port</td>
<td>500</td>
<td></td>
</tr>
<tr>
<td>Destination Port</td>
<td>500</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Input Rule I3</th>
<th>Source IP</th>
<th>Virtual Private Gateway 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dest IP</td>
<td>Customer Gateway</td>
<td></td>
</tr>
<tr>
<td>Protocol</td>
<td>IP 50 (ESP)</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Input Rule I4</th>
<th>Source IP</th>
<th>Virtual Private Gateway 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dest IP</td>
<td>Customer Gateway</td>
<td></td>
</tr>
<tr>
<td>Protocol</td>
<td>IP 50 (ESP)</td>
<td></td>
</tr>
</tbody>
</table>

**Outbound (to the Internet)**

<table>
<thead>
<tr>
<th>Output Rule O1</th>
<th>Source IP</th>
<th>Customer Gateway</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dest IP</td>
<td>Virtual Private Gateway 1</td>
<td></td>
</tr>
</tbody>
</table>
Rules I1, I2, O1, and O2 enable the transmission of IKE packets. Rules I3, I4, O3, and O4 enable the transmission of IPsec packets containing the encrypted network traffic.

If you are using NAT traversal (NAT-T) on your device, then you must include rules that allow UDP access over port 4500. Check if your device is advertising NAT-T.
Example: Check Point Device with Border Gateway Protocol

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

This section has example configuration information provided by your integration team if your customer gateway is a Check Point Security Gateway device running R77.10 or above, and using the Gaia operating system.

Before you begin, ensure that you've done the following:

- You've created a Site-to-Site VPN connection in Amazon VPC. For more information, see Getting Started in the AWS Site-to-Site VPN User Guide.
- You've read the requirements (p. 8) for your customer gateway device.

Topics
- High-Level View of the Customer Gateway (p. 13)
- Configuration File (p. 14)
- Configuring the Check Point Device (p. 15)
- How to Test the Customer Gateway Configuration (p. 21)

High-Level View of the Customer Gateway

The following diagram shows the general details of your customer gateway. The VPN connection consists of two separate tunnels. Using redundant tunnels ensures continuous availability in the case that a device fails.
Your integration team can provide you with a configuration file with the values you need in order to configure each tunnel and the IKE and IPsec settings for your VPN device. The configuration file includes instructions on how to use the Gaia web portal and Check Point SmartDashboard to configure your device. The same steps are provided in the next section.

The following is an extract of an example configuration file. The file contains two sections: IPSec Tunnel #1 and IPSec Tunnel #2. You must use the values provided in each section to configure each tunnel.

```
! Amazon Web Services
! Virtual Private Cloud

! AWS uses unique identifiers to manipulate the configuration of
! a VPN connection. Each VPN connection is assigned an identifier and is
! associated with two other identifiers, namely the
! customer gateway identifier and virtual private gateway identifier.
!
! Your VPN connection ID     : vpn-12345678
! Your virtual private gateway ID : vgw-12345678
! Your customer gateway ID    : cgw-12345678

! This configuration consists of two tunnels. Both tunnels must be
! configured on your customer gateway.
!
! ------------------------------------------------------------------------
! IPSec Tunnel #1
! ------------------------------------------------------------------------
```
Configuring the Check Point Device

The following procedures demonstrate how to configure the VPN tunnels, network objects, and security for your VPN connection. You must replace the example values in the procedures with the values that are provided in the configuration file.

Note
For more information, go to the Amazon Web Services (AWS) VPN BGP article on the Check Point Support Center.

Topics
- Step 1: Configure the Tunnel Interfaces (p. 15)
- Step 2: Configure BGP (p. 16)
- Step 3: Create Network Objects (p. 17)
- Step 4: Create a VPN Community and Configure IKE and IPsec (p. 18)
- Step 5: Configure the Firewall (p. 19)
- Step 6: Enable Dead Peer Detection and TCP MSS Clamping (p. 20)

Step 1: Configure the Tunnel Interfaces

The first step to create the VPN tunnels and provide the private (inside) IP addresses of the customer gateway and virtual private gateway for each tunnel. For the first tunnel, use the information provided under the IPSec Tunnel #1 section of the configuration file. For the second tunnel, use the values provided in the IPSec Tunnel #2 section of the configuration file.

To configure the tunnel interface

1. Connect to your security gateway over SSH. If you're using the non-default shell, change to clish by running the following command: clish
2. Set the customer gateway ASN (the ASN that was provided when the customer gateway was created in AWS) by running the following command:

   ```
   set as 65000
   ```
3. Create the tunnel interface for the first tunnel, using the information provided under the IPSec Tunnel #1 section of the configuration file. Provide a unique name for your tunnel, such as AWS_VPC_Tunnel_1.

   ```
   add vpn tunnel 1 type numbered local 169.254.44.234 remote 169.254.44.233
   peer AWS_VPC_Tunnel_1
   set interface vpnt1 state on
   set interface vpnt1 mtu 1436
   ```
Step 2: Configure BGP

In this step, you create a BGP policy that allows the import of routes that are advertised by AWS. Then, configure your customer gateway to advertise its local routes to AWS.

**To create a BGP policy**

1. In the Gaia WebUI, choose Advanced Routing, Inbound Route Filters. Choose Add, and select Add BGP Policy (Based on AS).
2. For Add BGP Policy, select a value between 512 and 1024 in the first field, and enter the virtual private gateway ASN in the second field; for example, 7224.
3. Choose Save.

The following steps are for distributing local interface routes. You can also redistribute routes from different sources; for example, static routes, or routes obtained through dynamic routing protocols. For more information, go to the Gaia Advanced Routing R77 Versions Administration Guide.

**To advertise local routes**

1. In the Gaia WebUI, choose Advanced Routing, Routing Redistribution. Choose Add Redistribution From and select Interface.
2. For To Protocol, select the virtual private gateway ASN; for example, 7224.
3. For Interface, select an internal interface. Choose Save.
Step 3: Create Network Objects

In this step, you create a network object for each VPN tunnel, specifying the public (outside) IP addresses for the virtual private gateway. You later add these network objects as satellite gateways for your VPN community. You also need to create an empty group to act as a placeholder for the VPN domain.

To define a new network object

1. Open the Check Point SmartDashboard.
2. For Groups, open the context menu and choose Groups, Simple Group. You can use the same group for each network object.
3. For Network Objects, open the context (right-click) menu and choose New, Interoperable Device.
4. For Name, enter the name you provided for your tunnel in step 1, for example, AWS_VPC_Tunnel_1 or AWS_VPC_Tunnel_2.
5. For IPv4 Address, enter the outside IP address of the virtual private gateway provided in the configuration file, for example, 54.84.169.196. Save your settings and close the dialog box.

6. In the left category pane, choose Topology.
7. In the VPN Domain section, choose Manually defined, and browse to and select the empty simple group that you created in step 2. Choose OK.
8. Repeat these steps to create a second network object, using the information under the IPSec Tunnel #2 section of the configuration file.
9. Go to your gateway network object, open your gateway or cluster object, and choose Topology.
10. In the VPN Domain section, choose Manually defined, and browse to and select the empty simple group that you created in step 2. Choose OK.

Note
You can keep any existing VPN domain that you've configured. However, ensure that the hosts and networks that are used or served by the new VPN connection are not declared in that VPN domain, especially if the VPN domain is automatically derived.

Note
If you're using clusters, then edit the topology and define the interfaces as cluster interfaces. Use the IP addresses specified in the configuration file.
Step 4: Create a VPN Community and Configure IKE and IPsec

In this step, you create a VPN community on your Check Point gateway, to which you add the network objects (interoperable devices) for each tunnel. You also configure the Internet Key Exchange (IKE) and IPsec settings.

To create and configure the VPN community, IKE, and IPsec settings

1. From your gateway properties, choose IPSec VPN in the category pane.
2. Choose Communities, New, Star Community.
3. Provide a name for your community (for example, AWS_VPN_Star), and then choose Center Gateways in the category pane.
4. Choose Add, and add your gateway or cluster to the list of participant gateways.
5. In the category pane, choose Satellite Gateways, Add, and add the interoperable devices you created earlier (AWS_VPC_Tunnel_1 and AWS_VPC_Tunnel_2) to the list of participant gateways.

   Note
   You must select the IKEv1 for IPv4 and IKEv2 for IPv6 option for IKEv1 functionality; however, IKEv2 and IPv6 are currently not supported.

7. In the dialog box, configure the encryption properties as follows, and choose OK when you're done:

   • IKE Security Association (Phase 1) Properties:
     • Perform key exchange encryption with: AES-128
     • Perform data integrity with: SHA1
   • IPsec Security Association (Phase 2) Properties:
     • Perform IPsec data encryption with: AES-128
     • Perform data integrity with: SHA-1

8. In the category pane, choose Tunnel Management. Choose Set Permanent Tunnels, On all tunnels in the community. In the VPN Tunnel Sharing section, choose One VPN tunnel per Gateway pair.
9. In the category pane, expand Advanced Settings, and choose Shared Secret.
10. Select the peer name for the first tunnel, choose Edit, and enter the pre-shared key as specified in the configuration file in the IPSec Tunnel #1 section.
11. Select the peer name for the second tunnel, choose Edit, and enter the pre-shared key as specified in the configuration file in the IPSec Tunnel #2 section.
12. Still in the Advanced Settings category, choose Advanced VPN Properties, configure the properties as follows, and choose OK when you're done:

- IKE (Phase 1):
  - Use Diffie-Hellman group: Group 2 (1024 bit)
  - Renegotiate IKE security associations every 480 minutes
- IPsec (Phase 2):
  - Choose Use Perfect Forward Secrecy
  - Use Diffie-Hellman group: Group 2 (1024 bit)
  - Renegotiate IPsec security associations every 3600 seconds

Step 5: Configure the Firewall

In this step, you configure a policy with firewall rules and directional match rules that allow communication between the VPC and the local network. You then install the policy on your gateway.

To create firewall rules

1. In the SmartDashboard, choose Global Properties for your gateway. In the category pane, expand VPN, and choose Advanced.
2. Choose Enable VPN Directional Match in VPN Column, and choose OK.
3. In the SmartDashboard, choose Firewall, and create a policy with the following rules:
• Allow the VPC subnet to communicate with the local network over the required protocols.
• Allow the local network to communicate with the VPC subnet over the required protocols.

4. Open the context menu for the cell in the VPN column, and choose Edit Cell.

5. In the VPN Match Conditions dialog box, choose Match traffic in this direction only. Create the following directional match rules by choosing Add for each, and choose OK when you're done:
• internal_clear > VPN community (The VPN star community you created earlier, for example, AWS_VPN_Star)
• VPN community > VPN community
• VPN community > internal_clear

6. In the SmartDashboard, choose Policy, Install.

7. In the dialog box, choose your gateway and choose OK to install the policy.

Step 6: Enable Dead Peer Detection and TCP MSS Clamping

Your Check Point gateway can use Dead Peer Detection (DPD) to identify when an IKE association is down.

To configure DPD for a permanent tunnel, the permanent tunnel must be configured in the AWS VPN community. For more information, see Step 8 in Step 4: Create a VPN Community and Configure IKE and IPsec (p. 18)).

By default, the tunnel_keepalive_method property for a VPN gateway is set to tunnel_test. You must change the value to dpd. Each VPN gateway in the VPN community that requires DPD monitoring must be configured with the tunnel_keepalive_method property, including any 3rd party VPN gateway. You cannot configure different monitoring mechanisms for the same gateway.

You can update the tunnel_keepalive_method property using the GuiDBedit tool.

To modify the tunnel_keepalive_method property

1. Open the Check Point SmartDashboard, and choose Security Management Server, Domain Management Server.
2. Choose File, Database Revision Control... and create a revision snapshot.
3. Close all SmartConsole windows, such as the SmartDashboard, SmartView Tracker, and SmartView Monitor.
4. Start the GuiDBedit tool. For more information, see the Check Point Database Tool article on the Check Point Support Center.
6. In the upper left pane, choose Table, Network Objects, network_objects.
7. In the upper right pane, select the relevant Security Gateway, Cluster object.
8. Press CTRL+F, or use the Search menu to search for the following: tunnel_keepalive_method.
9. In the lower pane, open the context menu for tunnel_keepalive_method, and select Edit.... Choose dpd, OK.
10. Repeat steps 7–9 for each gateway that's part of the AWS VPN Community.
11. Choose File, Save All.
12. Close the GuiDBedit tool.
13. Open the Check Point SmartDashboard, and choose Security Management Server, Domain Management Server.

For more information, see the New VPN features in R77.10 article on the Check Point Support Center.

TCP MSS clamping reduces the maximum segment size of TCP packets to prevent packet fragmentation.

**To enable TCP MSS clamping**

1. Navigate to the following directory: C:\Program Files (x86)\CheckPoint\SmartConsole \R77.10\PROGRAM\.
2. Open the Check Point Database Tool by running the GuiDBEdit.exe file.
3. Choose Table, Global Properties, properties.
4. For fw_clamp_tcp_mss, choose Edit. Change the value to true and choose OK.

---

**How to Test the Customer Gateway Configuration**

You can test the gateway configuration for each tunnel.

**To test the customer gateway device configuration for each tunnel**

1. On your customer gateway device, determine whether the BGP status is Established.
   
   It takes approximately 30 seconds for a BGP peering to be established.
2. Ensure that the customer gateway device is advertising a route to the virtual private gateway. The route may be the default route (0.0.0.0/0) or a more specific route you prefer.

When properly established, your BGP peering should be receiving one route from the virtual private gateway corresponding to the prefix that your VPC integration team specified for the VPC (for example, 10.0.0.0/24). If the BGP peering is established, you are receiving a prefix, and you are advertising a prefix, your tunnel is configured correctly. Make sure that both tunnels are in this state.

Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:

- Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
- Configure your instance's security group and network ACL to enable inbound ICMP traffic.
- Ensure that you have configured routing for your VPN connection: your subnet's route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

**To test the end-to-end connectivity of each tunnel**

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are listed in the launch wizard when you launch an instance from the Amazon EC2 console. For more information, see the Amazon VPC Getting Started Guide.
2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.
3. On a system in your home network, use the ping command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway device. A successful response should be similar to the following.
ping 10.0.0.4

Pinging 10.0.0.4 with 32 bytes of data:
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128

Ping statistics for 10.0.0.4:
Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),

Approximate round trip times in milliseconds:
Minimum = 0ms, Maximum = 0ms, Average = 0ms

**Note**
If you ping an instance from your customer gateway device router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don't respond to ping messages from tunnel IP addresses.

4. (Optional) To test tunnel failover, you can temporarily disable one of the tunnels on your customer gateway device, and repeat the above step. You cannot disable a tunnel on the AWS side of the VPN connection.

On the Check Point gateway side, you can verify the tunnel status by running the following command from the command line tool in expert mode:

`vpn tunnelutil`

In the options that display, choose 1 to verify the IKE associations and 2 to verify the IPsec associations.

You can also use the Check Point Smart Tracker Log to verify that packets over the connection are being encrypted. For example, the following log indicates that a packet to the VPC was sent over tunnel 1 and was encrypted.
### How to Test the Customer Gateway Configuration

Example: Check Point Device without Border Gateway Protocol

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

This section has example configuration information provided by your integration team if your customer gateway is a Check Point Security Gateway device running R77.10 or above, and using the Gaia operating system.

Before you begin, ensure that you've done the following:

• You've created a Site-to-Site VPN connection in Amazon VPC. For more information, see Getting Started in the AWS Site-to-Site VPN User Guide.
• You've read the requirements (p. 8) for your customer gateway device.

Topics

• High-Level View of the Customer Gateway (p. 24)
• Configuration File (p. 25)
• Configuring the Check Point Device (p. 26)
• How to Test the Customer Gateway Configuration (p. 33)

High-Level View of the Customer Gateway

The following diagram shows the general details of your customer gateway. The VPN connection consists of two separate tunnels. Using redundant tunnels ensures continuous availability in the case that a device fails.
Configuration File

Your integration team can provide you with a configuration file that has the values you need to configure each tunnel and the IKE and IPSec settings for your VPN device. The configuration file includes instructions on how to use the Gaia web portal and Check Point SmartDashboard to configure your device. The same steps are provided in the next section.

The following is an extract of an example configuration file. The file contains two sections: IPSec Tunnel #1 and IPSec Tunnel #2. You must use the values provided in each section to configure each tunnel.

<table>
<thead>
<tr>
<th>Amazon Web Services</th>
<th>Virtual Private Cloud</th>
</tr>
</thead>
<tbody>
<tr>
<td>! Amazon Web Services</td>

</tr>
</tbody>
</table>
Configuring the Check Point Device

The following procedures demonstrate how to configure the VPN tunnels, network objects, and security for your VPN connection. You must replace the example values in the procedures with the values that are provided in the configuration file.

**Note**
For more information, go to the Check Point Security Gateway IPsec VPN to Amazon Web Services VPC article on the Check Point Support Center.

**Topics**
- Step 1: Configure Tunnel Interface (p. 26)
- Step 2: Configure the Static Route (p. 27)
- Step 3: Create Network Objects (p. 29)
- Step 4: Create a VPN Community and Configure IKE and IPsec (p. 30)
- Step 5: Configure the Firewall (p. 31)
- Step 6: Enable Dead Peer Detection and TCP MSS Clamping (p. 32)

**Step 1: Configure Tunnel Interface**

The first step is to create the VPN tunnels and provide the private (inside) IP addresses of the customer gateway and virtual private gateway for each tunnel. To create the first tunnel, use the information provided under the **IPSec Tunnel #1** section of the configuration file. To create the second tunnel, use the values provided in the **IPSec Tunnel #2** section of the configuration file.

To configure the tunnel interface

1. Open the Gaia portal of your Check Point Security Gateway device.
2. Choose **Network Interfaces**, **Add**, **VPN tunnel**.
3. In the dialog box, configure the settings as follows, and choose **OK** when you are done:
   - For **VPN Tunnel ID**, enter any unique value, such as 1.
   - For **Peer**, enter a unique name for your tunnel, such as `AWS_VPC_Tunnel_1` or `AWS_VPC_Tunnel_2`.
   - Ensure that **Numbered** is selected, and for **Local Address**, enter the IP address specified for CGW Tunnel IP in the configuration file, for example, `169.254.44.234`.
• For Remote Address, enter the IP address specified for VGW Tunnel IP in the configuration file, for example, 169.254.44.233.

4. Connect to your security gateway over SSH. If you're using the non-default shell, change to clish by running the following command: clish

5. For tunnel 1, run the following command:

```bash
set interface vpnt1 mtu 1436
```

For tunnel 2, run the following command:

```bash
set interface vpnt2 mtu 1436
```

6. Repeat these steps to create a second tunnel, using the information under the IPSec Tunnel #2 section of the configuration file.

**Step 2: Configure the Static Route**

In this step, you specify the static route to the subnet in the VPC for each tunnel to enable you to send traffic over the tunnel interfaces. The second tunnel enables failover in case there is an issue with the
first tunnel. If an issue is detected, the policy-based static route is removed from the routing table, and the second route is activated. You must also enable the Check Point gateway to ping the other end of the tunnel to check if the tunnel is up.

**To configure the static routes**

1. In the Gaia portal, choose **IPv4 Static Routes, Add**.
2. Specify the CIDR of your subnet, for example, **10.28.13.0/24**.
3. Choose **Add Gateway, IP Address**.
4. Enter the IP address specified for **VGW Tunnel IP** in the configuration file (for example, **169.254.44.233**), and specify a priority of 1.
5. Select **Ping**.
6. Repeat steps 3 and 4 for the second tunnel, using the **VGW Tunnel IP** value under the **IPSec Tunnel #2** section of the configuration file. Specify a priority of 2.

7. Choose **Save**.
If you're using a cluster, repeat the steps above for the other members of the cluster.

**Step 3: Create Network Objects**

In this step, you create a network object for each VPN tunnel, specifying the public (outside) IP addresses for the virtual private gateway. You later add these network objects as satellite gateways for your VPN community. You also need to create an empty group to act as a placeholder for the VPN domain.

**To define a new network object**

1. Open the Check Point SmartDashboard.
2. For **Groups**, open the context menu and choose **Groups, Simple Group**. You can use the same group for each network object.
3. For **Network Objects**, open the context (right-click) menu and choose **New, Interoperable Device**.
4. For **Name**, enter the name you provided for your tunnel, for example, **AWS_VPC_Tunnel_1** or **AWS_VPC_Tunnel_2**.
5. For **IPv4 Address**, enter the outside IP address of the virtual private gateway provided in the configuration file, for example, **54.84.169.196**. Save your settings and close the dialog box.

6. In the SmartDashboard, open your gateway properties and in the category pane, choose **Topology**.
7. To retrieve the interface configuration, choose **Get Topology**.
8. In the **VPN Domain** section, choose **Manually defined**, and browse to and select the empty simple group that you created in step 2. Choose **OK**.

**Note**
You can keep any existing VPN domain that you’ve configured. However, ensure that the hosts and networks that are used or served by the new VPN connection are not declared in that VPN domain, especially if the VPN domain is automatically derived.

9. Repeat these steps to create a second network object, using the information under the **IPSec Tunnel #2** section of the configuration file.

**Note**
If you're using clusters, then edit the topology and define the interfaces as cluster interfaces. Use the IP addresses specified in the configuration file.
Step 4: Create a VPN Community and Configure IKE and IPsec

In this step, you create a VPN community on your Check Point gateway, to which you add the network objects (interoperable devices) for each tunnel. You also configure the Internet Key Exchange (IKE) and IPsec settings.

To create and configure the VPN community, IKE, and IPsec settings

1. From your gateway properties, choose IPSec VPN in the category pane.
2. Choose Communities, New, Star Community.
3. Provide a name for your community (for example, AWS_VPN_Star), and then choose Center Gateways in the category pane.
4. Choose Add, and add your gateway or cluster to the list of participant gateways.
5. In the category pane, choose Satellite Gateways, Add, and add the interoperable devices you created earlier (AWS_VPC_Tunnel_1 and AWS_VPC_Tunnel_2) to the list of participant gateways.
6. In the category pane, choose Encryption. In the Encryption Method section, choose IKEv1 only. In the Encryption Suite section, choose Custom, Custom Encryption.
7. In the dialog box, configure the encryption properties as follows, and choose OK when you're done:
   - IKE Security Association (Phase 1) Properties:
     - Perform key exchange encryption with: AES-128
     - Perform data integrity with: SHA1
   - IPsec Security Association (Phase 2) Properties:
     - Perform IPsec data encryption with: AES-128
     - Perform data integrity with: SHA-1
8. In the category pane, choose Tunnel Management. Choose Set Permanent Tunnels, On all tunnels in the community. In the VPN Tunnel Sharing section, choose One VPN tunnel per Gateway pair.
9. In the category pane, expand Advanced Settings, and choose Shared Secret.
10. Select the peer name for the first tunnel, choose Edit, and enter the pre-shared key as specified in the configuration file in the IPSec Tunnel #1 section.
11. Select the peer name for the second tunnel, choose Edit, and enter the pre-shared key as specified in the configuration file in the IPSec Tunnel #2 section.
12. Still in the Advanced Settings category, choose Advanced VPN Properties, configure the properties as follows, and choose OK when you're done:

- IKE (Phase 1):
  - Use Diffie-Hellman group: Group 2
  - Renegotiate IKE security associations every 480 minutes
- IPsec (Phase 2):
  - Choose Use Perfect Forward Secrecy
  - Use Diffie-Hellman group: Group 2
  - Renegotiate IPsec security associations every 3600 seconds

**Step 5: Configure the Firewall**

In this step, you configure a policy with firewall rules and directional match rules that allow communication between the VPC and the local network. You then install the policy on your gateway.

**To create firewall rules**

1. In the SmartDashboard, choose Global Properties for your gateway. In the category pane, expand VPN, and choose Advanced.
2. Choose Enable VPN Directional Match in VPN Column, and save your changes.
3. In the SmartDashboard, choose Firewall, and create a policy with the following rules:
Step 6: Enable Dead Peer Detection and TCP MSS Clamping

Your Check Point gateway can use Dead Peer Detection (DPD) to identify when an IKE association is down.

To configure DPD for a permanent tunnel, the permanent tunnel must be configured in the AWS VPN community (refer to Step 8 in Step 4: Create a VPN Community and Configure IKE and IPsec (p. 30)).

By default, the tunnel_keepalive_method property for a VPN gateway is set to tunnel_test. You must change the value to dpd. Each VPN gateway in the VPN community that requires DPD monitoring must be configured with the tunnel_keepalive_method property, including any 3rd party VPN gateway. You cannot configure different monitoring mechanisms for the same gateway.

You can update the tunnel_keepalive_method property using the GuiDBedit tool.

To modify the tunnel_keepalive_method property

1. Open the Check Point SmartDashboard, and choose Security Management Server, Domain Management Server.
2. Choose File, Database Revision Control... and create a revision snapshot.
3. Close all SmartConsole windows, such as the SmartDashboard, SmartView Tracker, and SmartView Monitor.
4. Start the GuiDBedit tool. For more information, see the Check Point Database Tool article on the Check Point Support Center.
6. In the upper left pane, choose Table, Network Objects, network_objects.
7. In the upper right pane, select the relevant Security Gateway, Cluster object.
8. Press CTRL+F, or use the Search menu to search for the following: tunnel_keepalive_method.
9. In the lower pane, open the context menu for tunnel_keepalive_method, and choose Edit.... Choose dpd and choose OK.
10. Repeat steps 7–9 for each gateway that’s part of the AWS VPN Community.
11. Choose File, Save All.
12. Close the GuiDBedit tool.
13. Open the Check Point SmartDashboard, and choose Security Management Server, Domain Management Server.

For more information, see the New VPN features in R77.10 article on the Check Point Support Center.

TCP MSS clamping reduces the maximum segment size of TCP packets to prevent packet fragmentation.

**To enable TCP MSS clamping**

1. Navigate to the following directory: C:\Program Files (x86)\CheckPoint\SmartConsole\R77.10\PROGRAM\.
2. Open the Check Point Database Tool by running the GuiDBEdit.exe file.
3. Choose Table, Global Properties, properties.
4. For fw_clamp_tcp_mss, choose Edit. Change the value to true and choose OK.

---

**How to Test the Customer Gateway Configuration**

You can test the gateway configuration for each tunnel.

**To test the customer gateway device configuration for each tunnel**

1. Ensure that the customer gateway device has a static route to your VPC, as suggested in the configuration templates provided by AWS.
2. Ensure that a static route has been added to the VPN connection so that traffic can get back to your customer gateway device. For example, if your local subnet prefix is 198.10.0.0/16, you need to add a static route with that CIDR range to your VPN connection. Make sure that both tunnels have a static route to your VPC.

Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:

- Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
- Configure your instance's security group and network ACL to enable inbound ICMP traffic.
- Ensure that you have configured routing for your VPN connection - your subnet’s route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

**To test the end-to-end connectivity of each tunnel**

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are listed in the launch wizard when you launch an instance from the AWS Management Console. For more information, see the Amazon VPC Getting Started Guide.
2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.
3. On a system in your home network, use the ping command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway device. A successful response should be similar to the following.

```plaintext
ping 10.0.0.4
```
Pinging 10.0.0.4 with 32 bytes of data:

Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128

Ping statistics for 10.0.0.4:
Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),

Approximate round trip times in milliseconds:
Minimum = 0ms, Maximum = 0ms, Average = 0ms

**Note**

If you ping an instance from your customer gateway device router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don't respond to ping messages from tunnel IP addresses.

4. (Optional) To test tunnel failover, you can temporarily disable one of the tunnels on your customer gateway device, and repeat the above step. You cannot disable a tunnel on the AWS side of the VPN connection.

On the Check Point gateway side, you can verify the tunnel status by running the following command from the command line tool in expert mode:

```plaintext
vpn tunnelutil
```

In the options that display, choose 1 to verify the IKE associations and 2 to verify the IPsec associations.

You can also use the Check Point Smart Tracker Log to verify that packets over the connection are being encrypted. For example, the following log indicates that a packet to the VPC was sent over tunnel 1 and was encrypted.
### How to Test the Customer Gateway Configuration

Example: Cisco ASA Device

In this section, you get an example of the configuration information provided by your integration team if your customer gateway is a Cisco ASA device running Cisco ASA 8.2+ software.

The diagram shows the high-level layout of the customer gateway. You should use the real configuration information that you receive from your integration team and apply it to your customer gateway.

Before you begin, ensure that you’ve done the following:

- You’ve created a Site-to-Site VPN connection in Amazon VPC. For more information, see Getting Started in the AWS Site-to-Site VPN User Guide.
- You’ve read the requirements (p. 8) for your customer gateway device.

Topics

- A High-Level View of the Customer Gateway (p. 36)
- An Example Configuration (p. 37)
- How to Test the Customer Gateway Configuration (p. 41)

A High-Level View of the Customer Gateway

The following diagram shows the general details of your customer gateway. The VPN connection consists of two separate tunnels. Using redundant tunnels ensures continuous availability in the case that a device fails.
An Example Configuration

Please note that some Cisco ASAs only support Active/Standby mode. When you use these Cisco ASAs, you can have only one active tunnel at a time. The other standby tunnel becomes active if the first tunnel becomes unavailable. With this redundancy, you should always have connectivity to your VPC through one of the tunnels.

The configuration in this section is an example of the configuration information your integration team should provide. The example configuration contains a set of information for each of the tunnels that you must configure.

The example configuration includes example values to help you understand how configuration works. For example, we provide example values for the VPN connection ID (vpn-12345678) and virtual private gateway ID (vgw-12345678), and placeholders for the AWS endpoints (AWS_ENDPOINT_1 and AWS_ENDPOINT_2). Replace these example values with the actual values from the configuration information that you receive.

In addition, you must:

- Configure the outside interface.
- Ensure that the Crypto ISAKMP Policy Sequence number is unique.
- Ensure that the Crypto List Policy Sequence number is unique.
- Ensure that the Crypto IPsec Transform Set and the Crypto ISAKMP Policy Sequence are harmonious with any other IPsec tunnels configured on the device.
- Ensure that the SLA monitoring number is unique.
• Configure all internal routing that moves traffic between the customer gateway and your local network.

Important
The following configuration information is an example of what you can expect your integration team to provide. Many of the values in the following example are different from the actual configuration information that you receive. You must use the actual values and not the example values shown here, or your implementation will fail.

```plaintext
! Amazon Web Services
! Virtual Private Cloud
!
! AWS utilizes unique identifiers to manipulate the configuration of
! a VPN Connection. Each VPN Connection is assigned an identifier and is
! associated with two other identifiers, namely the
! Customer Gateway Identifier and Virtual Private Gateway Identifier.
!
! Your VPN Connection ID                  : vpn-12345678
! Your Virtual Private Gateway ID         : vgw-12345678
! Your Customer Gateway ID                : cgw-12345678
!
! This configuration consists of two tunnels. Both tunnels must be
! configured on your Customer Gateway. Only a single tunnel will be up at a
! time to the VGW.
!
! You may need to populate these values throughout the config based on your setup:
! outside_interface - External interface of the ASA
! outside_access_in - Inbound ACL on the external interface
! amzn_vpn_map - Outside crypto map
! vpc_subnet and vpc_subnet_mask - VPC address range
! local_subnet and local_subnet_mask - Local subnet address range
! sla_monitor_address - Target address that is part of acl-amzn to run SLA monitoring
!
! --------------------------------------------------------------------------------
! IPSec Tunnels
! --------------------------------------------------------------------------------
! #1: Internet Key Exchange (IKE) Configuration
!
! A policy is established for the supported ISAKMP encryption,
! authentication, Diffie-Hellman, lifetime, and key parameters.
!
! Note that there are a global list of ISAKMP policies, each identified by
! sequence number. This policy is defined as #201, which may conflict with
! an existing policy using the same or lower number depending on
! the encryption type. If so, we recommend changing the sequence number to
! avoid conflicts and overlap.
!
! Please note, these sample configurations are for the minimum requirement of AES128, SHA1,
! and DH Group 2.
! You will need to modify these sample configuration files to take advantage of AES256,
! SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.
! The address of the external interface for your customer gateway must be a static
! address.
! Your customer gateway may reside behind a device performing network address translation
! (NAT).
! To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to
! unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.
!
crypto isakmp identity address
crypto isakmp enable outside_interface
crypto isakmp policy 201
  encryption aes
  authentication pre-share
```
group 2
lifetime 28800
hash sha
exit

! The tunnel group sets the Pre Shared Key used to authenticate the
! tunnel endpoints.
!
tunnel-group AWS_ENDPOINT_1 type ipsec-l2l
tunnel-group AWS_ENDPOINT_1 ipsec-attributes
  pre-shared-key password_here
!
! This option enables IPSec Dead Peer Detection, which causes periodic
! messages to be sent to ensure a Security Association remains operational.
!
isakmp keepalive threshold 10 retry 10
exit

!
tunnel-group AWS_ENDPOINT_2 type ipsec-l2l
tunnel-group AWS_ENDPOINT_2 ipsec-attributes
  pre-shared-key password_here
!
! This option enables IPSec Dead Peer Detection, which causes periodic
! messages to be sent to ensure a Security Association remains operational.
!
isakmp keepalive threshold 10 retry 10
exit

! #2: Access List Configuration

! Access lists are configured to permit creation of tunnels and to send applicable traffic
over them.
! This policy may need to be applied to an inbound ACL on the outside interface that is
used to manage control-plane traffic.
! This is to allow VPN traffic into the device from the Amazon endpoints.
!
access-list outside_access_in extended permit ip host AWS_ENDPOINT_1
  host YOUR_UPLINK_ADDRESS
access-list outside_access_in extended permit ip host AWS_ENDPOINT_2
  host YOUR_UPLINK_ADDRESS
!
! The following access list named acl-amzn specifies all traffic that needs to be routed to
the VPC. Traffic will
! be encrypted and transmitted through the tunnel to the VPC. Association with the IPSec
security association
! is done through the "crypto map" command.
!
! This access list should contain a static route corresponding to your VPC CIDR and allow
traffic from any subnet.
! If you do not wish to use the "any" source, you must use a single access-list entry for
accessing the VPC range.
! If you specify more than one entry for this ACL without using "any" as the source, the
VPN will function erratically.
! The any rule is also used so the security association will include the ASA outside
interface where the SLA monitor
! traffic will be sourced from.
! See section #4 regarding how to restrict the traffic going over the tunnel
!
access-list acl-amzn extended permit ip any vpc_subnet vpc_subnet_mask

! #3: IPSec Configuration
! The IPSec transform set defines the encryption, authentication, and IPSec
An Example Configuration

crypto ipsec ikev1 transform-set transform-amzn esp-aes esp-sha-hmac

crypto map amzn_vpn_map 1 match address acl-amzn
crypto map amzn_vpn_map 1 set pfs group2
crypto map amzn_vpn_map 1 set peer AWS_ENDPOINT_1 AWS_ENDPOINT_2
crypto map amzn_vpn_map 1 set transform-set transform-amzn
crypto map amzn_vpn_map 1 set security-association lifetime seconds 3600

sla monitor 1
type echo protocol ipICMPEcho sla_monitor_address interface outside_interface
frequency 5
exit
sla monitor schedule 1 life forever start-time now
How to Test the Customer Gateway Configuration

*When using Cisco ASA as a customer gateway, only one tunnel is in the UP state. The second tunnel should be configured, but is only used if the first tunnel goes down. The second tunnel cannot be in the UP state when the first tunnel is in the UP state. Your console displays that only one tunnel is up and shows the second tunnel as down. This is expected behavior for Cisco ASA customer gateway tunnels because ASA as a customer gateway only supports a single tunnel being up at one time.*

You can test the gateway configuration for each tunnel.

**To test the customer gateway configuration for each tunnel**

- Ensure that a static route has been added to the VPN connection so that traffic can get back to your customer gateway. For example, if your local subnet prefix is 198.10.0.0/16, add a static route with that CIDR range to your VPN connection. Make sure that both tunnels have a static route to your VPC.

Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:
• Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
• Configure your instance's security group and network ACL to enable inbound ICMP traffic.
• Ensure that you have configured routing for your VPN connection - your subnet's route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

To test the end-to-end connectivity of each tunnel

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are listed in the launch wizard when you launch an instance from the AWS Management Console. For more information, see the Amazon VPC Getting Started Guide.
2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.
3. On a system in your home network, use the ping command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway. A successful response should be similar to the following.

```
ping 10.0.0.4
```

Pinging 10.0.0.4 with 32 bytes of data:
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128

Ping statistics for 10.0.0.4:
Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),
Approximate round trip times in milliseconds:
Minimum = 0ms, Maximum = 0ms, Average = 0ms

Note
If you ping an instance from your customer gateway router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don’t respond to ping messages from tunnel IP addresses.
4. (Optional) To test tunnel failover, you can temporarily disable one of the tunnels on your customer gateway, and repeat the above step. You cannot disable a tunnel on the AWS side of the VPN connection.

If your tunnels do not test successfully, see Troubleshooting Cisco ASA Customer Gateway Connectivity (p. 177).
Example: Cisco ASA Device with a Virtual Tunnel Interface and Border Gateway Protocol

In this section, you get an example of the configuration information provided by your integration team if your customer gateway is a Cisco ASA device running Cisco ASA 9.7.1+ software.

Before you begin, ensure that you’ve done the following:

• You’ve created a Site-to-Site VPN connection in Amazon VPC. For more information, see Getting Started in the AWS Site-to-Site VPN User Guide.

• You’ve read the requirements (p. 8) for your customer gateway device.

Topics

• A High-Level View of the Customer Gateway (p. 43)

• Example Configuration (p. 44)

• How to Test the Customer Gateway Configuration (p. 50)

A High-Level View of the Customer Gateway

The following diagram shows the general details of your customer gateway. The VPN connection consists of two separate tunnels. Using redundant tunnels ensures continuous availability in the case that a device fails.
Cisco ASAs from version 9.7.1 and later support Active/Active mode. When you use these Cisco ASAs, you can have both tunnels active at the same time. With this redundancy, you should always have connectivity to your VPC through one of the tunnels.

Example Configuration

The configuration in this section is an example of the configuration information your integration team should provide. The example configuration contains a set of information for each of the tunnels that you must configure.

The example configuration includes example values to help you understand how configuration works. For example, we provide example values for the VPN connection ID (vpn-12345678) and virtual private gateway ID (vgw-12345678), and placeholders for the AWS endpoints (AWS_ENDPOINT_1 and AWS_ENDPOINT_2). Replace these example values with the actual values from the configuration information that you receive.

In addition, you must do the following:

- Configure the outside interface.
- Ensure that the Crypto ISAKMP Policy Sequence number is unique.
- Ensure that the Crypto IPsec Transform Set and the Crypto ISAKMP Policy Sequence are harmonious with any other IPsec tunnels configured on the device.
- Configure all internal routing that moves traffic between the customer gateway and your local network.

Important

The following configuration information is an example of what you can expect your integration team to provide. Many of the values in the following example are different from the actual
configuration information that you receive. You must use the actual values and not the example values shown here, or your implementation will fail.

```sh
! Amazon Web Services
! Virtual Private Cloud

! AWS utilizes unique identifiers to manipulate the configuration of a VPN Connection. Each VPN Connection is assigned an identifier and is associated with two other identifiers, namely the Customer Gateway Identifier and Virtual Private Gateway Identifier.

! Your VPN Connection ID : vpn-12345678
! Your Virtual Private Gateway ID : vgw-12345678
! Your Customer Gateway ID : cgw-12345678

This configuration consists of two tunnels. Both tunnels must be configured on your Customer Gateway.

# IPSec Tunnel #1
# Internet Key Exchange (IKE) Configuration

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman, lifetime, and key parameters. Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.

You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 5, 14-18, 22, 23, and 24.

The address of the external interface for your customer gateway must be a static address. Your customer gateway may reside behind a device performing network address translation (NAT).

To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

Note that there are a global list of ISAKMP policies, each identified by sequence number. This policy is defined as #200, which may conflict with an existing policy using the same number. If so, we recommend changing the sequence number to avoid conflicts.

crypto ikev1 enable 'outside_interface'

```
crypto ikev1 policy 200
  encryption aes
  authentication pre-share
  group 2
  lifetime 28800
  hash sha
```

# IPSec Configuration

The IPSec transform set defines the encryption, authentication, and IPSec mode parameters. Please note, you may use these additionally supported IPSec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.

crypto ipsec ikev1 transform-set ipsec-prop-vpn-12345678-0 esp-aes esp-sha-hmac

The IPSec profile references the IPSec transform set and further defines the Diffie-Hellman group and security association lifetime.
crypto ipsec profile ipsec-vpn-12345678-0
   set pfs group2
   set security-association lifetime seconds 3600
   set ikev1 transform-set ipsec-prop-vpn-12345678-0
exit

! Additional parameters of the IPSec configuration are set here. Note that
! these parameters are global and therefore impact other IPSec
! associations.
! This option instructs the router to clear the "Don't Fragment"
! bit from packets that carry this bit and yet must be fragmented, enabling
! them to be fragmented.
! You will need to replace the outside_interface with the interface name of your ASA
Firewall.
crypto ipsec df-bit clear-df 'outside_interface'

! This option causes the firewall to reduce the Maximum Segment Size of
! TCP packets to prevent packet fragmentation.
sysopt connection tcpmss 1379

! This configures the gateway's window for accepting out of order
! IPSec packets. A larger window can be helpful if too many packets
! are dropped due to reordering while in transit between gateways.
! crypto ipsec security-association replay window-size 128

! This option instructs the router to fragment the unencrypted packets
! (prior to encryption).
! You will need to replace the outside_interface with the interface name of your ASA
Firewall.
! crypto ipsec fragmentation before-encryption 'outside_interface'

! ------------------------------------------------------------------------

! The tunnel group sets the Pre Shared Key used to authenticate the
! tunnel endpoints.
! tunnel-group 13.54.43.86 type ipsec-l2l
tunnel-group 13.54.43.86 ipsec-attributes
   ikev1 pre-shared-key pre-shared-key
!
! This option enables IPSec Dead Peer Detection, which causes semi-periodic
! messages to be sent to ensure a Security Association remains operational.
! isakmp keepalive threshold 10 retry 10
exit

! ------------------------------------------------------------------------
#3: Tunnel Interface Configuration
!
! A tunnel interface is configured to be the logical interface associated
! with the tunnel. All traffic routed to the tunnel interface will be
! encrypted and transmitted to the VPC. Similarly, traffic from the VPC
! will be logically received on this interface.
!
Association with the IPSec security association is done through the "tunnel protection" command.

The address of the interface is configured with the setup for your Customer Gateway. If the address changes, the Customer Gateway and VPN Connection must be recreated with Amazon VPC.

You will need to replace the outside_interface with the interface name of your ASA Firewall.

```conf
interface Tunnel1
  nameif Tunnel-int-vpn-12345678-0
  ip address 169.254.33.198 255.255.255.252
  tunnel source interface 'outside_interface'
  tunnel destination 13.54.43.86
  tunnel mode ipsec ipv4
  tunnel protection ipsec profile ipsec-vpn-12345678-0
  no shutdown
exit
```

### #4: Border Gateway Protocol (BGP) Configuration

BGP is used within the tunnel to exchange prefixes between the Virtual Private Gateway and your Customer Gateway. The Virtual Private Gateway will announce the prefix corresponding to your VPC.

Your Customer Gateway may announce a default route (0.0.0.0/0), which can be done with the 'network' and 'default-originate' statements.

The BGP timers are adjusted to provide more rapid detection of outages.

The local BGP Autonomous System Number (ASN) (65343) is configured as part of your Customer Gateway. If the ASN must be changed, the Customer Gateway and VPN Connection will need to be recreated with AWS.

```conf
router bgp 65343
  address-family ipv4 unicast
    neighbor 169.254.33.197 remote-as 7224
    neighbor 169.254.33.197 timers 10 30 30
    neighbor 169.254.33.197 default-originate
    neighbor 169.254.33.197 activate

  no auto-summary
  no synchronization
exit-address-family
```

To advertise additional prefixes to Amazon VPC, copy the 'network' statement and identify the prefix you wish to advertise. Make sure the prefix is present in the routing table of the device with a valid next-hop.

```conf
network 0.0.0.0
```

### IPSec Tunnel #2

### #1: Internet Key Exchange (IKE) Configuration

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman, lifetime, and key parameters.

Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.
You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24. The address of the external interface for your customer gateway must be a static address. Your customer gateway may reside behind a device performing network address translation (NAT). To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

Note that there are a global list of ISAKMP policies, each identified by sequence number. This policy is defined as #201, which may conflict with an existing policy using the same number. If so, we recommend changing the sequence number to avoid conflicts.

```
crypto ikev1 enable 'outside_interface'
crypto ikev1 policy 201
  encryption aes
  authentication pre-share
  group 2
  lifetime 28800
  hash sha

# #2: IPSec Configuration
# The IPSec transform set defines the encryption, authentication, and IPSec mode parameters.
# Please note, you may use these additionally supported IPSec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.

crypto ipsec ikev1 transform-set ipsec-prop-vpn-12345678-1 esp-aes esp-sha-hmac

# The IPSec profile references the IPSec transform set and further defines the Diffie-Hellman group and security association lifetime.

crypto ipsec profile ipsec-vpn-12345678-1
  set pfs group2
  set security-association lifetime seconds 3600
  set ikev1 transform-set ipsec-prop-vpn-12345678-1
exit

# Additional parameters of the IPSec configuration are set here. Note that these parameters are global and therefore impact other IPSec associations.
# This option instructs the router to clear the "Don't Fragment" bit from packets that carry this bit and yet must be fragmented, enabling them to be fragmented.
# You will need to replace the outside_interface with the interface name of your ASA Firewall.

crypto ipsec df-bit clear-df 'outside_interface'

# This option causes the firewall to reduce the Maximum Segment Size of TCP packets to prevent packet fragmentation.
sysopt connection tcpmss 1379

# This configures the gateway's window for accepting out of order IPSec packets. A larger window can be helpful if too many packets are dropped due to reordering while in transit between gateways.
```
crypto ipsec security-association replay window-size 128
! This option instructs the router to fragment the unencrypted packets
! (prior to encryption).
! You will need to replace the outside_interface with the interface name of your ASA
Firewall.
! crypto ipsec fragmentation before-encryption 'outside_interface'

! The tunnel group sets the Pre Shared Key used to authenticate the
! tunnel endpoints.
! tunnel-group 52.65.137.78 type ipsec-l2l
   tunnel-group 52.65.137.78 ipsec-attributes
      ikev1 pre-shared-key pre-shared-key
! This option enables IPSec Dead Peer Detection, which causes semi-periodic
! messages to be sent to ensure a Security Association remains operational.
! isakmp keepalive threshold 10 retry 10
exit

#3: Tunnel Interface Configuration
! A tunnel interface is configured to be the logical interface associated
! with the tunnel. All traffic routed to the tunnel interface will be
! encrypted and transmitted to the VPC. Similarly, traffic from the VPC
! will be logically received on this interface.
! Association with the IPSec security association is done through the
! "tunnel protection" command.
! The address of the interface is configured with the setup for your
! Customer Gateway. If the address changes, the Customer Gateway and VPN
! Connection must be recreated with Amazon VPC.
! You will need to replace the outside_interface with the interface name of your ASA
Firewall.

interface Tunnel2
   nameif Tunnel-int-vpn-12345678-1
   ip address 169.254.33.194 255.255.255.252
   tunnel source interface 'outside_interface'
   tunnel destination 52.65.137.78
   tunnel mode ipsec ipv4
   tunnel protection ipsec profile ipsec-vpn-12345678-1
   no shutdown
exit

#4: Border Gateway Protocol (BGP) Configuration
! BGP is used within the tunnel to exchange prefixes between the
! Virtual Private Gateway and your Customer Gateway. The Virtual Private Gateway
! will announce the prefix corresponding to your VPC.
How to Test the Customer Gateway Configuration

When using Cisco ASA as a customer gateway in routed mode, both tunnels will be in the UP state.

You can test the gateway configuration for each tunnel.

To test the customer gateway configuration for each tunnel

- Ensure that routes are advertised with BGP correctly and showing in routing table so that traffic can get back to your customer gateway. For example, if your local subnet prefix is 198.10.0.0/16, you must advertise it through BGP. Make sure that both tunnels are configured with BGP routing.

Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:

- Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
- Configure your instance's security group and network ACL to enable inbound ICMP traffic.
- Ensure that you have configured routing for your VPN connection - your subnet's route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

To test the end-to-end connectivity of each tunnel

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are listed in the launch wizard when you launch an instance from the AWS Management Console. For more information, see the Amazon VPC Getting Started Guide.
2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.
3. On a system in your home network, use the **ping** command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway. A successful response should be similar to the following.

```
ping 10.0.0.4
```

Pinging 10.0.0.4 with 32 bytes of data:

Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128

Ping statistics for 10.0.0.4:
Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),

Approximate round trip times in milliseconds:
Minimum = 0ms, Maximum = 0ms, Average = 0ms

**Note**
If you ping an instance from your customer gateway router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don't respond to ping messages from tunnel IP addresses.

4. (Optional) To test tunnel failover, you can temporarily disable one of the tunnels on your customer gateway, and repeat the above step. You cannot disable a tunnel on the AWS side of the VPN connection.

If your tunnels do not test successfully, see [Troubleshooting Cisco ASA Customer Gateway Connectivity](p. 177).
Example: Cisco ASA Device with a Virtual Tunnel Interface (without Border Gateway Protocol)

This guide (the *Network Administrator Guide*) has been merged into the *AWS Site-to-Site VPN User Guide* and is no longer maintained. For more information about configuring your customer gateway device, see the *AWS Site-to-Site VPN User Guide*.

In this section, you get an example of the configuration information provided by your integration team if your customer gateway is a Cisco ASA device running Cisco ASA 9.7.1+ software and if you want to configure a statically routed VPN connection.

Before you begin, ensure that you've done the following:

- You've created a Site-to-Site VPN connection in Amazon VPC. For more information, see *Getting Started* in the *AWS Site-to-Site VPN User Guide*.
- You've read the requirements (p. 8) for your customer gateway device.

**Topics**

- A High-Level View of the Customer Gateway (p. 52)
- Example Configuration (p. 53)
- How to Test the Customer Gateway Configuration (p. 58)

A High-Level View of the Customer Gateway

The following diagram shows the general details of your customer gateway. The VPN connection consists of two separate tunnels. Using redundant tunnels ensures continuous availability in the case that a device fails.
Cisco ASAs from version 9.7.1 and later support Active/Active mode. When you use these Cisco ASAs, you can have both tunnels active at the same time. With this redundancy, you should always have connectivity to your VPC through one of the tunnels.

Example Configuration

The configuration in this section is an example of the configuration information your integration team should provide. The example configuration contains a set of information for each of the tunnels that you must configure.

The example configuration includes example values to help you understand how configuration works. For example, we provide example values for the VPN connection ID (vpn-12345678) and virtual private gateway ID (vgw-12345678), and placeholders for the AWS endpoints (AWS_ENDPOINT_1 and AWS_ENDPOINT_2). Replace these example values with the actual values from the configuration information that you receive.

In addition, you must do the following:

- Configure the outside interface.
- Ensure that the Crypto ISAKMP Policy Sequence number is unique.
- Ensure that the Crypto IPsec Transform Set and the Crypto ISAKMP Policy Sequence are harmonious with any other IPsec tunnels configured on the device.
• Configure all internal routing that moves traffic between the customer gateway and your local network.

**Important**
The following configuration information is an example of what you can expect your integration team to provide. Many of the values in the following example are different from the actual configuration information that you receive. You must use the actual values and not the example values shown here, or your implementation will fail.

```
! Amazon Web Services
! Virtual Private Cloud

AWS utilizes unique identifiers to manipulate the configuration of
a VPN Connection. Each VPN Connection is assigned an identifier and is
associated with two other identifiers, namely the
Customer Gateway Identifier and Virtual Private Gateway Identifier.

! Your VPN Connection ID : vpn-12345678
! Your Virtual Private Gateway ID   : vgw-12345678
! Your Customer Gateway ID      : cgw-12345678

This configuration consists of two tunnels. Both tunnels must be
configured on your Customer Gateway.

#1: Internet Key Exchange (IKE) Configuration

A policy is established for the supported ISAKMP encryption,
attribution, Diffie-Hellman, lifetime, and key parameters.
Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.
You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.
The address of the external interface for your customer gateway must be a static address.
Your customer gateway may reside behind a device performing network address translation (NAT).
To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall !rules
to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.
Note that there are a global list of ISAKMP policies, each identified by
sequence number. This policy is defined as #200, which may conflict with
an existing policy using the same number. If so, we recommend changing
the sequence number to avoid conflicts.

crypto ikev1 enable 'outside_interface'
crypto ikev1 policy 200
    encryption aes
    authentication pre-share
    group 2
    lifetime 28800
    hash sha
```

```
#2: IPSec Configuration

The IPSec transform set defines the encryption, authentication, and IPSec
mode parameters.
```
Please note, you may use these additionally supported IPSec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.

```
crypto ipsec ikev1 transform-set ipsec-prop-vpn-12345678-0 esp-aes esp-sha-hmac
```

The IPSec profile references the IPSec transform set and further defines the Diffie-Hellman group and security association lifetime.

```
crypto ipsec profile ipsec-vpn-12345678-0
  set pfs group2
  set security-association lifetime seconds 3600
  set ikev1 transform-set ipsec-prop-vpn-12345678-0
exit
```

Additional parameters of the IPSec configuration are set here. Note that these parameters are global and therefore impact other IPSec associations.

```
You will need to replace the outside_interface with the interface name of your ASA Firewall.
crypto ipsec df-bit clear-df 'outside_interface'
```

This option causes the firewall to reduce the Maximum Segment Size of TCP packets to prevent packet fragmentation.

```
sysopt connection tcpmss 1379
```

This configures the gateway's window for accepting out of order IPSec packets. A larger window can be helpful if too many packets are dropped due to reordering while in transit between gateways.

```
crypto ipsec security-association replay window-size 128
```

This option instructs the router to fragment the unencrypted packets (prior to encryption).

```
You will need to replace the outside_interface with the interface name of your ASA Firewall.
crypto ipsec fragmentation before-encryption 'outside_interface'
```

The tunnel group sets the Pre Shared Key used to authenticate the tunnel endpoints.

```
tunnel-group 13.54.43.86 type ipsec-l2l
tunnel-group 13.54.43.86 ipsec-attributes
  ikev1 pre-shared-key pre-shared-key
```

This option enables IPSec Dead Peer Detection, which causes semi-periodic messages to be sent to ensure a Security Association remains operational.

```
isakmp keepalive threshold 10 retry 10
exit
```
#3: Tunnel Interface Configuration

A tunnel interface is configured to be the logical interface associated with the tunnel. All traffic routed to the tunnel interface will be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

Association with the IPSec security association is done through the "tunnel protection" command.

The address of the interface is configured with the setup for your Customer Gateway. If the address changes, the Customer Gateway and VPN Connection must be recreated with Amazon VPC.

You will need to replace the `outside_interface` with the interface name of your ASA Firewall.

```plaintext
interface Tunnel1
    nameif Tunnel-int-vpn-12345678-0
    ip address 169.254.33.198 255.255.255.252
    tunnel source interface 'outside_interface'
    tunnel destination 13.54.43.86
    tunnel mode ipsec ipv4
    tunnel protection ipsec profile ipsec-vpn-12345678-0
    no shutdown
exit
```

#4 Static Route Configuration

Your Customer Gateway needs to set a static route for the prefix corresponding to your VPC to send traffic over the tunnel interface.

An example for a VPC with the prefix 10.0.0.0/16 is provided below:

```plaintext
route Tunnel-int-vpn-12345678-0 10.0.0.0 255.255.0.0 169.254.33.197 100
```

IPSec Tunnel #2

#1: Internet Key Exchange (IKE) Configuration

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman, lifetime, and key parameters.

Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.

You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.

The address of the external interface for your customer gateway must be a static address.

Your customer gateway may reside behind a device performing network address translation (NAT).

To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

Note that there are a global list of ISAKMP policies, each identified by sequence number. This policy is defined as #201, which may conflict with an existing policy using the same number. If so, we recommend changing the sequence number to avoid conflicts.

```plaintext
crypto ikev1 enable 'outside_interface'
crypto ikev1 policy 201
    encryption aes
```
Example Configuration

```
authentication pre-share
group 2
lifetime 28800
hash sha

! #2: IPSec Configuration
!
# The IPSec transform set defines the encryption, authentication, and IPSec
# mode parameters.
# Please note, you may use these additionally supported IPSec parameters for encryption
# like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.
! crypto ipsec ikev1 transform-set ipsec-prop-\-vpn-12345678-1 esp-aes esp-sha-hmac

! The IPSec profile references the IPSec transform set and further defines
# the Diffie-Hellman group and security association lifetime.
! crypto ipsec profile ipsec-\-vpn-12345678-1
  set pfs group2
  set security-association lifetime seconds 3600
  set ikev1 transform-set ipsec-prop-\-vpn-12345678-1
exit

! Additional parameters of the IPSec configuration are set here. Note that
! these parameters are global and therefore impact other IPSec
! associations.
! This option instructs the router to clear the "Don't Fragment"
! bit from packets that carry this bit and yet must be fragmented, enabling
! them to be fragmented.
! You will need to replace the outside_interface with the interface name of your ASA
Firewall.
crypto ipsec df-bit clear-df 'outside_interface'

! This option causes the firewall to reduce the Maximum Segment Size of
! TCP packets to prevent packet fragmentation.
sysopt connection tcpmss 1379

! This configures the gateway's window for accepting out of order
! IPSec packets. A larger window can be helpful if too many packets
! are dropped due to reordering while in transit between gateways.
! crypto ipsec security-association replay window-size 128

! This option instructs the router to fragment the unencrypted packets
! (prior to encryption).
! You will need to replace the outside_interface with the interface name of your ASA
Firewall.
! crypto ipsec fragmentation before-encryption 'outside_interface'

! The tunnel group sets the Pre Shared Key used to authenticate the
! tunnel endpoints.
!```
How to Test the Customer Gateway Configuration

When using Cisco ASA as a customer gateway in routed mode, both tunnels will be in the UP state.

You can test the gateway configuration for each tunnel.

To test the customer gateway configuration for each tunnel

- Ensure that a static route has been added to the VPN connection so that traffic can get back to your customer gateway. For example, if your local subnet prefix is 198.10.0.0/16, add a static route with that CIDR range to your VPN connection. Make sure that both tunnels have a static route to your VPC.
Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:

- Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
- Configure your instance's security group and network ACL to enable inbound ICMP traffic.
- Ensure that you have configured routing for your VPN connection - your subnet's route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

To test the end-to-end connectivity of each tunnel

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are listed in the launch wizard when you launch an instance from the AWS Management Console. For more information, see the Amazon VPC Getting Started Guide.
2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.
3. On a system in your home network, use the `ping` command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway. A successful response should be similar to the following.

   ```
   ping 10.0.0.4
   ```

   Pinging 10.0.0.4 with 32 bytes of data:
   Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
   Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
   Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
   Ping statistics for 10.0.0.4:
   Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),
   Approximate round trip times in milliseconds:
   Minimum = 0ms, Maximum = 0ms, Average = 0ms

   **Note**
   If you ping an instance from your customer gateway router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don't respond to ping messages from tunnel IP addresses.

4. (Optional) To test tunnel failover, you can temporarily disable one of the tunnels on your customer gateway, and repeat the above step. You cannot disable a tunnel on the AWS side of the VPN connection.

If your tunnels do not test successfully, see Troubleshooting Cisco ASA Customer Gateway Connectivity (p. 177).
Example: Cisco IOS Device

In this section, you get an example of the configuration information provided by your integration team if your customer gateway is a Cisco IOS device running Cisco IOS 12.4 (or later) software.

Two diagrams illustrate the example configuration. The first diagram shows the high-level layout of the customer gateway, and the second diagram shows details from the example configuration. You should use the real configuration information that you receive from your integration team and apply it to your customer gateway.

Before you begin, ensure that you've done the following:

- You've created a Site-to-Site VPN connection in Amazon VPC. For more information, see Getting Started in the AWS Site-to-Site VPN User Guide.
- You've read the requirements (p. 8) for your customer gateway device.

Topics

- A High-Level View of the Customer Gateway (p. 61)
- A Detailed View of the Customer Gateway and an Example Configuration (p. 62)
- How to Test the Customer Gateway Configuration (p. 68)
A High-Level View of the Customer Gateway

The following diagram shows the general details of your customer gateway. The VPN connection consists of two separate tunnels. Using redundant tunnels ensures continuous availability in the case that a device fails.
A Detailed View of the Customer Gateway and an Example Configuration

The diagram in this section illustrates an example Cisco IOS customer gateway. Following the diagram is a corresponding example of the configuration information your integration team should provide. The example configuration contains a set of information for each of the tunnels that you must configure.

In addition, the example configuration refers to these items that you must provide:

- **YOUR_UPLINK_ADDRESS**—The IP address for the Internet-routable external interface on the customer gateway. The address must be static, and may be behind a device performing network address translation (NAT). To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500.

- **YOUR_BGP_ASN**—The customer gateway's BGP ASN (we use 65000 by default)

The example configuration includes several example values to help you understand how configuration works. For example, we provide example values for the VPN connection ID (vpn-44a8938f), virtual private gateway ID (vgw-8db04f81), the IP addresses (72.21.209.*, 169.254.255.*), and the remote ASN (7224). Replace these example values with the actual values from the configuration information that you receive.

In addition, you must:

- Configure the outside interface
- Configure the tunnel interface IDs (referred to as **Tunnel1** and **Tunnel2** in the example configuration).
- Ensure that the Crypto ISAKMP Policy Sequence number is unique.
- Ensure that the Crypto IPsec Transform Set and the Crypto ISAKMP Policy Sequence are harmonious with any other IPsec tunnels configured on the device.
- Configure all internal routing that moves traffic between the customer gateway and your local network.

In the following diagram and example configuration, you must replace the placeholder values are indicated by colored italic text with values that apply to your particular configuration.
Warning

The following configuration information is an example of what you can expect your integration team to provide. Many of the values in the following example are different from the actual configuration information that you receive. You must use the actual values and not the example values shown here, or your implementation will fail.

Amazon Virtual Private Cloud

AWS utilizes unique identifiers to manipulate the configuration of a VPN Connection. Each VPN Connection is assigned an identifier and is associated with two other identifiers, namely the Customer Gateway Identifier and Virtual Private Gateway Identifier.

- Your VPN Connection ID: vpn-44a8938f
- Your Virtual Private Gateway ID: vgw-6db04f01
- Your Customer Gateway ID: cgw-b4dc3961

This configuration consists of two tunnels. Both tunnels must be configured on your Customer Gateway.

---

IKE

#1: Internet Key Exchange (IKE) Configuration

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman, lifetime, and key parameters.

Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2. You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.
The address of the external interface for your customer gateway must be a static address.

Your customer gateway may reside behind a device performing network address translation (NAT).

To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

Note that there are a global list of ISAKMP policies, each identified by a sequence number. This policy is defined as #200, which may conflict with an existing policy using the same number. If so, we recommend changing the sequence number to avoid conflicts.

```
crypto isakmp policy 200
  encryption aes 128
  authentication pre-share
  group 2
  lifetime 28800
  hash sha
exit
```

The ISAKMP keyring stores the Pre Shared Key used to authenticate the tunnel endpoints.

```
crypto keyring keyring-vpn-44a8938f-0
  local-address YOUR_UPLINK_ADDRESS
  pre-shared-key address 72.21.209.225 key plain-text-password1
exit
```

An ISAKMP profile is used to associate the keyring with the particular endpoint.

```
crypto isakmp profile isakmp-vpn-44a8938f-0
  local-address YOUR_UPLINK_ADDRESS
  match identity address 72.21.209.225
  keyring keyring-vpn-44a8938f-0
exit
```

#2: IPsec Configuration

The IPsec transform set defines the encryption, authentication, and IPsec mode parameters. Please note, you may use these additionally supported IPsec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.

```
crypto ipsec transform-set ipsec-prop-vpn-44a8938f-0 esp-aes 128 esp-sha-hmac
  mode tunnel
exit
```

The IPsec profile references the IPsec transform set and further defines the Diffie-Hellman group and security association lifetime.

```
crypto ipsec profile ipsec-vpn-44a8938f-0
  set pfs group2
  set security-association lifetime seconds 3600
  set transform-set ipsec-prop-vpn-44a8938f-0
exit
```

Additional parameters of the IPsec configuration are set here. Note that these parameters are global and therefore impact other IPsec associations.

This option instructs the router to clear the "Don't Fragment" bit from packets that carry this bit and yet must be fragmented, enabling
crypto ipsec df-bit clear

This option enables IPsec Dead Peer Detection, which causes periodic messages to be sent to ensure a Security Association remains operational.

crypto isakmp keepalive 10 10 on-demand

This configures the gateway's window for accepting out of order IPsec packets. A larger window can be helpful if too many packets are dropped due to reordering while in transit between gateways.

crypto ipsec security-association replay window-size 128

This option instructs the router to fragment the unencrypted packets (prior to encryption).

crypto ipsec fragmentation before-encryption

#3: Tunnel Interface Configuration

A tunnel interface is configured to be the logical interface associated with the tunnel. All traffic routed to the tunnel interface will be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

Association with the IPsec security association is done through the "tunnel protection" command.

The address of the interface is configured with the setup for your Customer Gateway. If the address changes, the Customer Gateway and VPN Connection must be recreated with Amazon VPC.

interface Tunnel1
  ip address 169.254.255.2 255.255.255.252
  ip virtual-reassembly
  tunnel source YOUR_UPLINK_ADDRESS
  tunnel destination 72.21.209.225
  tunnel mode ipsec ipv4
  tunnel protection ipsec profile ipsec-vpn-44a8938f-0
  ip tcp adjust-mss 1387
  no shutdown
exit

#4: Border Gateway Protocol (BGP) Configuration

BGP is used within the tunnel to exchange prefixes between the Virtual Private Gateway and your Customer Gateway. The Virtual Private Gateway will announce the prefix corresponding to your VPC.

Your Customer Gateway may announce a default route (0.0.0.0/0), which can be done with the 'network' statement and 'default-originate' statements.

The BGP timers are adjusted to provide more rapid detection of outages.
The local BGP Autonomous System Number (ASN) (YOUR_BGP_ASN) is configured as part of your Customer Gateway. If the ASN must be changed, the Customer Gateway and VPN Connection will need to be recreated with AWS.

```
router bgp YOUR_BGP_ASN
    neighbor 169.254.255.1 remote-as 7224
    neighbor 169.254.255.1 activate
    neighbor 169.254.255.1 timers 10 30 30
    address-family ipv4 unicast
        neighbor 169.254.255.1 remote-as 7224
        neighbor 169.254.255.1 timers 10 30 30
        neighbor 169.254.255.1 default-originate
        neighbor 169.254.255.1 activate
    neighbor 169.254.255.1 soft-reconfiguration inbound
```

To advertise additional prefixes to Amazon VPC, copy the 'network' statement and identify the prefix you wish to advertise. Make sure the prefix is present in the routing table of the device with a valid next-hop.

```
network 0.0.0.0
```

-------------------------------------------------------------------------
IPsec Tunnel #2
-------------------------------------------------------------------------

**IKE**

#1: Internet Key Exchange (IKE) Configuration

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman, lifetime, and key parameters.

Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.

You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.

The address of the external interface for your customer gateway must be a static address.

Your customer gateway may reside behind a device performing network address translation (NAT).

To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

Note that there are a global list of ISAKMP policies, each identified by sequence number. This policy is defined as #201, which may conflict with an existing policy using the same number. If so, we recommend changing the sequence number to avoid conflicts.

```
crypto isakmp policy 201
    encryption aes 128
    authentication pre-share
    group 2
    lifetime 28800
    hash sha
exit
```

The ISAKMP keyring stores the Pre Shared Key used to authenticate the tunnel endpoints.

```
crypto keyring keyring-vpn-44a8938f-1
    local-address YOUR_UPLINK_ADDRESS
    pre-shared-key address 72.21.209.193 key plain-text-password2
exit
```

An ISAKMP profile is used to associate the keyring with the particular
crypto isakmp profile isakmp-vpn-44a8938f-1
    local-address YOUR_UPLINK_ADDRESS
    match identity address 72.21.209.193
    keyring keyring-vpn-44a8938f-1
exit

#2: IPsec Configuration

The IPsec transform set defines the encryption, authentication, and IPsec mode parameters.
Please note, you may use these additionally supported IPSec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.
crypto ipsec transform-set ipsec-prop-vpn-44a8938f-1 esp-aes 128 esp-sha-hmac
    mode tunnel
exit

The IPsec profile references the IPsec transform set and further defines the Diffie-Hellman group and security association lifetime.
crypto ipsec profile ipsec-vpn-44a8938f-1
    set pfs group2
    set security-association lifetime seconds 3600
    set transform-set ipsec-prop-vpn-44a8938f-1
exit

Additional parameters of the IPsec configuration are set here. Note that these parameters are global and therefore impact other IPsec associations.
This option instructs the router to clear the "Don't Fragment" bit from packets that carry this bit and yet must be fragmented, enabling them to be fragmented.
crypto ipsec df-bit clear

This option enables IPsec Dead Peer Detection, which causes periodic messages to be sent to ensure a Security Association remains operational.
crypto isakmp keepalive 10 10 on-demand

This configures the gateway’s window for accepting out of order IPsec packets. A larger window can be helpful if too many packets are dropped due to reordering while in transit between gateways.
crypto ipsec security-association replay window-size 128

This option instructs the router to fragment the unencrypted packets (prior to encryption).
crypto ipsec fragmentation before-encryption

#3: Tunnel Interface Configuration

A tunnel interface is configured to be the logical interface associated with the tunnel. All traffic routed to the tunnel interface will be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.
How to Test the Customer Gateway Configuration

You can test the gateway configuration for each tunnel.
To test the customer gateway device configuration for each tunnel

1. On your customer gateway device, determine whether the BGP status is Established.
   
   It takes approximately 30 seconds for a BGP peering to be established.
2. Ensure that the customer gateway device is advertising a route to the virtual private gateway. The route may be the default route (0.0.0.0/0) or a more specific route you prefer.

When properly established, your BGP peering should be receiving one route from the virtual private gateway corresponding to the prefix that your VPC integration team specified for the VPC (for example, 10.0.0.0/24). If the BGP peering is established, you are receiving a prefix, and you are advertising a prefix, your tunnel is configured correctly. Make sure that both tunnels are in this state.

Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:

- Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
- Configure your instance's security group and network ACL to enable inbound ICMP traffic.
- Ensure that you have configured routing for your VPN connection: your subnet's route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

To test the end-to-end connectivity of each tunnel

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are listed in the launch wizard when you launch an instance from the Amazon EC2 console. For more information, see the Amazon VPC Getting Started Guide.
2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.
3. On a system in your home network, use the ping command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway device. A successful response should be similar to the following.

   ping 10.0.0.4

   Pinging 10.0.0.4 with 32 bytes of data:

   Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
   Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
   Reply from 10.0.0.4: bytes=32 time<1ms TTL=128

   Ping statistics for 10.0.0.4:
   Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),
   Approximate round trip times in milliseconds:
   Minimum = 0ms, Maximum = 0ms, Average = 0ms

Note

   If you ping an instance from your customer gateway device router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don't respond to ping messages from tunnel IP addresses.

4. (Optional) To test tunnel failover, you can temporarily disable one of the tunnels on your customer gateway device, and repeat the above step. You cannot disable a tunnel on the AWS side of the VPN connection.
If your tunnels don't test successfully, see Troubleshooting Cisco IOS Customer Gateway Connectivity (p. 180).
Example: Cisco IOS Device without Border Gateway Protocol

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

In this section, you get an example of the configuration information provided by your integration team if your customer gateway is a Cisco Integrated Services router running Cisco IOS software.

Two diagrams illustrate the example configuration. The first diagram shows the high-level layout of the customer gateway, and the second diagram shows details from the example configuration. You should use the real configuration information that you receive from your integration team, and apply it to your customer gateway.

Before you begin, ensure that you've done the following:

- You've created a Site-to-Site VPN connection in Amazon VPC. For more information, see Getting Started in the AWS Site-to-Site VPN User Guide.
- You've read the requirements (p. 8) for your customer gateway device.

Topics
- A High-Level View of the Customer Gateway (p. 71)
- A Detailed View of the Customer Gateway and an Example Configuration (p. 72)
- How to Test the Customer Gateway Configuration (p. 78)

A High-Level View of the Customer Gateway

The following diagram shows the general details of your customer gateway. The VPN connection consists of two separate tunnels. Using redundant tunnels ensures continuous availability in the case that a device fails.
A Detailed View of the Customer Gateway and an Example Configuration

The diagram in this section illustrates an example Cisco IOS customer gateway (without BGP). Following the diagram, there is a corresponding example of the configuration information that your integration team should provide. The example configuration contains a set of information for each of the tunnels that you must configure.

In addition, the example configuration refers to this item that you must provide:

- **YOUR_UPLINK_ADDRESS**—The IP address for the Internet-routable external interface on the customer gateway. The address must be static, and may be behind a device performing network address translation (NAT). To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500.

The example configuration includes several example values to help you understand how configuration works. For example, we provide example values for the VPN connection ID (vpn-1a2b3c4d), virtual private gateway ID (vgw-12345678), the IP addresses (205.251.233.*, 169.254.255.*). Replace these example values with the actual values from the configuration information that you receive.

In addition, you must:

- Configure the outside interface.
- Configure the tunnel interface IDs (referred to as **Tunnel1** and **Tunnel2** in the example configuration).
• Ensure that the Crypto ISAKMP Policy Sequence number is unique.
• Ensure that the Crypto IPsec Transform Set and the Crypto ISAKMP Policy Sequence are harmonious with any other IPsec tunnels configured on the device.
• Ensure that the SLA monitoring number is unique.
• Configure all internal routing that moves traffic between the customer gateway and your local network.

In the following diagram and example configuration, you must replace the placeholder values are indicated by colored italic text with values that apply to your particular configuration.

![Diagram of IPsec Tunnel Configuration]

**Warning**
The following configuration information is an example of what you can expect your integration team to provide. Many of the values in the following example are different from the actual configuration information that you receive. You must use the actual values and not the example values shown here, or your implementation will fail.

```
IPSec Tunnel #1
#1: Internet Key Exchange (IKE) Configuration
A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman, lifetime, and key parameters.
Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.
You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.
The address of the external interface for your customer gateway must be a static address.
Your customer gateway may reside behind a device performing network address translation (NAT).
To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.
```

Note that there are a global list of ISAKMP policies, each identified by
sequence number. This policy is defined as #200, which may conflict with
an existing policy using the same number. If so, we recommend changing
the sequence number to avoid conflicts.

crypto isakmp policy 200
encryption aes 128
authentication pre-share
group 2
lifetime 28800
hash sha
exit

The ISAKMP keyring stores the Pre Shared Key used to authenticate the
tunnel endpoints.

crypto keyring keyring-vpn-1a2b3c4d-0
  local-address CUSTOMER_IP
  pre-shared-key address 205.251.233.121 key PASSWORD
exit

An ISAKMP profile is used to associate the keyring with the particular
tunnel endpoint.

crypto isakmp profile isakmp-vpn-1a2b3c4d-0
  local-address CUSTOMER_IP
  match identifier address 205.251.233.121
  keyring keyring-vpn-1a2b3c4d-0
exit

#2: IPSec Configuration

The IPSec transform set defines the encryption, authentication, and IPSec
mode parameters.

Please note, you may use these additionally supported IPSec parameters for encryption
like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.

crypto ipsec transform-set ipsec-prop-vpn-1a2b3c4d-0 esp-aes 128 esp-sha-hmac
  mode tunnel
exit

The IPSec profile references the IPSec transform set and further defines
the Diffie-Hellman group and security association lifetime.

crypto ipsec profile ipsec-vpn-1a2b3c4d-0
  set pfs group2
  set security-association lifetime seconds 3600
  set transform-set ipsec-prop-vpn-1a2b3c4d-0
exit

Additional parameters of the IPSec configuration are set here. Note that
these parameters are global and therefore impact other IPSec
associations.

This option instructs the router to clear the "Don't Fragment"
between packets that carry this bit and yet must be fragmented, enabling
them to be fragmented.

crypto ipsec df-bit clear

This option enables IPSec Dead Peer Detection, which causes periodic
messages to be sent to ensure a Security Association remains operational.

crypto isakmp keepalive 10 10 on-demand

This configures the gateway's window for accepting out of order
IPSec packets. A larger window can be helpful if too many packets
crypto ipsec security-association replay window-size 128

crypto ipsec fragmentation before-encryption

interface Tunnel1
  ip address 169.254.249.18 255.255.255.252
  ip virtual-reassembly
  tunnel source CUSTOMER_IP
  tunnel destination 205.251.233.121
  tunnel mode ipsec ipv4
  tunnel protection ipsec profile ipsec-vpn-1a2b3c4d-0
  ip tcp adjust-mss 1387
  no shutdown
exit

ip sla 100
  icmp-echo 169.254.249.17 source-interface Tunnel1
  timeout 1000
  frequency 5
exit
ip sla schedule 100  life forever start-time now
track 100 ip sla 100 reachability

#3: Tunnel Interface Configuration

A tunnel interface is configured to be the logical interface associated with the tunnel. All traffic routed to the tunnel interface will be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

Association with the IPSec security association is done through the "tunnel protection" command.

The address of the interface is configured with the setup for your Customer Gateway. If the address changes, the Customer Gateway and VPN Connection must be recreated with Amazon VPC.

interface Tunnel1
  ip address 169.254.249.18 255.255.255.252
  ip virtual-reassembly
  tunnel source CUSTOMER_IP
  tunnel destination 205.251.233.121
  tunnel mode ipsec ipv4
  tunnel protection ipsec profile ipsec-vpn-1a2b3c4d-0
  ip tcp adjust-mss 1387
  no shutdown
exit

#4 Static Route Configuration

Your Customer Gateway needs to set a static route for the prefix corresponding to your VPC to send traffic over the tunnel interface.

An example for a VPC with the prefix 10.0.0.0/16 is provided below:

ip route 10.0.0.0 255.255.0.0 Tunnel1 track 100

SLA Monitor is used to provide a failover between the two tunnels. If the primary tunnel fails, the redundant tunnel will automatically be used.

This sla is defined as #100, which may conflict with an existing sla using same number.

If so, we recommend changing the sequence number to avoid conflicts.

ip sla 100
  icmp-echo 169.254.249.17 source-interface Tunnel1
  timeout 1000
  frequency 5
exit
ip sla schedule 100  life forever start-time now
track 100 ip sla 100 reachability

IPSec Tunnel #2

#1: Internet Key Exchange (IKE) Configuration

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman, lifetime, and key parameters.
Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.

You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.

The address of the external interface for your customer gateway must be a static address.

Your customer gateway may reside behind a device performing network address translation (NAT).

To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

Note that there are a global list of ISAKMP policies, each identified by a sequence number. This policy is defined as #201, which may conflict with an existing policy using the same number. If so, we recommend changing the sequence number to avoid conflicts.

crypto isakmp policy 201
  encryption aes 128
  authentication pre-share
  group 2
  lifetime 28800
  hash sha
exit

The ISAKMP keyring stores the Pre Shared Key used to authenticate the tunnel endpoints.

crypto keyring keyring-vpn-1a2b3c4d
  local-address CUSTOMER_IP
  pre-shared-key address 205.251.233.122 key PASSWORD
exit

An ISAKMP profile is used to associate the keyring with the particular endpoint.

crypto isakmp profile isakmp-vpn-1a2b3c4d
  local-address CUSTOMER_IP
  match identity address 205.251.233.122
  keyring keyring-vpn-1a2b3c4d
exit

#2: IPSec Configuration

The IPSec transform set defines the encryption, authentication, and IPSec mode parameters.

Please note, you may use these additionally supported IPSec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.

crypto ipsec transform-set ipsec-prop-vpn-1a2b3c4d
  esp-aes 128 esp-sha-hmac
  mode tunnel
exit

The IPSec profile references the IPSec transform set and further defines the Diffie-Hellman group and security association lifetime.

crypto ipsec profile ipsec-vpn-1a2b3c4d
  set pfs group2
  set security-association lifetime seconds 3600
  set transform-set ipsec-prop-vpn-1a2b3c4d
exit

Additional parameters of the IPSec configuration are set here. Note that these parameters are global and therefore impact other IPSec associations.

This option instructs the router to clear the "Don't Fragment" bit from packets that carry this bit and yet must be fragmented, enabling...
them to be fragmented.

crypto ipsec df-bit clear

This option enables IPSec Dead Peer Detection, which causes periodic messages to be sent to ensure a Security Association remains operational.

crypto isakmp keepalive 10 10 on-demand

This configures the gateway's window for accepting out of order IPSec packets. A larger window can be helpful if too many packets are dropped due to reordering while in transit between gateways.

crypto ipsec security-association replay window-size 128

This option instructs the router to fragment the unencrypted packets (prior to encryption).

crypto ipsec fragmentation before-encryption

#3: Tunnel Interface Configuration

A tunnel interface is configured to be the logical interface associated with the tunnel. All traffic routed to the tunnel interface will be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

Association with the IPSec security association is done through the "tunnel protection" command.

The address of the interface is configured with the setup for your Customer Gateway. If the address changes, the Customer Gateway and VPN Connection must be recreated with Amazon VPC.

interface Tunnel2
ip address 169.254.249.22 255.255.255.252
ip virtual-reassembly
tunnel source CUSTOMER_IP
tunnel destination 205.251.233.122
tunnel mode ipsec ipv4
tunnel protection ipsec profile ipsec-vpn-1a2b3c4d-1
    This option causes the router to reduce the Maximum Segment Size of TCP packets to prevent packet fragmentation.
ip tcp adjust-mss 1387
no shutdown
exit

#4 Static Route Configuration

Your Customer Gateway needs to set a static route for the prefix corresponding to your VPC to send traffic over the tunnel interface.

An example for a VPC with the prefix 10.0.0.0/16 is provided below:
ip route 10.0.0.0 255.255.255.0 Tunnel2 track 200

SLA Monitor is used to provide a failover between the two tunnels. If the primary tunnel fails, the redundant tunnel will automatically be used.

This sla is defined as #200, which may conflict with an existing sla using same number.
If so, we recommend changing the sequence number to avoid conflicts.
ip sla 200
    icmp-echo 169.254.249.21 source-interface Tunnel2
timeout 1000
frequency 5
How to Test the Customer Gateway Configuration

You can test the gateway configuration for each tunnel.

To test the customer gateway device configuration for each tunnel

1. Ensure that the customer gateway device has a static route to your VPC, as suggested in the configuration templates provided by AWS.
2. Ensure that a static route has been added to the VPN connection so that traffic can get back to your customer gateway device. For example, if your local subnet prefix is 198.10.0.0/16, you need to add a static route with that CIDR range to your VPN connection. Make sure that both tunnels have a static route to your VPC.

Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:

- Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
- Configure your instance's security group and network ACL to enable inbound ICMP traffic.
- Ensure that you have configured routing for your VPN connection - your subnet's route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

To test the end-to-end connectivity of each tunnel

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are listed in the launch wizard when you launch an instance from the AWS Management Console. For more information, see the Amazon VPC Getting Started Guide.
2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.
3. On a system in your home network, use the ping command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway device. A successful response should be similar to the following.

```bash
ping 10.0.0.4
```

Pinging 10.0.0.4 with 32 bytes of data:

Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128

Ping statistics for 10.0.0.4:
Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),
Approximate round trip times in milliseconds:
Minimum = 0ms, Maximum = 0ms, Average = 0ms
Note
If you ping an instance from your customer gateway device router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don't respond to ping messages from tunnel IP addresses.

4. (Optional) To test tunnel failover, you can temporarily disable one of the tunnels on your customer gateway device, and repeat the above step. You cannot disable a tunnel on the AWS side of the VPN connection.

If your tunnels don't test successfully, see Troubleshooting Cisco IOS Customer Gateway without Border Gateway Protocol Connectivity (p. 185).
Example: SonicWALL Device

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

This topic provides an example of how to configure your router if your customer gateway device is a SonicWALL router.

Before you begin, ensure that you've done the following:

- You've created a Site-to-Site VPN connection in Amazon VPC. For more information, see Getting Started in the AWS Site-to-Site VPN User Guide.
- You've read the requirements (p. 8) for your customer gateway device.

Topics
- A High-Level View of the Customer Gateway Device (p. 80)
- Example Configuration File (p. 81)
- Configuring the SonicWALL Device Using the Management Interface (p. 85)
- How to Test the Customer Gateway Configuration (p. 85)

A High-Level View of the Customer Gateway Device

The following diagram shows the general details of your customer gateway device. The VPN connection consists of two separate tunnels: Tunnel 1 and Tunnel 2. Using redundant tunnels ensures continuous availability in the case that a device fails.
The configuration file downloaded from Amazon VPC includes the values needed to use the command line tools on OS 6.2 to configure each tunnel and the IKE and IPsec settings for your SonicWALL device. 

**Important**

The following configuration information uses example values. You must use the actual values and not the example values shown here, or your implementation will fail.

```
! Amazon Web Services
! Virtual Private Cloud
!
! VPN Connection Configuration
!******************************************************************************
! AWS utilizes unique identifiers to manipulate the configuration of
! a VPN Connection. Each VPN Connection is assigned a VPN Connection Identifier
! and is associated with two other identifiers, namely the
! Customer Gateway Identifier and the Virtual Private Gateway Identifier.
!
! Your VPN Connection ID                   : vpn-44a8938f
! Your Virtual Private Gateway ID          : vgw-8db04f81
! Your Customer Gateway ID                 : cgw-ff628496
!
! This configuration consists of two tunnels. Both tunnels must be
! configured on your Customer Gateway.
!
! This configuration was tested on a SonicWALL TZ 600 running OS 6.2.5.1-26n
!
! You may need to populate these values throughout the config based on your setup:
! <vpc_subnet> - VPC address range
!
! IPSec Tunnel !1
```
! #1: Internet Key Exchange (IKE) Configuration
!
Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.
You can modify these sample configuration files to use AES128, SHA1, AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.
The address of the external interface for your customer gateway must be a static address.
Your customer gateway may reside behind a device performing network address translation (NAT).
To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.
!
config
address-object ipv4 AWSVPC network 172.30.0.0/16
vpn policy tunnel-interface vpn-44a8938f-1
gateway primary 72.21.209.193
bound-to interface X1
auth-method shared-secret
shared-secret PRE-SHARED-KEY-IN-PLAIN-TEXT
ike-id local ip your_customer_gateway_IP_address
ike-id peer ip 72.21.209.193
end
!

#2: IPSec Configuration
!
The IPSec (Phase 2) proposal defines the protocol, authentication, encryption, and lifetime parameters for our IPSec security association.
Please note, you may use these additionally supported IPSec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.
!
config
proposal ipsec lifetime 3600
proposal ipsec authentication sha1
proposal ipsec encryption aes128
proposal ipsec perfect-forward-secrecy dh-group 2
proposal ipsec protocol ESP
keep-alive
enable
commit
end
!
You can use other supported IPSec parameters for encryption such as AES256, and other DH groups such as 2, 5, 14-18, 22, 23, and 24.
IPSec Dead Peer Detection (DPD) will be enabled on the AWS Endpoint. We recommend configuring DPD on your endpoint as follows:
- DPD Interval : 120
- DPD Retries : 3
To configure Dead Peer Detection for the SonicWall device, use the SonicOS management interface.
!
#3: Tunnel Interface Configuration
!
The tunnel interface is configured with the internal IP address.
To establish connectivity between your internal network and the VPC, you must have an interface facing your internal network in the "Trust" zone.

```
config
tunnel-interface vpn T1
ip-assignment VPN static
ip 169.254.44.242 netmask 255.255.255.252
!
```

---

### BGP

#4: Border Gateway Protocol (BGP) Configuration:

BGP is used within the tunnel to exchange prefixes between the Virtual Private Gateway and your Customer Gateway. The Virtual Private Gateway will announce the prefix corresponding to your VPC.

The local BGP Autonomous System Number (ASN) (65000) is configured as part of your Customer Gateway. If the ASN must be changed, the Customer Gateway and VPN Connection will need to be recreated with AWS.

```
routing
bgp
configure terminal
router bgp YOUR_BGP_ASN
network <Local_subnet>/24
neighbor 169.254.44.242 remote-as 7224
neighbor 169.254.44.242 timers 10 30
neighbor 169.254.44.242 soft-reconfiguration inbound
end
write
exit
commit
end
```

---

### IPSec Tunnel #2

#1: Internet Key Exchange (IKE) Configuration

Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.

You can modify these sample configuration files to use AES128, SHA1, AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.

The address of the external interface for your customer gateway must be a static address.

Your customer gateway may reside behind a device performing network address translation (NAT).

To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

```
config
address-object ipv4 AWSVPC network 172.30.0.0/16
vpn policy tunnel-interface vpn-44a8938f-1
gateway primary 72.21.209.225
bound-to interface X1
auth-method shared-secret
shared-secret PRE-SHARED-KEY-IN-PLAIN-TEXT
ike-id local ip your_customer_gateway_IP_address
ike-id peer ip 72.21.209.225
end
```
#2: IPSec Configuration

The IPSec (Phase 2) proposal defines the protocol, authentication, encryption, and lifetime parameters for our IPSec security association. Please note, you may use these additionally supported IPSec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.

```config
config
proposal ipsec lifetime 3600
proposal ipsec authentication sha1
proposal ipsec encryption aes128
proposal ipsec perfect-forward-secrecy dh-group 2
proposal ipsec protocol ESP
keep-alive
enable
commit
end
```

You can use other supported IPSec parameters for encryption such as AES256, and other DH groups such as 2, 5, 14-18, 22, 23, and 24.

IPSec Dead Peer Detection (DPD) will be enabled on the AWS Endpoint. We recommend configuring DFD on your endpoint as follows:
- DPD Interval : 120
- DPD Retries : 3

To configure Dead Peer Detection for the SonicWall device, use the SonicOS management interface.

#3: Tunnel Interface Configuration

The tunnel interface is configured with the internal IP address.

To establish connectivity between your internal network and the VPC, you must have an interface facing your internal network in the "Trust" zone.

```config
config
tunnel-interface vpn T2
ip-assignment VPN static
ip 169.254.44.114 netmask 255.255.255.252
```

#4: Border Gateway Protocol (BGP) Configuration:

BGP is used within the tunnel to exchange prefixes between the Virtual Private Gateway and your Customer Gateway. The Virtual Private Gateway will announce the prefix corresponding to your VPC.

The local BGP Autonomous System Number (ASN) (65000) is configured as part of your Customer Gateway. If the ASN must be changed, the Customer Gateway and VPN Connection will need to be recreated with AWS.

```config
routing
bgp
configure terminal
router bgp YOUR_BGP_ASN
network <Local_subnet>/24
```
Configuring the SonicWALL Device Using the Management Interface

You can also configure the SonicWALL device using the SonicOS management interface. For more information, see Configuring the SonicWALL Device Using the Management Interface (p. 91).

You cannot configure BGP for the device using the management interface. Instead, use the command line instructions provided in the example configuration file above, under the section named BGP.

How to Test the Customer Gateway Configuration

You can test the gateway configuration for each tunnel.

To test the customer gateway device configuration for each tunnel

1. On your customer gateway device, determine whether the BGP status is Established.
   It takes approximately 30 seconds for a BGP peering to be established.
2. Ensure that the customer gateway device is advertising a route to the virtual private gateway. The route may be the default route (0.0.0.0/0) or a more specific route you prefer.

When properly established, your BGP peering should be receiving one route from the virtual private gateway corresponding to the prefix that your VPC integration team specified for the VPC (for example, 10.0.0.0/24). If the BGP peering is established, you are receiving a prefix, and you are advertising a prefix, your tunnel is configured correctly. Make sure that both tunnels are in this state.

Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:

- Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
- Configure your instance's security group and network ACL to enable inbound ICMP traffic.
- Ensure that you have configured routing for your VPN connection: your subnet's route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

To test the end-to-end connectivity of each tunnel

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are listed in the launch wizard when you launch an instance from the Amazon EC2 console. For more information, see the Amazon VPC Getting Started Guide.
2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.
3. On a system in your home network, use the **ping** command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway device. A successful response should be similar to the following.

```plaintext
ping 10.0.0.4
```

```
Pinging 10.0.0.4 with 32 bytes of data:
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128

Ping statistics for 10.0.0.4:
Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),
Approximate round trip times in milliseconds:
Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

**Note**

If you ping an instance from your customer gateway device router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don't respond to ping messages from tunnel IP addresses.

4. (Optional) To test tunnel failover, you can temporarily disable one of the tunnels on your customer gateway device, and repeat the above step. You cannot disable a tunnel on the AWS side of the VPN connection.

If your tunnels don't test successfully, see Troubleshooting Generic Device Customer Gateway Connectivity Using Border Gateway Protocol (p. 198).
Example: SonicWALL SonicOS Device Without Border Gateway Protocol

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

This topic provides an example of how to configure your router if your customer gateway device is a SonicWALL router running SonicOS 5.9 or 6.2.

Before you begin, ensure that you've done the following:

- You've created a Site-to-Site VPN connection in Amazon VPC. For more information, see Getting Started in the AWS Site-to-Site VPN User Guide.
- You've read the requirements (p. 8) for your customer gateway device.

Topics

- A High-Level View of the Customer Gateway Device (p. 87)
- Example Configuration File (p. 88)
- Configuring the SonicWALL Device Using the Management Interface (p. 91)
- How to Test the Customer Gateway Configuration (p. 93)

A High-Level View of the Customer Gateway Device

The following diagram shows the general details of your customer gateway device. The VPN connection consists of two separate tunnels: Tunnel 1 and Tunnel 2. Using redundant tunnels ensures continuous availability in the case that a device fails.
Example Configuration File

The configuration file downloaded from Amazon VPC includes the values needed to use the command line tools on OS 6.2 and configure each tunnel and the IKE and IPsec settings for your SonicWALL device.

**Important**
The following configuration information uses example values. You must use the actual values and not the example values shown here, or your implementation will fail.

```
! Amazon Web Services
! Virtual Private Cloud
!
! VPN Connection Configuration
! =================================================
! AWS utilizes unique identifiers to manipulate the configuration of
! a VPN Connection. Each VPN Connection is assigned a VPN Connection Identifier
! and is associated with two other identifiers, namely the
! Customer Gateway Identifier and the Virtual Private Gateway Identifier.
!
! Your VPN Connection ID : vpn-44a8938f
! Your Virtual Private Gateway ID : vgw-8db04f81
! Your Customer Gateway ID : cgw-ff628496
!
! This configuration consists of two tunnels. Both tunnels must be
! configured on your customer gateway.
!```
This configuration was tested on a SonicWALL TZ 600 running OS 6.2.5.1-26n

You may need to populate these values throughout the config based on your setup:

- `<vpc_subnet>` - VPC IP address range

#1: Internet Key Exchange (IKE) Configuration

These sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.

You can modify these sample configuration files to use AES128, SHA1, AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.

The address of the external interface for your customer gateway must be a static address.

Your customer gateway may reside behind a device performing network address translation (NAT).

To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

```
config
address-object ipv4 AWSVPC network 172.30.0.0/16
vpn policy tunnel-interface vpn-44a8938f-1
gateway primary 72.21.209.193
bound-to interface X1
auth-method shared-secret
shared-secret $PRE-SHARED-KEY-IN-PLAIN-TEXT
ike-id local ip your_customer_gateway_IP_address
ike-id peer ip 72.21.209.193
end
```

#2: IPSec Configuration

The IPSec (Phase 2) proposal defines the protocol, authentication, encryption, and lifetime parameters for our IPSec security association.

Please note, you may use these additionally supported IPSec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.

```
config
proposal ipsec lifetime 3600
proposal ipsec authentication shal
proposal ipsec encryption aes128
proposal ipsec perfect-forward-secrecy dh-group 2
proposal ipsec protocol ESP
keep-alive
enable
commit
end
```

You can use other supported IPSec parameters for encryption such as AES256, and other DH groups such as 1,2, 5, 14-18, 22, 23, and 24.

IPSec Dead Peer Detection (DPD) will be enabled on the AWS Endpoint. We recommend configuring DPD on your endpoint as follows:

- DPD Interval : 120
- DPD Retries : 3

To configure Dead Peer Detection for the SonicWall device, use the SonicOS management interface.
#3: Tunnel Interface Configuration

The tunnel interface is configured with the internal IP address.
To establish connectivity between your internal network and the VPC, you must have an interface facing your internal network in the "Trust" zone.

```
config
tunnel-interface vpn T1
ip-assignment VPN static
ip 169.254.255.6 netmask 255.255.255.252
exit
```

#4: Static Route Configuration

Create a firewall policy permitting traffic from your local subnet to the VPC subnet and vice versa.
This example policy permits all traffic from the local subnet to the VPC through the tunnel interface.

```
policy interface T1 metric 1 source any destination name AWSVPC service any
gateway 169.254.255.5
```

IPSec Tunnel

---

#1: Internet Key Exchange (IKE) Configuration

These sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.
You can modify these sample configuration files to use AES128, SHA1, AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.
The address of the external interface for your customer gateway must be a static address.
Your customer gateway may reside behind a device performing network address translation (NAT).
To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

```
config
address-object ipv4 AWSVPC network 172.30.0.0/16
vpn policy tunnel-interface vpn-44a8938f-2
gateway primary 72.21.209.225
bound-to interface X1
auth-method shared-secret
shared-secret PRE-SHARED-KEY-IN-PLAIN-TEXT
ike-id local ip your_customer_gateway_IP_address
ike-id peer ip 72.21.209.225
end
```

#2: IPSec Configuration

The IPSec (Phase 2) proposal defines the protocol, authentication, encryption, and lifetime parameters for our IPSec security association.
Configuring the SonicWALL Device Using the Management Interface

The following procedure demonstrates how to configure the VPN tunnels on the SonicWALL device using the SonicOS management interface. You must replace the example values in the procedures with the values that are provided in the configuration file.
To configure the tunnels

1. Open the SonicWALL SonicOS management interface.
2. In the left pane, choose VPN, Settings. Under VPN Policies, choose Add....
3. In the VPN policy window on the General tab, complete the following information:
   - **Policy Type**: Choose Tunnel Interface.
   - **Authentication Method**: Choose IKE using Preshared Secret.
   - **Name**: Enter a name for the VPN policy. We recommend that you use the name of the VPN ID, as provided in the configuration file.
   - **IPsec Primary Gateway Name or Address**: Enter the IP address of the virtual private gateway (AWS endpoint) as provided in the configuration file; for example, 72.21.209.193.
   - **IPsec Secondary Gateway Name or Address**: Leave the default value.
   - **Shared Secret**: Enter the pre-shared key as provided in the configuration file, and enter it again in Confirm Shared Secret.
   - **Local IKE ID**: Enter the IPv4 address of the customer gateway (the SonicWALL device).
   - **Peer IKE ID**: Enter the IPv4 address of the virtual private gateway (AWS endpoint).
4. On the Network tab, complete the following information:
   - Under Local Networks, choose Any address. We recommend this option to prevent connectivity issues from your local network.
   - Under Remote Networks, choose Choose a destination network from list. Create an address object with the CIDR of your VPC in AWS.
5. On the Proposals tab, complete the following information:
   - Under IKE (Phase 1) Proposal, do the following:
     - **Exchange**: Choose Main Mode.
     - **DH Group**: Enter a value for the Diffie-Hellman group; for example, 2.
     - **Encryption**: Choose AES-128 or AES-256.
     - **Authentication**: Choose SHA1 or SHA256.
     - **Life Time**: Enter 28800.
   - Under IKE (Phase 2) Proposal, do the following:
     - **Protocol**: Choose ESP.
     - **Encryption**: Choose AES-128 or AES-256.
     - **Authentication**: Choose SHA1 or SHA256.
     - Select the Enable Perfect Forward Secrecy check box, and choose the Diffie-Hellman group.
     - **Life Time**: Enter 3600.
   - **Important**: If you created your virtual private gateway before October 2015, you must specify Diffie-Hellman group 2, AES-128, and SHA1 for both phases.
6. On the Advanced tab, complete the following information:
   - Select Enable Keep Alive.
   - Select Enable Phase2 Dead Peer Detection and enter the following:
     - For Dead Peer Detection Interval, enter 60 (this is the minimum that the SonicWALL device accepts).
     - For Failure Trigger Level, enter 3.
   - For VPN Policy bound to, select Interface X1. This is the interface that’s typically designated for public IP addresses.
7. Choose **OK**. On the **Settings** page, the **Enable** check box for the tunnel should be selected by default. A green dot indicates that the tunnel is up.

How to Test the Customer Gateway Configuration

You must first test the gateway configuration for each tunnel.

**To test the customer gateway device configuration for each tunnel**

- On your customer gateway device, verify that you have added a static route to the VPC CIDR IP space to use the tunnel interface.

Next, you must test the connectivity for each tunnel by launching an instance into your VPC and pinging the instance from your home network. Before you begin, make sure of the following:

- Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
- Configure your instance's security group and network ACL to enable inbound ICMP traffic.
- Ensure that you have configured routing for your VPN connection; your subnet's route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

**To test the end-to-end connectivity of each tunnel**

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are available in the **Quick Start** menu when you use the Launch Instances wizard in the AWS Management Console. For more information, see the Amazon VPC Getting Started Guide.
2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.
3. On a system in your home network, use the **ping** command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway. A successful response should be similar to the following:

```
ping 10.0.0.4
```

```
Pinging 10.0.0.4 with 32 bytes of data:
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),
Approximate round trip times in milliseconds:
Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

**Note**

If you ping an instance from your customer gateway router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don't respond to ping messages from tunnel IP addresses.
If your tunnels don't test successfully, see Troubleshooting Generic Device Customer Gateway Connectivity Using Border Gateway Protocol (p. 198).
Example: Fortinet Fortigate Device

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

The following topic provides example configuration information provided by your integration team if your customer gateway device is a Fortinet Fortigate 40+ device.

Two diagrams illustrate the example configuration. The first diagram shows the high-level layout of the customer gateway device, and the second diagram shows the details of the example configuration. You should use the real configuration information that you receive from your integration team and apply it to your customer gateway device.

Before you begin, ensure that you've done the following:

• You've created a Site-to-Site VPN connection in Amazon VPC. For more information, see Getting Started in the AWS Site-to-Site VPN User Guide.
• You've read the requirements (p. 8) for your customer gateway device.

Topics
• A High-Level View of the Customer Gateway Device (p. 96)
• A Detailed View of the Customer Gateway Device and an Example Configuration (p. 96)
• How to Test the Customer Gateway Configuration (p. 104)
A High-Level View of the Customer Gateway Device

The following diagram shows the general details of your customer gateway device. The VPN connection consists of two separate tunnels. Using redundant tunnels ensures continuous availability in the case that a device fails.

A Detailed View of the Customer Gateway Device and an Example Configuration

The diagram in this section illustrates an example Fortinet customer gateway device. Following the diagram, there is a corresponding example of the configuration information your integration team should provide. The example configuration contains a set of information for each of the tunnels that you must configure.

In addition, the example configuration refers to these items that you must provide:

- **YOUR_UPLINK_ADDRESS**—The IP address for the Internet-routable external interface on the customer gateway (which must be static, and may be behind a device performing network address translation (NAT)).
- **YOUR_BGP_ASN**—The customer gateway's BGP ASN (we use 65000 by default)

The example configuration includes several example values to help you understand how configuration works. For example, we provide example values for the VPN connection ID (vpn-44a8938f), virtual private gateway ID (vgw-8db04f81), the IP addresses (72.21.209.*, 169.254.255.*), and the remote ASN
(7224). Replace these example values with the actual values from the configuration information that you receive.

In the following diagram and example configuration, you must replace the placeholder values are indicated by colored italic text with values that apply to your particular configuration.

---

**Warning**
The following configuration information is an example of what you can expect your integration team to provide. Many of the values in the following example are different from the actual configuration information that you receive. You must use the actual values and not the example values shown here, or your implementation will fail.

```plaintext
Your VPN Connection ID: vpn-44a893ef
```
Your Virtual Private Gateway ID : vgw-8db04f81
Your Customer Gateway ID    : cgw-b4dc3961

This configuration consists of two tunnels. Both tunnels must be configured on your Customer Gateway.

#1: Internet Key Exchange (IKE) Configuration

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman, lifetime, and key parameters.

Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.

You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.

The address of the external interface for your customer gateway must be a static address.

Your customer gateway may reside behind a device performing network address translation (NAT).

To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

Configuration begins in root VDOM.

config vpn ipsec phase1-interface
edit vpn-44a8938f-0 ! Name must be shorter than 15 chars, best if shorter than 12
set interface "wan1"

The IPSec Dead Peer Detection causes periodic messages to be sent to ensure a Security Association remains operational

set dpd enable
set local-gw YOUR_UPLINK_ADDRESS
set dhgrp 2
set proposal aes128-sha1
set keylife 28800
set remote-gw 72.21.209.193
set psksecret plain-text-password1
set dpd-retryinterval 10
next
end

#2: IPSec Configuration

The IPSec transform set defines the encryption, authentication, and IPSec mode parameters.

Please note, you may use these additionally supported IPSec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.

config vpn ipsec phase2-interface
edit "vpn-44a8938f-0"
set phase1name "vpn-44a8938f-0"
set proposal aes128-sha1
set dhgrp 2
set keylifeseconds 3600
next

#!/usr/bin/tcsh

! #3: Tunnel Interface Configuration
!
! A tunnel interface is configured to be the logical interface associated
! with the tunnel. All traffic routed to the tunnel interface will be
! encrypted and transmitted to the VPC. Similarly, traffic from the VPC
! will be logically received on this interface.
!
! The address of the interface is configured with the setup for your
! Customer Gateway. If the address changes, the Customer Gateway and VPN
! Connection must be recreated with Amazon VPC.
!
config system interface
edit "vpn-44a8938f-0"
  set vdom "root"
  set ip 169.254.255.2 255.255.255.255
  set allowaccess ping
  set type tunnel
!
! This option causes the router to reduce the Maximum Segment Size of
! TCP packets to prevent packet fragmentation.
!
  set tcp-mss 1387
  set remote-ip 169.254.255.1
  set mtu 1427
  set interface "wan1"
next

!/usr/bin/tcsh

! #4: Border Gateway Protocol (BGP) Configuration
!
! BGP is used within the tunnel to exchange prefixes between the
! Virtual Private Gateway and your Customer Gateway. The Virtual Private Gateway
! will announce the prefix corresponding to your VPC.
!
! The local BGP Autonomous System Number (ASN) (YOUR_BGP ASN)
! is configured as part of your Customer Gateway. If the ASN must
! be changed, the Customer Gateway and VPN Connection will need to be recreated with AWS.
!
config router bgp
set as YOUR_BGP ASN
config neighbor
  edit 169.254.255.1
Amazon Virtual Private Cloud Network Administrator Guide
A Detailed View of the Customer Gateway
Device and an Example Configuration

set remote-as 7224
end

! Your Customer Gateway may announce a default route (0.0.0.0/0) to us.
! This is done using prefix list and route-map in Fortigate.

config router bgp
config neighbor
edit 169.254.255.1
set capability-default-originate enable
end
end

config router prefix-list
edit "default_route"
config rule
edit 1
set prefix 0.0.0.0 0.0.0.0
next
end
set router-id YOUR_UPLINK_ADDRESS
end

config router route-map
edit "routemap1"

IPSec Tunnel #2
--

#1: Internet Key Exchange (IKE) Configuration

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman, lifetime, and key parameters.

The address of the external interface for your customer gateway must be a static address.

Your customer gateway may reside behind a device performing network address translation (NAT).

To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

Configuration begins in root VDOM.

cfg vpn ipsec phase1-interface
ed it vprn-44a8938f-1 ! Name must be shorter than 15 chars, best if shorter than 12
set interface "wan1"

The IPSec Dead Peer Detection causes periodic messages to be sent to ensure a Security Association remains operational.

set dpd enable
set local-gw YOUR_UPLINK_ADDRESS
set dhgrp 2
set proposal aes128-sha1
set keylife 28800
set remote-gw 72.21.209.225
set psksecret plain-text-password2
set dpd-retryinterval 10
next
end
#2: IPSec Configuration

The IPSec transform set defines the encryption, authentication, and IPSec mode parameters.

Please note, you may use these additionally supported IPSec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.

```bash
config vpn ipsec phase2-interface
edit "vpn-44a8938f-1"
  set phase1name "vpn-44a8938f-1"
  set proposal aes128-sha1
  set dhgrp 2
  set keylifeseconds 3600
next
```

#3: Tunnel Interface Configuration

A tunnel interface is configured to be the logical interface associated with the tunnel. All traffic routed to the tunnel interface will be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

The address of the interface is configured with the setup for your Customer Gateway. If the address changes, the Customer Gateway and VPN Connection must be recreated with Amazon VPC.

```bash
config system interface
edit "vpn-44a8938f-1"
  set vdom "root"
  set ip 169.254.255.6 255.255.255.255
  set allowaccess ping
  set type tunnel
  set tcp-mss 1387
  set remote-ip 169.254.255.5
  set mtu 1427
  set interface "wan1"
next
```

#4: Border Gateway Protocol (BGP) Configuration

BGP is used within the tunnel to exchange prefixes between the
! Virtual Private Gateway and your Customer Gateway. The Virtual Private Gateway
! will announce the prefix corresponding to your VPC.
!
! The local BGP Autonomous System Number (ASN) (`YOUR_BGP_ASN`)
! is configured as part of your Customer Gateway. If the ASN must
! be changed, the Customer Gateway and VPN Connection will need to be recreated with AWS.
!
```config
router bgp
  set as `YOUR_BGP_ASN`
neighbor
  169.254.255.5
    set remote-as 7224
end
```

! Your Customer Gateway may announce a default route (0.0.0.0/0) to us.
! This is done using prefix list and route-map in Fortigate.

```config
router bgp
neighbor
  169.254.255.5
    set capability-default-originate enable
end

router prefix-list
  default_route
    rule 1
      prefix 0.0.0.0 0.0.0.0
      next
    router-id `YOUR_UPLINK_ADDRESS`
end

router route-map
  routemap1
    rule 1
      match-ip-address "default_route"
      next
    next
end
```

! To advertise additional prefixes to Amazon VPC, add these prefixes to the 'network'
! statement and identify the prefix you wish to advertise. Make sure the prefix is present
! in the routing table of the device with a valid next-hop. If you want to advertise
! 192.168.0.0/16 to Amazon, this can be done using the following:

```config
router bgp
network
  192.168.0.0 255.255.0.0
end
```

```config
router bgp
  set router-id `YOUR_UPLINK_ADDRESS`
end
```
How to Test the Customer Gateway Configuration

You can test the gateway configuration for each tunnel.

To test the customer gateway device configuration for each tunnel

1. On your customer gateway device, determine whether the BGP status is Established.

   It takes approximately 30 seconds for a BGP peering to be established.

2. Ensure that the customer gateway device is advertising a route to the virtual private gateway. The route may be the default route (0.0.0.0/0) or a more specific route you prefer.

When properly established, your BGP peering should be receiving one route from the virtual private gateway corresponding to the prefix that your VPC integration team specified for the VPC (for example, 10.0.0.0/24). If the BGP peering is established, you are receiving a prefix, and you are advertising a prefix, your tunnel is configured correctly. Make sure that both tunnels are in this state.
Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:

- Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
- Configure your instance's security group and network ACL to enable inbound ICMP traffic.
- Ensure that you have configured routing for your VPN connection: your subnet's route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

**To test the end-to-end connectivity of each tunnel**

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are listed in the launch wizard when you launch an instance from the Amazon EC2 console. For more information, see the Amazon VPC Getting Started Guide.

2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.

3. On a system in your home network, use the **ping** command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway device. A successful response should be similar to the following.

```
ping 10.0.0.4
```

```
Pinging 10.0.0.4 with 32 bytes of data:
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128

Ping statistics for 10.0.0.4:
Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),
Approximate round trip times in milliseconds:
Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

**Note**

If you ping an instance from your customer gateway device router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don't respond to ping messages from tunnel IP addresses.

4. (Optional) To test tunnel failover, you can temporarily disable one of the tunnels on your customer gateway device, and repeat the above step. You cannot disable a tunnel on the AWS side of the VPN connection.
Example: Juniper J-Series JunOS Device

This guide (the *Network Administrator Guide*) has been merged into the *AWS Site-to-Site VPN User Guide* and is no longer maintained. For more information about configuring your customer gateway device, see the *AWS Site-to-Site VPN User Guide*.

In this section, you get an example of the configuration information provided by your integration team if your customer gateway device is a Juniper J-Series router running JunOS 9.5 (or later) software.

Two diagrams illustrate the example configuration. The first diagram shows the high-level layout of the customer gateway device, and the second diagram shows details from the example configuration. You should use the real configuration information that you receive from your integration team and apply it to your customer gateway device.

Before you begin, ensure that you've done the following:

- You've created a Site-to-Site VPN connection in Amazon VPC. For more information, see *Getting Started* in the *AWS Site-to-Site VPN User Guide*.
- You've read the requirements (p. 8) for your customer gateway device.

Topics

- A High-Level View of the Customer Gateway Device (p. 107)
- A Detailed View of the Customer Gateway Device and an Example Configuration (p. 108)
- How to Test the Customer Gateway Configuration (p. 114)
A High-Level View of the Customer Gateway Device

The following diagram shows the general details of your customer gateway device. The VPN connection consists of two separate tunnels. Using redundant tunnels ensures continuous availability in the case that a device fails.
A Detailed View of the Customer Gateway Device and an Example Configuration

The diagram in this section illustrates an example Juniper JunOS customer gateway device. Following the diagram, there is a corresponding example of the configuration information your integration team should provide. The example configuration contains a set of information for each of the tunnels that you must configure.

In addition, the example configuration refers to these items that you must provide:

- **YOUR_UPLINK_ADDRESS**—The IP address for the Internet-routable external interface on the customer gateway device. The address must be static, and may be behind a device performing network address translation (NAT). To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500.

- **YOUR_BGP_ASN**—The customer gateway's BGP ASN (we use 65000 by default)

The example configuration includes several example values to help you understand how configuration works. For example, we provide example values for the VPN connection ID (vpn-44a8938f), virtual private gateway ID (vgw-8db04f81), the IP addresses (72.21.209.*, 169.254.255.*), and the remote ASN (7224). Replace these example values with the actual values from the configuration information that you receive.

In addition, you must:

- Configure the outside interface (referred to as `ge-0/0/0.0` in the example configuration).
- Configure the tunnel interface IDs (referred to as `st0.1` and `st0.2` in the example configuration).
- Configure all internal routing that moves traffic between the customer gateway and your local network.
- Identify the security zone for the uplink interface (the following configuration information uses the default “untrust” zone).
- Identify the security zone for the inside interface (the following configuration information uses the default “trust” zone).

In the following diagram and example configuration, you must replace the items in red italics with values that apply to your particular configuration.
Warning
The following configuration information is an example of what you can expect your integration team to provide. Many of the values in the following example are different from the actual configuration information that you receive. You must use the actual values and not the example values shown here, or your implementation will fail.

```plaintext
# Amazon Web Services
# Virtual Private Cloud
#
# AWS utilizes unique identifiers to manipulate the configuration of
# a VPN Connection. Each VPN Connection is assigned a VPN Connection
# Identifier and is associated with two other identifiers, namely the
# Customer Gateway Identifier and the Virtual Private Gateway Identifier.
#
# Your VPN Connection ID          : vpn-44a8938f
# Your Virtual Private Gateway ID : vgw-8db04f81
# Your Customer Gateway ID        : cgw-b4dc3961
#
# This configuration consists of two tunnels. Both tunnels must be
# configured on your Customer Gateway.
#

# IPsec Tunnel #1
# ---------------------------------------------------------------

IKE

# #1: Internet Key Exchange (IKE) Configuration
#
# A proposal is established for the supported IKE encryption,
# authentication, Diffie-Hellman, and lifetime parameters.
#
# Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.
```
# You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.
# The address of the external interface for your customer gateway must be a static address.
# To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

```bash
set security ike proposal ike-prop-vpn-44a8938f-1 authentication-method pre-shared-keys
set security ike proposal ike-prop-vpn-44a8938f-1 authentication-algorithm sha1
set security ike proposal ike-prop-vpn-44a8938f-1 encryption-algorithm aes-128-cbc
set security ike proposal ike-prop-vpn-44a8938f-1 lifetime-seconds 28800
set security ike proposal ike-prop-vpn-44a8938f-1 dh-group group2
```

# An IKE policy is established to associate a Pre Shared Key with the defined proposal.

```bash
set security ike policy ike-pol-vpn-44a8938f-1 mode main
set security ike policy ike-pol-vpn-44a8938f-1 proposals ike-prop-vpn-44a8938f-0 pre-shared-key ascii-text plain-text-password1
```

# The IKE gateway is defined to be the Virtual Private Gateway. The gateway configuration associates a local interface, remote IP address, and IKE policy.

```bash
set security ike gateway gw-vpn-44a8938f-1 ike-policy ike-pol-vpn-44a8938f-0
set security ike gateway gw-vpn-44a8938f-1 external-interface ge-0/0/0.0
set security ike gateway gw-vpn-44a8938f-1 address 72.21.209.225
```

# Troubleshooting IKE connectivity can be aided by enabling IKE tracing.
# The configuration below will cause the router to log IKE messages to the 'kmd' log. Run 'show messages kmd' to retrieve these logs.

```bash
set security ike traceoptions file kmd
set security ike traceoptions file size 1024768
set security ike traceoptions file files 10
set security ike traceoptions flag all
```

# 2: IPsec Configuration

# The IPsec proposal defines the protocol, authentication, encryption, and lifetime parameters for our IPsec security association.
# Please note, you may use these additionally supported IPsec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.

```bash
set security ipsec proposal ipsec-prop-vpn-44a8938f-1 protocol esp
set security ipsec proposal ipsec-prop-vpn-44a8938f-1 authentication-algorithm hmac-sha1-96
set security ipsec proposal ipsec-prop-vpn-44a8938f-1 encryption-algorithm aes-128-cbc
set security ipsec proposal ipsec-prop-vpn-44a8938f-1 lifetime-seconds 3600
```

# The IPsec policy incorporates the Diffie-Hellman group and the IPsec proposal.

```bash
set security ipsec policy ipsec-pol-vpn-44a8938f-1 perfect-forward-secrecy keys group2
set security ipsec policy ipsec-pol-vpn-44a8938f-1 proposals ipsec-prop-vpn-44a8938f-0
```
A security association is defined here. The IPsec Policy and IKE gateways are associated with a tunnel interface (st0.1).

The tunnel interface ID is assumed; if other tunnels are defined on your router, you will need to specify a unique interface name (for example, st0.10).

```
set security ipsec vpn vpn-44a8938f-1 bind-interface st0.1
set security ipsec vpn vpn-44a8938f-1 ike gateway gw-vpn-44a8938f-0
set security ipsec vpn vpn-44a8938f-1 ike ipsec-policy ipsec-pol-vpn-44a8938f-0
set security ipsec vpn vpn-44a8938f-1 df-bit clear
```

This option enables IPsec Dead Peer Detection, which causes periodic messages to be sent to ensure a Security Association remains operational.

```
set security ike gateway gw-vpn-44a8938f-1 dead-peer-detection
```

# #3: Tunnel Interface Configuration

The tunnel interface is configured with the internal IP address.

```
set interfaces st0.1 family inet address 169.254.255.2/30
set interfaces st0.1 family inet mtu 1436
set security zones security-zone trust interfaces st0.1
```

The security zone protecting external interfaces of the router must be configured to allow IKE traffic inbound.

```
set security zones security-zone untrust host-inbound-traffic system-services ike
```

The security zone protecting internal interfaces (including the logical tunnel interfaces) must be configured to allow BGP traffic inbound.

```
set security zones security-zone trust host-inbound-traffic protocols bgp
```

This option causes the router to reduce the Maximum Segment Size of TCP packets to prevent packet fragmentation.

```
set security flow tcp-mss ipsec-vpn mss 1387
```

# #4: Border Gateway Protocol (BGP) Configuration

BGP is used within the tunnel to exchange prefixes between the Virtual Private Gateway and your Customer Gateway. The Virtual Private Gateway will announce the prefix corresponding to your VPC.

```
# Your Customer Gateway may announce a default route (0.0.0.0/0),
# which can be done with the EXPORT-DEFAULT policy.
# To advertise additional prefixes to Amazon VPC, add additional prefixes to the "default" term
# EXPORT-DEFAULT policy. Make sure the prefix is present in the routing table of the device with
# a valid next-hop.
# The BGP timers are adjusted to provide more rapid detection of outages.
# The local BGP Autonomous System Number (ASN) (YOUR_BGP_ASN) is configured as part of your Customer Gateway. If the ASN must be changed, the
```

111
# Customer Gateway and VPN Connection will need to be recreated with AWS.

# We establish a basic route policy to export a default route to the
# Virtual Private Gateway.

set policy-options policy-statement EXPORT-DEFAULT term default from route-filter 0.0.0.0/0

set interfaces st0.2 family inet mtu 1436
set security zones security-zone trust interfaces st0.2
```

# The security zone protecting external interfaces of the router must be # configured to allow IKE traffic inbound.

```plaintext
set security zones security-zone untrust host-inbound-traffic system-services ike
```

# The security zone protecting internal interfaces (including the logical # tunnel interfaces) must be configured to allow BGP traffic inbound.
How to Test the Customer Gateway Configuration

You can test the gateway configuration for each tunnel.

To test the customer gateway device configuration for each tunnel

1. On your customer gateway device, determine whether the BGP status is Established.
   It takes approximately 30 seconds for a BGP peering to be established.

2. Ensure that the customer gateway device is advertising a route to the virtual private gateway. The route may be the default route (0.0.0.0/0) or a more specific route you prefer.

   When properly established, your BGP peering should be receiving one route from the virtual private gateway corresponding to the prefix that your VPC integration team specified for the VPC (for example,
10.0.0.0/24). If the BGP peering is established, you are receiving a prefix, and you are advertising a prefix, your tunnel is configured correctly. Make sure that both tunnels are in this state.

Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:

- Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
- Configure your instance's security group and network ACL to enable inbound ICMP traffic.
- Ensure that you have configured routing for your VPN connection: your subnet's route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

To test the end-to-end connectivity of each tunnel

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are listed in the launch wizard when you launch an instance from the Amazon EC2 console. For more information, see the Amazon VPC Getting Started Guide.
2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.
3. On a system in your home network, use the ping command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway device. A successful response should be similar to the following.

```bash
ping 10.0.0.4
```

```
Pinging 10.0.0.4 with 32 bytes of data:
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Ping statistics for 10.0.0.4:
Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),
Approximate round trip times in milliseconds:
Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

**Note**
If you ping an instance from your customer gateway device router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don't respond to ping messages from tunnel IP addresses.

4. (Optional) To test tunnel failover, you can temporarily disable one of the tunnels on your customer gateway device, and repeat the above step. You cannot disable a tunnel on the AWS side of the VPN connection.

If your tunnels don't test successfully, see Troubleshooting Juniper JunOS Customer Gateway Connectivity (p. 189).
Example: Juniper SRX JunOS Device

In this section, you get an example of the configuration information provided by your integration team if your customer gateway device is a Juniper SRX router running JunOS 11.0 (or later) software.

Two diagrams illustrate the example configuration. The first diagram shows the high-level layout of the customer gateway device, and the second diagram shows details from the example configuration. You should use the real configuration information that you receive from your integration team and apply it to your customer gateway device.

Before you begin, ensure that you've done the following:

- You've created a Site-to-Site VPN connection in Amazon VPC. For more information, see Getting Started in the AWS Site-to-Site VPN User Guide.
- You've read the requirements (p. 8) for your customer gateway device.

Topics

- A High-Level View of the Customer Gateway Device (p. 117)
- A Detailed View of the Customer Gateway Device and an Example Configuration (p. 118)
- How to Test the Customer Gateway Configuration (p. 124)
A High-Level View of the Customer Gateway Device

The following diagram shows the general details of your customer gateway device. The VPN connection consists of two separate tunnels. Using redundant tunnels ensures continuous availability in the case that a device fails.
A Detailed View of the Customer Gateway Device and an Example Configuration

The diagram in this section illustrates an example Juniper JunOS 11.0+ customer gateway device. Following the diagram, there is a corresponding example of the configuration information your integration team should provide. The example configuration contains a set of information for each of the tunnels that you must configure.

In addition, the example configuration refers to these items that you must provide:

- **YOUR_UPLINK_ADDRESS**—The IP address for the Internet-routable external interface on the customer gateway. The address must be static, and may be behind a device performing network address translation (NAT). To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500.

- **YOUR_BGP_ASN**—The customer gateway's BGP ASN (we use 65000 by default)

The example configuration includes several example values to help you understand how configuration works. For example, we provide example values for the VPN connection ID (vpn-44a8938f), virtual private gateway ID (vgw-8db04f81), the IP addresses (72.21.209.*, 169.254.255.*), and the remote ASN (7224). Replace these example values with the actual values from the configuration information that you receive.

In addition, you must:

- Configure the outside interface (referred to as `ge-0/0/0.0` in the example configuration).
- Configure the tunnel interface IDs (referred to as `st0.1` and `st0.2` in the example configuration).
- Configure all internal routing that moves traffic between the customer gateway and your local network.
- Identify the security zone for the uplink interface (the following configuration information uses the default “untrust” zone).
- Identify the security zone for the inside interface (the following configuration information uses the default “trust” zone).

In the following diagram and example configuration, you must replace the placeholder values are indicated by colored italic text with values that apply to your particular configuration.
Warning
The following configuration information is an example of what you can expect your integration team to provide. Many of the values in the following example are different from the actual configuration information that you receive. You must use the actual values and not the example values shown here, or your implementation will fail.

```bash
# Amazon Web Services
# Virtual Private Cloud
#
# AWS utilizes unique identifiers to manipulate the configuration of
# a VPN Connection. Each VPN Connection is assigned a VPN Connection
# Identifier and is associated with two other identifiers, namely the
# Customer Gateway Identifier and the Virtual Private Gateway Identifier.
#
# Your VPN Connection ID          : vpn-44a8938f
# Your Virtual Private Gateway ID : vgw-8db04f81
# Your Customer Gateway ID        : cgw-b4dc3961
#
# This configuration consists of two tunnels. Both tunnels must be
# configured on your Customer Gateway.
#
# -------------------------------------------
# IPsec Tunnel #1
# -------------------------------------------

IKE

# #1: Internet Key Exchange (IKE) Configuration
# # A proposal is established for the supported IKE encryption,
# # authentication, Diffie-Hellman, and lifetime parameters.
# # Please note, these sample configurations are for the minimum requirement of AES128, SHA1,
# # and DH Group 2.
```
# You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.

# The address of the external interface for your customer gateway must be a static address.

# To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

set security ike policy ike-pol-vpn-44a8938f-1 proposals ike-prop-vpn-44a8938f-1
set security ike policy ike-pol-vpn-44a8938f-1 pre-shared-key ascii-text plain-text-password1
```

# The IKE gateway is defined to be the Virtual Private Gateway. The gateway configuration associates a local interface, remote IP address, and IKE policy.

```plaintext
# This example shows the outside of the tunnel as interface ge-0/0/0.0.  
# This should be set to the interface that IP address YOUR_UPLINK_ADDRESS is associated with.  
# This address is configured with the setup for your Customer Gateway.  
# If the address changes, the Customer Gateway and VPN Connection must be recreated.
set security ike gateway gw-vpn-44a8938f-1 ike-policy ike-pol-vpn-44a8938f-1
set security ike gateway gw-vpn-44a8938f-1 external-interface ge-0/0/0.0
set security ike gateway gw-vpn-44a8938f-1 address 72.21.209.225
set security ike gateway gw-vpn-44a8938f-1 no-nat-traversal
```

# Troubleshooting IKE connectivity can be aided by enabling IKE tracing.

```plaintext
# The configuration below will cause the router to log IKE messages to the 'kmd' log. Run 'show messages kmd' to retrieve these logs.
set security ike traceoptions file kmd
set security ike traceoptions file size 1024768
set security ike traceoptions file files 10
set security ike traceoptions flag all
```

# #2: IPsec Configuration

# The IPsec proposal defines the protocol, authentication, encryption, and lifetime parameters for our IPsec security association.
# Please note, you may use these additionally supported IPsec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.

```plaintext
set security ipsec proposal ipsec-prop-vpn-44a8938f-1 protocol esp
set security ipsec proposal ipsec-prop-vpn-44a8938f-1 authentication-algorithm hmac-sha1-96
set security ipsec proposal ipsec-prop-vpn-44a8938f-1 encryption-algorithm aes-128-cbc
set security ipsec proposal ipsec-prop-vpn-44a8938f-1 lifetime-seconds 3600
```

# The IPsec policy incorporates the Diffie-Hellman group and the IPsec proposal.

```plaintext
set security ipsec policy ipsec-pol-vpn-44a8938f-1 perfect-forward-secrecy keys group2
set security ipsec policy ipsec-pol-vpn-44a8938f-1 proposals ipsec-prop-vpn-44a8938f-1
```
A security association is defined here. The IPsec Policy and IKE gateways are associated with a tunnel interface (st0.1).

The tunnel interface ID is assumed; if other tunnels are defined on your router, you will need to specify a unique interface name (for example, st0.10).

```
set security ipsec vpn vpn-44a8938f-1 bind-interface st0.1
set security ipsec vpn vpn-44a8938f-1 ike gateway gw-vpn-44a8938f-1
set security ipsec vpn vpn-44a8938f-1 ike ipsec-policy ipsec-pol-vpn-44a8938f-1
df-bit clear
```

This option enables IPsec Dead Peer Detection, which causes periodic messages to be sent to ensure a Security Association remains operational.

```
set security ike gateway gw-vpn-44a8938f-1 dead-peer-detection
```

### #3: Tunnel Interface Configuration

The tunnel interface is configured with the internal IP address.

```
set interfaces st0.1 family inet address 169.254.255.2/30
set interfaces st0.1 family inet mtu 1436
set security zones security-zone trust interfaces st0.1
```

The security zone protecting external interfaces of the router must be configured to allow IKE traffic inbound.

```
set security zones security-zone untrust host-inbound-traffic system-services ike
```

The security zone protecting internal interfaces (including the logical tunnel interfaces) must be configured to allow BGP traffic inbound.

```
set security zones security-zone trust host-inbound-traffic protocols bgp
```

This option causes the router to reduce the Maximum Segment Size of TCP packets to prevent packet fragmentation.

```
set security flow tcp-mss ipsec-vpn mss 1387
```

### #4: Border Gateway Protocol (BGP) Configuration

BGP is used within the tunnel to exchange prefixes between the Virtual Private Gateway and your Customer Gateway. The Virtual Private Gateway will announce the prefix corresponding to your VPC.

```
set security ike gateway gw-vpn-44a8938f-1 dead-peer-detection
```

Your Customer Gateway may announce a default route (0.0.0.0/0), which can be done with the EXPORT-DEFAULT policy.

```
To advertise additional prefixes to Amazon VPC, add additional prefixes to the "default" term EXPORT-DEFAULT policy. Make sure the prefix is present in the routing table of the device with a valid next-hop.
```

The BGP timers are adjusted to provide more rapid detection of outages.

```
The local BGP Autonomous System Number (ASN) (YOUR_BGP ASN) is configured
```
# as part of your Customer Gateway. If the ASN must be changed, the
# Customer Gateway and VPN Connection will need to be recreated with AWS.
#
# We establish a basic route policy to export a default route to the
# Virtual Private Gateway.
#

---

**How to Test the Customer Gateway Configuration**

You can test the gateway configuration for each tunnel.

**To test the customer gateway device configuration for each tunnel**

1. On your customer gateway device, determine whether the BGP status is Established.
   It takes approximately 30 seconds for a BGP peering to be established.
2. Ensure that the customer gateway device is advertising a route to the virtual private gateway. The
   route may be the default route (0.0.0.0/0) or a more specific route you prefer.
When properly established, your BGP peering should be receiving one route from the virtual private gateway corresponding to the prefix that your VPC integration team specified for the VPC (for example, 10.0.0.0/24). If the BGP peering is established, you are receiving a prefix, and you are advertising a prefix, your tunnel is configured correctly. Make sure that both tunnels are in this state.

Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:

- Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
- Configure your instance's security group and network ACL to enable inbound ICMP traffic.
- Ensure that you have configured routing for your VPN connection: your subnet's route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

To test the end-to-end connectivity of each tunnel

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are listed in the launch wizard when you launch an instance from the Amazon EC2 console. For more information, see the Amazon VPC Getting Started Guide.
2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.
3. On a system in your home network, use the ping command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway device. A successful response should be similar to the following.

```
ping 10.0.0.4
```

```
Pinging 10.0.0.4 with 32 bytes of data:
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Ping statistics for 10.0.0.4:
Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),
Approximate round trip times in milliseconds:
Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

**Note**

If you ping an instance from your customer gateway device router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don't respond to ping messages from tunnel IP addresses.

4. (Optional) To test tunnel failover, you can temporarily disable one of the tunnels on your customer gateway device, and repeat the above step. You cannot disable a tunnel on the AWS side of the VPN connection.

If your tunnels don't test successfully, see Troubleshooting Juniper JunOS Customer Gateway Connectivity (p. 189).
Example: Juniper ScreenOS Device

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

In this section, you get an example of the configuration information provided by your integration team if your customer gateway device is a Juniper SSG or Netscreen series device running Juniper ScreenOS software.

Two diagrams illustrate the example configuration. The first diagram shows the high-level layout of the customer gateway device, and the second diagram shows details from the example configuration. You should use the real configuration information that you receive from your integration team and apply it to your customer gateway device.

Before you begin, ensure that you’ve done the following:

- You’ve created a Site-to-Site VPN connection in Amazon VPC. For more information, see Getting Started in the AWS Site-to-Site VPN User Guide.
- You’ve read the requirements (p. 8) for your customer gateway device.

Topics

- A High-Level View of the Customer Gateway Device (p. 127)
- A Detailed View of the Customer Gateway Device and an Example Configuration (p. 128)
- How to Test the Customer Gateway Configuration (p. 133)
A High-Level View of the Customer Gateway Device

The following diagram shows the general details of your customer gateway device. The VPN connection consists of two separate tunnels. Using redundant tunnels ensures continuous availability in the case that a device fails.
A Detailed View of the Customer Gateway Device and an Example Configuration

The diagram in this section illustrates an example Juniper ScreenOS customer gateway device. Following the diagram, there is a corresponding example of the configuration information your integration team should provide. The example configuration contains information for each of the tunnels that you must configure.

In addition, the example configuration refers to these items that you must provide:

- **YOUR_UPLINK_ADDRESS**—The IP address for the Internet-routable external interface on the customer gateway device. The address must be static, and may be behind a device performing network address translation (NAT). To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500.
- **YOUR_BGP_ASN**—The customer gateway's BGP ASN (we use 65000 by default)

The example configuration includes several example values to help you understand how configuration works. For example, we provide example values for the VPN connection ID (vpn-44a8938f), virtual private gateway ID (vgw-8db04f81), the IP addresses (72.21.209.*, 169.254.255.*), and the remote ASN (7224). Replace these example values with the actual values from the configuration information that you receive.

In addition, you must:

- Configure the outside interface (referred to as ethernet0/0 in the example configuration).
- Configure the tunnel interface IDs (referred to as tunnel.1 and tunnel.2 in the example configuration).
- Configure all internal routing that moves traffic between the customer gateway and your local network.

In the following diagram and example configuration, you must replace the placeholder values are indicated by colored italic text with values that apply to your particular configuration.
Warning
The following configuration information is an example of what you can expect your integration team to provide. Many of the values in the following example are different from the configuration information that you receive. You must use the actual values and not the example values shown here, or your implementation will fail.

Important
The configuration below is appropriate for ScreenOS versions 6.2 and later. You can download a configuration that is specific to ScreenOS version 6.1. In the Download Configuration dialog box, select Juniper Networks, Inc. from the Vendor list, SSG and ISG Series Routers from the Platform list, and ScreenOS 6.1 from the Software list.

# Amazon Web Services
# Virtual Private Cloud
#
# AWS utilizes unique identifiers to manipulate the configuration of a VPN Connection. Each VPN Connection is assigned a VPN Connection Identifier and is associated with two other identifiers, namely the Customer Gateway Identifier and the Virtual Private Gateway Identifier.
#
# Your VPN Connection ID : vpn-44a8938f
# Your Virtual Private Gateway ID : vgw-8db04f81
# Your Customer Gateway ID : cgw-b4dc3961
#
# This configuration consists of two tunnels. Both tunnels must be configured on your Customer Gateway.
#
# This configuration was tested on a Juniper SSG-5 running ScreenOS 6.3R2.
#
# #1: Internet Key Exchange (IKE) Configuration
# A proposal is established for the supported IKE encryption, authentication,
# Diffie-Hellman, and lifetime parameters.
# Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.
# You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.
# The address of the external interface for your customer gateway must be a static address.
# Your customer gateway may reside behind a device performing network address translation (NAT).
# To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

```
set ike p1-proposal ike-prop-vpn-44a8938f-1 preshare group2 esp aes128 sha-1 second 28800
```

# The IKE gateway is defined to be the Virtual Private Gateway. The gateway configuration
# associates a local interface, remote IP address, and IKE policy.
# This example shows the outside of the tunnel as interface ethernet0/0. This
# should be set to the interface that IP address YOUR_UPLINK_ADDRESS is
# associated with.
# This address is configured with the setup for your Customer Gateway.
# If the address changes, the Customer Gateway and VPN Connection must be recreated.

```
set ike gateway gw-vpn-44a8938f-1 address 72.21.209.225 id 72.21.209.225 main outgoing-interface ethernet0/0 preshare "plain-text-password1" proposal ike-prop-vpn-44a8938f-1
```

# Troubleshooting IKE connectivity can be aided by enabling IKE debugging.
# To do so, run the following commands:
# clear dbuf -- Clear debug buffer
# debug ike all -- Enable IKE debugging
# get dbuf stream -- View debug messages
# undebug all -- Turn off debugging

# #2: IPsec Configuration
# The IPsec (Phase 2) proposal defines the protocol, authentication,
# encryption, and lifetime parameters for our IPsec security association.
# Please note, you may use these additionally supported IPsec parameters for encryption
# like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.

```
set ike p2-proposal ipsec-prop-vpn-44a8938f-1 group2 esp aes128 sha-1 second 3600
set ike gateway gw-vpn-44a8938f-1 dpd-liveness interval 10
set vpn IPSEC-vpn-44a8938f-1 gateway gw-vpn-44a8938f-1 replay tunnel proposal ipsec-prop-vpn-44a8938f-1
```

# #3: Tunnel Interface Configuration
# The tunnel interface is configured with the internal IP address.
To establish connectivity between your internal network and the VPC, you must have an interface facing your internal network in the "Trust" zone.

```
set interface tunnel.1 zone Trust
set interface tunnel.1 ip 169.254.255.2/30
set interface tunnel.1 mtu 1436
set vpn IPSEC-vpn-4408938f-1 bind interface tunnel.1
```

By default, the router will block asymmetric VPN traffic, which may occur with this VPN Connection. This occurs, for example, when routing policies cause traffic to sent from your router to VPC through one IPsec tunnel while traffic returns from VPC through the other.

This command allows this traffic to be received by your device.

```
set zone Trust asymmetric-vpn
```

This option causes the router to reduce the Maximum Segment Size of TCP packets to prevent packet fragmentation.

```
set flow vpn-tcp-mss 1387
```

---

#4: Border Gateway Protocol (BGP) Configuration

BGP is used within the tunnel to exchange prefixes between the Virtual Private Gateway and your Customer Gateway. The Virtual Private Gateway will announce the prefix corresponding to your VPC.

Your Customer Gateway may announce a default route (0.0.0.0/0).

The BGP timers are adjusted to provide more rapid detection of outages.

The local BGP Autonomous System Number (ASN) (YOUR_BGP_ASN) is configured as part of your Customer Gateway. If the ASN must be changed, the Customer Gateway and VPN Connection will need to be recreated with AWS.

```
set vrouter trust-vr
set max-ecmp-routes 2
set protocol bgp YOUR_BGP_ASN
set hold-time 30
set network 0.0.0.0/0
```

To advertise additional prefixes to Amazon VPC, copy the 'network' statement and identify the prefix you wish to advertise (set ipv4 network X.X.X.X/X). Make sure the prefix is present in the routing table of the device with a valid next-hop.

```
set enable
set neighbor 169.254.255.1 remote-as 7224
```

---

# #3: Tunnel Interface Configuration

# The tunnel interface is configured with the internal IP address.
# To establish connectivity between your internal network and the VPC, you
How to Test the Customer Gateway Configuration

You can test the gateway configuration for each tunnel.

To test the customer gateway device configuration for each tunnel

1. On your customer gateway device, determine whether the BGP status is Established.
It takes approximately 30 seconds for a BGP peering to be established.

2. Ensure that the customer gateway device is advertising a route to the virtual private gateway. The route may be the default route (0.0.0.0/0) or a more specific route you prefer.

When properly established, your BGP peering should be receiving one route from the virtual private gateway corresponding to the prefix that your VPC integration team specified for the VPC (for example, 10.0.0.0/24). If the BGP peering is established, you are receiving a prefix, and you are advertising a prefix, your tunnel is configured correctly. Make sure that both tunnels are in this state.

Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:

- Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
- Configure your instance's security group and network ACL to enable inbound ICMP traffic.
- Ensure that you have configured routing for your VPN connection: your subnet's route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

To test the end-to-end connectivity of each tunnel

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are listed in the launch wizard when you launch an instance from the Amazon EC2 console. For more information, see the Amazon VPC Getting Started Guide.
2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.
3. On a system in your home network, use the ping command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway device. A successful response should be similar to the following.

```plaintext
ping 10.0.0.4

Pinging 10.0.0.4 with 32 bytes of data:
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Ping statistics for 10.0.0.4:
Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),
Approximate round trip times in milliseconds:
Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

**Note**
If you ping an instance from your customer gateway device router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don't respond to ping messages from tunnel IP addresses.

4. (Optional) To test tunnel failover, you can temporarily disable one of the tunnels on your customer gateway device, and repeat the above step. You cannot disable a tunnel on the AWS side of the VPN connection.
If your tunnels don't test successfully, see Troubleshooting Juniper ScreenOS Customer Gateway Connectivity (p. 192).
Example: Netgate PfSense Device without Border Gateway Protocol

This guide (the *Network Administrator Guide*) has been merged into the *AWS Site-to-Site VPN User Guide* and is no longer maintained. For more information about configuring your customer gateway device, see the *AWS Site-to-Site VPN User Guide*.

This topic provides an example of how to configure your router if your customer gateway is a Netgate pfSense firewall running OS 2.2.5 or later.

Before you begin, ensure that you've done the following:

- You've created a Site-to-Site VPN connection in Amazon VPC. For more information, see Getting Started in the *AWS Site-to-Site VPN User Guide*.
- You've read the requirements (p. 8) for your customer gateway device.

**Topics**

- A High-Level View of the Customer Gateway Device (p. 136)
- Example Configuration (p. 137)
- How to Test the Customer Gateway Configuration (p. 140)

A High-Level View of the Customer Gateway Device

The following diagram shows the general details of your customer gateway device. The VPN connection consists of two separate tunnels: *Tunnel 1* and *Tunnel 2*. Using redundant tunnels ensures continuous availability in the case that a device fails.

You should use the real configuration information that you receive from your integration team and apply it to your customer gateway device.
Example Configuration

The example configuration includes several example values to help you understand how configuration works. For example, we provide example values for the VPN connection ID (vpn-12345678), virtual private gateway ID (vgw-12345678), and placeholders for the AWS endpoints (AWS_ENDPOINt_1 and AWS_ENDPOINt_2).

In the following example configuration, you must replace the placeholder values are indicated by colored italic text with values that apply to your particular configuration.

**Important**
The following configuration information is an example of what you can expect an integration team to provide. Many of the values in the following example are different from the actual configuration information that you receive. You must use the actual values and not the example values shown here, or your implementation will fail.
Your VPN Connection ID  : vpn-12345678
Your Virtual Private Gateway ID  : vgw-12345678
Your Customer Gateway ID  : cgw-12345678

This configuration consists of two tunnels. Both tunnels must be configured on your Customer Gateway for redundancy.

# IPSec Tunnel #1

#1: Internet Key Exchange (IKE) Configuration

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman, lifetime, and key parameters. The IKE peer is configured with the supported IKE encryption, authentication, Diffie-Hellman, lifetime, and key parameters. Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.

You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24. The address of the external interface for your customer gateway must be a static address.

Your customer gateway may reside behind a device performing network address translation (NAT). To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

Go to VPN-->IPSec. Add a new Phase1 entry (click + button )

General information
a. Disabled : uncheck
b. Key Exchange version : V1

d. Interface : WAN
e. Remote Gateway: AWS_ENDPOINT_2
f. Description: Amazon-IKE-vpn-12345678-1

Phase 1 proposal (Authentication)

a. Authentication Method: Mutual PSK
b. Negotiation mode : Main
c. My identifier : My IP address
d. Peer identifier : Peer IP address
e. Pre-Shared Key: plain-text-password2
How to Test the Customer Gateway Configuration

You must first test the gateway configuration for each tunnel.

To test the customer gateway configuration for each tunnel

- In the Amazon VPC console, ensure that a static route has been added to the VPN connection so that traffic can get back to your customer gateway. For example, if your local subnet prefix is 198.10.0.0/16, you must add a static route with that CIDR range to your VPN connection. Make sure that both tunnels have a static route to your VPC.

Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:
• Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
• Configure your instance's security group and network ACL to enable inbound ICMP traffic.
• Ensure that you have configured routing for your VPN connection - your subnet's route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

To test the end-to-end connectivity of each tunnel

1. Launch an instance from one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are available in the Quick Start menu when you use the Launch Instances Wizard in the Amazon EC2 console. For more information, see Launching an Instance in the Amazon EC2 User Guide for Linux Instances.
2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.
3. On a system in your home network, use the ping command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway. A successful response should be similar to the following.

```
ping 10.0.0.4
```

```
Pinging 10.0.0.4 with 32 bytes of data:

  Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
  Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
  Reply from 10.0.0.4: bytes=32 time<1ms TTL=128

Ping statistics for 10.0.0.4:
  Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),
Approximate round trip times in milliseconds:
  Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

**Note**
If you ping an instance from your customer gateway router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don't respond to ping messages from tunnel IP addresses.

4. (Optional) To test tunnel failover, you can temporarily disable one of the tunnels on your customer gateway, and repeat the above step. You cannot disable a tunnel on the AWS side of the VPN connection.
Example: Palo Alto Networks Device

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

The following topic provides example configuration information provided by your integration team if your customer gateway device is a Palo Alto Networks PANOS 4.1.2+ device.

Two diagrams illustrate the example configuration. The first diagram shows the high-level layout of the customer gateway device, and the second diagram shows the details of the example configuration. You should use the real configuration information that you receive from your integration team and apply it to your customer gateway device.

Before you begin, ensure that you’ve done the following:

- You've created a Site-to-Site VPN connection in Amazon VPC. For more information, see Getting Started in the AWS Site-to-Site VPN User Guide.
- You've read the requirements (p. 8) for your customer gateway device.

- A High-Level View of the Customer Gateway Device (p. 143)
- A Detailed View of the Customer Gateway Device and an Example Configuration (p. 143)
- How to Test the Customer Gateway Configuration (p. 150)
A High-Level View of the Customer Gateway Device

The following diagram shows the general details of your customer gateway device. The VPN connection consists of two separate tunnels. Using redundant tunnels ensures continuous availability in the case that a device fails.

A Detailed View of the Customer Gateway Device and an Example Configuration

The diagram in this section illustrates an example Palo Alto customer gateway device. Following the diagram, there is a corresponding example of the configuration information your integration team should provide. The example configuration contains a set of information for each of the tunnels that you must configure.

In addition, the example configuration refers to these items that you must provide:

- **YOUR_UPLINK_ADDRESS**—The IP address for the Internet-routable external interface on the customer gateway device (which must be static, and may be behind a device performing network address translation (NAT); however, NAT traversal (NAT-T) is not supported).
- **YOUR_BGP ASN**—The customer gateway's BGP ASN (we use 65000 by default)

The example configuration includes several example values to help you understand how configuration works. For example, we provide example values for the VPN connection ID (vpn-44a8938f), virtual private gateway ID (vgw-8db04f81), the IP addresses (72.21.209.*, 169.254.255.*), and the remote ASN...
Replace these example values with the actual values from the configuration information that you receive.

In the following diagram and example configuration, you must replace the placeholder values are indicated by colored italic text with values that apply to your particular configuration.

**Warning**
The following configuration information is an example of what you can expect your integration team to provide. Many of the values in the following example are different from the actual configuration information that you receive. You must use the actual values and not the example values shown here, or your implementation will fail.
Your VPN Connection ID : vpn-44a8938f
Your Virtual Private Gateway ID : vgw-8db04f81
Your Customer Gateway ID : cgw-b4dc3961

This configuration consists of two tunnels. Both tunnels must be configured on your Customer Gateway.

#1: Internet Key Exchange (IKE) Configuration

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman, lifetime, and key parameters.
Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.
You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.
The address of the external interface for your customer gateway must be a static address.
Your customer gateway may reside behind a device performing network address translation (NAT).
To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

configure
edit network ike crypto-profiles ike-crypto-profiles ike-crypto-vpn-44a8938f-0
set dh-group group2
set hash sha1
set lifetime seconds 28800
set encryption aes128
top

edit network ike gateway ike-vpn-44a8938f-0
set protocol ikev1 dpd interval 10 retry 3 enable yes
set protocol ikev1 ike-crypto-profile ike-crypto-vpn-44a8938f-0 exchange-mode main
set authentication pre-shared-key key plain-text-password1
set local-address ip YOUR_UPLINK_ADDRESS
set local-address interface ethernet1/1
set peer-address ip 72.21.209.193
top

#2: IPSec Configuration

The IPSec transform set defines the encryption, authentication, and IPSec mode parameters.
Please note, you may use these additionally supported IPSec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.

edit network ike crypto-profiles ipsec-crypto-profiles ipsec-vpn-44a8938f-0
set esp authentication sha1
set esp encryption aes128
set dh-group group2 lifetime seconds 3600
A tunnel interface is configured to be the logical interface associated with the tunnel. All traffic routed to the tunnel interface will be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

Association with the IPSec security association is done through the "tunnel protection" command.

The address of the interface is configured with the setup for your Customer Gateway. If the address changes, the Customer Gateway and VPN Connection must be recreated with Amazon VPC.

```
edit network interface tunnel
set ip 169.254.255.5/30
set units tunnel.1
set mtu 1427
top
edit network tunnel ipsec ipsec-tunnel-1
set auto-key ike-gateway ike-vpn-44a8938f-0
set auto-key ipsec-crypto-profile ipsec-vpn-44a8938f-0
set tunnel-interface tunnel.1
set anti-replay yes
top
```

BGP is used within the tunnel to exchange prefixes between the Virtual Private Gateway and your Customer Gateway. The Virtual Private Gateway will announce the prefix corresponding to your VPC.

The local BGP Autonomous System Number (ASN) (YOUR_BGP ASN) is configured as part of your Customer Gateway. If the ASN must be changed, the Customer Gateway and VPN Connection will need to be recreated with AWS.

```
edit network virtual-router default protocol bgp
set enable yes
set router-id YOUR_UPLINK_ADDRESS
set local-as YOUR_BGP ASN
edit peer-group AmazonBGP	edit peer amazon-tunnel-44a8938f-0
```
set connection-options keep-alive-interval 10
set connection-options hold-time 30
set enable yes
set local-address ip 169.254.255.5/30
set local-address interface tunnel.1
set peer-as 7224
set peer-address ip 169.254.255.2

top

! Your Customer Gateway may announce a default route (0.0.0.0/0) to us.

edit network virtual-router default protocol bgp policy
set export rules vr-export action allow
set match address-prefix 0.0.0.0/0 exact yes
set used-by AmazonBGP enable yes
top

! To advertise additional prefixes to Amazon VPC, add these prefixes to the 'address-
prefix' statement and identify the prefix you wish to advertise. Make sure the prefix is present
in the routing table of the device with a valid next-hop. If you want to advertise
192.168.0.0/16 to Amazon, this can be done using the following.

edit network virtual-router default protocol bgp policy
set export rules vr-export action allow
set match address-prefix 192.168.0.0/16 exact yes
set used-by AmazonBGP enable yes
top

How to Test the Customer Gateway Configuration

You can test the gateway configuration for each tunnel.

To test the customer gateway device configuration for each tunnel

1. On your customer gateway device, determine whether the BGP status is Established.
   
   It takes approximately 30 seconds for a BGP peering to be established.

2. Ensure that the customer gateway device is advertising a route to the virtual private gateway. The route may be the default route (0.0.0.0/0) or a more specific route you prefer.

When properly established, your BGP peering should be receiving one route from the virtual private gateway corresponding to the prefix that your VPC integration team specified for the VPC (for example, 10.0.0.0/24). If the BGP peering is established, you are receiving a prefix, and you are advertising a prefix, your tunnel is configured correctly. Make sure that both tunnels are in this state.

Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:

- Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
- Configure your instance's security group and network ACL to enable inbound ICMP traffic.
- Ensure that you have configured routing for your VPN connection: your subnet's route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

To test the end-to-end connectivity of each tunnel

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are listed in the launch wizard when you launch an instance from the Amazon EC2 console. For more information, see the Amazon VPC Getting Started Guide.

2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.

3. On a system in your home network, use the ping command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway device. A successful response should be similar to the following.

```
ping 10.0.0.4

Pinging 10.0.0.4 with 32 bytes of data:

Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128

Ping statistics for 10.0.0.4:
Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),

Approximate round trip times in milliseconds:
Minimum = 0ms, Maximum = 0ms, Average = 0ms
```
Note
If you ping an instance from your customer gateway device router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don’t respond to ping messages from tunnel IP addresses.

4. (Optional) To test tunnel failover, you can temporarily disable one of the tunnels on your customer gateway device, and repeat the above step. You cannot disable a tunnel on the AWS side of the VPN connection.
Example: Yamaha Device

This guide (the *Network Administrator Guide*) has been merged into the *AWS Site-to-Site VPN User Guide* and is no longer maintained. For more information about configuring your customer gateway device, see the *AWS Site-to-Site VPN User Guide*.

In this section, we walk you through an example of the configuration information provided by your integration team if your customer gateway device is a Yamaha RT107e, RTX1200, RTX1210, RTX1500, RTX3000, or SRT100 router.

Two diagrams illustrate the example configuration. The first diagram shows the high-level layout of the customer gateway device, and the second diagram shows the details of the example configuration. You should use the real configuration information that you receive from your integration team and apply it to your customer gateway device.
Before you begin, ensure that you've done the following:

- You've created a Site-to-Site VPN connection in Amazon VPC. For more information, see Getting Started in the AWS Site-to-Site VPN User Guide.
- You've read the requirements (p. 8) for your customer gateway device.

**Topics**

- A High-Level View of the Customer Gateway Device (p. 153)
- A Detailed View of the Customer Gateway Device and an Example Configuration (p. 153)
- How to Test the Customer Gateway Configuration (p. 159)

## A High-Level View of the Customer Gateway Device

The following diagram shows the general details of your customer gateway device. The VPN connection consists of two separate tunnels. Using redundant tunnels ensures continuous availability in case a device fails.

![Diagram of a high-level view of the customer gateway device]

## A Detailed View of the Customer Gateway Device and an Example Configuration

The diagram in this section illustrates an example Yamaha customer gateway device. Following the diagram, there is a corresponding example of the configuration information your integration team
should provide. The example configuration contains a set of information for each of the tunnels that you must configure.

In addition, the example configuration refers to these items that you must provide:

- **YOUR_UPLINK_ADDRESS**—The IP address for the Internet-routable external interface on the customer gateway device. The address must be static, and may be behind a device performing network address translation (NAT). To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500.

- **YOUR_LOCAL_NETWORK_ADDRESS**—The IP address that is assigned to the LAN interface connected to your local network (most likely a private address such as 192.168.0.1)

- **YOUR_BGP_ASN**—The customer gateway's BGP ASN (we use 65000 by default)

The example configuration includes several example values to help you understand how configuration works. For example, we provide example values for the VPN connection ID (vpn-44a8938f), virtual private gateway ID (vgw-8db04f81), the IP addresses (72.21.209.*, 169.254.255.*), and the remote ASN (7224). Replace these example values with the actual values from the configuration information that you receive.

In addition, you must also:

- Configure the outside interface (referred to as **LAN3** in the example configuration).
- Configure the tunnel interface IDs (referred to as **Tunnel #1** and **Tunnel #2** in the example configuration).
- Configure all internal routing that moves traffic between the customer gateway and your local network.

In the following diagram and example configuration, you must replace the placeholder values are indicated by colored italic text with values that apply to your particular configuration.

**Warning**

The following configuration information is an example of what you can expect your integration team to provide. Many of the values in the following example are different from the actual
configuration information that you receive. You must use the actual values and not the example values shown here. Otherwise, your implementation will fail.

# Amazon Web Services
# Virtual Private Cloud

# AWS utilizes unique identifiers to manage the configuration of
# a VPN Connection. Each VPN Connection is assigned an identifier and is
# associated with two other identifiers, namely the
# Customer Gateway Identifier and Virtual Private Gateway Identifier.
#
# Your VPN Connection ID            : vpn-44a8938f
# Your Virtual Private Gateway ID   : vgw-8db04f81
# Your Customer Gateway ID          : cgw-b4dc3961
#
# This configuration consists of two tunnels. Both tunnels must be
# configured on your Customer Gateway.
#
# --------------------------------------------
# IPsec Tunnel #1
# --------------------------------------------

    #1: Internet Key Exchange (IKE) Configuration
    #
    # A policy is established for the supported ISAKMP encryption,
    # authentication, Diffie-Hellman, lifetime, and key parameters.
    #
    # Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.
    # You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.
    # The address of the external interface for your customer gateway must be a static
    # address.
    # Your customer gateway may reside behind a device performing network address translation (NAT).
    # To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall !rules
    # to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.
    #
    tunnel select 1
    ipsec ike encryption 1 aes-cbc
    ipsec ike group 1 modp1024
    ipsec ike hash 1 sha

    # This line stores the Pre Shared Key used to authenticate the
    # tunnel endpoints.
    #
    ipsec ike pre-shared-key 1 text plain-text-password1

    #2: IPsec Configuration
    #
    # The IPsec policy defines the encryption, authentication, and IPsec
    # mode parameters. 
    # Please note, you may use these additionally supported IPsec parameters for encryption
    # like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.
    #
# Note that there are a global list of IPSec policies, each identified by
# sequence number. This policy is defined as #201, which may conflict with
# an existing policy using the same number. If so, we recommend changing
# the sequence number to avoid conflicts.

ipsec tunnel 201
ipsec sa policy 201 1 esp aes-cbc sha-hmac

# The IPsec profile references the IPsec policy and further defines
# the Diffie-Hellman group and security association lifetime.
ipsec ike duration ipsec-sa 1 3600
ipsec ike pfs 1 on

# Additional parameters of the IPsec configuration are set here. Note that
# these parameters are global and therefore impact other IPsec
# associations.
# This option instructs the router to clear the "Don't Fragment"
# bit from packets that carry this bit and yet must be fragmented, enabling
# them to be fragmented.
#
ipsec tunnel outer df-bit clear

# This option enables IPsec Dead Peer Detection, which causes periodic
# messages to be sent to ensure a Security Association remains operational.
ipsec ike keepalive use 1 on dpd 10 3

# #3: Tunnel Interface Configuration
#
# A tunnel interface is configured to be the logical interface associated
# with the tunnel. All traffic routed to the tunnel interface will be
# encrypted and transmitted to the VPC. Similarly, traffic from the VPC
# will be logically received on this interface.
#
# The address of the interface is configured with the setup for your
# Customer Gateway. If the address changes, the Customer Gateway and VPN
# Connection must be recreated with Amazon VPC.
#
ipsec ike local address 1 YOUR_LOCAL_NETWORK_ADDRESS
ipsec ike remote address 1 72.21.209.225
ipsec ike local address id <id> 0.0.0.0/0
ipsec ike remote address id <id> 0.0.0.0/0
ip tunnel address 169.254.255.2/30
ip tunnel remote address 169.254.255.1

# This option causes the router to reduce the Maximum Segment Size of
# TCP packets to prevent packet fragmentation
ip tunnel tcp mss limit 1387
tunnel enable 1
tunnel select none
ipsec auto refresh on
# 4: Border Gateway Protocol (BGP) Configuration

BGP is used within the tunnel to exchange prefixes between the Virtual Private Gateway and your Customer Gateway. The Virtual Private Gateway will announce the prefix corresponding to your VPC.

Your Customer Gateway may announce a default route (0.0.0.0/0), which can be done with the 'network' and 'default-originate' statements.

The BGP timers are adjusted to provide more rapid detection of outages.

The local BGP Autonomous System Number (ASN) (YOUR_BGP_ASN) is configured as part of your Customer Gateway. If the ASN must be changed, the Customer Gateway and VPN Connection will need to be recreated with AWS.

```
bgp use on
bgp autonomous-system YOUR_BGP_ASN
bgp neighbor 1 7224 169.254.255.1 hold-time=30 local-address=169.254.255.2
```

To advertise additional prefixes to Amazon VPC, copy the 'network' statement and identify the prefix you wish to advertise. Make sure the prefix is present in the routing table of the device with a valid next-hop. For example, the following two lines will advertise 192.168.0.0/16 and 10.0.0.0/16 to Amazon VPC.

```
bgp import filter 1 equal 10.0.0.0/16
bgp import filter 1 equal 192.168.0.0/16
```

```
bgp import filter 1 equal 0.0.0.0/0
bgp import 7224 static filter 1
```

# IPsec Tunnel #2

# 1: Internet Key Exchange (IKE) Configuration

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman, lifetime, and key parameters.

Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2. You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.

The address of the external interface for your customer gateway must be a static address. Your customer gateway may reside behind a device performing network address translation (NAT).

To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

```
tunnel select 2
ipsec ike encryption 2 aes-cbc
ipsec ike group 2 modp1024
ipsec ike hash 2 sha

bgp import filter 1 equal 0.0.0.0/0
bgp import 7224 static filter 1
bgp configure refresh

---

How to Test the Customer Gateway Configuration

You can test the gateway configuration for each tunnel.

To test the customer gateway device configuration for each tunnel

1. On your customer gateway device, determine whether the BGP status is Established.
   It takes approximately 30 seconds for a BGP peering to be established.
2. Ensure that the customer gateway device is advertising a route to the virtual private gateway. The route may be the default route (0.0.0.0/0) or a more specific route you prefer.

When properly established, your BGP peering should be receiving one route from the virtual private gateway corresponding to the prefix that your VPC integration team specified for the VPC (for example, 10.0.0.0/24). If the BGP peering is established, you are receiving a prefix, and you are advertising a prefix, your tunnel is configured correctly. Make sure that both tunnels are in this state.

Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:

- Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
- Configure your instance’s security group and network ACL to enable inbound ICMP traffic.
- Ensure that you have configured routing for your VPN connection: your subnet's route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

To test the end-to-end connectivity of each tunnel

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are listed in the launch wizard when you launch an instance from the Amazon EC2 console. For more information, see the Amazon VPC Getting Started Guide.
2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance’s details.
3. On a system in your home network, use the ping command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway device. A successful response should be similar to the following.

```plaintext
ping 10.0.0.4
```

```
Pinging 10.0.0.4 with 32 bytes of data:

Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128

Ping statistics for 10.0.0.4:
Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),
Approximate round trip times in milliseconds:
Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

Note
If you ping an instance from your customer gateway device router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don’t respond to ping messages from tunnel IP addresses.

4. (Optional) To test tunnel failover, you can temporarily disable one of the tunnels on your customer gateway device, and repeat the above step. You cannot disable a tunnel on the AWS side of the VPN connection.

If your tunnels don't test successfully, see Troubleshooting Yamaha Customer Gateway Connectivity (p. 195).
Example: Generic Customer Gateway Device Using Border Gateway Protocol

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

If your customer gateway device isn't one of the types discussed earlier in this guide, your integration team can provide you with generic information that you can use to configure your customer gateway device. This section contains an example of that information.

Two diagrams illustrate the example configuration. The first diagram shows the high-level layout of the customer gateway device, and the second diagram shows details from the example configuration. You should use the real configuration information that you receive from your integration team and apply it to your customer gateway device.

Before you begin, ensure that you've done the following:

- You've created a Site-to-Site VPN connection in Amazon VPC. For more information, see Getting Started in the AWS Site-to-Site VPN User Guide.
- You've read the requirements (p. 8) for your customer gateway device.

Topics

- A High-Level View of the Customer Gateway Device (p. 162)
- A Detailed View of the Customer Gateway Device and an Example Configuration (p. 162)
- How to Test the Customer Gateway Configuration (p. 167)
A High-Level View of the Customer Gateway Device

The following diagram shows the general details of your customer gateway device. The VPN connection consists of two separate tunnels. Using redundant tunnels ensures continuous availability in the case that a device fails.

A Detailed View of the Customer Gateway Device and an Example Configuration

The diagram in this section illustrates an example generic customer gateway device. Following the diagram, there is a corresponding example of the configuration information your integration team should provide. The example configuration contains a set of information for each of the tunnels that you must configure.

In addition, the example configuration refers to these items that you must provide:

- **YOUR_UPLINK_ADDRESS**—The IP address for the Internet-routable external interface on the customer gateway device. The address must be static, and may be behind a device performing network address translation (NAT). To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500.
- **YOUR_BGP_ASN**—The customer gateway's BGP ASN (we use 65000 by default)

The example configuration includes several example values to help you understand how configuration works. For example, we provide example values for the VPN connection ID (vpn-44a8938f), virtual...
private gateway ID (vgw-8db04f81), the IP addresses (72.21.209.*, 169.254.255.*), and the remote ASN (7224). Replace these example values with the actual values from the configuration information that you receive.

In the following diagram and example configuration, you must replace the placeholder values are indicated by colored italic text with values that apply to your particular configuration.

![Diagram of Amazon Virtual Private Cloud Network Administrator Guide](image)

Amazon Web Services
Virtual Private Cloud

**VPN Connection Configuration**

AWS utilizes unique identifiers to manipulate the configuration of a VPN Connection. Each VPN Connection is assigned a VPN identifier and is associated with two other identifiers, namely the Customer Gateway Identifier and the Virtual Private Gateway Identifier.

Your VPN Connection ID: vpn-44a8938f
Your Virtual Private Gateway ID: vgw-8db04f81
Your Customer Gateway ID: cgw-b4dc3961

A VPN Connection consists of a pair of IPsec tunnel security associations (SAs). It is important that both tunnel security associations be configured.

**IPsec Tunnel #1**

`#1: Internet Key Exchange Configuration`

Configure the IKE SA as follows:
Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.
You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.
The address of the external interface for your customer gateway must be a static address. Your customer gateway may reside behind a device performing network address translation (NAT).

To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

- IKE version: IKEv1
- Authentication Method: Pre-Shared Key
- Pre-Shared Key: plain-text-password1
- Authentication Algorithm: sha1
- Encryption Algorithm: aes-128-cbc
- Lifetime: 28800 seconds
- Phase 1 Negotiation Mode: main
- Diffie-Hellman: Group 2

#2: IPsec Configuration

Configure the IPsec SA as follows:

- Please note, you may use these additionally supported IPSec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.
- Protocol: esp
- Authentication Algorithm: hmac-sha1-96
- Encryption Algorithm: aes-128-cbc
- Lifetime: 3600 seconds
- Mode: tunnel
- Perfect Forward Secrecy: Diffie-Hellman Group 2

IPsec Dead Peer Detection (DPD) will be enabled on the AWS Endpoint. We recommend configuring DPD on your endpoint as follows:

- DPD Interval: 10
- DPD Retries: 3

IPsec ESP (Encapsulating Security Payload) inserts additional headers to transmit packets. These headers require additional space, which reduces the amount of space available to transmit application data. To limit the impact of this behavior, we recommend the following configuration on your Customer Gateway:

- TCP MSS Adjustment: 1387 bytes
- Clear Don't Fragment Bit: enabled
- Fragmentation: Before encryption

#3: Tunnel Interface Configuration

Your Customer Gateway must be configured with a tunnel interface that is associated with the IPsec tunnel. All traffic transmitted to the tunnel interface is encrypted and transmitted to the Virtual Private Gateway.

The Customer Gateway and Virtual Private Gateway each have two addresses that relate to this IPsec tunnel. Each contains an outside address, upon which encrypted traffic is exchanged. Each also contain an inside address associated with the tunnel interface.

The Customer Gateway outside IP address was provided when the Customer Gateway was created. Changing the IP address requires the creation of a new Customer Gateway.

The Customer Gateway inside IP address should be configured on your tunnel interface.

Outside IP Addresses:
- Customer Gateway: YOUR_UPLINK_ADDRESS
- Virtual Private Gateway: 72.21.209.193

Inside IP Addresses
- Customer Gateway: 169.254.255.2/30
- Virtual Private Gateway: 169.254.255.1/30

Configure your tunnel to fragment at the optimal size:
- Tunnel interface MTU: 1436 bytes

BGP
#4: Border Gateway Protocol (BGP) Configuration:

The Border Gateway Protocol (BGPv4) is used within the tunnel, between the inside IP addresses, to exchange routes from the VPC to your home network. Each BGP router has an Autonomous System Number (ASN). Your ASN was provided to AWS when the Customer Gateway was created.

BGP Configuration Options:
- Customer Gateway ASN: YOUR_BGP_ASN
- Virtual Private Gateway ASN: 7224
- Neighbor IP Address: 169.254.255.1
- Neighbor Hold Time: 30

Configure BGP to announce routes to the Virtual Private Gateway. The gateway will announce prefixes to your customer gateway based upon the prefix you assigned to the VPC at creation time.

IPsec Tunnel #2
=================================
#1: Internet Key Exchange Configuration

Configure the IKE SA as follows:
Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.
You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.
The address of the external interface for your customer gateway must be a static address. Your customer gateway may reside behind a device performing network address translation (NAT).
To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.
- IKE version: IKEv1
- Authentication Method: Pre-Shared Key
- Pre-Shared Key: plain-text-password2
- Authentication Algorithm: sha1
- Encryption Algorithm: aes-128-cbc
- Lifetime: 28800 seconds
- Phase 1 Negotiation Mode: main
- Diffie-Hellman: Group 2

#2: IPsec Configuration

Configure the IPsec SA as follows:
Please note, you may use these additionally supported IPsec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.
- Protocol: esp
- Authentication Algorithm : hmac-sha1-96
- Encryption Algorithm     : aes-128-cbc
- Lifetime                 : 3600 seconds
- Mode                     : tunnel
- Perfect Forward Secrecy  : Diffie-Hellman Group 2

IPsec Dead Peer Detection (DPD) will be enabled on the AWS Endpoint. We recommend configuring DPD on your endpoint as follows:
- DPD Interval             : 10
- DDP Retries              : 3

IPsec ESP (Encapsulating Security Payload) inserts additional headers to transmit packets. These headers require additional space, which reduces the amount of space available to transmit application data. To limit the impact of this behavior, we recommend the following configuration on your Customer Gateway:
- TCP MSS Adjustment       : 1387 bytes
- Clear Don't Fragment Bit : enabled
- Fragmentation            : Before encryption

#3: Tunnel Interface Configuration

Your Customer Gateway must be configured with a tunnel interface that is associated with the IPsec tunnel. All traffic transmitted to the tunnel interface is encrypted and transmitted to the Virtual Private Gateway.

The Customer Gateway and Virtual Private Gateway each have two addresses that relate to this IPsec tunnel. Each contains an outside address, upon which encrypted traffic is exchanged. Each also contain an inside address associated with the tunnel interface.

The Customer Gateway outside IP address was provided when the Customer Gateway was created. Changing the IP address requires the creation of a new Customer Gateway.

The Customer Gateway inside IP address should be configured on your tunnel interface.

Outside IP Addresses:
- Customer Gateway:        : YOUR_UPLINK_ADDRESS
- Virtual Private Gateway  : 72.21.209.193

Inside IP Addresses
- Customer Gateway : 169.254.255.6/30
- Virtual Private Gateway : 169.254.255.5/30

Configure your tunnel to fragment at the optimal size:
- Tunnel interface MTU     : 1436 bytes

#4: Border Gateway Protocol (BGP) Configuration:

The Border Gateway Protocol (BGPv4) is used within the tunnel, between the inside IP addresses, to exchange routes from the VPC to your home network. Each BGP router has an Autonomous System Number (ASN). Your ASN was provided to AWS when the Customer Gateway was created.

BGP Configuration Options:
- Customer Gateway ASN     : YOUR_BGP ASN
- Virtual Private Gateway ASN : 7224
How to Test the Customer Gateway Configuration

You can test the gateway configuration for each tunnel.

To test the customer gateway device configuration for each tunnel

1. On your customer gateway device, determine whether the BGP status is Established.

   It takes approximately 30 seconds for a BGP peering to be established.

2. Ensure that the customer gateway device is advertising a route to the virtual private gateway. The route may be the default route (0.0.0.0/0) or a more specific route you prefer.

When properly established, your BGP peering should be receiving one route from the virtual private gateway corresponding to the prefix that your VPC integration team specified for the VPC (for example, 10.0.0.0/24). If the BGP peering is established, you are receiving a prefix, and you are advertising a prefix, your tunnel is configured correctly. Make sure that both tunnels are in this state.

Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:

- Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
- Configure your instance’s security group and network ACL to enable inbound ICMP traffic.
- Ensure that you have configured routing for your VPN connection: your subnet’s route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

To test the end-to-end connectivity of each tunnel

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are listed in the launch wizard when you launch an instance from the Amazon EC2 console. For more information, see the Amazon VPC Getting Started Guide.
2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.
3. On a system in your home network, use the ping command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway device. A successful response should be similar to the following.

   `ping 10.0.0.4`

   Pinging 10.0.0.4 with 32 bytes of data:

   Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
   Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
   Reply from 10.0.0.4: bytes=32 time<1ms TTL=128

   ```
Ping statistics for 10.0.0.4:
Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),

Approximate round trip times in milliseconds:
Minimum = 0ms, Maximum = 0ms, Average = 0ms

**Note**
If you ping an instance from your customer gateway device router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don’t respond to ping messages from tunnel IP addresses.

4. (Optional) To test tunnel failover, you can temporarily disable one of the tunnels on your customer gateway device, and repeat the above step. You cannot disable a tunnel on the AWS side of the VPN connection.

If your tunnels don’t test successfully, see Troubleshooting Generic Device Customer Gateway Connectivity Using Border Gateway Protocol (p. 198).
Example: Generic Customer Gateway Device without Border Gateway Protocol

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

If your customer gateway device isn't one of the types discussed earlier in this guide, your integration team can provide you with generic information that you can use to configure your customer gateway device. This section contains an example of that information.

Two diagrams illustrate the example configuration. The first diagram shows the high-level layout of the customer gateway device, and the second diagram shows details from the example configuration. You should use the real configuration information that you receive from your integration team and apply it to your customer gateway device.

Before you begin, ensure that you've done the following:

- You've created a Site-to-Site VPN connection in Amazon VPC. For more information, see Getting Started in the AWS Site-to-Site VPN User Guide.
- You've read the requirements (p. 8) for your customer gateway device.

Topics

- A High-Level View of the Customer Gateway Device (p. 170)
- A Detailed View of the Customer Gateway Device and an Example Configuration (p. 170)
- How to Test the Customer Gateway Configuration (p. 175)
A High-Level View of the Customer Gateway Device

The following diagram shows the general details of your customer gateway device. The VPN connection consists of two separate tunnels: Tunnel 1 and Tunnel 2. Using redundant tunnels ensures continuous availability in the case that a device fails.

A Detailed View of the Customer Gateway Device and an Example Configuration

The diagram in this section illustrates a generic customer gateway device that uses static routing for its VPN connection. It does not support dynamic routing, or Border Gateway Protocol (BGP). Following the diagram, there is a corresponding example of the configuration information your integration team should give you. The example configuration contains a set of information for each of the two tunnels you must configure.

In addition, the example configuration refers to one item that you must provide:

- **YOUR_UPLINK_ADDRESS**—The IP address for the Internet-routable external interface on the customer gateway device. The address must be static, and may be behind a device performing network address
translation (NAT). To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500.

The example configuration includes several example values to help you understand how configuration works. For example, we provide example values for the VPN connection ID (vpn-44a8938f), virtual private gateway ID (vgw-8db04f81), and the VGW IP addresses (72.21.209.*, 169.254.255.*). Replace these example values with the actual values from the configuration information that you receive.

In the following diagram and example configuration, you must replace the placeholder values are indicated by colored italic text with values that apply to your particular configuration.

Important
The following configuration information is an example of what you can expect an integration team to provide. Many of the values in the following example are different from the actual configuration information that you receive. You must use the actual values and not the example values shown here, or your implementation will fail.

Amazon Web Services
Virtual Private Cloud

VPN Connection Configuration
AWS utilizes unique identifiers to manipulate the configuration of a VPN Connection. Each VPN Connection is assigned a VPN Connection Identifier and is associated with two other identifiers, namely the Customer Gateway Identifier and the Virtual Private Gateway Identifier.

Your VPN Connection ID : vpn-44a8938f
Your Virtual Private Gateway ID : vgw-8db04f81
Your Customer Gateway ID : cgw-ff628496

A VPN Connection consists of a pair of IPSec tunnel security associations (SAs). It is important that both tunnel security associations be configured.

IPSec Tunnel #1
#1: Internet Key Exchange Configuration

Configure the IKE SA as follows:

Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.

You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.

The address of the external interface for your customer gateway must be a static address.

Your customer gateway may reside behind a device performing network address translation (NAT).

To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.

- IKE version : IKEv1
- Authentication Method : Pre-Shared Key
- Pre-Shared Key : PRE-SHARED-KEY-IN-PLAIN-TEXT
- Authentication Algorithm : sha1
- Encryption Algorithm : aes-128-cbc
- Lifetime : 28800 seconds
- Phase 1 Negotiation Mode : main
- Diffie-Hellman : Group 2

#2: IPSec Configuration

Configure the IPSec SA as follows:

Please note, you may use these additionally supported IPSec parameters for encryption like AES256 and other DH groups like 2, 5, 14-18, 22, 23, and 24.

- Protocol : esp
- Authentication Algorithm : hmac-sha1-96
- Encryption Algorithm : aes-128-cbc
- Lifetime : 3600 seconds
- Mode : tunnel
- Perfect Forward Secrecy : Diffie-Hellman Group 2

IPSec Dead Peer Detection (DPD) will be enabled on the AWS Endpoint. We recommend configuring DPD on your endpoint as follows:

- DPD Interval : 10
- DPD Retries : 3

IPSec ESP (Encapsulating Security Payload) inserts additional headers to transmit packets. These headers require additional space, which reduces the amount of space available to transmit application data.

To limit the impact of this behavior, we recommend the following configuration on your Customer Gateway:

- TCP MSS Adjustment : 1387 bytes
- Clear Don’t Fragment Bit : enabled
- Fragmentation : Before encryption

#3: Tunnel Interface Configuration

Your Customer Gateway must be configured with a tunnel interface that is associated with the IPSec tunnel. All traffic transmitted to the tunnel interface is encrypted and transmitted to the Virtual Private Gateway.

The Customer Gateway and Virtual Private Gateway each have two addresses that relate to this IPSec tunnel. Each contains an outside address, upon which encrypted
traffic is exchanged. Each also contain an inside address associated with the tunnel interface.

The Customer Gateway outside IP address was provided when the Customer Gateway was created. Changing the IP address requires the creation of a new Customer Gateway.

The Customer Gateway inside IP address should be configured on your tunnel interface.

Outside IP Addresses:
- Customer Gateway: YOUR_UPLINK_ADDRESS
- Virtual Private Gateway: 72.21.209.193

Inside IP Addresses
- Customer Gateway: 169.254.255.74/30
- Virtual Private Gateway: 169.254.255.73/30

Configure your tunnel to fragment at the optimal size:
- Tunnel interface MTU: 1436 bytes

#4: Static Routing Configuration:

To route traffic between your internal network and your VPC, you will need a static route added to your router.

Static Route Configuration Options:
- Next hop: 169.254.255.73

You should add static routes towards your internal network on the VGW. The VGW will then send traffic towards your internal network over the tunnels.

IPSec Tunnel #2

#1: Internet Key Exchange Configuration

Configure the IKE SA as follows:
Please note, these sample configurations are for the minimum requirement of AES128, SHA1, and DH Group 2.
You will need to modify these sample configuration files to take advantage of AES256, SHA256, or other DH groups like 2, 14-18, 22, 23, and 24.
The address of the external interface for your customer gateway must be a static address. Your customer gateway may reside behind a device performing network address translation (NAT).
To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, we recommend disabling NAT-T.
- IKE version: IKEv1
- Authentication Method: Pre-Shared Key
- Pre-Shared Key: PRE-SHARED-KEY-IN-PLAIN-TEXT
- Authentication Algorithm: sha1
- Encryption Algorithm: aes-128-cbc
- Lifetime: 28800 seconds
- Phase 1 Negotiation Mode: main
- Diffie-Hellman: Group 2
#2: IPSec Configuration

Configure the IPSec SA as follows:
Please note, you may use these additionally supported IPSec parameters for encryption like AES256 and other DH groups like 2, 5, 14–18, 22, 23, and 24.

- Protocol                 : esp
- Authentication Algorithm : hmac-sha1-96
- Encryption Algorithm     : aes-128-cbc
- Lifetime                 : 3600 seconds
- Mode                     : tunnel
- Perfect Forward Secrecy  : Diffie-Hellman Group 2

IPSec Dead Peer Detection (DPD) will be enabled on the AWS Endpoint. We recommend configuring DPD on your endpoint as follows:
- DPD Interval             : 10
- DPD Retries              : 3

IPSec ESP (Encapsulating Security Payload) inserts additional headers to transmit packets. These headers require additional space, which reduces the amount of space available to transmit application data. To limit the impact of this behavior, we recommend the following configuration on your Customer Gateway:
- TCP MSS Adjustment       : 1387 bytes
- Clear Don't Fragment Bit : enabled
- Fragmentation            : Before encryption

#3: Tunnel Interface Configuration

Your Customer Gateway must be configured with a tunnel interface that is associated with the IPSec tunnel. All traffic transmitted to the tunnel interface is encrypted and transmitted to the Virtual Private Gateway.

The Customer Gateway and Virtual Private Gateway each have two addresses that relate to this IPSec tunnel. Each contains an outside address, upon which encrypted traffic is exchanged. Each also contain an inside address associated with the tunnel interface.

The Customer Gateway outside IP address was provided when the Customer Gateway was created. Changing the IP address requires the creation of a new Customer Gateway.

The Customer Gateway inside IP address should be configured on your tunnel interface.

Outside IP Addresses:
- Customer Gateway                    : YOUR_UPLINK_ADDRESS
- Virtual Private Gateway             : 72.21.209.225

Inside IP Addresses
- Customer Gateway                  : 169.254.255.78/30
- Virtual Private Gateway            : 169.254.255.77/30

Configure your tunnel to fragment at the optimal size:
- Tunnel interface MTU     : 1436 bytes

#4: Static Routing Configuration:

To route traffic between your internal network and your VPC, you will need a static route added to your router.

Static Route Configuration Options:
How to Test the Customer Gateway Configuration

You must first test the gateway configuration for each tunnel.

To test the customer gateway device configuration for each tunnel

- On your customer gateway device, verify that you have added a static route to the VPC CIDR IP space to use the tunnel interface.

Next you must test the connectivity for each tunnel by launching an instance into your VPC, and pinging the instance from your home network. Before you begin, make sure of the following:

- Use an AMI that responds to ping requests. We recommend that you use one of the Amazon Linux AMIs.
- Configure your instance's security group and network ACL to enable inbound ICMP traffic.
- Ensure that you have configured routing for your VPN connection - your subnet's route table must contain a route to the virtual private gateway. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

To test the end-to-end connectivity of each tunnel

1. Launch an instance of one of the Amazon Linux AMIs into your VPC. The Amazon Linux AMIs are available in the Quick Start menu when you use the Launch Instances Wizard in the AWS Management Console. For more information, see the Amazon VPC Getting Started Guide.
2. After the instance is running, get its private IP address (for example, 10.0.0.4). The console displays the address as part of the instance's details.
3. On a system in your home network, use the ping command with the instance's IP address. Make sure that the computer you ping from is behind the customer gateway. A successful response should be similar to the following.

PROMPT> ping 10.0.0.4
Pinging 10.0.0.4 with 32 bytes of data:

Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128
Reply from 10.0.0.4: bytes=32 time<1ms TTL=128

Ping statistics for 10.0.0.4:
Packets: Sent = 3, Received = 3, Lost = 0 (0% loss),
Average round trip times in milliseconds:
Minimum = 0ms, Maximum = 0ms, Average = 0ms

Note
If you ping an instance from your customer gateway router, ensure that you are sourcing ping messages from an internal IP address, not a tunnel IP address. Some AMIs don't respond to ping messages from tunnel IP addresses.
If your tunnels don't test successfully, see Troubleshooting Generic Device Customer Gateway Connectivity Using Border Gateway Protocol (p. 198).
Troubleshooting Cisco ASA Customer Gateway Connectivity

Important
Some Cisco ASAs only support Active/Standby mode. When you use these Cisco ASAs, you can have only one active tunnel at a time. The other standby tunnel becomes active only if the first tunnel becomes unavailable. The standby tunnel may produce the following error in your log files, which can be ignored:

Rejecting IPSec tunnel: no matching crypto map entry for remote proxy 0.0.0.0/0.0.0.0/0/0 local proxy 0.0.0.0/0.0.0.0/0/0 on interface outside

IKE

Use the following command. The response shows a customer gateway with IKE configured correctly.
ciscoasa# show crypto isakmp sa

Active SA: 2
Rekey SA: 0 (A tunnel will report 1 Active and 1 Rekey SA during rekey)
Total IKE SA: 2

1 IKE Peer: AWS_ENDPOINT_1
   Type : L2L    Role : initiator
   Rekey: no     State : MM_ACTIVE

You should see one or more lines containing an src value for the remote gateway specified in the tunnels. The state value should be MM_ACTIVE and status should be ACTIVE. The absence of an entry, or any entry in another state, indicates that IKE is not configured properly.

For further troubleshooting, run the following commands to enable log messages that provide diagnostic information.

router# term mon
router# debug crypto isakmp

To disable debugging, use the following command:

router# no debug crypto isakmp

IPsec

Use the following command. The response shows a customer gateway with IPsec configured correctly.

ciscoasa# show crypto ipsec sa

interface: outside
  Crypto map tag: VPN_crypto_map_name, seq num: 2, local addr: 172.25.50.101

  access-list integ-ppe-loopback extended permit ip any vpc_subnet subnet_mask
  local ident (addr/mask/prot/port): (0.0.0.0/0.0.0.0/0/0)
  remote ident (addr/mask/prot/port): (vpc_subnet/subnet_mask/0/0)
  current_peer: integ-ppe1
  #pkts encaps: 0, #pkts encrypt: 0, #pkts digest: 0
  #pkts decaps: 0, #pkts decrypt: 0, #pkts verify: 0
  #pkts compressed: 0, #pkts decompressed: 0
  #pkts not compressed: 0, #pkts comp failed: 0, #pkts decomp failed: 0
  #pre-frag successes: 0, #pre-frag failures: 0, #fragments created: 0
  #PMTUs sent: 0, #PMTUs rcvd: 0, #decapsulated frgs needing reassembly: 0
  #send errors: 0, #recv errors: 0

  local crypto endpt.: 172.25.50.101, remote crypto endpt.: AWS_ENDPOINT_1

  path mtu 1500, ipsec overhead 74, media mtu 1500
  current outbound spi: 6D9F8D3B
  current inbound spi: 48B456A6

  inbound esp sas:
    spi: 0x48B456A6 (1219778214)
    transform: esp-aes esp-sha-hmac no compression
    in use settings ={L2L, Tunnel, PFS Group 2, }
For each tunnel interface, you should see both inbound esp sas and outbound esp sas. This assumes that an SA is listed (for example, spi: 0x48B456A6), and IPsec is configured correctly.

In Cisco ASA, the IPsec only comes up after "interesting traffic" is sent. To always keep the IPsec active, we recommend configuring SLA monitor. SLA monitor continues to send interesting traffic, keeping the IPsec active.

You can also use the following ping command to force your IPsec to start negotiation and go up:

```
ping ec2_instance_ip_address
```

For further troubleshooting, use the following command to enable debugging:

```
router# debug crypto ipsec
```

To disable debugging, use the following command:

```
router# no debug crypto ipsec
```

Routing

Ping the other end of the tunnel. If this is working, then your IPsec should be up and running fine. If this is not working, check your access lists, and refer the previous IPsec section.

If you are not able to reach your instances, check the following:

1. Verify that the access-list is configured to allow traffic that is associated with the crypto map.
   
   You can do this using the following command:
Cisco ASA# show run crypto

crypto ipsec transform-set transform-amzn esp-aes esp-sha-hmac
crypto map vpn_crypto_map_name 1 match address access-list-name
crypto map vpn_crypto_map_name 1 set pfs
crypto map vpn_crypto_map_name 1 set peer AWS_ENDPOINT_1 AWS_ENDPOINT_2
crypto map vpn_crypto_map_name 1 set transform-set transform-amzn
crypto map vpn_crypto_map_name 1 set security-association lifetime seconds 3600

2. Next, check the access list as follows:

ciscoasa# show run access-list access-list-name

access-list access-list-name extended permit ip any vpc_subnet subnet_mask

For example:

access-list access-list-name extended permit ip any 10.0.0.0 255.255.0.0

3. Verify that this access list is correct. The example access list in the previous step allows all internal traffic to the VPC subnet 10.0.0.0/16.

4. Run a traceroute from the Cisco ASA device, to see if it reaches the Amazon routers (for example, AWS_ENDPOINT_1/AWS_ENDPOINT_2).

If this reaches the Amazon router, then check the static routes that you added in the AWS Management Console, and also the security groups for the particular instances.

5. For further troubleshooting, review the configuration.

Troubleshooting Cisco IOS Customer Gateway Connectivity

This guide (the *Network Administrator Guide*) has been merged into the *AWS Site-to-Site VPN User Guide* and is no longer maintained. For more information about configuring your customer gateway device, see the *AWS Site-to-Site VPN User Guide*.

When you troubleshoot the connectivity of a Cisco customer gateway, consider four things: IKE, IPsec, tunnel, and BGP. You can troubleshoot these areas in any order, but we recommend that you start with IKE (at the bottom of the network stack) and move up.

**IKE**

Use the following command. The response shows a customer gateway with IKE configured correctly.

router# show crypto isakmp sa

<table>
<thead>
<tr>
<th>IPv4 Crypto ISAKMP SA</th>
<th>dst</th>
<th>src</th>
<th>state</th>
<th>conn-id</th>
<th>slot</th>
<th>status</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.37.160</td>
<td>72.21.209.193</td>
<td>QM_IDLE</td>
<td>2001</td>
<td>0</td>
<td>ACTIVE</td>
<td></td>
</tr>
</tbody>
</table>

180
You should see one or more lines containing an `src` value for the Remote Gateway specified in the tunnels. The state should be `QM_IDLE` and status should be `ACTIVE`. The absence of an entry, or any entry in another indicate that IKE is not configured properly.

For further troubleshooting, run the following commands to enable log messages that provide diagnostic information.

```
router# term mon
router# debug crypto isakmp
```

To disable debugging, use the following command:

```
router# no debug crypto isakmp
```

### IPsec

Use the following command. The response shows a customer gateway with IPsec configured correctly.

```
router# show crypto ipsec sa
```

```
interface: Tunnel1
  Crypto map tag: Tunnel1-head-0, local addr 192.168.37.160
  protected vrf: (none)
  local ident (addr/mask/prot/port): (0.0.0.0/0.0.0.0/0/0)
  remote ident (addr/mask/prot/port): (0.0.0.0/0.0.0.0/0/0)
  current peer 72.21.209.225 port 500
    PERMIT, flags={origin_is_acl,}
    #pkts encaps: 149, #pkts encrypt: 149, #pkts digest: 149
    #pkts decaps: 146, #pkts decrypt: 146, #pkts verify: 146
    #pkts compressed: 0, #pkts decompressed: 0
    #pkts not compressed: 0, #pkts compr. failed: 0
    #pkts not decompressed: 0, #pkts decompress failed: 0
    #send errors 0, #recv errors 0
  local crypto endpt.: 174.78.144.73, remote crypto endpt.: 72.21.209.225
  path mtu 1500, ip mtu 1500, ip mtu idb FastEthernet0
  current outbound spi: 0xB8357C22(3090512930)
  inbound esp sas:
    spi: 0x6ADDB173(112046451)
    transform: esp-aes esp-sha-hmac ,
    in use settings ={Tunnel, }
    conn id: 1, flow id: Motorola SEC 2.0:1, crypto map: Tunnel1-head-0
    sa timing: remaining key lifetime (k/sec): (4467148/3189)
    IV size: 16 bytes
    replay detection support: Y  replay window size: 128
    Status: ACTIVE

  inbound ah sas:

  inbound pcp sas:

  outbound esp sas:
    spi: 0xB8357C22(3090512930)
    transform: esp-aes esp-sha-hmac ,
    in use settings ={Tunnel, }
```
For each tunnel interface, you should see both inbound esp sas and outbound esp sas. Assuming an SA is listed (spi: 0xF95D2F3C, for example) and the Status is ACTIVE, IPsec is configured correctly.

For further troubleshooting, use the following command to enable debugging.

```
router# debug crypto ipsec
```
Use the following command to disable debugging.

```
router# no debug crypto ipsec
```

## Tunnel

First, check that you have the necessary firewall rules in place. For more information, see Configuring a Firewall Between the Internet and Your Customer Gateway Device (p. 11).

If your firewall rules are set up correctly, then continue troubleshooting with the following command:

```
router# show interfaces tun1
```

```
Tunnel is up, line protocol is up
  Hardware is Tunnel
  Internet address is 169.254.255.2/30
  MTU 17867 bytes, BW 100 Kbit/sec, DLY 50000 usec,
    reliability 255/255, txload 2/255, rxload 1/255
  Encapsulation TUNNEL, loopback not set
  Keepalive not set
  Tunnel source 174.78.144.73, destination 72.21.209.225
  Tunnel protocol/transport IPSEC/IP
  Tunnel TTL 255
  Tunnel transport MTU 1427 bytes
  Tunnel transmit bandwidth 8000 (kbps)
  Tunnel receive bandwidth 8000 (kbps)
  Tunnel protection via IPSec (profile "ipsec-vpn-92df3bfb-0")
  Last input never, output never, output hang never
  Last clearing of "show interface" counters never
  Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
  Queueing strategy: fifo
  Output queue: 0/0 (size/max)
    5 minute input rate 0 bits/sec, 1 packets/sec
    5 minute output rate 1000 bits/sec, 1 packets/sec
    407 packets input, 30010 bytes, 0 no buffer
    Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
```

Make sure that the line protocol is up. Check that the tunnel source IP address, source interface and destination respectively match the tunnel configuration for the customer gateway outside IP address, interface, and virtual private gateway outside IP address. Make sure that Tunnel protection via IPSec is present. Make sure to run the command on both tunnel interfaces. To resolve any problems here, review the configuration and check the physical connections to your customer gateway.

Also use the following command, replacing 169.254.255.1 with the inside IP address of your virtual private gateway.

```
router# ping 169.254.255.1 df-bit size 1410
```

```
Type escape sequence to abort.
Sending 5, 1410-byte ICMP Echos to 169.254.255.1, timeout is 2 seconds:
Packet sent with the DF bit set
!!!!!!
```

You should see five exclamation points.

For further troubleshooting, review the configuration.
BGP

Use the following command:

```
router# show ip bgp summary
```

BGP router identifier 192.168.37.160, local AS number 65000
BGP table version is 8, main routing table version 8
2 network entries using 312 bytes of memory
2 path entries using 136 bytes of memory
3/1 BGP path/bestpath attribute entries using 444 bytes of memory
1 BGP AS-PATH entries using 24 bytes of memory
0 BGP route-map cache entries using 0 bytes of memory
0 BGP filter-list cache entries using 0 bytes of memory
BGP using 948 total bytes of memory
BGP activity 4/1 prefixes, 4/1 paths, scan interval 15 secs

<table>
<thead>
<tr>
<th>Neighbor</th>
<th>V</th>
<th>AS</th>
<th>MsgRcvd</th>
<th>MsgSent</th>
<th>TblVer</th>
<th>InQ</th>
<th>OutQ</th>
<th>Up/Down</th>
<th>State/PfxRcd</th>
</tr>
</thead>
<tbody>
<tr>
<td>169.254.255.1</td>
<td>4</td>
<td>7224</td>
<td>363</td>
<td>323</td>
<td>8</td>
<td>0</td>
<td>0</td>
<td>00:54:21</td>
<td>1</td>
</tr>
<tr>
<td>169.254.255.5</td>
<td>4</td>
<td>7224</td>
<td>364</td>
<td>323</td>
<td>8</td>
<td>0</td>
<td>0</td>
<td>00:00:24</td>
<td>1</td>
</tr>
</tbody>
</table>

Here, both neighbors should be listed. For each, you should see a State/PfxRcd value of 1.

If the BGP peering is up, verify that your customer gateway router is advertising the default route (0.0.0.0/0) to the VPC.

```
router# show bgp all neighbors 169.254.255.1 advertised-routes
```

For address family: IPv4 Unicast
BGP table version is 3, local router ID is 174.78.144.73
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Originating default network 0.0.0.0

```
Network            Next Hop       Metric  LocPrf Weight Path
*> 10.120.0.0/16    169.254.255.1 100      0    7224    i
```

Total number of prefixes 1

Additionally, ensure that you're receiving the prefix corresponding to your VPC from the virtual private gateway.

```
router# show ip route bgp
```

10.0.0.0/16 is subnetted, 1 subnets
B    10.255.0.0 [20/0] via 169.254.255.1, 00:00:20

For further troubleshooting, review the configuration.

**Virtual Private Gateway Attachment**

Make sure that your virtual private gateway is attached to your VPC. Your integration team does this with the AWS Management Console.
If you have questions or need further assistance, use the Amazon VPC forum.

Troubleshooting Cisco IOS Customer Gateway without Border Gateway Protocol Connectivity

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

When you troubleshoot the connectivity of a Cisco customer gateway, consider three things: IKE, IPsec, and tunnel. You can troubleshoot these areas in any order, but we recommend that you start with IKE (at the bottom of the network stack) and move up.

IKE

Use the following command. The response shows a customer gateway with IKE configured correctly.

```
router# show crypto isakmp sa
```

```
IPv4 Crypto ISAKMP SA
dst    src              state      conn-id slot status
174.78.144.73 205.251.233.121 QM_IDLE       2001    0  ACTIVE
174.78.144.73 205.251.233.122 QM_IDLE       2002    0  ACTIVE
```

You should see one or more lines containing a src value for the remote gateway specified in the tunnels. The state should be QM_IDLE and status should be ACTIVE. The absence of an entry, or any entry in another state, indicates that IKE is not configured properly.

For further troubleshooting, run the following commands to enable log messages that provide diagnostic information.

```
router# term mon
router# debug crypto isakmp
```

To disable debugging, use the following command:

```
router# no debug crypto isakmp
```

IPsec

Use the following command. The response shows a customer gateway with IPsec configured correctly.

```
router# show crypto ipsec sa
```

```
interface: Tunnel1
Crypto map tag: Tunnel1-head-0, local addr 174.78.144.73

protected vrf: (none)
local ident (addr/mask/prot/port): (0.0.0.0/0.0.0.0/0/0)
remote ident (addr/mask/prot/port): (0.0.0.0/0.0.0.0/0/0)
current_peer 72.21.209.225 port 500
```
PERMIT, flags={origin_is_acl,}

local ident (addr/mask/prot/port): (0.0.0.0/0.0.0.0/0/0)
remote ident (addr/mask/prot/port): (0.0.0.0/0.0.0.0/0/0)
current peer 72.21.209.193 port 500
PERMIT, flags={origin_is_acl,}
#pkts encaps: 26, #pkts encrypt: 26, #pkts digest: 26
#pkts decaps: 24, #pkts decrypt: 24, #pkts verify: 24
#pkts compressed: 0, #pkts decompressed: 0
#pkts not compressed: 0, #pkts compr. failed: 0
#pkts not decompressed: 0, #pkts decompress failed: 0
#send errors 0, #recv errors 0

local crypto endpt.: 174.78.144.73, remote crypto endpt.: 205.251.233.122
path mtu 1500, ip mtu 1500, ip mtu idb FastEthernet0
current outbound spi: 0xF59A3FF6(4120526838)
inbound esp sas:
spi: 0xB8357C22(3090512930)
transform: esp-aes esp-sha-hmac,
in use settings ={Tunnel,}
conn id: 3, flow_id: Motorola SEC 2.0:3, crypto map: Tunnel2-head-0
sa timing: remaining key lifetime (k/sec): (4387273/3492)
IV size: 16 bytes
For each tunnel interface, you should see both an inbound esp sas and outbound esp sas. This assumes that an SA is listed (for example, spi: 0x48B456A6), the status is ACTIVE, and IPsec is configured correctly.

For further troubleshooting, use the following command to enable debugging.

```
router# debug crypto ipsec
```

To disable debugging, use the following command:

```
router# no debug crypto ipsec
```

**Tunnel**

First, check that you have the necessary firewall rules in place. For more information, see Configuring a Firewall Between the Internet and Your Customer Gateway Device (p. 11).

If your firewall rules are set up correctly, then continue troubleshooting with the following command:

```
router# show interfaces tun1
```
Output queue: 0/0 (size/max)
5 minute input rate 0 bits/sec, 1 packets/sec
5 minute output rate 1000 bits/sec, 1 packets/sec
407 packets input, 30010 bytes, 0 no buffer
Received 0 broadcasts, 0 runts, 0 giants, 0 throttles

Make sure that the line protocol is up. Check that the tunnel source IP address, source interface, and destination respectively match the tunnel configuration for the customer gateway outside IP address, interface, and virtual private gateway outside IP address. Make sure that Tunnel protection through IPSec is present. Make sure to run the command on both tunnel interfaces. To resolve any problems, review the configuration and check the physical connections to your customer gateway.

You can also use the following command, replacing 169.254.249.18 with the inside IP address of your virtual private gateway.

```
router# ping 169.254.249.18 df-bit size 1410
```

Type escape sequence to abort.
Sending 5, 1410-byte ICMP Echos to 169.254.249.18, timeout is 2 seconds:
Packet sent with the DF bit set
!!!!!!

You should see five exclamation points.

**Routing**

To see your static route table, use the following command:

```
router# sh ip route static
```

```
1.0.0.0/8 is variably subnetted
S       10.0.0.0/16 is directly connected, Tunnel1
          is directly connected, Tunnel2
```

You should see that the static route for the VPC CIDR through both tunnels exists. If it does not exist, add the static routes as shown here:

```
router# ip route 10.0.0.0 255.255.0.0 Tunnel1 track 100
router# ip route 10.0.0.0 255.255.0.0 Tunnel2 track 200
```

**Checking the SLA Monitor**

```
router# show ip sla statistics 100
```

```
IPSLAs Latest Operation Statistics
IPSLA operation id: 100
          Latest RTT: 128 milliseconds
          Latest operation start time: *18:08:02.155 UTC Wed Jul 15 2012
          Latest operation return code: OK
          Number of successes: 3
          Number of failures: 0
          Operation time to live: Forever
```

```
router# show ip sla statistics 200
```

188
IPSLA's Latest Operation Statistics

IPSLA operation id: 200
Latest RTT: 128 milliseconds
Latest operation start time: 18:08:02.155 UTC Wed Jul 15 2012
Latest operation return code: OK
Number of successes: 3
Number of failures: 0
Operation time to live: Forever

The value of "Number of successes" indicates whether the SLA monitor has been set up successfully.

For further troubleshooting, review the configuration.

Virtual Private Gateway Attachment

Verify that your virtual private gateway is attached to your VPC. Your integration team does this with the AWS Management Console.

If you have questions or need further assistance, please use the Amazon VPC forum.

Troubleshooting Juniper JunOS Customer Gateway Connectivity

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

When you troubleshoot the connectivity of a Juniper customer gateway, consider four things: IKE, IPsec, tunnel, and BGP. You can troubleshoot these areas in any order, but we recommend that you start with IKE (at the bottom of the network stack) and move up.

IKE

Use the following command. The response shows a customer gateway with IKE configured correctly.

```bash
user@router> show security ike security-associations
```

<table>
<thead>
<tr>
<th>Index</th>
<th>Remote Address</th>
<th>State</th>
<th>Initiator cookie</th>
<th>Responder cookie</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>72.21.209.225</td>
<td>UP</td>
<td>c4cd953602568b74</td>
<td>0d6d194993328b02</td>
<td>Main</td>
</tr>
<tr>
<td>3</td>
<td>72.21.209.193</td>
<td>UP</td>
<td>b8c8fbb7dc68d9173</td>
<td>ca7cbeb0af8a4b4bb</td>
<td>Main</td>
</tr>
</tbody>
</table>

You should see one or more lines containing a Remote Address of the Remote Gateway specified in the tunnels. The State should be UP. The absence of an entry, or any entry in another state (such as DOWN) is an indication that IKE is not configured properly.

For further troubleshooting, enable the IKE trace options (as recommended in the example configuration information (see Example: Juniper J-Series JunOS Device (p. 106))). Then run the following command to print a variety of debugging messages to the screen.

```bash
user@router> monitor start kmd
```
From an external host, you can retrieve the entire log file with the following command:

```
scp username@router.hostname:/var/log/kmd
```

**IPsec**

Use the following command. The response shows a customer gateway with IPsec configured correctly.

```
user@router> show security ipsec security-associations
```

<table>
<thead>
<tr>
<th>ID</th>
<th>Gateway</th>
<th>Port</th>
<th>Algorithm</th>
<th>SPI</th>
<th>Life:sec/kb</th>
<th>Mon vsys</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;131073</td>
<td>72.21.209.225</td>
<td>500</td>
<td>ESP:aes-128/sha1</td>
<td>df27aae4</td>
<td>326/ 4KB</td>
<td>326/ 4KB</td>
</tr>
<tr>
<td>&gt;131073</td>
<td>72.21.209.225</td>
<td>500</td>
<td>ESP:aes-128/sha1</td>
<td>5de29aa1</td>
<td>326/ 4KB</td>
<td>326/ 4KB</td>
</tr>
<tr>
<td>&lt;131074</td>
<td>72.21.209.193</td>
<td>500</td>
<td>ESP:aes-128/sha1</td>
<td>dd16c453</td>
<td>300/ 4KB</td>
<td>300/ 4KB</td>
</tr>
<tr>
<td>&gt;131074</td>
<td>72.21.209.193</td>
<td>500</td>
<td>ESP:aes-128/sha1</td>
<td>c1e0eb29</td>
<td>300/ 4KB</td>
<td>300/ 4KB</td>
</tr>
</tbody>
</table>

Specifically, you should see at least two lines per Gateway address (corresponding to the Remote Gateway). Note the carets at the beginning of each line (< >) which indicate the direction of traffic for the particular entry. The output has separate lines for inbound traffic (<, traffic from the virtual private gateway to this customer gateway) and outbound traffic (>).

For further troubleshooting, enable the IKE traceoptions (for more information, see the preceding section about IKE).

**Tunnel**

First, double-check that you have the necessary firewall rules in place. For a list of the rules, see Configuring a Firewall Between the Internet and Your Customer Gateway Device (p. 11).

If your firewall rules are set up correctly, then continue troubleshooting with the following command:

```
user@router> show interfaces st0.1
```

Logical interface st0.1 (Index 70) (SNMP ifIndex 126)
- Flags: Point-To-Point SNMP-Traps Encapsulation: Secure-Tunnel
- Input packets: 8719
- Output packets: 41841
- Security: Zone: Trust
- Allowed host-inbound traffic: bgp ping ssh traceroute
- Protocol inet, MTU: 9192
  - Flags: None
  - Addresses, Flags: Is-Preferred Is-Primary
  - Destination: 169.254.255.0/30, Local: 169.254.255.2

Make sure that the Security: Zone is correct, and that the Local address matches the customer gateway tunnel inside address.

Next, use the following command, replacing 169.254.255.1 with the inside IP address of your virtual private gateway. Your results should look like the response shown here.

```
user@router> ping 169.254.255.1 size 1382 do-not-fragment
```

PING 169.254.255.1 (169.254.255.1): 1410 data bytes
64 bytes from 169.254.255.1: icmp_seq=0 ttl=64 time=71.080 ms
For further troubleshooting, review the configuration.

**BGP**

Use the following command:

```
user@router> show bgp summary
```

<table>
<thead>
<tr>
<th>Table</th>
<th>Tot Paths</th>
<th>Act Paths</th>
<th>Suppressed</th>
<th>History</th>
<th>Damp State</th>
<th>Pending</th>
</tr>
</thead>
<tbody>
<tr>
<td>inet.0</td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For further troubleshooting, use the following command, replacing 169.254.255.1 with the inside IP address of your virtual private gateway.

```
user@router> show bgp neighbor 169.254.255.1
```

Peer: 169.254.255.1+179 AS 7224 Local: 169.254.255.2+57175 AS 65000
Type: External State: Established Flags: <ImportEval Sync>

Last Error: None
Export: [ EXPORT-DEFAULT ]
Options: <Preference HoldTime PeerAS LocalAS Refresh>
Holdtime: 30 Preference: 170 Local AS: 65000 Local System AS: 0
Number of flaps: 0
Peer ID: 169.254.255.1 Local ID: 10.50.0.10 Active Holdtime: 30
Keepalive Interval: 10 Peer index: 0
BFD: disabled, down
Local Interface: st0.1
NLRI for restart configured on peer: inet-unicast
NLRI advertised by peer: inet-unicast
NLRI for this session: inet-unicast
Peer supports Refresh capability (2)
Restart time configured on the peer: 120
Stale routes from peer are kept for: 300
Restart time requested by this peer: 120
NLRI that peer supports restart for: inet-unicast
NLRI that restart is negotiated for: inet-unicast
NLRI of received end-of-rib markers: inet-unicast
NLRI of all end-of-rib markers sent: inet-unicast
Peer supports 4 byte AS extension (peer-as 7224)
Table inet.0 Bit: 10000
  RIB State: BGP restart is complete
  Send state: in sync
  Active prefixes: 1
  Received prefixes: 1
  Accepted prefixes: 1
  Suppressed due to damping: 0
  Advertised prefixes: 1
Last traffic (seconds): Received 4 Sent 8 Checked 4
Input messages: Total 24 Updates 2 Refreshes 0 Octets 505
Output messages: Total 26 Updates 1 Refreshes 0 Octets 582
Here you should see Received prefixes and Advertised prefixes listed at 1 each. This should be within the Table inet.0 section.

If the State is not Established, check the Last State and Last Error for details of what is required to correct the problem.

If the BGP peering is up, verify that your customer gateway router is advertising the default route (0.0.0.0/0) to the VPC.

```
user@router> show route advertising-protocol bgp 169.254.255.1
```

Additionally, make sure that you're receiving the prefix corresponding to your VPC from the virtual private gateway.

```
user@router> show route receive-protocol bgp 169.254.255.1
```

**Virtual Private Gateway Attachment**

Make sure that your virtual private gateway is attached to your VPC. Your integration team does this with the AWS Management Console.

If you have questions or need further assistance, use the Amazon VPC forum.

---

**Troubleshooting Juniper ScreenOS Customer Gateway Connectivity**

This guide (the *Network Administrator Guide*) has been merged into the *AWS Site-to-Site VPN User Guide* and is no longer maintained. For more information about configuring your customer gateway device, see the *AWS Site-to-Site VPN User Guide*.

When you troubleshoot the connectivity of a Juniper ScreenOS-based customer gateway, consider four things: IKE, IPsec, tunnel, and BGP. You can troubleshoot these areas in any order, but we recommend that you start with IKE (at the bottom of the network stack) and move up.

**IKE and IPsec**

Use the following command. The response shows a customer gateway with IKE configured correctly.

```
ssg5-serial-> get sa
```
You should see one or more lines containing a Remote Address of the Remote Gateway specified in the tunnels. The Sta value should be A/- and SPI should be a hexadecimal number other than 00000000. Entries in other states indicate that IKE is not configured properly.

For further troubleshooting, enable the IKE trace options (as recommended in the example configuration information (see Example: Juniper ScreenOS Device (p. 126)).

**Tunnel**

First, double-check that you have the necessary firewall rules in place. For a list of the rules, see Configuring a Firewall Between the Internet and Your Customer Gateway Device (p. 11).

If your firewall rules are set up correctly, then continue troubleshooting with the following command:

ssg5-serial-> get interface tunnel.1

Make sure that you see link:ready, and that the IP address matches the customer gateway tunnel inside address.

Next, use the following command, replacing 169.254.255.1 with the inside IP address of your virtual private gateway. Your results should look like the response shown here.

ssg5-serial-> ping 169.254.255.1

Type escape sequence to abort
Sending 5, 100-byte ICMP Echos to 169.254.255.1, timeout is 1 seconds
!!!!!!
Success Rate is 100 percent (5/5), round-trip time min/avg/max=32/32/33 ms

For further troubleshooting, review the configuration.

**BGP**

Use the following command:

```
ssg5-serial-> get vrouter trust-vr protocol bgp neighbor
```

<table>
<thead>
<tr>
<th>Peer AS</th>
<th>Remote IP</th>
<th>Local IP</th>
<th>Wt Status</th>
<th>State</th>
<th>ConnID Up/Down</th>
</tr>
</thead>
<tbody>
<tr>
<td>7224</td>
<td>169.254.255.1</td>
<td>169.254.255.2</td>
<td>100</td>
<td>Enabled</td>
<td>ESTABLISH</td>
</tr>
<tr>
<td>7224</td>
<td>169.254.255.5</td>
<td>169.254.255.6</td>
<td>100</td>
<td>Enabled</td>
<td>ESTABLISH</td>
</tr>
</tbody>
</table>

Both BGP peers should be listed as State: ESTABLISH, which means the BGP connection to the virtual private gateway is active.

For further troubleshooting, use the following command, replacing `169.254.255.1` with the inside IP address of your virtual private gateway.

```
ssg5-serial-> get vr trust-vr prot bgp neigh 169.254.255.1
```

```
peer: 169.254.255.1, remote AS: 7224, admin status: enable
type: EBGP, multihop: 0(disable), MED: node default(0)
connection state: ESTABLISH, connection id: 18 retry interval: node default(120s), cur retry time 15s
configured hold time: node default(90s), configured keepalive: node default(30s)
configured adv-interval: default(30s)
designated local IP: n/a
local IP address/port: 169.254.255.2/13946, remote IP address/port: 169.254.255.1/179
router ID of peer: 169.254.255.1, remote AS: 7224
negotiated hold time: 30s, negotiated keepalive interval: 10s
route map in name: , route map out name:
weight: 100 (default)
self as next hop: disable
send default route to peer: disable
ignore default route from peer: disable
send community path attribute: no
reflector client: no
Neighbor Capabilities:
  Route refresh: advertised and received
  Address family IPv4 Unicast: advertised and received
force reconnect is disable
total messages to peer: 106, from peer: 106
update messages to peer: 6, from peer: 4
TX queue length 0, TX queue HWM: 1
route-refresh messages to peer: 0, from peer: 0
last reset 00:05:33 ago, due to BGP send Notification(Hold Timer Expired)(code 4 : subcode 0)
number of total successful connections: 4
connected: 2 minutes 6 seconds
Elapsed time since last update: 2 minutes 6 seconds
```

If the BGP peering is up, verify that your customer gateway router is advertising the default route (0.0.0.0/0) to the VPC. This command applies to ScreenOS version 6.2.0 and higher.
Virtual Private Gateway Attachment

Make sure that your virtual private gateway is attached to your VPC. Your integration team does this with the AWS Management Console.

If you have questions or need further assistance, please use the Amazon VPC forum.

Troubleshooting Yamaha Customer Gateway Connectivity

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

When you troubleshoot the connectivity of a Yamaha customer gateway, consider four things: IKE, IPsec, tunnel, and BGP. You can troubleshoot these areas in any order, but we recommend that you start with IKE (at the bottom of the network stack) and move up.

IKE

Use the following command. The response shows a customer gateway with IKE configured correctly.

```
# show ipsec sa gateway 1
```

```
sgw flags local-id                      remote-id # of sa
---------------------------------------------
1   U K YOUR_LOCAL_NETWORK_ADDRESS       72.21.209.225   1:2 s:1 r:1
```

You should see a line containing a remote-id value for the Remote Gateway specified in the tunnels. You can list all the security associations (SAs) by omitting the tunnel number.
For further troubleshooting, run the following commands to enable DEBUG level log messages that provide diagnostic information.

```
# syslog debug on
# ipsec ike log message-info payload-info key-info
```

To cancel the logged items, use the following command:

```
# no ipsec ike log
# no syslog debug on
```

### IPsec

Use the following command. The response shows a customer gateway with IPsec configured correctly.

```
# show ipsec sa gateway 1 detail
```

<table>
<thead>
<tr>
<th>SA[1]</th>

<td></td>
</tr>
</tbody>
</table>

For each tunnel interface, you should see both receive sas and send sas.

For further troubleshooting, use the following command to enable debugging.

```
# syslog debug on
```
Use the following command to disable debugging.

```
# no ipsec ike log
# no syslog debug on
```

**Tunnel**

First, check that you have the necessary firewall rules in place. For a list of the rules, see Configuring a Firewall Between the Internet and Your Customer Gateway Device (p. 11).

If your firewall rules are set up correctly, then continue troubleshooting with the following command:

```
# show status tunnel 1
```

TUNNEL[1]:
Description:
   Interface type: IPsec
   Current status is Online.
   from 2011/08/15 18:19:45.
   5 hours 7 minutes 58 seconds connection.
   Received: (IPv4) 3933 packets [244941 octets]
   (IPv6) 0 packet [0 octet]
   Transmitted: (IPv4) 3933 packets [241407 octets]
   (IPv6) 0 packet [0 octet]

Make sure that the current status value is online and that Interface type is IPsec. Make sure to run the command on both tunnel interfaces. To resolve any problems here, review the configuration.

**BGP**

Use the following command:

```
# show status bgp neighbor
```

BGP neighbor is 169.254.255.1, remote AS 7224, local AS 65000, external link
   BGP version 0, remote router ID 0.0.0.0
   BGP state = Active
   Last read 00:00:00, hold time is 0, keepalive interval is 0 seconds
   Received 0 messages, 0 notifications, 0 in queue
   Sent 0 messages, 0 notifications, 0 in queue
   Connection established 0; dropped 0
   Last reset never
Local host: unspecified
Foreign host: 169.254.255.1, Foreign port: 0

BGP neighbor is 169.254.255.5, remote AS 7224, local AS 65000, external link
   BGP version 0, remote router ID 0.0.0.0
   BGP state = Active
   Last read 00:00:00, hold time is 0, keepalive interval is 0 seconds
   Received 0 messages, 0 notifications, 0 in queue
   Sent 0 messages, 0 notifications, 0 in queue
   Connection established 0; dropped 0
   Last reset never
Local host: unspecified
Foreign host: 169.254.255.5, Foreign port:
Here, both neighbors should be listed. For each, you should see a BGP state value of Active.

If the BGP peering is up, verify that your customer gateway router is advertising the default route (0.0.0.0/0) to the VPC.

```
# show status bgp neighbor 169.254.255.1 advertised-routes
```

<table>
<thead>
<tr>
<th>Total routes: 1</th>
<th>*: valid route</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network</td>
<td>Next Hop</td>
</tr>
<tr>
<td>* default</td>
<td>0.0.0.0</td>
</tr>
</tbody>
</table>

Additionally, ensure that you’re receiving the prefix corresponding to your VPC from the virtual private gateway.

```
# show ip route
```

<table>
<thead>
<tr>
<th>Destination</th>
<th>Gateway</th>
<th>Interface</th>
<th>Kind</th>
<th>Additional Info.</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td><em><strong>.</strong></em>.<em><strong>.</strong></em></td>
<td>LAN3(DHCP)</td>
<td>static</td>
<td></td>
</tr>
<tr>
<td>10.0.0.0/16</td>
<td>169.254.255.1</td>
<td>TUNNEL[1]</td>
<td>BGP</td>
<td>path=10124</td>
</tr>
</tbody>
</table>

For further troubleshooting, review the configuration.

**Virtual Private Gateway Attachment**

Make sure that your virtual private gateway is attached to your VPC. Your integration team does this with the AWS Management Console.

If you have questions or need further assistance, please use the Amazon VPC forum.

**Troubleshooting Generic Device Customer Gateway Connectivity Using Border Gateway Protocol**

This guide (the *Network Administrator Guide*) has been merged into the *AWS Site-to-Site VPN User Guide* and is no longer maintained. For more information about configuring your customer gateway device, see the *AWS Site-to-Site VPN User Guide*.

The following diagram and table provide general instructions for troubleshooting a customer gateway that uses Border Gateway Protocol for devices other than those listed in this guide.

**Tip**

When troubleshooting problems, you might find it useful to enable the debug features of your gateway device. Consult your gateway device vendor for details.
Start

Does an IKE Security Association exist? No → Review your IKE configuration

Yes →

Does an IPSec Security Association exist? No → Review your IPSec configuration

Yes →

Are the correct firewall rules set up? No → Review your firewall configuration

Yes →

Is there IP connectivity via the tunnel? No → Review tunnel interface configuration to ensure the proper IP address is configured

Yes →

Is the BGP peering active? No → Review your BGP configuration

Yes →

Is the virtual private gateway attached to the VPC? No → Use the AWS Management Console to attach the virtual private gateway to the VPC

Yes → Tunnels are configured
### IKE
Determine if an IKE Security Association exists.

An IKE security association is required to exchange keys that are used to establish the IPsec Security Association.

If no IKE security association exists, review your IKE configuration settings. You must configure the encryption, authentication, perfect-forward-secrecy, and mode parameters as listed in the customer gateway configuration.

If an IKE security association exists, move on to IPsec.

### IPsec
Determine if an IPsec Security Association exists.

An IPsec security association is the tunnel itself. Query your customer gateway to determine if an IPsec Security Association is active. Proper configuration of the IPsec SA is critical. You must configure the encryption, authentication, perfect-forward-secrecy, and mode parameters as listed in the customer gateway configuration.

If no IPsec Security Association exists, review your IPsec configuration.

If an IPsec Security Association exists, move on to the tunnel.

### Tunnel
Confirm that the required firewall rules are set up (for a list of the rules, see Configuring a Firewall Between the Internet and Your Customer Gateway Device (p. 11)). If they are, move forward.

Determine if there is IP connectivity via the tunnel.

Each side of the tunnel has an IP address as specified in the customer gateway configuration. The virtual private gateway address is the address used as the BGP neighbor address. From your customer gateway, ping this address to determine if IP traffic is being properly encrypted and decrypted.

If the ping isn't successful, review your tunnel interface configuration to make sure that the proper IP address is configured.

If the ping is successful, move on to BGP.

### BGP
Determine if the BGP peering is active.

For each tunnel, do the following:

- On your customer gateway, determine if the BGP status is Active or Established. It may take approximately 30 seconds for a BGP peering to become active.
- Ensure that the customer gateway is advertising the default route (0.0.0.0/0) to the virtual private gateway.

If the tunnels are not in this state, review your BGP configuration.

If the BGP peering is established, you are receiving a prefix, and you are advertising a prefix, your tunnel is configured correctly. Make sure that both tunnels are in this state, and you’re done.

Make sure that your virtual private gateway is attached to your VPC. Your integration team does this with the AWS Management Console.
For general testing instructions applicable to all customer gateways, see How to Test the Customer Gateway Configuration (p. 167).

If you have questions or need further assistance, please use the Amazon VPC forum.

Troubleshooting Generic Device Customer Gateway without Border Gateway Protocol Connectivity

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

The following diagram and table provide general instructions for troubleshooting a customer gateway device that does not use Border Gateway Protocol.

**Tip**
- When troubleshooting problems, you might find it useful to enable the debug features of your gateway device. Consult your gateway device vendor for details.
Amazon Virtual Private Cloud Network Administrator Guide
Generic Device Customer Gateway
Connectivity (without BGP)

Start

Does an IKE Security Association exist?

No
Review your IKE configuration

Yes

Does an IPsec Security Association exist?

No
Review your IPsec configuration

Yes

Are the correct firewall rules set up?

No
Review your firewall configuration

Yes

Is there IP connectivity via the tunnel?

No
Review tunnel interface configuration to ensure the proper IP address is configured

Yes

Is the virtual private gateway attached to the VPC?

No
Use the AWS Management Console to attach the virtual private gateway to the VPC

Yes

Tunnels are configured correctly. You're done.
Determine if an IKE Security Association exists.

An IKE security association is required to exchange keys that are used to establish the IPsec Security Association.

If no IKE security association exists, review your IKE configuration settings. You must configure the encryption, authentication, perfect-forward-secrecy, and mode parameters as listed in the customer gateway configuration.

If an IKE security association exists, move on to IPsec.

Determine if an IPsec Security Association exists.

An IPsec security association is the tunnel itself. Query your customer gateway to determine if an IPsec Security Association is active. Proper configuration of the IPsec SA is critical. You must configure the encryption, authentication, perfect-forward-secrecy, and mode parameters as listed in the customer gateway configuration.

If no IPsec Security Association exists, review your IPsec configuration.

If an IPsec Security Association exists, move on to the tunnel.

Confirm that the required firewall rules are set up (for a list of the rules, see Configuring a Firewall Between the Internet and Your Customer Gateway Device (p. 11)). If they are, move forward.

Determine if there is IP connectivity via the tunnel.

Each side of the tunnel has an IP address as specified in the customer gateway configuration. The virtual private gateway address is the address used as the BGP neighbor address. From your customer gateway, ping this address to determine if IP traffic is being properly encrypted and decrypted.

If the ping isn't successful, review your tunnel interface configuration to make sure that the proper IP address is configured.

If the ping is successful, move on to Routing.

Routing:
For each tunnel, do the following:

- Verify that you have added a static route to your VPC CIDR with the tunnels as the next hop.
- Verify that you have added a static route on the AWS Management Console, to tell the VGW to route traffic back to your internal networks.

If the tunnels are not in this state, review your device configuration.

Make sure that both tunnels are in this state, and you're done.

Make sure that your virtual private gateway is attached to your VPC. Your integration team does this in the AWS Management Console.

If you have questions or need further assistance, use the Amazon VPC forum.
Configuring Windows Server 2008 R2 as a Customer Gateway Device

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

You can configure Windows Server 2008 R2 as a customer gateway device for your VPC. Use the following process whether you are running Windows Server 2008 R2 on an EC2 instance in a VPC, or on your own server.

Topics
- Configuring Your Windows Server (p. 204)
- Step 1: Create a VPN Connection and Configure Your VPC (p. 205)
- Step 2: Download the Configuration File for the VPN Connection (p. 206)
- Step 3: Configure the Windows Server (p. 208)
- Step 4: Set Up the VPN Tunnel (p. 210)
- Step 5: Enable Dead Gateway Detection (p. 215)
- Step 6: Test the VPN Connection (p. 216)

Configuring Your Windows Server

To configure Windows Server as a customer gateway device, ensure that you have Windows Server 2008 R2 on your own network, or on an EC2 instance in a VPC. If you use an EC2 instance that you launched from a Windows AMI, do the following:

- Disable source/destination checking for the instance:
  1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
- Update your adapter settings so that you can route traffic from other instances:
  1. Connect to your Windows instance. For more information, see Connecting to Your Windows Instance.
  2. Open the Control Panel, and start the Device Manager.
  3. Expand the Network adapters node.
  4. Open the context (right-click) menu for the Citrix or AWS PV network adapter and choose Properties.
  5. On the Advanced tab, disable the IPv4 Checksum Offload, TCP Checksum Offload (IPv4), and UDP Checksum Offload (IPv4) properties, and then choose OK.
- Associate an Elastic IP address with the instance:
  1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
  2. In the navigation pane, choose Elastic IPs. Choose Allocate new address.
To create a VPN connection from your VPC, you must first create a virtual private gateway and attach it to your VPC. Then you can create a VPN connection and configure your VPC. You must also have the CIDR range for your network in which the Windows server is located, for example, 172.31.0.0/16.

To create a virtual private gateway
1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose Virtual Private Gateways, and then Create Virtual Private Gateway.
3. You can optionally enter a name for your virtual private gateway, and then choose Yes, Create.
4. Select the virtual private gateway that you created, and then choose Attach to VPC.
5. In the Attach to VPC dialog box, select your VPC from the list, and then choose Yes, Attach.

To create a VPN connection
1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose VPN Connections, and then Create VPN Connection.
3. Select the virtual private gateway from the list.
4. For Customer Gateway, choose New. For IP address, specify the public IP address of your Windows Server.

   Note
   The IP address must be static and may be behind a device performing network address translation (NAT). To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If your customer gateway device is an EC2 Windows Server instance, use its Elastic IP address.
5. Select the Static routing option, enter the Static IP Prefixes values for your network in CIDR notation, and then choose Yes, Create.

To configure your VPC

- Create a private subnet in your VPC (if you don't have one already) for launching instances that will communicate with the Windows server. For more information, see Adding a Subnet to Your VPC.

   Note
   A private subnet is a subnet that does not have a route to an internet gateway. The routing for this subnet is described in the next item.
• Update your route tables for the VPN connection:
  • Add a route to your private subnet's route table with the virtual private gateway as the target, and
    the Windows server's network (CIDR range) as the destination.
  • Enable route propagation for the virtual private gateway. For more information, see Route Tables in
    the Amazon VPC User Guide.
• Create a security group configuration for your instances that allows communication between your VPC
  and network:
  • Add rules that allow inbound RDP or SSH access from your network. This enables you to connect
    to instances in your VPC from your network. For example, to allow computers in your network to
    access Linux instances in your VPC, create an inbound rule with a type of SSH, and the source set to
    the CIDR range of your network; for example, 172.31.0.0/16. For more information, see Security
    Groups for Your VPC in the Amazon VPC User Guide.
  • Add a rule that allows inbound ICMP access from your network. This enables you to test your VPN
    connection by pinging an instance in your VPC from your Windows server.

Step 2: Download the Configuration File for the VPN Connection

You can use the Amazon VPC console to download a Windows server configuration file for your VPN
connection.

To download the configuration file
1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose VPN Connections.
3. Select your VPN connection and choose Download Configuration.
4. Select Microsoft as the vendor, Windows Server as the platform, and 2008 R2 as the software.
   Choose Yes, Download. You can open the file or save it.

The configuration file contains a section of information similar to the following example. You see this
information presented twice, one time for each tunnel. Use this information when configuring the
Windows Server 2008 R2 server.

```
vgw-1a2b3c4d Tunnel1
--------------------------------------------------------------------
Local Tunnel Endpoint:            203.0.113.1
Remote Tunnel Endpoint:          203.83.222.237
Endpoint 1:                      [Your_Static_Route_IP_Prefix]
Endpoint 2:                      [Your_VPC_CIDR_Block]
Preshared key:                   xCjNLsLoCmKsakwcdor9yX6GsEXAMPLE
```

Local Tunnel Endpoint
The IP address for the customer gateway device—in this case, your Windows server—that terminates
the VPN connection on your network's side. If your customer gateway device is a Windows server
instance, this is the instance's private IP address.

Remote Tunnel Endpoint
One of two IP addresses for the virtual private gateway that terminates the VPN connection on the
AWS side.
Endpoint 1

The IP prefix that you specified as a static route when you created the VPN connection. These are the IP addresses on your network that are allowed to use the VPN connection to access your VPC.

Endpoint 2

The IP address range (CIDR block) of the VPC attached to the virtual private gateway (for example 10.0.0.0/16).

Preshared key

The pre-shared key that is used to establish the IPsec VPN connection between Local Tunnel Endpoint and Remote Tunnel Endpoint.

We suggest that you configure both tunnels as part of the VPN connection. Each tunnel connects to a separate VPN concentrator on the Amazon side of the VPN connection. Although only one tunnel at a time is up, the second tunnel automatically establishes itself if the first tunnel goes down. Having redundant tunnels ensure continuous availability in case of a device failure. Because only one tunnel is available at a time, the Amazon VPC console indicates that one tunnel is down. This is expected behavior, so there's no action required from you.

With two tunnels configured, if a device failure occurs within AWS, your VPN connection automatically fails over to the second tunnel of the AWS virtual private gateway within a matter of minutes. When you configure your customer gateway device, it's important that you configure both tunnels.

**Note**

From time to time, AWS performs routine maintenance on the virtual private gateway. This maintenance may disable one of the two tunnels of your VPN connection for a brief period of time. Your VPN connection automatically fails over to the second tunnel while we perform this maintenance.

Additional information regarding the Internet Key Exchange (IKE) and IPsec Security Associations (SA) is presented in the downloaded configuration file. Because the VPC VPN suggested settings are the same as the Windows Server 2008 R2 default IPsec configuration settings, minimal work is needed on your part.

<table>
<thead>
<tr>
<th>MainModeSecMethods</th>
<th>DHGroup2-3DES-SHA1, DHGroup2-AES128-SHA1</th>
</tr>
</thead>
<tbody>
<tr>
<td>MainModeKeyLifetime</td>
<td>480min, 0sec</td>
</tr>
<tr>
<td>QuickModeSecMethods</td>
<td>ESP:SHA1-AES128+60min+100000kb, ESP:SHA1-3DES+60min+100000kb</td>
</tr>
<tr>
<td>QuickModePFS</td>
<td>DHGroup2</td>
</tr>
</tbody>
</table>

**MainModeSecMethods**

The encryption and authentication algorithms for the IKE SA. These are the suggested settings for the VPN connection, and are the default settings for Windows Server 2008 R2 IPsec VPN connections.

**MainModeKeyLifetime**

The IKE SA key lifetime. This is the suggested setting for the VPN connection, and is the default setting for Windows Server 2008 R2 IPsec VPN connections.

**QuickModeSecMethods**

The encryption and authentication algorithms for the IPsec SA. These are the suggested settings for the VPN connection, and are the default settings for Windows Server 2008 R2 IPsec VPN connections.

**QuickModePFS**

We suggest the use of master key perfect forward secrecy (PFS) for your IPsec sessions.
Step 3: Configure the Windows Server

Before you set up the VPN tunnel, you must install and configure Routing and Remote Access Services on your Windows server. That allows remote users to access resources on your network.

To install Routing and Remote Access Services on Windows Server 2008 R2

1. Log on to the Windows Server 2008 R2 server.
2. Choose Start, All Programs, Administrative Tools, Server Manager.
3. Install Routing and Remote Access Services:
   a. In the Server Manager navigation pane, choose Roles.
   b. In the Roles pane, choose Add Roles.
   c. On the Before You Begin page, verify that your server meets the prerequisites and choose Next.
   e. On the Network Policy and Access Services page, choose Next.
   f. On the Select Role Services page, choose Routing and Remote Access Services, leave Remote Access Service and Routing selected, and then choose Next.
   g. On the Confirm Installation Selections page, choose Install.
   h. When the wizard completes, choose Close.

To configure and enable Routing and Remote Access Server

1. In the Server Manager navigation pane, choose Roles, Network Policy and Access.
2. Open the context (right-click) menu for Routing and Remote Access Server and choose Configure and Enable Routing and Remote Access.
3. In the Routing and Remote Access Setup Wizard, on the Welcome page, choose Next.
4. On the Configuration page, choose Custom Configuration, Next.
5. Choose LAN routing, Next.

7. When prompted by the Routing and Remote Access dialog box, choose Start service.
Step 4: Set Up the VPN Tunnel

You can configure the VPN tunnel by running the netsh scripts included in the downloaded configuration file, or by using the New Connection Security Rule Wizard on the Windows server.

**Important**

We suggest that you use master key perfect forward secrecy (PFS) for your IPsec sessions. However, you can't enable PFS using the Windows Server 2008 R2 user interface; you can only enable this setting by running the netsh script with qmpfs=dhgroup2. Therefore, you should consider your requirements before you pick an option.

### Option 1: Run netsh Script

Copy the netsh script from the downloaded configuration file and replace the variables. The following is an example script.

```
netsh advfirewall consec add rule Name="VGW-1a2b3c4d Tunnel 1" Enable=Yes ^
Profile=any Type=Static Mode=Tunnel ^
LocalTunnelEndpoint=Windows_Server_Private_IP_address ^
RemoteTunnelEndpoint=203.83.222.236 Endpoint1=Static_Route_IP_Prefix ^
Endpoint2=VPC_CIDR_Block Protocol=Any Action=RequireInClearOut ^
Auth1=ComputerPSK Auth1PSK=xCjNLsLoCmKsakwcd0R9yX6Gsexample ^
QMSecMethods=ESP:SHA1-AES128+60min+100000kb ^
ExemptIPsecProtectedConnections=No ApplyAuthz=No QMPFS=dhgroup2
```

**Name:** You can replace the suggested name (**VGW-1a2b3c4d Tunnel 1**) with a name of your choice.

**LocalTunnelEndpoint:** Enter the private IP address of the Windows server on your network.

**Endpoint1:** The CIDR block of your network on which the Windows server resides, for example, 172.31.0.0/16.

**Endpoint2:** The CIDR block of your VPC or a subnet in your VPC, for example, 10.0.0.0/16.

Run the updated script in a command prompt window. (The ^ enables you to cut and paste wrapped text at the command line.) To set up the second VPN tunnel for this VPN connection, repeat the process using the second netsh script in the configuration file.

When you are done, go to **2.4: Configure the Windows Firewall (p. 214).**

For more information about the netsh parameters, go to Netsh AdvFirewall Consec Commands in the Microsoft TechNet Library.

### Option 2: Use the Windows Server User Interface

You can also use the Windows server user interface to set up the VPN tunnel. This section guides you through the steps.

**Important**

You can't enable master key perfect forward secrecy (PFS) using the Windows Server 2008 R2 user interface. Therefore, if you decide to use PFS, you must use the netsh scripts described in option 1 instead of the user interface described in this option.

- **2.1: Configure a Security Rule for a VPN Tunnel (p. 211)**
- **2.3: Confirm the Tunnel Configuration (p. 214)**
- **2.4: Configure the Windows Firewall (p. 214)**
2.1: Configure a Security Rule for a VPN Tunnel

In this section, you configure a security rule on your Windows server to create a VPN tunnel.

To configure a security rule for a VPN tunnel

1. In the Server Manager navigation pane, expand Configuration, and then expand Windows Firewall with Advanced Security.
2. Open the context (right-click) menu for Connection Security Rules and choose New Rule.
4. On the Tunnel Type page, under What type of tunnel would you like to create, choose Custom Configuration. Under Would you like to exempt IPsec-protected connections from this tunnel, leave the default value checked (No. Send all network traffic that matches this connection security rule through the tunnel), and then choose Next.
5. On the Requirements page, choose Require authentication for inbound connections. Do not establish tunnels for outbound connections, and then choose Next.

6. On Tunnel Endpoints page, under Which computers are in Endpoint 1, choose Add. Enter the CIDR range of your network (behind your Windows server customer gateway device), and then choose OK. The range can include the IP address of your customer gateway device.
7. Under What is the local tunnel endpoint (closest to computer in Endpoint 1), choose Edit. Enter the private IP address of your Windows server, and then choose OK.
8. Under What is the remote tunnel endpoint (closest to computers in Endpoint 2), choose Edit. Enter the IP address of the virtual private gateway for Tunnel 1 from the configuration file (see Remote Tunnel Endpoint), and then choose OK.
   
   Important
   If you are repeating this procedure for Tunnel 2, be sure to select the endpoint for Tunnel 2.

9. Under Which computers are in Endpoint 2, choose Add. Enter the CIDR block of your VPC and choose OK.
Important
You must scroll in the dialog box until you locate Which computers are in Endpoint 2. Do not choose Next until you have completed this step, or you won't be able to connect to your server.

10. Confirm that all the settings you've specified are correct and choose Next.
13. Select Pre-Shared key, enter the pre-shared key value from the configuration file, and choose OK.

Important
If you are repeating this procedure for Tunnel 2, be sure to select the pre-shared key for Tunnel 2.
14. Ensure that **First authentication is optional** is not selected, and choose **OK**.

15. On the **Authentication Method** page, choose **Next**.

16. On the **Profile** page, select all three check boxes: **Domain**, **Private**, and **Public**. Choose **Next**.

17. On the **Name** page, enter a name for your connection rule and choose **Finish**.

Repeat the above procedure, specifying the data for Tunnel 2 from your configuration file.

After you've finished, you'll have two tunnels configured for your VPN connection.
2.3: Confirm the Tunnel Configuration

To confirm the tunnel configuration

1. In the Server Manager navigation pane, expand the Configuration node, expand Windows Firewall with Advanced Security, and then choose Connection Security Rules.

2. Verify the following for both tunnels:
   - **Enabled** is Yes.
   - **Authentication mode** is Require inbound and clear outbound.
   - **Authentication method** is Custom.
   - **Endpoint 1 port** is Any.
   - **Endpoint 2 port** is Any.
   - **Protocol** is Any.

3. Double-click the security rule for your first tunnel.

4. On the Computers tab, verify the following:
   - Under **Endpoint 1**, the CIDR block range shown matches the CIDR block range of your network.
   - Under **Endpoint 2**, the CIDR block range shown matches the CIDR block range of your VPC.

5. On the Authentication tab, under **Method**, choose Customize, and verify that First authentication methods contains the correct pre-shared key from your configuration file for the tunnel. Choose OK.

6. On the Advanced tab, verify that Domain, Private, and Public are all selected.

   - **Use IPsec tunneling** is selected.
   - **Local tunnel endpoint (closest to Endpoint 1)** contains the IP address of your server. If your customer gateway device is a Windows server instance, this is the instance's private IP address.
   - **Remote tunnel endpoint (closest to Endpoint 2)** contains the IP address of the virtual private gateway for this tunnel.

8. Double-click the security rule for your second tunnel. Repeat steps 4 to 7 for this tunnel.

2.4: Configure the Windows Firewall

After setting up your security rules on your server, configure some basic IPsec settings to work with the virtual private gateway.

To configure the Windows firewall

1. In the Server Manager navigation pane, open the context (right-click) menu for Windows Firewall with Advanced Security and choose Properties.

2. Choose IPsec Settings.

3. Under **IPsec exemptions**, verify that Exempt ICMP from IPsec is No (default). Verify that IPsec tunnel authorization is None.

5. In the Customize IPsec Settings dialog box, under **Key exchange (Main Mode)**, select Advanced and then choose Customize.

6. In Customize Advanced Key Exchange Settings, under **Security methods**, verify that these default values are used for the first entry.
   - Integrity: SHA-1
   - Encryption: AES-CBC 128
Step 5: Enable Dead Gateway Detection

Next, configure TCP to detect when a gateway becomes unavailable. You can do this by modifying this registry key: `HKLM\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters`. Do not perform
To enable dead gateway detection

1. On the server, choose Start and type regedit to start Registry Editor.
2. Expand HKEY_LOCAL_MACHINE, SYSTEM, CurrentControlSet, Services, Tcpip, and Parameters.
3. In the other pane, open the context (right-click) menu for New, and select DWORD (32-bit) Value.
4. Enter the name EnableDeadGWDetect.
5. Open the context (right-click) menu for EnableDeadGWDetect and choose Modify.
6. In Value data, enter 1 and choose OK.
7. Close Registry Editor and reboot the server.

For more information, go to EnableDeadGWDetect in the Microsoft TechNet Library.

Step 6: Test the VPN Connection

To test that the VPN connection is working correctly, launch an instance into your VPC, and ensure that it does not have an Internet connection. After you've launched the instance, ping its private IP address from your Windows server. The VPN tunnel comes up when traffic is generated from the customer gateway device, therefore the ping command also initiates the VPN connection.

To launch an instance in your VPC and get its private IP address

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. choose Launch Instance.
3. Select an Amazon Linux AMI, and select an instance type.
4. On the Step3: Configure Instance Details page, for Network, select your VPC. For Subnet, select a subnet. Ensure that you select the private subnet that you configured in Step 1: Create a VPN Connection and Configure Your VPC (p. 205).
5. In the Auto-assign Public IP list, ensure that the setting is set to Disable.
6. Choose Next until you get to the Step 6: Configure Security Group page. You can select an existing security group that you configured in Step 1: Create a VPN Connection and Configure Your VPC (p. 205). Or, you can create a new security group and ensure that it has a rule that allows all ICMP traffic from the IP address of your Windows server.
7. Complete the rest of the steps in the wizard, and launch your instance.
8. On the Instances page, select your instance. Get the private IP address in the Private IPs field on the details pane.

Connect to or log on to your Windows server, open the command prompt, and then use the ping command to ping your instance using its private IP address; for example:

```
ping 10.0.0.4
```

Pinging 10.0.0.4 with 32 bytes of data:
Reply from 10.0.0.4: bytes=32 time=2ms TTL=62
Reply from 10.0.0.4: bytes=32 time=2ms TTL=62
Reply from 10.0.0.4: bytes=32 time=2ms TTL=62
Reply from 10.0.0.4: bytes=32 time=2ms TTL=62
Reply from 10.0.0.4: bytes=32 time=2ms TTL=62

Ping statistics for 10.0.0.4:

216
Step 6: Test the VPN Connection

Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milliseconds:
Minimum = 2ms, Maximum = 2ms, Average = 2ms

If the `ping` command fails, check the following information:

- Ensure that you have configured your security group rules to allow ICMP to the instance in your VPC. If your Windows server is an EC2 instance, ensure that its security group's outbound rules allow IPsec traffic. For more information, see Configuring Your Windows Server (p. 204).
- Ensure that the operating system on the instance you are pinging is configured to respond to ICMP. We recommend that you use one of the Amazon Linux AMIs.
- If the instance you are pinging is a Windows instance, log in to the instance and enable inbound ICMPv4 on the Windows firewall.
- Ensure that you have configured the route tables for your VPC or your subnet correctly. For more information, see Step 1: Create a VPN Connection and Configure Your VPC (p. 205).
- If your customer gateway device is a Windows server instance, ensure that you've disabled source/destination checking for the instance. For more information, see Configuring Your Windows Server (p. 204).

In the Amazon VPC console, on the **VPN Connections** page, select your VPN connection. The first tunnel is in the UP state. The second tunnel should be configured, but it isn't used unless the first tunnel goes down. It may take a few moments to establish the encrypted tunnels.
Configuring Windows Server 2012 R2 as a Customer Gateway Device

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

You can configure Windows Server 2012 R2 as a customer gateway device for your VPC. Use the following process whether you are running Windows Server 2012 R2 on an EC2 instance in a VPC, or on your own server.

Topics
- Configuring Your Windows Server (p. 218)
- Step 1: Create a VPN Connection and Configure Your VPC (p. 219)
- Step 2: Download the Configuration File for the VPN Connection (p. 220)
- Step 3: Configure the Windows Server (p. 222)
- Step 4: Set Up the VPN Tunnel (p. 222)
- Step 5: Enable Dead Gateway Detection (p. 228)
- Step 6: Test the VPN Connection (p. 229)

Configuring Your Windows Server

To configure Windows Server as a customer gateway device, ensure that you have Windows Server 2012 R2 on your own network, or on an EC2 instance in a VPC. If you use an EC2 instance that you launched from a Windows AMI, do the following:

- Disable source/destination checking for the instance:
  1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.

- Update your adapter settings so that you can route traffic from other instances:
  1. Connect to your Windows instance. For more information, see Connecting to Your Windows Instance.
  2. Open the Control Panel, and start the Device Manager.
  3. Expand the Network adapters node.
  4. Select the AWS PV network device, choose Action, Properties.
  5. On the Advanced tab, disable the IPv4 Checksum Offload, TCP Checksum Offload (IPv4), and UDP Checksum Offload (IPv4) properties, and then choose OK.

- Associate an Elastic IP address with the instance:
  1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
  2. In the navigation pane, choose Elastic IPs. Choose Allocate new address.
3. Select the Elastic IP address, and choose Actions, Associate Address. 
4. For Instance, select your Windows Server instance. Choose Associate.

Take note of this address — you need it when you create the customer gateway in your VPC.

- Ensure the instance's security group rules allow outbound IPsec traffic. By default, a security group allows all outbound traffic; however, if the security group's outbound rules have been modified from their original state, you must create the following outbound custom protocol rules for IPsec traffic: IP protocol 50, IP protocol 51, and UDP 500.

Take note of the CIDR range for your network in which the Windows server is located, for example, 172.31.0.0/16.

**Step 1: Create a VPN Connection and Configure Your VPC**

To create a VPN connection from your VPC, you must first create a virtual private gateway and attach it to your VPC. Then you can create a VPN connection and configure your VPC. You must also have the CIDR range for your network in which the Windows server is located, for example, 172.31.0.0/16.

**To create a virtual private gateway**

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose Virtual Private Gateways, Create Virtual Private Gateway.
3. You can optionally enter a name for your virtual private gateway and choose Yes, Create.
4. Select the virtual private gateway that you created and choose Attach to VPC.
5. In the Attach to VPC dialog box, select your VPC from the list and choose Yes, Attach.

**To create a VPN connection**

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose VPN Connections, Create VPN Connection.
3. Select the virtual private gateway from the list.
4. For Customer Gateway, choose New. For IP address, specify the public IP address of your Windows Server. 

    **Note**
    The IP address must be static and may be behind a device performing network address translation (NAT). To ensure that NAT traversal (NAT-T) can function, you must adjust your firewall rules to unblock UDP port 4500. If your customer gateway is an EC2 Windows Server instance, use its Elastic IP address.

5. Select the Static routing option, enter the Static IP Prefixes values for your network in CIDR notation, and then choose Yes, Create.

**To configure your VPC**

- Create a private subnet in your VPC (if you don't have one already) for launching instances to communicate with the Windows server. For more information, see Adding a Subnet to Your VPC.

    **Note**
    A private subnet is a subnet that does not have a route to an internet gateway. The routing for this subnet is described in the next item.
Step 2: Download the Configuration File for the VPN Connection

You can use the Amazon VPC console to download a Windows server configuration file for your VPN connection.

To download the configuration file

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose VPN Connections.
3. Select your VPN connection and choose Download Configuration.
4. Select Microsoft as the vendor, Windows Server as the platform, and 2012 R2 as the software. Choose Yes, Download. You can open the file or save it.

The configuration file contains a section of information similar to the following example. You see this information presented twice, one time for each tunnel. Use this information when configuring the Windows Server 2012 R2 server.

<table>
<thead>
<tr>
<th>vgw-1a2b3c4d Tunnel1</th>
<th>Local Tunnel Endpoint: 203.0.113.1</th>
<th>Remote Tunnel Endpoint: 203.83.222.237</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint 1: [Your_Static_Route_IP_Prefix]</td>
<td>Endpoint 2: [Your_VPC_CIDR_Block]</td>
<td>Preshared key: xCjNLsLoCmKsakwcdor9yX6GsEXAMPLE</td>
</tr>
</tbody>
</table>

Local Tunnel Endpoint

The IP address for the customer gateway—in this case, your Windows server—that terminates the VPN connection on your network's side. If your customer gateway is a Windows server instance, this is the instance's private IP address.

Remote Tunnel Endpoint

One of two IP addresses for the virtual private gateway that terminates the VPN connection on the AWS side of the connection.
Endpoint 1

The IP prefix that you specified as a static route when you created the VPN connection. These are the IP addresses in your network that are allowed to use the VPN connection to access your VPC.

Endpoint 2

The IP address range (CIDR block) of the VPC attached to the virtual private gateway (for example 10.0.0.0/16).

Preshared key

The pre-shared key that is used to establish the IPsec VPN connection between Local Tunnel Endpoint and Remote Tunnel Endpoint.

We suggest that you configure both tunnels as part of the VPN connection. Each tunnel connects to a separate VPN concentrator on the Amazon side of the VPN connection. Although only one tunnel at a time is up, the second tunnel automatically establishes itself if the first tunnel goes down. Having redundant tunnels ensure continuous availability in the case of a device failure. Because only one tunnel is available at a time, the Amazon VPC console indicates that one tunnel is down. This is expected behavior, so there's no action required from you.

With two tunnels configured, if a device failure occurs within AWS, your VPN connection automatically fails over to the second tunnel of the AWS virtual private gateway within a matter of minutes. When you configure your customer gateway device, it's important that you configure both tunnels.

Note

From time to time, AWS performs routine maintenance on the virtual private gateway. This maintenance may disable one of the two tunnels of your VPN connection for a brief period of time. Your VPN connection automatically fails over to the second tunnel while we perform this maintenance.

Additional information regarding the Internet Key Exchange (IKE) and IPsec Security Associations (SA) is presented in the downloaded configuration file. Because the VPC VPN suggested settings are the same as the Windows Server 2012 R2 default IPsec configuration settings, minimal work is needed on your part.

<table>
<thead>
<tr>
<th>MainModeSecMethods:</th>
<th>DHGroup2-AES128-SHA1</th>
</tr>
</thead>
<tbody>
<tr>
<td>MainModeKeyLifetime:</td>
<td>480min,0sess</td>
</tr>
<tr>
<td>QuickModeSecMethods:</td>
<td>ESP:SHA1-AES128+60min+100000kb</td>
</tr>
<tr>
<td>QuickModePFS:</td>
<td>DHGroup2</td>
</tr>
</tbody>
</table>

MainModeSecMethods

The encryption and authentication algorithms for the IKE SA. These are the suggested settings for the VPN connection, and are the default settings for Windows Server 2012 R2 IPsec VPN connections.

MainModeKeyLifetime

The IKE SA key lifetime. This is the suggested setting for the VPN connection, and is the default setting for Windows Server 2012 R2 IPsec VPN connections.

QuickModeSecMethods

The encryption and authentication algorithms for the IPsec SA. These are the suggested settings for the VPN connection, and are the default settings for Windows Server 2012 R2 IPsec VPN connections.

QuickModePFS

We suggest that you use master key perfect forward secrecy (PFS) for your IPsec sessions.
Step 3: Configure the Windows Server

Before you set up the VPN tunnel, you must install and configure Routing and Remote Access Services on your Windows server. That allows remote users to access resources on your network.

To install Routing and Remote Access Services on Windows Server 2012 R2

1. Log on to the Windows Server 2012 R2 server.
2. Go to the Start menu, and choose Server Manager.
3. Install Routing and Remote Access Services:
   a. From the Manage menu, choose Add Roles and Features.
   b. On the Before You Begin page, verify that your server meets the prerequisites, and then choose Next.
   c. Choose Role-based or feature-based installation, and then choose Next.
   d. Select a server from the server pool, select your Windows 2012 R2 server, and then choose Next.
   e. Select Network Policy and Access Services in the list. In the dialog box that displays, choose Add Features to confirm the features that are required for this role.
   f. In the same list, choose Remote Access, Next.
   g. On the Select features page, choose Next.
   i. On the Remote Access page, choose Next. On the next page, select DirectAccess and VPN (RAS). In the dialog box that displays, choose Add Features to confirm the features that are required for this role service. In the same list, select Routing, and then choose Next.
   j. On the Web Server Role (IIS) page, choose Next. Leave the default selection, and choose Next.
   k. Choose Install. When the installation completes, choose Close.

To configure and enable Routing and Remote Access Server

1. On the dashboard, choose Notifications (the flag icon). There should be a task to complete the post-deployment configuration. Choose the Open the Getting Started Wizard link.
2. Choose Deploy VPN only.
3. In the Routing and Remote Access dialog box, choose the server name, choose Action, and select Configure and Enable Routing and Remote Access.
4. In the Routing and Remote Access Server Setup Wizard, on the first page, choose Next.
5. On the Configuration page, choose Custom Configuration, Next.
7. When prompted by the Routing and Remote Access dialog box, choose Start service.

Step 4: Set Up the VPN Tunnel

You can configure the VPN tunnel by running the netsh scripts included in the downloaded configuration file, or by using the New Connection Security Rule wizard on the Windows server.

Important

We suggest that you use master key perfect forward secrecy (PFS) for your IPsec sessions. If you choose to run the netsh script, it includes a parameter to enable PFS (qmpfs=dhgroup2). You
cannot enable PFS using the Windows Server 2012 R2 user interface — you must enable it using the command line.

## Option 1: Run netsh Script

Copy the netsh script from the downloaded configuration file and replace the variables. The following is an example script.

```bash
netsh advfirewall consec add rule Name="vgw-1a2b3c4d Tunnel 1" ^
Enable=Yes Profile=any Type=Static Mode=Tunnel ^
LocalTunnelEndpoint=Windows_Server_Private_IP_address ^
RemoteTunnelEndpoint=203.83.222.236 Endpoint1=Your_Static_Route_IP_Prefix ^
Endpoint2=Your_VPC_CIDR_Block Protocol=Any Action=RequireInClearOut ^
Auth1=ComputerPSK Auth1PSK=xCjNLsLoCmKsakwcdor9yX6GsoEXMpL ^
QMSecMethods=ESP:SHA1-AES128+60min+100000kb ^
ExemptIPsecProtectedConnections=No ApplyAuthz=No QMPFS=dhgroup2
```

**Name:** You can replace the suggested name (vgw-1a2b3c4d Tunnel 1) with a name of your choice.

**LocalTunnelEndpoint:** Enter the private IP address of the Windows server on your network.

**Endpoint1:** The CIDR block of your network on which the Windows server resides, for example, 172.31.0.0/16.

**Endpoint2:** The CIDR block of your VPC or a subnet in your VPC, for example, 10.0.0.0/16.

Run the updated script in a command prompt window on your Windows server. (The ^ enables you to cut and paste wrapped text at the command line.) To set up the second VPN tunnel for this VPN connection, repeat the process using the second netsh script in the configuration file.

When you are done, go to 2.4: Configure the Windows Firewall (p. 227).

For more information about the netsh parameters, go to Netsh AdvFirewall Consec Commands in the Microsoft TechNet Library.

## Option 2: Use the Windows Server User Interface

You can also use the Windows server user interface to set up the VPN tunnel. This section guides you through the steps.

**Important**

You can’t enable master key perfect forward secrecy (PFS) using the Windows Server 2012 R2 user interface. You must enable PFS using the command line, as described in Enable Master Key Perfect Forward Secrecy (p. 226).

**Topics**

- 2.1: Configure a Security Rule for a VPN Tunnel (p. 223)
- 2.3: Confirm the Tunnel Configuration (p. 226)
- Enable Master Key Perfect Forward Secrecy (p. 226)

## 2.1: Configure a Security Rule for a VPN Tunnel

In this section, you configure a security rule on your Windows server to create a VPN tunnel.

**To configure a security rule for a VPN tunnel**

1. Open Server Manager, choose **Tools**, and select **Windows Firewall with Advanced Security**.
2. Select **Connection Security Rules**, choose **Action**, and then **New Rule**.

3. In the **New Connection Security Rule** wizard, on the **Rule Type** page, choose **Tunnel**, and then choose **Next**.

4. On the **Tunnel Type** page, under **What type of tunnel would you like to create**, choose **Custom configuration**. Under **Would you like to exempt IPsec-protected connections from this tunnel**, leave the default value checked (**No. Send all network traffic that matches this connection security rule through the tunnel**), and then choose **Next**.

5. On the **Requirements** page, choose **Require authentication for inbound connections. Do not establish tunnels for outbound connections**, and then choose **Next**.

6. On the **Tunnel Endpoints** page, under **Which computers are in Endpoint 1**, choose **Add**. Enter the CIDR range of your network (behind your Windows server customer gateway device; for example, **172.31.0.0/16**), and then choose **OK**. The range can include the IP address of your customer gateway device.

7. Under **What is the local tunnel endpoint (closest to computer in Endpoint 1)**, choose **Edit**. In the **IPv4 address** field, enter the private IP address of your Windows server, and then choose **OK**.

8. Under **What is the remote tunnel endpoint (closest to computers in Endpoint 2)**, choose **Edit**. In the **IPv4 address** field, enter the IP address of the virtual private gateway for Tunnel 1 from the configuration file (see **Remote Tunnel Endpoint**), and then choose **OK**.

   **Important**
   If you are repeating this procedure for Tunnel 2, be sure to select the endpoint for Tunnel 2.

9. Under **Which computers are in Endpoint 2**, choose **Add**. In the **This IP address or subnet field**, enter the CIDR block of your VPC, and then choose **OK**.

   **Important**
   You must scroll in the dialog box until you locate **Which computers are in Endpoint 2**. Do not choose **Next** until you have completed this step, or you won’t be able to connect to your server.
10. Confirm that all the settings you've specified are correct and choose Next.

13. Select Preshared key, enter the pre-shared key value from the configuration file and choose OK.

   **Important**

   If you are repeating this procedure for Tunnel 2, be sure to select the pre-shared key for Tunnel 2.

14. Ensure that First authentication is optional is not selected, and choose OK.

15. Choose Next.

17. On the Name page, enter a name for your connection rule; for example, VPN to AWS Tunnel 1, and then choose Finish.

Repeat the above procedure, specifying the data for Tunnel 2 from your configuration file.

After you've finished, you'll have two tunnels configured for your VPN connection.

2.3: Confirm the Tunnel Configuration

To confirm the tunnel configuration

1. Open Server Manager, choose Tools, select Windows Firewall with Advanced Security, and then select Connection Security Rules.

2. Verify the following for both tunnels:
   - **Enabled** is Yes
   - **Endpoint 1** is the CIDR block for your network
   - **Endpoint 2** is the CIDR block of your VPC
   - **Authentication mode** is Require inbound and clear outbound
   - **Authentication method** is Custom
   - **Endpoint 1 port** is Any
   - **Endpoint 2 port** is Any
   - **Protocol** is Any

3. Select the first rule and choose Properties.

4. On the Authentication tab, under Method, choose Customize, and verify that First authentication methods contains the correct pre-shared key from your configuration file for the tunnel, and then choose OK.

5. On the Advanced tab, verify that Domain, Private, and Public are all selected.

6. Under IPsec tunneling, choose Customize. Verify the following IPsec tunneling settings, and then choose OK and OK again to close the dialog box.
   - **Use IPsec tunneling** is selected.
   - **Local tunnel endpoint (closest to Endpoint 1)** contains the IP address of your Windows server. If your customer gateway device is an EC2 instance, this is the instance's private IP address.
   - **Remote tunnel endpoint (closest to Endpoint 2)** contains the IP address of the virtual private gateway for this tunnel.

7. Open the properties for your second tunnel. Repeat steps 4 to 7 for this tunnel.

Enable Master Key Perfect Forward Secrecy

You can enable master key perfect forward secrecy by using the command line. You cannot enable this feature using the user interface.

To enable master key perfect forward secrecy

1. In your Windows server, open a new command prompt window.

2. Type the following command, replacing rule_name with the name you gave the first connection rule.

```plaintext
netsh advfirewall conseq set rule name="rule_name" new QMPPS=dhgroup2
QMSecMethods=ESP:SHA1-AES128+60min+100000kb
```
3. Repeat step 2 for the second tunnel, this time replacing rule_name with the name that you gave the second connection rule.

### 2.4: Configure the Windows Firewall

After setting up your security rules on your server, configure some basic IPsec settings to work with the virtual private gateway.

**To configure the Windows firewall**

1. Open Server Manager, choose Tools, select Windows Firewall with Advanced Security, and then choose Properties.
2. On the IPsec Settings tab, under IPsec exemptions, verify that Exempt ICMP from IPsec is No (default). Verify that IPsec tunnel authorization is None.
4. Under Key exchange (Main Mode), select Advanced and then choose Customize.
5. In Customize Advanced Key Exchange Settings, under Security methods, verify that these default values are used for the first entry.
   - Integrity: SHA-1
   - Encryption: AES-CBC 128
   - Key exchange algorithm: Diffie-Hellman Group 2
   - Under Key lifetimes, verify that Minutes is 480 and Sessions is 0.

These settings correspond to these entries in the configuration file:

```
MainModeSecMethods: DHGroup2-AES128-SHA1,DHGroup2-3DES-SHA1
MainModeKeyLifetime: 480min,0sec
```

6. Under Key exchange options, select Use Diffie-Hellman for enhanced security, and then choose OK.
7. Under Data protection (Quick Mode), select Advanced, and then choose Customize.
8. Select Require encryption for all connection security rules that use these settings.
9. Under Data integrity and encryption, leave the default values:
   - Protocol: ESP
   - Integrity: SHA-1
   - Encryption: AES-CBC 128
   - Lifetime: 60 minutes

These values correspond to the following entry from the configuration file.

```
QuickModeSecMethods: ESP:SHA1-AES128+60min+100000kb
```

10. Choose OK to return to the Customize IPsec Settings dialog box and choose OK again to save the configuration.
Step 5: Enable Dead Gateway Detection

Next, configure TCP to detect when a gateway becomes unavailable. You can do this by modifying this registry key: HKLM\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters. Do not perform this step until you've completed the preceding sections. After you change the registry key, you must reboot the server.

To enable dead gateway detection

1. From your Windows server, launch the command prompt or a PowerShell session, and type `regedit` to start Registry Editor.
2. Expand HKEY_LOCAL_MACHINE, expand SYSTEM, expand CurrentControlSet, expand Services, expand Tcpip, and then expand Parameters.
3. From the Edit menu, select New and select DWORD (32-bit) Value.
4. Enter the name EnableDeadGWDetect.
5. Select EnableDeadGWDetect and choose Edit, Modify.
6. In Value data, enter 1, and then choose OK.
7. Close the Registry Editor and reboot the server.

For more information, see EnableDeadGWDetect in the Microsoft TechNet Library.
Step 6: Test the VPN Connection

To test that the VPN connection is working correctly, launch an instance into your VPC, and ensure that it does not have an internet connection. After you've launched the instance, ping its private IP address from your Windows server. The VPN tunnel comes up when traffic is generated from the customer gateway device, therefore the ping command also initiates the VPN connection.

To launch an instance in your VPC and get its private IP address

1. Open the Amazon EC2 console, and choose Launch Instance.
2. Select an Amazon Linux AMI, and select an instance type.
3. On the Step 3: Configure Instance Details page, select your VPC from the Network list, and select a subnet from the Subnet list. Ensure that you select the private subnet that you configured in Step 1: Create a VPN Connection and Configure Your VPC (p. 219).
4. In the Auto-assign Public IP list, ensure that the setting is set to Disable.
5. Choose Next until you get to the Step 6: Configure Security Group page. You can select an existing security group that you configured in Step 1: Create a VPN Connection and Configure Your VPC (p. 219). Or, you can create a new security group and ensure that it has a rule that allows all ICMP traffic from the IP address of your Windows server.
6. Complete the rest of the steps in the wizard, and launch your instance.
7. On the Instances page, select your instance. For Private IPs, note the private IP address on the details pane.

Connect to or log on to your Windows server, open the command prompt, and then use the ping command to ping your instance using its private IP address; for example:

```plaintext
ping 10.0.0.4
```

| Pinging 10.0.0.4 with 32 bytes of data:  
| Reply from 10.0.0.4: bytes=32 time=2ms TTL=62  
| Reply from 10.0.0.4: bytes=32 time=2ms TTL=62  
| Reply from 10.0.0.4: bytes=32 time=2ms TTL=62  
| Reply from 10.0.0.4: bytes=32 time=2ms TTL=62  

Ping statistics for 10.0.0.4:  
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),  
Approximate round trip times in milli-seconds:  
Minimum = 2ms, Maximum = 2ms, Average = 2ms

If the ping command fails, check the following information:

- Ensure that you have configured your security group rules to allow ICMP to the instance in your VPC. If your Windows server is an EC2 instance, ensure that its security group’s outbound rules allow IPsec traffic. For more information, see Configuring Your Windows Server (p. 218).
- Ensure that the operating system on the instance you are pinging is configured to respond to ICMP. We recommend that you use one of the Amazon Linux AMIs.
- If the instance you are pinging is a Windows instance, connect to the instance and enable inbound ICMPv4 on the Windows firewall.
- Ensure that you have configured the route tables correctly for your VPC or your subnet. For more information, see Step 1: Create a VPN Connection and Configure Your VPC (p. 219).
- If your customer gateway device is a Windows server instance, ensure that you've disabled source/destination checking for the instance. For more information, see Configuring Your Windows Server (p. 218).
In the Amazon VPC console, on the **VPN Connections** page, select your VPN connection. The first tunnel is in the UP state. The second tunnel should be configured, but it isn't used unless the first tunnel goes down. It may take a few moments to establish the encrypted tunnels.
Document History

This guide (the Network Administrator Guide) has been merged into the AWS Site-to-Site VPN User Guide and is no longer maintained. For more information about configuring your customer gateway device, see the AWS Site-to-Site VPN User Guide.

For more information about the important changes in each release of the AWS Site-to-Site VPN Network Administrator Guide, see Document History in the Amazon VPC User Guide.
